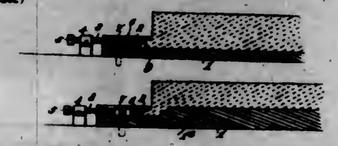
lever, all arranged to co-operate substantially as and for the purpose specified.

3. In a cultivator, the combination of the axle B, having the forked arm E, wheel-spindle H, having recess *i*, pivot-bolts *f f*, and wheel-hub *j*, having recess *l*, all substantially as and for the purpose specified.

386,109. CAR-TRUCK. JAMES E. W. CURRIER, Ottawa, Ontario, Canada, assignor of one-half to John W. Currier, North Troy, Vt. Filed Feb. 6, 1888. Serial No. 263,149. (No model.)

Claim.—1. The car A, provided with the loop H, in combination with the truck B, provided with the tongue E, inserted in said loop, said truck being pivotally connected with said car by the king-bolt C, substantially as described.



2. The car A, provided with the loop H, the truck B, provided with the tongue E and pivotally connected with said car by the king-bolt C, and a spring or springs for cushioning and centering the tongue, combined and arranged to operate substantially as set forth.

3. The combination, with a car-body, of a truck pivoted thereto and provided with a tongue at one end, and a loose chain connected to the car-body and tongue, substantially as described.

4. The combination, with a car-body provided with a loop attached to its bottom, of a truck pivoted to the car-body and provided with a tongue at one end which projects through said loop, and a loose chain connected to the car-body and tongue, substantially as described.

5. The truck B, provided with the tongue E, braces *x*, and ring *z*, the car A, provided with the loop H, the chains *y y*, connecting said ring and car, the springs *r*, for cushioning said tongue, and the king-bolt C, for connecting the truck and car, all constructed, combined, and arranged to operate substantially as set forth.

386,110. APPARATUS FOR SECURING BLOCKS OF PLASTIC MATERIAL WHILE PLANING THEM INTO SHEETS. FRANCIS CURTIS, Newburyport, Mass., assignor to the Arlington Manufacturing Company, of New Jersey. Filed Dec. 17, 1887. Serial No. 258,217. (No model.)

Claim.—1. The combination of the plate 1, the clamps 2, resting upon the top surface of the plate and provided with slots 6, the screws 7, extending through the slots in the clamps and through the plate to engage the bed-plate of a sheet-cutting machine, and horizontal screws 3, for sliding the clamps on a top surface of the plate, substantially as described.

2. As a means of holding a block of pyroxyline material or other plastic composition to be cut into sheets, a plate having a smooth upper surface, and clamps bearing upon and adjustable on a top surface of the plate and undercut at their inner edges, to overlap a lateral flange on the bottom of the composition block, substantially as described.

3. As means for holding a block of pyroxyline or other plastic composition to be cut into sheets, the plate 1, having a smooth upper surface, the clamps 2, bearing upon a top surface of the plate and having undercut edges to overlie a flange on the composition block, and screws 3, for sliding the clamps on an upper side of the plate, substantially as described.

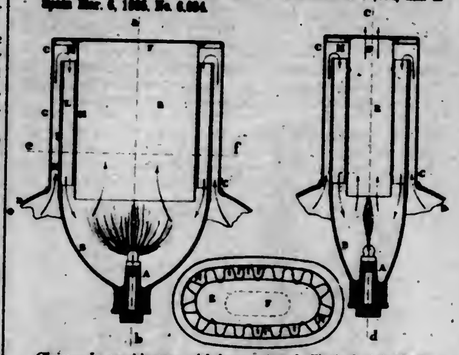
4. A plate provided with a smooth even surface raised above the marginal portion, in combination with one or more clamps mounted upon the marginal portion or portions of said plate near the edge or edges of the raised portion, and means for operating said clamps, substantially as described.

5. The combination, with the plate having a raised portion, 1ª, provided with a smooth surface, of clamps 2, arranged upon one or more of the marginal portions surrounding the raised portion, set-screws passing through slots 6 in said clamp, and set-screws 3, bearing against the edges of the same, substantially as described.

6. The combination, with the plate having a smooth-surfaced raised portion, 1ª, the edges of which slope downward to the marginal parts of the plate, of the clamp or clamps 2, having correspondingly-beveled edges, the set-screws 7, passing through slots 6 in said clamp, and the set-screws 3, tapped through brackets 4 and bearing against the outer edge of the clamp, substantially as described.

386,111. ELECTRIC-WIRE INSULATOR. HENRY H. CUTLER, Newton, Mass. Filed Oct. 31, 1887. Serial No. 253,693. (No model.)

Claim.—In a supporting-insulator for electric wires, the combination, with the base A, provided with pins or studs *e e*, of a pair of blocks or rollers, B B, composed of glass, porcelain, or other suitable non-conducting material, and having circumferential grooves *g*, said rollers being made removable from the pins or studs, and being arranged close together, with the circumferential groove of one roller opposite to that of the other, whereby an aperture is formed between the peripheries of said rollers, through which the line-wire is free to slide, and by which it is retained in place between the rollers, substantially in the manner and for the purpose set forth.



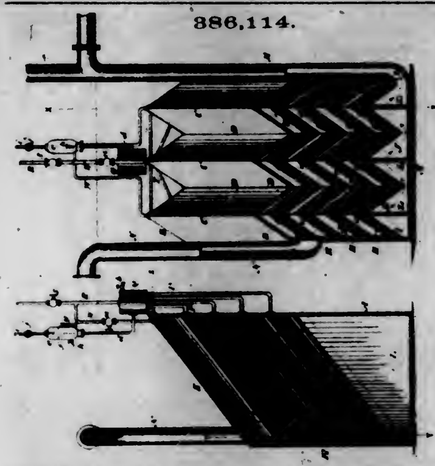
386,112. ICE-CREAM FREEZER. JOHN M. DAWLEY, Chillicothe, assignor of one-half to E. S. Evans, Columbus, Ohio. Filed May 11, 1887. Serial No. 237,594. (No model.)

Claim.—1. In an ice-cream freezer, the combination, with the can having projecting from the lid thereof the notched projections A, of the rotary paddle-carrying shaft pivoted within said can and having nut *i*, and cross-piece H, having square hole *k*, pivoted on said shaft, substantially as and for the purpose specified.

2. In an ice-cream freezer, the combination of the ice-tub having stop-arms *y*, the can having notched projections A, the cross-piece H, adapted to engage said stops and projections, and the rotary shaft C, carrying a number of inclined adjustable agitating-paddles adapted to scrape the cream from the inner surface of the can, substantially as and for the purpose specified.

386,113. GAS-BURNER. HENRI DELMAS-ARIMA, St. Gaudens, France. Filed Sept. 9, 1886. Serial No. 213,128. (No model.) Patented in France Oct. 3, 1882, No. 157,300, and May 30, 1885, No. 169,282; in Belgium Apr. 26, 1884, No. 64,967; in England May 3, 1884, No. 7,193; in Germany May 6, 1884, No. 32,681; in Italy Nov. 30, 1884, No. 17,654; in Austria-Hungary Mar. 1, 1885, No. 30,134 and No. 10,754, and in Spain Mar. 6, 1885, No. 6,654.

Claim.—In combination with burner A and elliptical globe B, the three vertical casings G H I, connected with but separated from one another to form the concentric chambers K and L, connected at their upper ends by a chamber, M, cover C, connecting the casings G H, and provided with a central discharge, F, and a plate, N, corrugated vertically and placed within the chamber L.

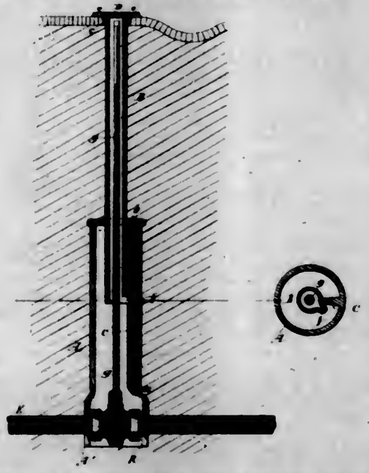


386,114. SEPARATING OIL FROM FEED-WATER. DANIEL DOBBINS, New York, N. Y. Filed May 24, 1888. Serial No. 274,866. (No model.)

Claim.—1. The apparatus herein described, having the inlet supply-pipe and the delivery-pipe, combined with the receptacle having the series of partitions with alternating elevations and depressions, and pipes leading from the elevations to a tank for collecting the oil.

2. The receptacle having the partitions provided with alternating elevations and depressions and forming spaces H between them, combined with the supply-pipe, alternating openings I between the said spaces, the delivery-pipe, and the series of pipes leading from the higher points of the spaces to a tank, substantially as set forth.

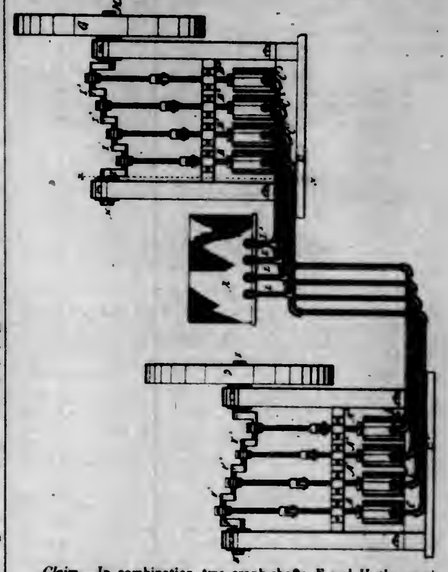
3. The receptacle having the partitions provided with alternating elevations and depressions and alternating openings I, combined with the supply-pipe, the delivery-pipe, the water-compartment J, plates L, and a series of pipes leading from the higher points of the spaces to a receiving-tank in communication with the air, substantially as set forth.



386,114.

4. The receptacle having the supply and delivery and subdivided by partitions whose surfaces have elevations and depressions, and openings I, combined with pipes leading from the said elevations to a receiver for oil containing a float and being in connection with the condenser, substantially as set forth.

5. The receptacle having the supply and delivery and subdivided by inclined partitions forming inclined spaces between them, alternating openings being provided in the partitions, combined with pipes leading from the higher points of said spaces to a tank for collecting the oil, said tank being in communication with the atmosphere, substantially as and for the purposes set forth.



386,115. TELESCOPIC STOP-COCK FOR WATER-SERVICE. EDWARD DOUGLAS, Middletown, Conn., assignor to W. and E. Douglas, same place. Filed Mar. 16, 1888. Serial No. 267,392. (No model.)

Claim.—1. In a stop-cock box for water and gas pipes, the combination, with a lower section having a single longitudinal rib therein and provided at its upper end with an opening, of an upper smaller section adapted to slide within the lower section and provided at its lower end with a single projection adapted to engage either face of the rib, substantially as set forth.

2. In a stop-cock box for water and gas pipes, the combination, with a lower section having a longitudinal rib therein and provided at its upper end with a central opening, of the upper section, considerably smaller than the lower section, and fitting the opening in the top of said lower section, thereby forming a continuous flange or shoulder at the junction of the two sections, the said upper section being provided at its lower end with a lug or projection adapted to engage either face of the longitudinal rib of the lower section, and a screw-cap having a depending screw-threaded flange adapted to engage the upper screw-threaded end of the upper section, substantially as set forth.

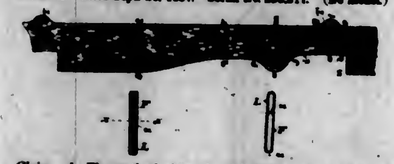
386,116. APPARATUS FOR TRANSMITTING POWER. FREDERICK H. DU BOIS, New York, N. Y. Filed Mar. 29, 1886. Serial No. 197,073. (No model.)

Claim.—In combination, two crank-shafts, E and H, the cranks of each shaft being set at equal angles to one another, and those of one shaft oppositely arranged to those of the other, a set of pumps and a set of engines in series connected to the respective cranks, and a series of a similar number of pipes, C, each connecting a pump-cylinder of one series with an engine-cylinder of the other series, for communicating a continuous rotary movement from the driving to the driven shaft, substantially as set forth.

386,117. YARN-GUIDING MECHANISM FOR STRAIGHT-KNITTING MACHINES. WILLIAM BOTT, Laconia, N. H. Filed Sept. 10, 1887. Serial No. 249,236. (No model.)

Claim.—1. The combination, in a knitting-machine, of two straight and parallel rows of reciprocating needles, a reciprocating yarn-carrier having two yarn-guiding eyes and constructed and arranged to be semi-rotated or have its ends reversed, and thereby transfer each yarn carried thereby from one row of needles to the opposite row of needles at each end of its traverse, the reversing mechanism having provision for acting upon said yarn-carrier to reverse it, adjustable stops for controlling the operation of the said reversing mechanism, pattern-cams to control the position of the said stops to automatically effect the reversal of the yarn-carrier at predetermined times, and mechanism, substantially as described, connecting said adjustable stops and cams.

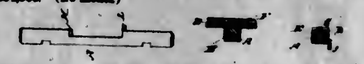
2. The two parallel rows of needles, means having provision for reciprocating said needles, a reciprocating yarn-carrier having two yarn-guiding eyes arranged upon opposite sides of its axis of revolution, and a rack and pinion for reversing said yarn-carrier, combined with a pair of movable stops, one at each end of the machine, to operate said rack, and pattern-cams to move the said stops into and out of the path of said rack, according as it may be desired to reverse said yarn-carrier to cross each yarn from one set of needles to the other or to deliver the same yarn to the same set of needles for two or more courses in succession.



3. The two parallel rows of needles, means having provision for reciprocating said needles, a reciprocating and reversible yarn-carrier having two yarn-guiding eyes arranged upon opposite sides of its axis of revolution, a pinion, and two rack-bars engaging therewith upon opposite sides for reversing the said yarn-carrier, combined with two movable stops for operating said racks, and pattern-cams for moving said stops from the path of one rack-bar to the path of the other rack-bar, and vice versa, substantially as and for the purposes described.

4. The two parallel rows of needles, means having provision for reciprocating said needles, a reciprocating and reversible yarn-carrier having two yarn-guiding eyes arranged upon opposite sides of its axis of revolution, the yarn-carrier-reversing mechanism having provision for acting upon said yarn-carrier to reverse the same, and the locking mechanism having provision for retaining the said yarn-carrier in position at the conclusion of each semi-rotation thereof, combined with a pair of movable stops arranged one at each end of the traverse of said yarn-carrier, and pattern-cams for moving the said stops into position to operate said reversing mechanism or to prevent the operation of said reversing mechanism, according to the work to be done.

386,117.



386,118. ART OF KNITTING STOCKINGS. WILLIAM BOTT, Laconia, N. H. Filed Sept. 20, 1887. Serial No. 250,217. (No model.)

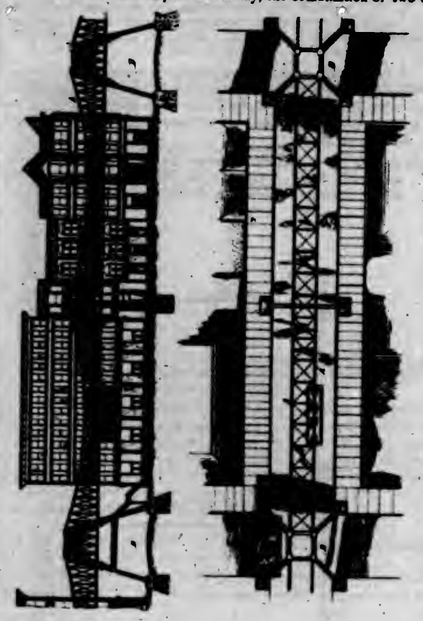
Claim.—1. The method of forming full-fashioned stockings, which consists in taking up the full number of stitches required to form the top of the leg, knitting a few circular courses, dropping a portion of the stitches, knitting a few courses upon the remaining needles by feeding each yarn to the same row of needles in both directions throughout said courses, thereby forming two short sections of flat webs, then throwing out of action one-half of the remaining needles, knitting a toe-bulge by knitting a given number of courses back and forth and narrowing, and then a corresponding number of like courses and widening, at the same time uniting the widened portion to the narrowed portion, then throwing into action the needles last thrown out of action, then knitting a sufficient number of circular courses to form the greater portion of the foot, then widening for several courses to form a gusset or gore in the bottom of the foot, then knitting the heel-bulge in the same manner as the toe-bulge and upon the same side of the tube as the gusset or gore, then knitting a series of circular courses to form the ankle, then widening upon the same side of the tube as the heel-bulge till all the needles first thrown out of action are again in operation, then knitting a series of circular courses, using the whole number of needles to complete the desired length of the leg, then throwing out of action and dropping the stitches from the same needles that were first thrown out, (repeating the foregoing operations as many times as there are stockings required,) and then severing the sections and uniting by seaming the disconnected side of the toe-bulge to the foot portion.

2. The herein-described improvement in the art of knitting stockings in continuous web or connected series, whereby the top of the leg forming part of one stocking may be accurately severed from the toe-forming portion of the next stocking of the web with the minimum of waste, which consists in knitting several courses between the leg and toe portions of different stockings to form two short flat webs each having two selvage edges, to thereby designate the courses within which the web may be divided.

386,119. METALLIC RAILWAY-TIE. REMSEN W. FLOWER, Jr., and S. LLOYD WIEGAND, Philadelphia, Pa. Filed Oct. 6, 1887. Serial No. 251,668. (No model.)

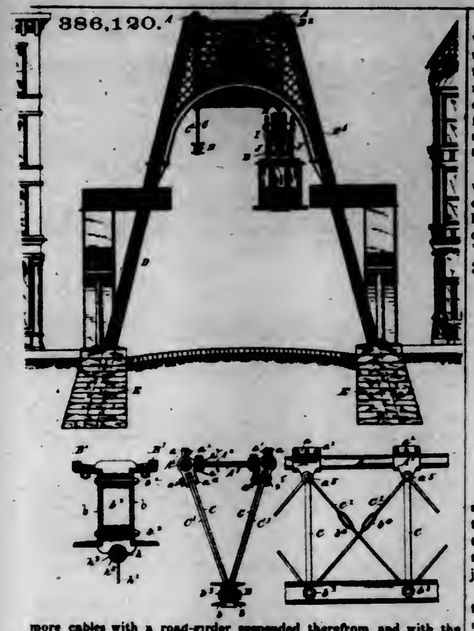
Claim.—1. A tubular metallic railway-tie having projecting flanges, with portion of the metal of the bottom near the mid-length thereof cut and bent into shoulders adapted to engage in the compacted ballast of the central part of the road-bed, substantially as set forth.

2. A tubular metallic railway-tie having the lower parts of the sides thereof cut and bent outwardly at the mid-length thereof and adapted to be covered by and engage in the compacted ballast of the road-bed, substantially as set forth.



386,120. ELEVATED SUSPENSION-RAILROAD. E. CLARKE FORSYTH, Chicago, Ill. Filed Mar. 19, 1888. Serial No. 267,668. (No model.)

Claim.—1. In an elevated suspension-railway, two or more cables trussed together laterally, in combination with a road-girder suspended from the cables by suitable connections, and with track-rails mounted upon the said girders to afford a way for a car carried below, substantially as described.

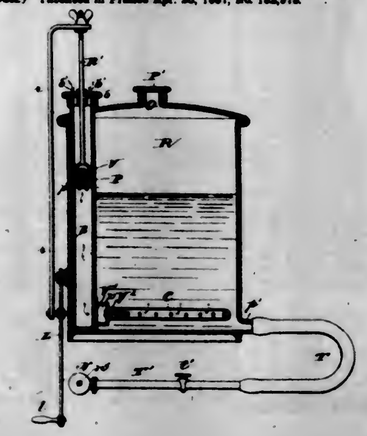


2. In an elevated suspension-railway, a series of piers, in combination with two or more cables trussed together laterally and suspended from and lying intermediate to the piers, a road girder or girders supported from the cables by suitable connections, and track-rails mounted upon the said girder, one upon each side of the top thereof, all as and for the purpose specified.

3. In a road-girder, the combination of two channel-beams, *b b*, arranged back to back, strut-castings *b'*, in the recesses of which the channel-beams rest, rivets or bolts b^3, which secure them together, and track-rails mounted one upon the top flange of each of the channel-beams and continuous with them, as and for the purpose specified.

4. In an elevated suspension-railway, the combination of two or

386,120.

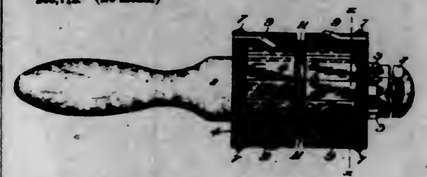


more cables with a road-girder suspended therefrom, and with the struts and ties connecting them, the lower ends of the said struts and ties being intermediate to the channel-beams forming the girder, and attached to them by bolts passing through the web of both the beams, thus permitting the tops and sides of the beams to be unobstructed to allow of the free passage of car-trucks, substantially as specified.

5. In an elevated railway, the combination of a road-girder formed of two channel-beams secured together back to back, rail B', struts C, ties C', and cables A A, trussed together laterally, substantially as specified.

6. In an elevated suspension-railway, the combination of cables A A, trussed together laterally, road-girder B, struts C, ties C', and castings A' A', secured at intervals upon the cables, substantially as specified.

7. In a double-track elevated railway, two cables, A A, approximately parallel, trussed together laterally, each cable having suspended from it by suitable struts and ties a road-girder adapted each to form a roadway upon which suspended cars may run, substantially as and for the purpose specified.

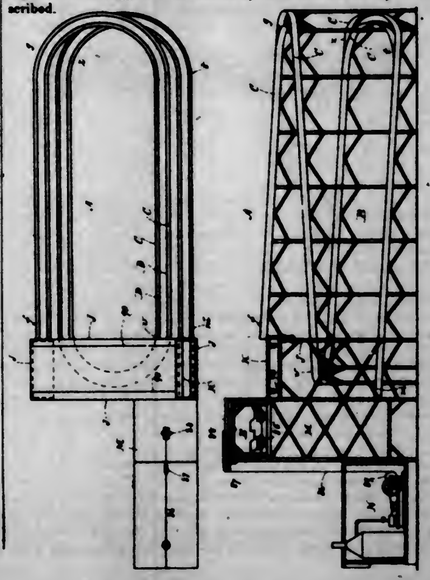


386,121. ATOMIZER. CLEMENT GAUTHIER, Marans, near Cavignac, Gironde, France. Filed Nov. 22, 1887. Serial No. 255,894. (No model.) Patented in France Apr. 23, 1887, No. 182,973.

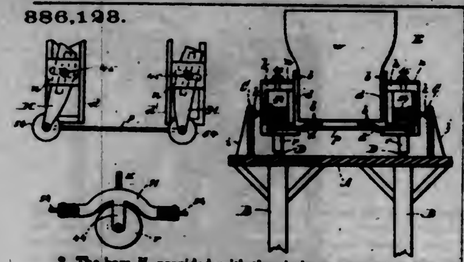
Claim.—1. In an atomizer, the combination, with a fluid-reservoir, an atomizing-nozzle connected therewith, and a valve in the connection between the nozzle and reservoir, of an air-pump located within the reservoir, a perforated pipe arranged in the lower portion of the reservoir in proximity to the bottom thereof, and communicating at one end with the discharge-port of the pump, a back-pressure valve for closing the end of said perforated pipe, and a like valve for said discharge-port of the pump, all arranged for co-operation substantially as and for the purpose specified.

2. The herein-described atomizing-nozzle N, having a vertical wall or partition, n^4, interposed in its passage between its inlet and discharge ends to form a narrow opening, n^5, and the spherical enlargement n^6, formed in said passage between the wall n^4 and the discharge-orifice of the nozzle, as and for the purpose specified.

386,122. MANDREL FOR WELDING PIPE-COUPLING SLEEVES. ROBERT W. GORDON, McKeesport, Pa. Filed Apr. 5, 1888. Serial No. 269,712. (No model.)



Claim.—1. In a mandrel for welding pipe-coupling sleeves, which sleeves have interior projections or recesses, the combination of a central core and outer sections, part of said sections having a smaller base than outer surface, and part having a larger base than outer surface, the sections being united with the core by engaging grooves and projections, substantially as and for the purposes described.

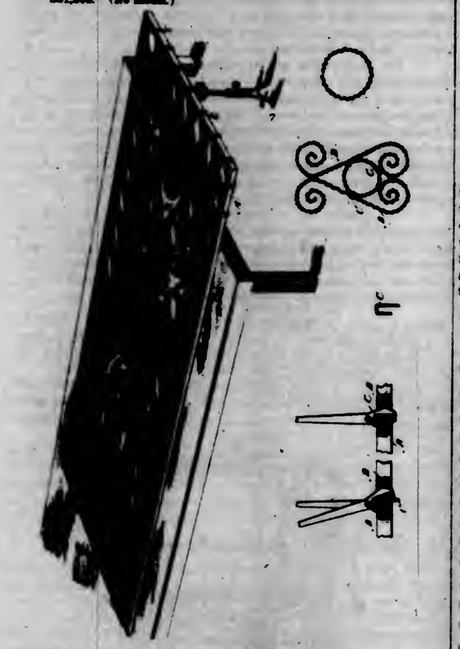


2. In a mandrel for welding pipe-coupling sleeves, the combination of a central core, outer sections, and recesses and projections for uniting the sections with the central core, and projections or grooves formed on the outer faces of the sections, substantially as and for the purposes described.

386,123. TOBOGGAN-SLIDE. CHARLES H. CRAFT, Haverhill, Mass., assignor to himself and Orlando Brown, same place. Filed Apr. 25, 1888. Serial No. 271,804. (No model.)

Claim.—1. In a toboggan-slide, the serpentine track A, provided with the guard-boards C and rails D, in combination with the toboggan E, supported on trucks r, resting on said rails, said trucks being journaled on bars H, provided with wheels 54, connected by cross-rods, as p, and adapted to swing laterally and engage said boards, whereby the trucks are kept in the line of the rails and prevented from cramping, and the toboggan is automatically steered, substantially as described.

386,128.



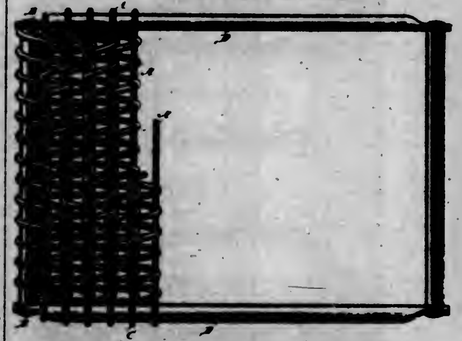
2. The bars H, provided with the pintles x, arms 44, and journaled trucks r, in combination with a toboggan-body, as w, each pair of said bars being connected by cross-rods p, substantially as set forth.

3. The toboggan-body w, provided with the brackets d, in combination with the horizontally-arranged bars H, provided with wheels 54, respectively journaled to swing laterally in said brackets, and provided with the journaled supporting-trucks r, and the track A, provided with the guard-boards C, substantially as described.

4. The bracket d, having the horizontal top n, provided with the hole j, in combination with the bar H, having the pintle x inserted in said hole and provided with the nut 45, the truck r, journaled in arms 44 on said bar, and the body w, substantially as set forth.

386,124. METHOD OF UNITING PIECES OF SCROLL-WORK. FREDERICK HARDWORTH, Chicago, Ill. Filed Mar. 14, 1887. Serial No. 231,302. (No model.)

Claim.—1. That improvement in the art of fastening together scroll-work which consists in placing the scrolls in position directly on a table, projecting the scroll-work over the end or side of the table, then passing an open-ended loop having one arm thereof longer than the other over the scrolls at the points to be joined or united, and then closing the open ends of the loop and tightly binding the scrolls by means of a suitable tool, all substantially as described.

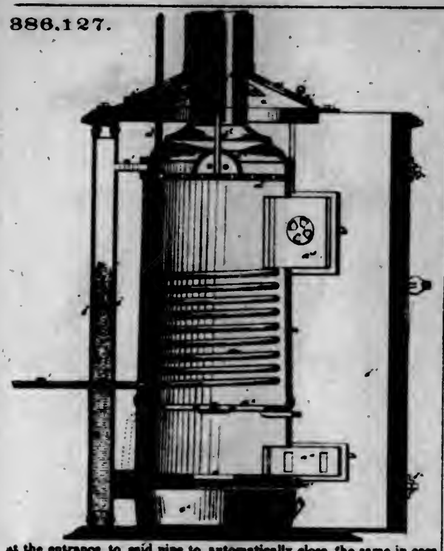


2. That improvement in the art of manufacturing scroll-work which consists in placing the scrolls in position, leaving open spaces around the points of contact of the scrolls, placing an open-ended loop, with one arm thereof longer than the other, around the points to be joined together, then closing the open arms over the scrolls, thus clamping the scrolls and firmly binding them together by means of a suitable tool.

386,125. METHOD OF MAKING SCROLL-WORK. FREDERICK HARDWORTH, Chicago, Ill. Filed June 11, 1887. Serial No. 241,021. (No model.)

Claim.—The method herein shown for uniting or joining together the different parts of scroll-work, which consists in placing in position the scrolls on a table with a part thereof projecting over the side of the table, then placing an open loop having one arm longer than the other in position on the scrolls where they are to be joined together from below or from the under side of the scroll-work, then adjusting a movable anvil under the loop, and then closing the longer arm over the scrolls, substantially as shown.

386,126. WIRE MAT. FREDERICK HARDWORTH, Chicago, Ill. Filed June 11, 1887. Serial No. 241,022. (No model.)

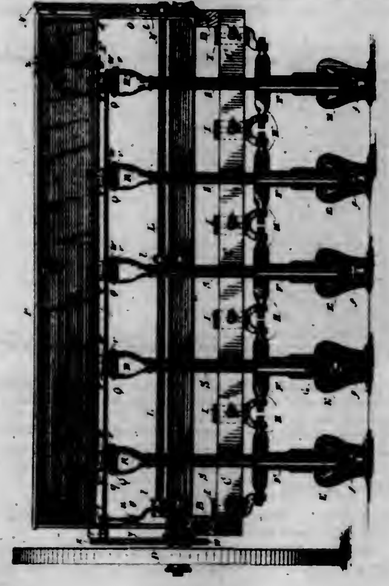


Claim.—As an article of manufacture, a mat made of coiled wire, one strand of which is coiled to the left and one strand coiled to the right, and the two coils joined together by a straight wire and provided with a border, on two sides of which the rods forming the border pass through the coils, and on the remainder of the sides the ends of the straight wires are wound around the rods forming the border, substantially as shown.

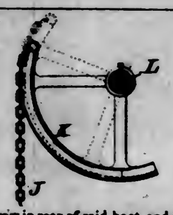
386,127. HEATER. ARENT W. HINZ, Chicago, Ill. Filed May 30, 1887. Serial No. 239,513. (No model.)

Claim.—1. In an apparatus for heating, the combination, with a heating cylinder or stove having a smoke-escape pipe, a valve located

386,127.



at the entrance to said pipe to automatically close the same in case the stove should become upset, of the double wall-casing surrounding the heater, and provided with a door and having a stationary and a rotating plate, each plate provided with openings, and a flap-valve having a stop-lug, substantially as and for the purpose specified.



2. The combination, with a stove or heating-cylinder, of a protecting-casing surrounding the same, said casing provided with a stationary and a rotating plate, each plate provided with openings adapted to register one with the other, and a flap-valve having a stop-lug hinged beside each opening to automatically close said opening in case the stove should upset, substantially as specified.

386,128. GRAIN-DRILL. WILLIAM H. HOLLINGER, Hiawatha, and JOSEPH W. GILLETT, Woodbine, Kans. Filed Mar. 12, 1887. Serial No. 230,494. (No model.)

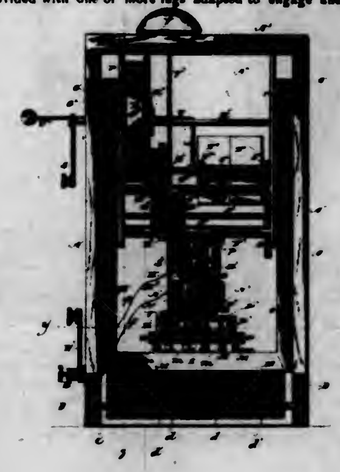
Claim.—1. The combination of the plow-carrying boot, the crimped wheel in rear of said boot, to pulverize the soil and cover the

386,128.

grain fed to the furrow in rear of said boot, and the loosely-hung link-connection between said boot and said crimped wheel, whereby the wheel is loosely suspended or connected and accommodates itself to the soil and furrow as the machine is drawn along, substantially as described.

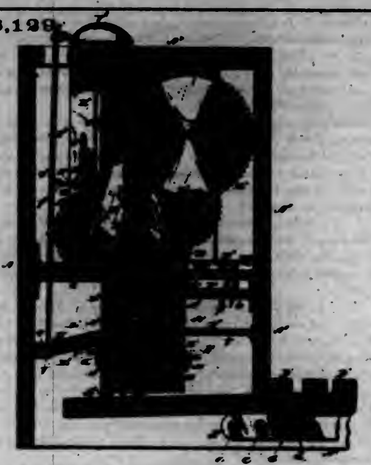
2. The combination of the series of plow-carrying boots, the adjusting and supporting chains, and the supporting pulleys or surfaces for said chains adjustable independently, whereby the plows may be adjusted vertically independently, so as to work in the desired relation, as herein described.

3. The combination, substantially as hereinbefore set forth, of a series of plow-carrying boots, a series of independent adjusting devices and connections for said boots, whereby each may be independently set or hung vertically, as desired, and a lifting-lever common to said boots, whereby they may be all lifted or raised vertically simultaneously, as herein described.



4. The combination of the series of plow-carrying boots, the series of independent adjusting devices carried by a rock shaft or rod, the connections between said boots and said independent adjusting devices, whereby each boot may be set or hung as desired, and a lifting-lever to rock said shaft or rod to raise or lower all of said boots together, as herein described.

5. The combination of the series of plow-carrying boots, the double-mold-board plows attached thereto, the drag-bars, respectively connected at one end to said boots and at the other end to vertically-adjustable plates on the front of the machine-frame, the series of independent adjusting devices carried by a rock shaft or rod, the connections between said boots and said independent adjusting devices, whereby each plow may be set or hung as desired, and a lifting-lever to rock said shaft or rod to raise or lower all of said plows together, substantially as herein described.



6. The combination, substantially as hereinbefore set forth, of the series of plow-carrying boots jointed to the frame of the machine by drag-bars, the series of independent adjusting devices for said boots, the supporting connections or chains between said independent adjusting devices and said boots, the rock shaft or rod carrying said adjusting devices, and the main lifting-lever to rock said shaft.

386,129. AUTOMATIC TELEGRAPH-TRANSMITTER. ERNST P. HOTCHKISS, Oak Park, Ill., assignor of one-half to William W. Dudley, Washington, D. C., and Carlos J. Ward, Oak Park, Ill. Filed Aug. 10, 1885. Renewed Oct. 21, 1887. Serial No. 253,013. (No model.)

Claim.—1. In a telegraphic transmitter, in combination with the series of movable strips, the series of key-levers below the same, each provided with one or more legs adapted to engage and lift one or

386,129.

more of the strips as the lever is operated, substantially as and for the purpose described.

2. In a telegraphic transmitter, the series of key-levers, each of which is provided on its upper edge with one or more projections corresponding in extent and relative arrangement with the telegraphic character or signal for a letter, sign, or number of a telegraphic code, and the series of movable strips above such levers and at right angles thereto, substantially as and for the purpose described.

3. In a telegraphic transmitter, in combination with the series of parallel movable strips, the series of key-levers below the same, each provided on its upper edge with an arrangement of dot and dash projections corresponding with the arrangement of dots and dashes constituting the telegraphic signal or character for the letter, sign, or number of the key-lever, each dot projection being adapted to engage one of the strips and the dash projection two or more, according to the length of the dash in the character, substantially as and for the purpose described.

4. In combination with the contact devices, the rotary wheel provided with movable pieces normally out of position to operate the contact devices as the wheel revolves, and means for moving and holding one or more of such pieces in position to operate the contact devices as the wheel revolves, substantially as and for the purpose described.

5. In combination with mechanism for making and breaking circuit, the rotary circuit-wheel provided with pivoted arms normally out of position to operate the make-and-break mechanism, and means for moving and holding one or more of such arms in position to operate such mechanism to close the circuit, substantially as and for the purpose described.

6. In combination with the transmitting-lever provided with a stud, the rotary circuit-wheel carrying a series of pivoted pieces normally in position, so as to avoid the stud on the lever as the wheel rotates, and means, substantially as described, for moving one or more of these arms into position to engage the stud on the transmitting-lever as the wheel revolves, substantially as and for the purpose described.

7. In combination with the circuit-wheel rotating in one direction, a key-lever, and suitable mechanism for rotating the wheel, means for starting the mechanism into action to rotate the wheel after the key-lever has been moved and released, and for stopping such mechanism as soon as the character or signal is finished independently of the complete rotation of the wheel, substantially as and for the purpose described.

8. In a telegraphic transmitter, in combination with the rotary circuit-wheel and mechanism tending to normally revolve it, means for releasing the mechanism and allowing the wheel to revolve and send a signal when a key has been depressed and released, and automatic means for stopping the driving mechanism and the wheel and striking an alarm when the character or signal is finished without reference to the completion of a rotation by the wheel, substantially as and for the purpose described.

9. In combination with the radial pivoted bars on the circuit-wheel, the series of movable strips below the wheel, each having an arm or leg adapted to engage and lift one of the bars when the strip is raised, substantially as and for the purpose described.

10. In combination with the pivoted radial bars on the rotary circuit-wheel, the movable strips below the wheel, each provided with an arm adapted to engage one of such bars when the strip is raised, and having a leg or shoulder adapted to engage the side of the bar and prevent its movement until the strip falls again, substantially as and for the purpose described.

11. The rotary circuit-wheel provided with the radial bars L L, pivoted thereto, each having on its upper side an upright arm turned in at its upper end toward the axis of the wheel, and the hook arms or pawls N^{5} N^{5}, pivoted so as to swing in radial planes, and at their lower hooked ends engaging the ends of the inturned portions of the arms or bars L L, when such bars are down in their normal horizontal position, substantially as and for the purpose described.

12. The circuit-wheel having the upper and lower heads, the radial bars pivoted to the lower head, provided with upright arms having their upper portions turned inward, and the upright bars pivoted to the upper head, having their lower ends hooked and adapted to engage the inner ends of the inturned portions of the arms on the radial bars, when such bars are in horizontal positions, substantially as and for the purpose described.

13. In combination with the series of hooked arms pivoted to a head or flange of the circuit-wheel, so that their lower hooked ends tend to normally swing outward, the series of radial bars pivoted to a second head or flange of the wheel, having inturned hooked projections adapted, when the bars are down in horizontal position, to engage the hooked ends of the pivoted hooked arms to hold them normally swung inward until the bars are raised, substantially as and for the purpose described.

14. In combination with the rotary circuit-wheel having the series of pivoted hook-arms having their lower ends hooked and so pivoted that they tend to swing such lower ends outward, and the pivoted radial bars having hooked uprights adapted to engage the hooks on the pivoted hook-arms and hold them swung inward while the radial bars are down, but to rise above such hooks when the radial bars are raised, so as to let the hook-arms swing outward, the transmitting-lever, and a stud situated inside of the circle of travel of the upper ends of the pivoted hook-arms when the lower hooked ends thereof are held in, substantially as and for the purpose described.

15. In combination with the rotary circuit-wheel having the series of pivoted hooked arms N^{5} N^{5} and the series of pivoted radial bars L L, provided with the hooked uprights normally engaging the ends of the hooks of the pivoted hooked arms, the transmitting-lever for operating the contact devices, having the stud so situated as to be engaged and thrown up by the upper ends of the pivoted hook-arms only when such ends have been swung inward from their normal position, substantially as and for the purpose described.

16. In combination with the pivoted radial bars of the rotary circuit-wheel and means for raising one or more of these bars as desired, the stopping and starting lever V, resting upon several of the bars, so as to be raised by the bars as they are raised, and the stop-lever adapted to be moved by the stopping and starting lever to release the circuit-wheel-driving mechanism when the latter lever is raised, substantially as and for the purpose described.

17. In combination with the pivoted radial bars of the circuit-wheel, the stopping and starting lever having a portion resting upon one or more of the bars, and the pivoted stop-arm resting upon the lever adapted to engage a portion of one of the bars when the bars and lever are down, substantially as and for the purpose described.

18. In combination with the pivoted bars L L of the circuit-wheel, the lever adapted to be raised as one or more of the bars are lifted, and a stop adapted to normally engage one of the bars and to be raised to release the bar when the lever is raised, substantially as and for the purpose described.

19. In combination with the circuit-wheel provided with the pivoted bars L L and means for rotating the wheel, the stopping and starting lever adapted to be raised by the swinging up of one or more of the bars, and means for stopping the driving mechanism when the lever is down and releasing it when the lever is up, substantially as and for the purpose described.

20. In combination with the rotary circuit-wheel and the pivoted bars L L thereof, spring mechanism for driving the wheel, an arm on the fly-shaft, a lever engaging one or more of the bars, adapted to be raised by the raising of one or more of such bars, the pivoted arm resting on such lever, and the rod connected therewith, having a pin or arm adapted to engage the arm on the fly-shaft when the pivoted arm resting on the lever is down, a bell, and a hammer on the rod adapted to strike the bell as the rod swings into position to stop the fly-shaft, substantially as and for the purpose described.

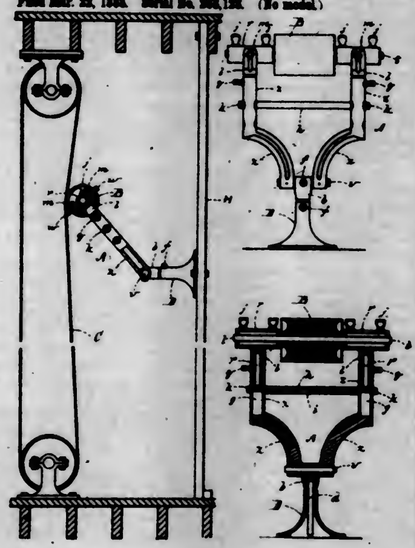
21. In combination with the rotary circuit-wheel and mechanism for rotating the same, the lever adapted to be raised by the raising of one or more of the pivoted radial bars of the circuit-wheel, the pivoted stop-arm resting on such lever, and when the lever is down adapted to engage an arm or projection on one of the bars of the wheel, the rod connected and swinging with such pivoted stop-arm, the bell, and the head or hammer on the rod adapted to strike the bell whenever the lever and stop-arm drop again into their lowest

positions after being raised, substantially as and for the purpose described.

22. In combination with the series of movable strips E E, having the upwardly-extending arms at their ends, the stationary guiding lugs or ears between the arms of contiguous strips, and the anti-friction rollers engaging the outer sides of the arms, substantially as and for the purpose described.

23. In combination with the pivoted hook arms or pawls of the circuit-wheel, and the transmitting-lever having a stud or lug so situated as to be engaged by the upper ends of such of the pawls as are swung to bring their upper ends inward, means, substantially as described, for swinging such pawls to move their upper ends outward again after they have engaged the stud on the lever, substantially as and for the purpose described.

24. In combination with the pivoted hook or pawl arms on the rotary circuit-wheel, the transmitting-lever having a lug adapted to be engaged by the upper ends of such of the hook arms or pawls as may be swung to bring their upper ends inward beyond the rest, and the trip-arm adapted to engage the lower portions of the pawls or arms and swing them inward after their upper ends have engaged the stud on the lever, substantially as and for the purpose described.



25. In combination with the rotary circuit-wheel and the pivoted radial bars provided with hooked arms, and the pivoted hooked arms or pawls carried by said wheel, the transmitting-lever having the lug adapted to be engaged by the upper end of any pawl which is swung to bring its upper end inward beyond the others, and the trip adapted to engage such pawl below its pivot to swing its lower end inward again on a line with the other pawls after its upper end has engaged the stud on the lever, substantially as and for the purpose described.

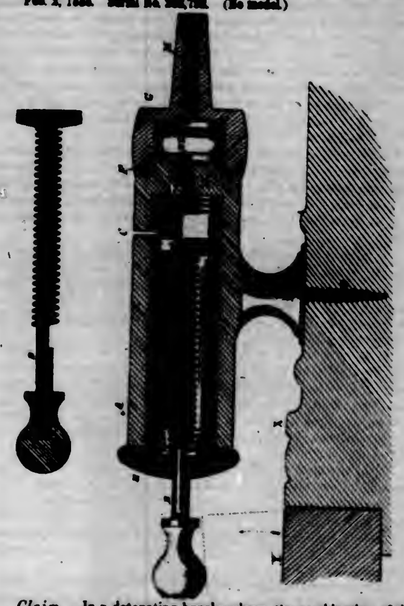
26. In a telegraphic transmitter, in combination with the transmitting devices and the driving mechanism therefor, the fly or fan shaft, and the means for increasing or diminishing the effective area of the fan, which consists in the plate engaging and rotating with the fan and adapted to be slid along the shaft, so as to leave more or less of the plate extending beyond the end of the fan, substantially as and the purpose described.

27. In a telegraphic transmitter, in combination with the transmitting devices and the driving mechanism therefor, the fly or regulating fan, and the plate engaging and rotating with the fan, pivotally supported on a sliding sleeve on the fly-shaft, substantially as and for the purpose described.

28. In a telegraphic transmitter, in combination with the mechanism for driving the transmitting devices, the fan-shaft and the fixed fan thereon, the sliding sleeve on the shaft, the rod connected with the sleeve, whereby said sleeve can be slid on the shaft toward or from the fan, and the plate connected with the sleeve so that it can rotate but must move with it along the shaft, all substantially as shown and described, so that the speed of the transmitting devices can be regulated at will by moving the rod connected with the sleeve.

386,130. BELT-TIGHTENER. SETH G. HUNTER, Watertown, N. Y. Filed Mar. 22, 1888. Serial No. 268,128. (No model.)

Claim.—1. In a belt-tightener, the combination of the following instrumentalities, to wit: a bracket, a rod adjustably secured in said bracket and provided with a pintle, a body journaled on said pintle, hangers adjustably secured to said body, bearings pivoted in said hangers, and a roll journaled in said pivoted bearings, all being arranged to operate substantially as set forth.



2. In a belt-tightener, the body A, having the hollow arms *x*, in combination with the rod *d*, having the head *b*, provided with the pintle *v*, the bracket D, provided with the adjusting-screw *f*, and the roll B, journaled in bearings secured in said arms in such a manner that said roll may be adjusted longitudinally with respect to the belt, substantially as described.

3. In a belt-tightener, the body A, having the hollow arms *x*, in combination with the bearings *r*, pivoted in adjustable hangers on said arms, and the roll B, journaled in said bearings, said body being adjustably secured in a bracket fastened to a post or wall, substantially as set forth.

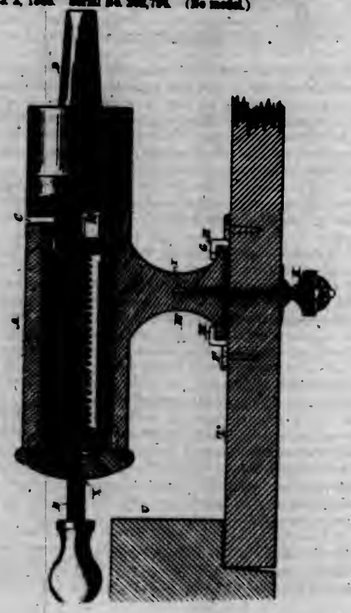
4. In a belt-tightener, arms *x*, each having an inwardly-curved portion, *z*, the straight portions being provided with longitudinal holes in their outer ends, the sleeve *h*, rod *i*, and nuts *k*, for connecting and bracing said arms, a hanger, *l*, adjustably secured on each of said arms, said hangers being respectively provided with arms *m* and rods *p*, boxes or bearings *r*, pivoted in the arms, a roll, B, journaled on the rod *l* in said pivoted boxes or bearings, a bracket, D, and a rod, *d*, adjustably secured in said bracket and having the head *b*, provided with the pintle *v*, the curved portions *z* of the arms *x* being pivoted on said pintle, substantially as described.

5. In a belt-tightener, a bracket, a rod adjustably secured in said bracket, a body jointed to said rod and provided with arms having holes in their outer ends, hangers adjustably secured on said arms, boxes or bearings pivoted in said hangers, and a roll journaled in said pivoted bearings, all combined and arranged to operate substantially as set forth.

386,131. BURGLAR-ALARM. JOHN IRBAH, St. Louis, Mo. Filed Feb. 2, 1888. Serial No. 262,792. (No model.)

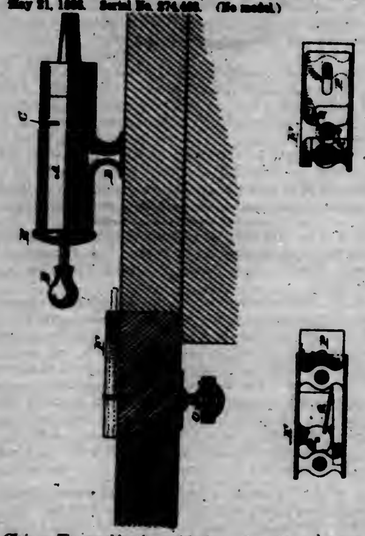
Claim.—In a detonating burglar-alarm, the combination of the hollow firing-cylinder A, screw-threaded at F, and the hollow cylindrical extension G for carrying a second explosive, screw-threaded and provided with the openings K and L, whereby the firing-cylinder can be elongated and caused to fire two explosives at will, substantially as set forth.

386,132. ALARM. JOHN IRBAH, St. Louis, Mo. Filed Feb. 2, 1888. Serial No. 262,793. (No model.)



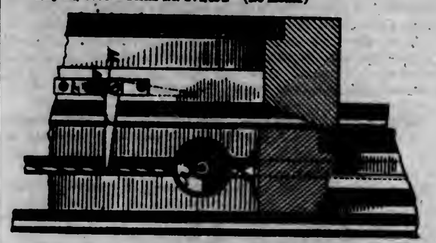
Claim.—1. The combination, with a clock alarm mechanism having a firing alarm mechanism connected to it, of the connecting supporting-rod C, the screw-cap C', working on the upper end of said rod to vary the length of the connection between the clock alarm mechanism and firing alarm mechanism, and the spring-plunger of the firing mechanism, substantially as set forth.

386,132.



2. The combination, with the lamp and firing-cylinder, of an alarm mechanism, the horizontally-adjustable sliding match-holder F, provided with a base, G, and the clamps H, whereby the base G may slide in the recess I to adjust the match to different distances from the lamp, substantially as set forth.

386,133. BURGLAR-ALARM. JOHN IRBAH, St. Louis, Mo. Filed Feb. 2, 1888. Serial No. 262,794. (No model.)

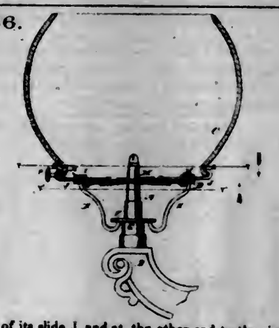


Claim.—In a detonating burglar-alarm, the combination of a firing-cylinder and its firing mechanism, a shank for the cylinder provided with a key-hole, a key to rotate the shank-cylinder and firing mechanism, a base-plate for the shank, and means for holding the base-plate to place upon the inside of a door, so that the key will operate from the outside, substantially as set forth.

386,134. BURGLAR-ALARM. JOHN IRBAH, St. Louis, Mo. Filed May 21, 1888. Serial No. 274,603. (No model.)

Claim.—The combination, with the spring-plunger of a detonating burglar-alarm, of a trip attachment, F, consisting of a slide, P, connected to a rotary part, R, adapted to be turned by a key, O, from the outside of a door to throw the slide P out of or into position to strike the spring-plunger and operate the alarm mechanism attached to the inside of a door, when the door is opened, substantially as set forth.

386,135. BURGLAR-ALARM. JOHN IRBAH, St. Louis, Mo. Filed May 21, 1888. Serial No. 274,604. (No model.)



Claim.—The combination, with the spring-plunger of a detonating burglar-alarm, of a trip attachment for use upon a window-sash, consisting of the plate T, adapted to be screwed to the vertical part of a sash and provided with a shoulder, U, and the arm V, pivoted loosely to the plate and rounded at W, so as to turn a quarter of a revolution and be stopped by the shoulder U, the arm V also adapted to be set so as to project over the spring-plunger of the alarm mechanism and cause it to operate when a window is raised, substantially as set forth.

386,136. SUPPORT FOR GLOBES. ROBERT JAMES, New York, N. Y. Filed Nov. 30, 1887. Serial No. 256,493. (No model.)

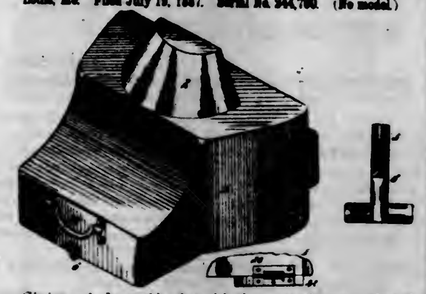
Claim.—1. The ring D, sustaining-arms E, and disk F, combined with the slides J, having shoulders L, the guides for the slides, and the springs M, each of the slides being independent of the others, and each spring M being secured at one end to the inner end of its slide J and at the other end to the ring D on the opposite side of the burner, substantially as shown and described.

2. The ring D, sustained around the burner and having guides, combined with the slides J and springs M, each of the slides being independent of the others, and each spring M being secured at one end to

386,186.

the inner end of its slide J and at the other end to the ring D on the opposite side of the burner, substantially as shown and described.

386,137. SEPARATING AMMONIUM CHLORIDE. GUSTAV JÄRMAY, Northwich, County of Chester, England. Filed Oct. 15, 1887. Serial No. 252,477. (No specimens.) Patented in England Aug. 14, 1886, No. 10,419.



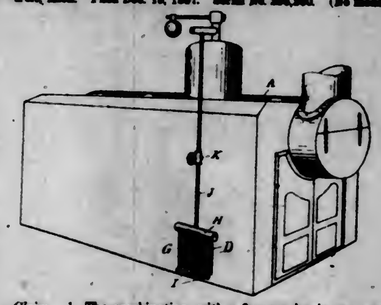
Claim.—The improvement in treating the residual or ammonium-chloride liquors obtained in the ammonia-soda process, which consists in adding at one operation to these liquors the requisite quantity of sodium chloride to replace the ammonium chloride, such amount being greater than what would saturate the original ammonium-chloride liquor, keeping the salt in suspension by constant agitation, and at the same time cooling, whereby the sodium chloride gradually replaces the ammonium chloride in the solution, and the latter salt separates out, and on the agitation ceasing falls to the bottom, whereby I obtain in one operation crystallized ammonium chloride and a mother-liquor applicable in the ammonia-soda process in the place of brine.

386,138. PROCESS OF DISTILLING PINE-WOOD FOR THE PRODUCTION OF CRUDE DRY TURPENTINE AND PINE-TAR. BERNHARD KOCH, New Orleans, La., assignor of one-half to Charles J. Allen, same place. Filed Mar. 1, 1887. Serial No. 229,229. (No specimens.)

Claim.—1. The process for the production of turpentine and pine-tar, consisting, essentially, in extracting the pine-oil by dry distillation, agitating the distillate with milk of lime, allowing the mixture to settle, separating the oil and lye or other impurities which have combined therewith, agitating the oil with dilute sulphuric acid, removing the last remaining traces of alkali, and finally distilling the oil.

2. The process for the production of turpentine and pine-tar, consisting, essentially, in extracting the pine-oil by dry distillation, mixing a solution of caustic soda with the crude dry distilled turpentine, allowing it to settle, drawing off the accumulated lye, redistilling the turpentine, then thoroughly intermixing an aqueous solution of caustic potash, separating the oil and lye, agitating the oil with concentrated sulphuric acid, washing it out with water and again with an aqueous solution of caustic potash, and finally redistilling the oil.

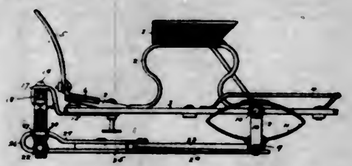
386,139. COVER FOR TYPE-WRITERS. GODFREY H. LASAR, St. Louis, Mo. Filed July 19, 1887. Serial No. 244,709. (No model.)



Claim.—1. In combination with the cover of a type-writer, the inwardly-bent and downwardly-extending plates 12, secured to the cover on the inside thereof near its lower edge, rock-shaft 4, secured to the base of the machine, lever 7, secured to the rock-shaft, and spring-bolts connected to the levers, substantially as and for the purpose set forth.

2. In combination with the cover of a type-writer, having wings 20, the pieces 21 and 22, the piece 22 being hinged to one of the wings, substantially as and for the purpose set forth.

3. In combination with the cover of a type-writer, having wings 20, the pieces 21 22, the piece 22 being hinged to one of the wings and provided with a pin fitting in a catch on the wing, substantially as and for the purpose set forth.



386,140. AIR-FEEDING DEVICE. FREDERICK LEADBEATER, Detroit, Mich. Filed Dec. 19, 1887. Serial No. 258,260. (No model.)

Claim.—1. The combination, with a furnace having an aperture with parallel sides leading into the ash-pit, of the plurality of vertical division-strips dividing said aperture into separated passage-ways, a corresponding series of vertical perforated tubes arranged outside said aperture, one opposite the space between each two strips, and a cross-head communicating with all of said tubes and connected with a suitable source of steam, substantially as described.

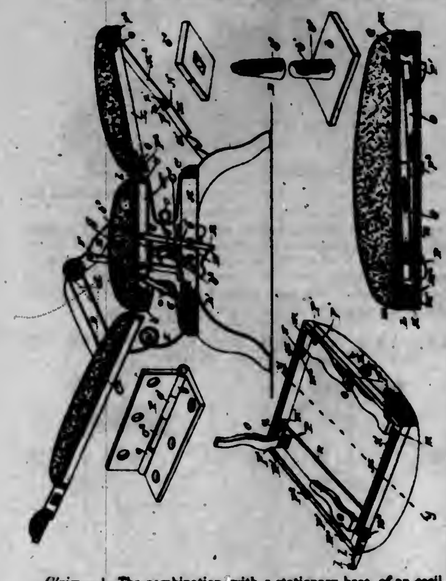
2. In a steam and air feeding device for smoke-consumers, the combination of the aperture D, formed in the side wall of the ash-pit, the partitions E, inlets F, perforated tubes G, drip-cocks I, one for each tube G, cross-head H, supply-pipe J, and valve K in such supply-pipe, the parts being arranged and constructed to operate substantially as and for the purpose described.

386,141. BUCKBOARD-WAGON. WILLIAM LEPPERT and WILLIAM I. GARDNER, Seymour, Ind. Filed Mar. 27, 1888. Serial No. 268,717. (No model.)

Claim.—1. In a buckboard-wagon, the combination of the slat bottom, the dropped or bent rear axle, the longitudinally-arranged elliptic springs supporting the rear end of said bottom, the transverse forward elliptic spring, the front axle pivoted beneath the same, the cross-bar secured to the upper side of the same, and the curved brackets supporting the forward end of said bottom in rear of said spring, substantially as described.

2. In a buckboard-wagon, the combination of the slat bottom, the dropped or bent axle, and the springs secured to the sides of said bottom and also to said axle, substantially as and for the purpose described.

3. In a buckboard-wagon, the combination of the slat bottom, the dropped or bent axle, and the transverse bar formed with ends which are bent upward and outward, with the elliptic springs secured to said dropped or bent portion of the axle and to the bent ends of said transverse bar, substantially as and for the purpose described.



4. In a buckboard-wagon, the combination of the slat bottom, the forward axle, the transverse spring, the cross-bar secured to said spring, and the upwardly-curved brackets supporting said bottom and having rectangularly-hooked ends resting upon said cross-bar, substantially as and for the purpose described.

5. In a buckboard-wagon, the combination of the slat bottom, the transverse bar secured thereto near its rear end and formed with bent ends, and the upwardly-curved brackets at the forward end of said bottom, with the dropped or bent rear axle, the springs secured to its bent portion and to the bent ends of said transverse bar, the forward spring, the front axle, and the cross-bar, to which are secured said brackets, substantially as and for the purpose described.

6. The combination of the slat bottom 3, the cross-bar 18, and the forward elliptic spring, 20, with the upwardly-curved brackets 14, having their ends 17 bent forward and downward, and notted bolts 19, passing through said forwardly-bent portions of the bracket ends and through said cross-bar, substantially as and for the purpose described.

7. The combination, with the slat bottom 3, the upwardly-curved brackets 14, the forward cross-bar, 18, secured to said brackets and to the forward elliptic spring, 20, the bolster 21, also secured to said spring, and the front axle, 22, pivoted under said bolster, of the reach 23, the metallic bar 25 upon its under side, which is curved forward and over said front axle and secured by its cross-head 27 to the forward face of said bolster, and the bracket or brace 26, bolted to the upper side of said reach and secured by its cross-head 30 to the rear face of said bolster, substantially as and for the purpose described.

386,142. CONVERTIBLE CHAIR AND COT. FRANK C. LEWIS, Catskill, N. Y. Filed Mar. 21, 1887. Serial No. 231,743. (No model.)

Claim.—1. The combination, with a stationary base, of an oscillating seat mounted thereon and supported above the same, a back pivotally connected to the same, the arms pivoted to both the seat and the back, and also pivoted together, and the return-springs arranged on opposite sides of the seat and connected to the base and the arms, as and for the purpose described.

2. The combination of a base, an oscillating seat mounted thereon, the arms D and links E, an adjustable back pivoted to the free ends of the arms and the seat, and the return-springs pivotally connected to the base and the arms at an intermediate point of the same, as and for the purpose described.

3. In a reclining-chair, the combination, with an adjustable back and the arms, of the coupled clamping devices and the wedge-shaped braces pivoted to the arms and passing through the clamping devices, the braces being tapered from their point of connection with the arms toward their free ends, as and for the purpose set forth.

4. In a reclining-chair, the combination, with the adjustable back and the arms, of a pair of clamping devices and the longitudinally-tapered braces pivoted to the arms and passing through the clamping devices, as and for the purpose described.

5. In a reclining-chair, the combination, with the adjustable back and the arms, of the tapered braces pivoted to the arms and the clamping devices, each having the coupled rods provided with eyes for the passage of the braces, and the binding-wheels, as and for the purpose described.

6. In a reclining-chair, the combination, with an adjustable back and the arms connected to the back and the seat by intermediate links, of the tapered braces pivoted to the links, and clamping devices having the rods thereof coupled together, and each provided with the eye and the threaded extension, the slotted washers, and the binding wheels fitted on the threaded extension, as and for the purpose described.

7. In a chair of the class described, the combination, with the adjustable back and arms, of the braces, and the clamping devices for the braces, having the oppositely-threaded rods, and the threaded coupling-sleeve into which the rods are screwed, as and for the purpose set forth.

8. In combination with the base, the seat, the convertible foot-rest and ottoman detachably connected directly to the seat, and adjustable bars connecting the opposite end of the foot-rest to the base, and folding legs connected to the foot-rest, whereby when the foot-rest is to be used as an ottoman it can be detached from the seat and base, the adjustable bars folded within the frame of the foot-rest, and the hinged legs let down to support the ottoman, and when used as a foot-rest the legs are folded within the ottoman-frame, the adjustable bars are let down, and connection is made between the foot-rest frame and the base and seat, as set forth.

9. The herein-described combined ottoman and foot-rest, comprising a frame suitably covered or upholstered and provided with devices for detachably connecting the frame to a chair to form a foot-rest, a series of legs connected to the frame by hinges P, one leaf of which is secured to the frame and the other leaf is secured to the legs, one leaf of the hinge sliding on the other, so as to give both a sliding and a swinging movement to the legs, said legs being provided with shoulders to engage the frame of the foot-rest when the article is employed as an ottoman, and the folding bars, also connected to the foot-rest frame, said bars to connect with the chair when the article is to be used as a foot-rest, as set forth.

10. The foot-rest having the longitudinal recesses and the lateral openings *m'*, and the folding rack-bars pivoted at one end of the foot-rest, and connected by an intermediate tie-bar to fit in the lateral openings, as and for the purpose described.

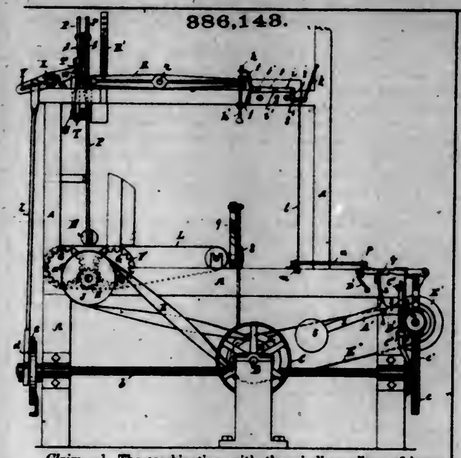
11. A foot-rest having the folding legs O hinged thereto and provided with the shoulders *p'*, the hinges P, permitting the legs to have a lateral movement independently of their swinging movement, and the buttons Q and stops P', for locking the legs in a vertical position, substantially as described.

12. The foot-rest L, having the recessed legs O independently hinged inside thereof and adapted to slide on the hinge-pintles, to engage the frame of the foot-rest when the legs are supported in their vertical positions, each pair of legs being adapted to fold compactly within the body of the rest and overlap one another, and the locking device *p*, to hold the legs against movement when folded, as set forth.

13. The combination, with the foot-rest or ottoman L, the hinges P, adapted to have a sliding movement, having one leaf attached to the foot-rest, and the legs O, having the other leaf of the hinge connected thereto, whereby the said legs are independently hinged inside the foot-rest, the leaf of the hinge that is attached to the legs sliding on the pintle of the leaf that is secured to the foot-rest frame, whereby the legs are given both a sliding and a swinging movement, the shoulders on the legs engaging the frame of the foot-rest to lock the legs in position, as set forth.

14. The combination, with the foot-rest or ottoman L, the shouldered legs, and the hinges P, for independently hinging the legs inside the foot-rest; the said hinges having one leaf secured to the foot-rest and the other leaf secured to the legs, said hinge-leaves sliding upon the pintles, and also having a swinging movement, whereby the legs are given both a sliding and swinging movement, the shouldered portion of the legs engaging the foot-rest frame, and the stops for locking the legs in their vertical position, as set forth.

15. The combination, with a base and a seat, of the clamping devices and a tapering link pivoted to the seat and fitting in the clamping devices to be held thereby against movement, as and for the purpose specified.



16. The combination, with a base and an oscillating seat, of a clamping device having an eyebolt passing through the base, a binding-wheel fitted on the bolt, and a tapering link pivoted to the seat and fitted in the eye of the bolt, as and for the purpose described.

17. In combination with the stationary base, an oscillating seat mounted thereon, a back pivotally connected to the seat, the return-springs I, connected to the base and acting on the back, and the foot-rest L, connected to the seat, whereby the occupant can rock the chair while in a reclining position by pressing the foot upon the outer end of the foot-rest, and thus throwing his weight into the back of the chair, causing the seat to rock in one direction, and when the pressure of the foot is relieved the return-springs are caused to react to bring the back and the seat to the former position, as set forth.

386,143. COTTON-BATTING MACHINE. WILLARD I. LEWIS, Walpole, Mass. Filed Feb. 14, 1887. Serial No. 227,503. (No model.)

Brief.—The batting is nipped between winding-rollers loosely mounted at the lower ends of levers pivoted at the upper ends to a tilting frame, which, when moved by the upward pressure of the levers caused by the completed bat, disturbs a dead-center, allowing a spring to actuate a train of devices to throw into gear a constantly-revolving worm and a cam-shaft, the cam on which actuates a system of cranks and levers to withdraw the winding-rollers from the batting. The descent of the pivoted levers and tilting frame again sets the dead-center and disengages the worm and gear on the cam-shaft.

386,143.

Claim.—1. The combination, with the winding-rollers, of levers having a laterally-swinging movement and provided at their lower ends with studs on which said rollers are loosely mounted, a vertically-moving frame on which said levers are pivoted, and means for swinging said levers toward and from each other, substantially as described.

2. The combination, with a moving support for the batting, of the winding-rollers N N, the levers P P, having studs on which said winding-rollers are loosely mounted, and a vertically-movable frame on which said levers are pivoted, substantially as described.

3. The combination, with the feed-rollers P P, means for actuating said rollers, and an apron, L, of the winding-rollers N N, the levers P P, provided with studs N' N', on which said winding-rollers are loosely mounted, so as to revolve freely with the progressive movement of the batting, and a vertically-movable frame on which said levers are pivoted, substantially as described.

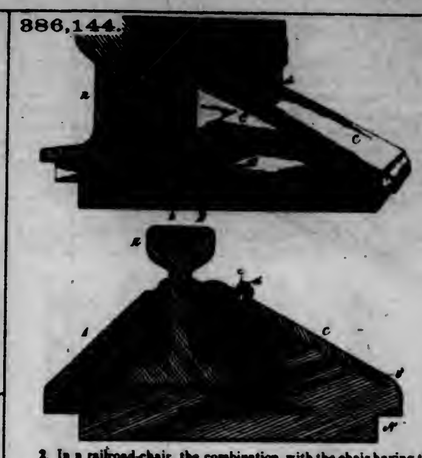
4. The combination, with the winding-rollers N N, of the levers P P, provided with studs on which said rollers are loosely mounted, and a tilting frame, R, having a front bar to which said levers are fulcrumed, substantially as described.

5. The combination, with the winding-rollers N N, levers P P, and tilting frame R, of the bifurcated lever *f*, having set-screws *h h'*, the link *i*, bell-crank lever *j*, and spring *k*, substantially as described.

6. The combination of the winding-rollers N N, levers P P, tilting frame R, lever *f*, having set-screws *h h'*, link *i*, bell-crank lever *j*, spring *k*, rod *l*, rocking bar *n*, having arms *m p*, latch *q*, lever *w*, links *r v*, sliding box *t*, three-armed lever A', sliding bar B', having hook *b'*, cam-shaft *b*, having a gear, *c*, provided with pins *c'*, the worm *u*, and its driving devices, substantially as described.

7. The combination, with the winding-rollers N N, levers P P, tilting frame R, cam-shaft *b*, and devices for actuating said cam-shaft, of mechanism intermediate said tilting frame and cam-shaft, whereby the movement of the said frame occasioned by the upward pressure of the completed bat serves to throw the cam-shaft into action, substantially as described.

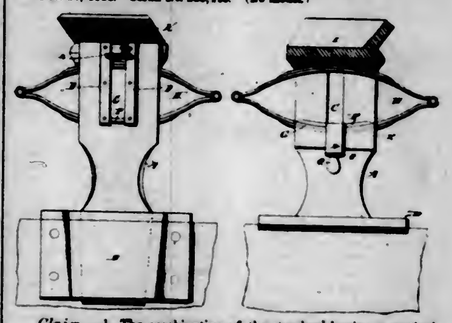
8. The combination, with the winding-rollers N N, levers P P, and tilting frame R, of the bifurcated lever *f*, link *i*, bell-crank *j*, spring *k*, rod *l*, rocking bar *n*, having arms *m p*, latch *q*, three-armed lever A', having pawl 2, lever *w*, links *v v*, and sliding box *t*, whereby the latch *q* is lifted and released from the pawl 2 and the sliding box *t* permitted to descend, substantially as described.



9. The combination of the cam-shaft *b*, having a worm-gear, *c*, provided with a pin, *c'*, the sliding bar B', provided with hook *b'*, the weighted three-armed lever A', having pawl 2, the latch *q*, the lever *w*, links *v v*, sliding box *t*, worm *u*, and the carrying-shaft of said worm, substantially as described.

10. The combination of the winding-rollers N N and the levers P P with the cam-shaft *b*, having cam *d*, the rod *z*, having pin *e*, the arm Y, shaft X, having arms W W, the connecting-rods V V, bell-cranks T T, and connecting-rods S S, substantially as described.

386,144. RAILROAD-CHAIR. GEORGE V. LIEBERGOLL, Coldwater, Mich. Filed Apr. 28, 1888. Serial No. 271,836. (No model.)



Claim.—1. In a railroad-chair, the combination, with the chair constructed as described, of the sliding block B, provided with the wedge and semi-wedge shaped projections or flanges b^2 b^3 b^4 and groove *d'*, arranged and operated substantially as and for the purpose set forth.

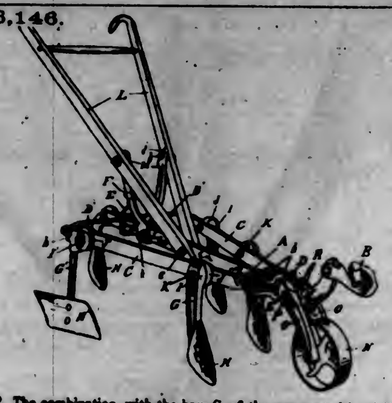
386,144.

2. In a railroad-chair, the combination, with the chair having the groove *c* and wedge-shaped and semi-wedge-shaped grooves *b' b^2* formed therein, as described, of the sliding block B, having the wedge and semi-wedge shaped projections b^2 b^3 b^4, and the cover C, having a slot in it near its upper end, through which the staple *c*, secured to the block B, projects, and a key, *d*, passed through the staple, whereby the several parts of the chair and rail-sections are locked together, substantially as and for the purpose specified.

386,145. WAGON-SEAT. GEORGE MAHL, Shippensville, Pa. Filed Feb. 27, 1888. Serial No. 265,446. (No model.)

Claim.—1. The combination of the standard having a vertical slot therein, the elliptical spring attached firmly at its lower side to the standard, and the seat secured to the upper side of the spring, and the arm K, projecting through the slot in the standard and provided with a T-head to engage the sides thereof, substantially as specified.

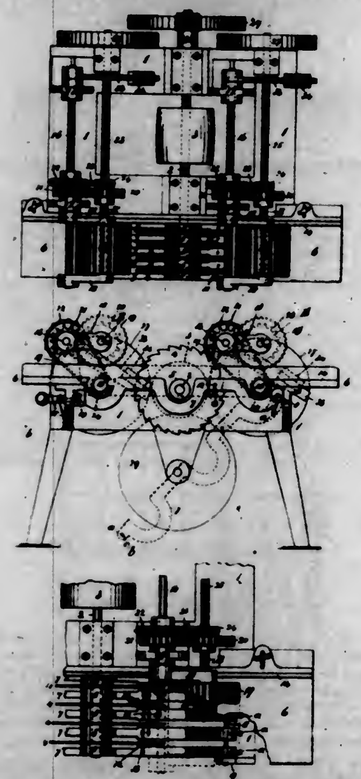
2. The combination of the standard having a slot, C, therein, the bracket secured to the standard and having a groove in its upper side, the elliptical spring mounted in the said groove, the seat secured to the spring, and the guide-arm operating in the slot, substantially as specified.



3. The combination, with the standard having a bracket or shoulder thereon, of the elliptical spring bearing on the bracket or shoulder, the clamp embracing the spring and the bracket, and the seat secured to the spring, substantially as and for the purpose specified.

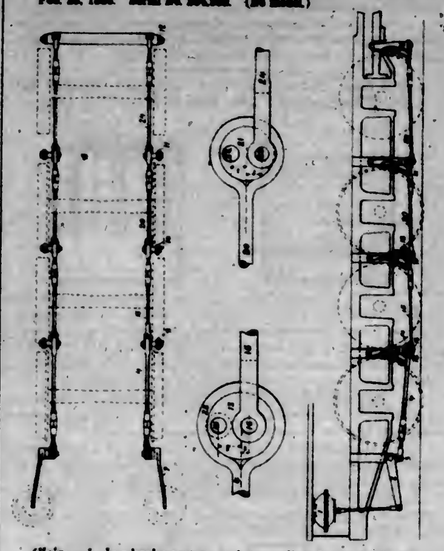
4. The combination, with the standard having a bracket, E, of the elliptical spring mounted on the bracket and having the seat secured thereto, and the clamp embracing the bracket and the lower side of the spring and having the apertured arm O, the set-screw mounted in the aperture in the said arm, and the jaw P, bearing on the side of the spring, substantially as and for the purpose specified.

386,146. CULTIVATOR. JAMES G. MALLERY, Flint, Mich. Filed Dec. 2, 1887. Serial No. 256,774. (No model.)



Claim.—1. The combination, with the central bar, A, and the head-plates D, secured to said central bar, and provided at their ends with lugs *a*, of the side bars, C, having their forward ends twisted and bent at right angles, as shown, and provided with holes to receive said lugs, substantially as shown and described.

386,146.

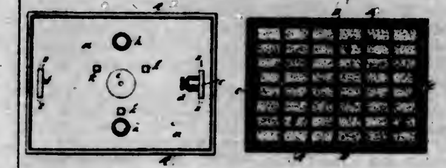


2. The combination, with the bars C, of the corrugated head I', having formed integral therewith the bolt *c*, the corrugated disk J', the standard G', passed through a hole in the head, and the set-screw A, all substantially as described, and for the purpose specified.

386,147. CIRCULAR GANG SAWING-MACHINE. THOMAS MASLEY, Prince Albert, Saskatchewan, Canada. Filed Feb. 6, 1888. Serial No. 263,167. (No model.)

Claim.—The combination, with the sawing-tables 6 6, of a series of laterally-adjustable guide-bars, 7, intervening the saws and pivoted to drop at one end and connecting the tables horizontally, and provided with adjustable pins 12 to prevent the saws wabbling and insure a straight cut, as set forth.

386,148. LOCOMOTIVE-BRAKE. ALBERT F. MASSEY, Watertown, N. Y., assignor to the Eames Vacuum Brake Company, same place. Filed Feb. 28, 1888. Serial No. 264,992. (No model.)



Claim.—1. In a brake system, an intermediate lever with its three centers of stress inclosed within a strap or jaw, combined with a pull-rod, substantially as set forth.

2. In a brake system, an eccentric inserted in the line of pull-rods, in combination with two separate bearings located within said eccentric on opposite sides of the center for the purpose of dividing the stress on the pull-rod between two or more brake-shoes, substantially as set forth.

3. In a brake system, a pair of intermediate levers revolving about the same center, wherein one lever is inclosed within the other and each forms the fulcrum for the other.

386,149. GALVANIC BATTERY. ABRAHAM V. MERRIOLS, New York, N. Y. Filed Oct. 26, 1887. Serial No. 253,081. (No model.)

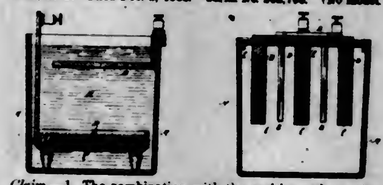
Claim.—1. A depolarizing agent or material for galvanic batteries, containing hydrate and oxide of copper, substantially as described.

2. A depolarizing agent or material for galvanic batteries, consisting of a mixture of carbonate, hydrate, and oxide of copper, substantially as described.

3. A depolarizing agent or material for galvanic batteries, consisting of a mixture of carbonate, hydrate, and oxide of copper and granulated carbon, substantially as described.

4. A depolarizing agent or material for galvanic batteries, containing hydrate of copper, substantially as described.

5. The combination, with the positive and negative electrode of a galvanic battery, of the exciting chlorine solution and the depolarizing agent or material consisting of a mixture of carbonate, hydrate, and oxide of copper, substantially as described.



6. In a galvanic battery, the combination, with the positive and negative electrodes, and the exciting-fluid, of the porous pot or receptacle F, suspended near the top of the cell, for containing a supply of the exciting chemical, and arranged to allow said chemical to gradually pass into the upper portion of the fluid by dialysis, substantially as described.

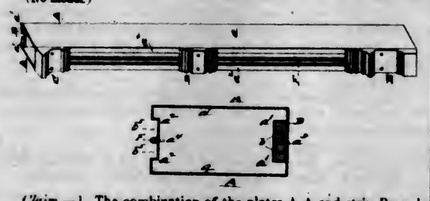
7. In a galvanic battery, the combination, with the positive electrode and the exciting-fluid, of the horizontally-arranged negative electrode having cells for containing the depolarizer, and the plat-

form D, supporting said negative electrode a distance from the bottom of the cell, whereby a chamber is formed beneath said negative electrode, substantially as described.

8. In a galvanic battery, the combination, with the positive electrode, of the trough suspended beneath said electrode to receive the matter falling therefrom, substantially as described.

386,150. GALVANIC BATTERY. ABRAHAM V. MERRIOLE, New York, N. Y. Filed Feb. 2, 1888. Serial No. 262,706. (No model.)

Claim.—1. The combination, with the positive and negative electrodes, of an oxidizing-fluid containing an alkaline nitrate and a depolarizer containing an alkaline hydrate, substantially as described.

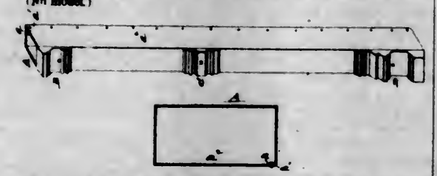


2. An exciting-fluid for galvanic batteries, consisting of an alkaline-chloride solution containing an alkaline nitrate, substantially as described.

3. The combination, with the negative and positive electrodes, of an alkaline-chloride exciting-fluid and a depolarizing agent or material containing hydrate of copper, substantially as described.

4. The combination, with a carbon electrode, of a depolarizing agent or material containing hydrate of copper, substantially as described.

5. The combination, with a carbon electrode and an alkaline-chloride exciting-fluid, of a depolarizing agent or material containing hydrate of copper, substantially as described.



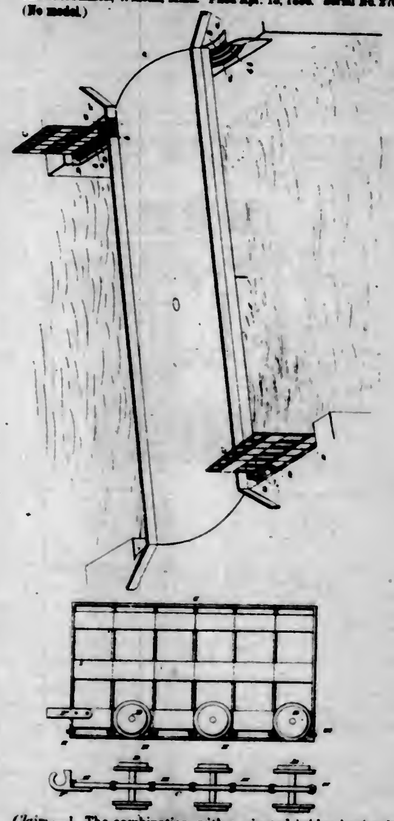
386,151. PLATE-METAL COLUMN. FRANK MOELLER and HENRY F. EDWARDS, St. Louis, Mo. Filed Feb. 17, 1888. Serial No. 264,366. (No model.)

Claim.—1. The combination of the plates A A and strip B, each of said plates forming a side and half of the back and half of the front of the column, and said plates at the rear of the column being shaped to form a recess in which said strip is secured, substantially as described.

2. The combination of the plates, shaped and united at the front of the column, as described, and the head-strip, substantially as described.

386,152. PLATE-METAL COLUMN. FRANK MOELLER and HENRY F. EDWARDS, St. Louis, Mo. Filed Feb. 17, 1888. Serial No. 264,367. (No model.)

Claim.—The herein-described plate-metal column, the same consisting of the single plate A, shaped to form a box-column, and at the rear of the column having a flange, *a*, fitted within and united to the rear edge of the column-side, substantially as described.

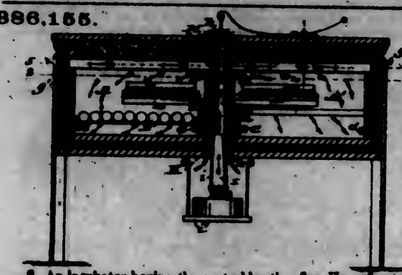


386,153. WAGON-CHUTE. FRITZ MOELLER, Davenport, Iowa, assignor of one-half to Joseph S. Watson, same place. Filed Mar. 31, 1888. Serial No. 269,191. (No model.)

Claim.—A removable chute or conductor for wagon-boxes, composed of textile or other pliable material, having the parts A, B, C, and D joined together, as described, and provided with button-holes, and adapted to be attached to the rear end of a wagon-box by means of the buttons *b*, substantially as set forth and described.

386,153.

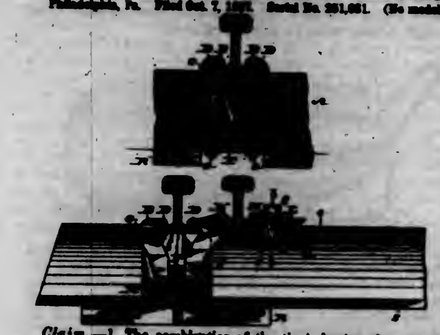
386,154. BRIDGE-GATE. MATTHEWSON MYRE and CHESTLAD CHESTNUTWOOD, Winona, Minn. Filed Apr. 13, 1888. Serial No. 270,894. (No model.)



Claim.—1. The combination, with a pivoted bridge having legs, as described, of the flexible gates having hooks F and mounted on rollers, and having rollers at their lower sides, the tracks in the masonry, and the guide-flanges between the same, substantially as specified.

2. The flexible gates mounted on rollers and having friction-rollers at their lower sides, in combination with the tracks and the guide-flanges between the same, substantially as specified.

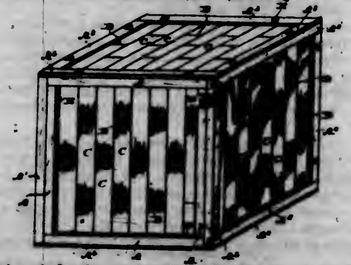
386,155. INCUBATOR. JAMES L. NIX, Carpenter, Ill. Filed Oct. 13, 1887. Serial No. 252,674. (No model.)



Claim.—1. An incubator, constructed as described, having a central flue open at top and bottom, partly surrounded by an air-flue and communicating with the egg-compartments, a chamber above the egg-compartments communicating with the central flue, and a damper controlling the said central flue, substantially as set forth.

386,155.

2. An incubator having the central heating-flue, H, perforated at *g* and partly surrounded by an air-flue, K, perforated at its upper end, and thus communicating with the egg-compartments, a heating-chamber, G, over the top of the egg-compartments A A', and having outlets *f*, and the outlets F' of the egg-compartments, substantially as set forth.

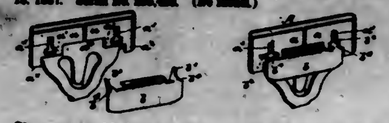


386,156. RAILROAD-TIE AND FASTENING. JAMES A. GREEN, Philadelphia, Pa. Filed Oct. 7, 1887. Serial No. 251,681. (No model.)

Claim.—1. The combination of the tie A, having the vertical opening C and the side openings, E, leading into said opening C, with a rail, the chock-pieces B, each having inwardly-bent upper lips, D, and outwardly-bent lower lips, G, and the key F, adapted to pass through said opening E and between said pieces B, firmly wedging the latter against the top and bottom walls of the tie, substantially as described.

2. A hollow tie with angular opening in the top thereof, in combination with a chock-piece having a depending tongue, a bolt having an angular portion corresponding to the angular opening in the tie, and provided with a head adapted to bear against the under side of the top wall of said tie, and a nut, the depending tongue of the chock-piece fitting into a rabbet, *d*, on the side of the bolt, substantially as and for the purpose set forth.

386,157. BOX OR CRATE. CHARLES E. PARRY, Watertown, Wis. Filed Apr. 23, 1888. Serial No. 271,502. (No model.)



Claim.—1. In a box-section, the combination of a suitable frame, having wires or cords stretched across the same, with a flexible wooden filling woven in and out or over and under said wires or cords.

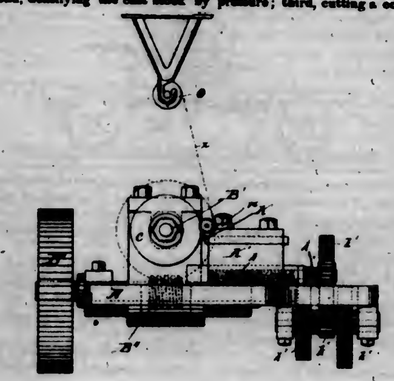
2. In a box-section, the combination of a suitable frame, having wires or cords stretched across the same, with a filling consisting of thin strips of wood woven alternately over and under said wires or cords and secured at their ends to said frame.

3. A box or crate consisting of a series of box-sections, each formed of a frame having wires or cords stretched across the same, and a filling of thin strips of wood woven over and under said wires or cords, and removable fastening devices for temporarily securing said sections together.

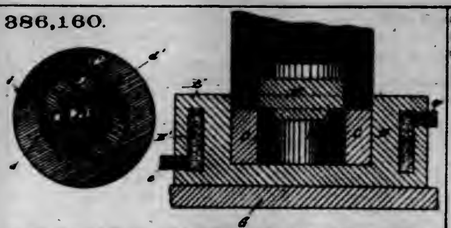
386,158. BUCKLE. THOMAS O. PORTER, Boston, Mass. Filed Nov. 16, 1887. Serial No. 254,603. (No model.)

Claim.—A buckle having a flattened tube provided with a jaw-holding recess, *c'*, and with inverted-T-shaped holes *c²*, and a jaw-plate having the jaw *b'*, and T-shaped ears *b²*, the ends of which are first bent to a right angle to the necks thereof, to permit them to be inserted through the longitudinal sections of the T-shaped holes in the flattened tube, and the necks to enter the wide sections of said holes, and are then turned to their original positions to span said holes and secure the jaw-plate to the flattened tube, substantially as described.

386,159. BOILER-SETTING. JOHN B. RAMEY, Oshkosh, Wis. Filed Mar. 16, 1888. Serial No. 267,493. (No model.)



Claim.—1. In a boiler-setting, the combination of an outside wall surrounding the supporting-wall, with an unobstructed space between the two walls leading from the front to the rear, the doors G G G, regulating and governing the supply of air into said space, the wall *n* and the platform *i*, connected with the inside wall, L', so as to form the inclosed hot-air chamber *h*, with a setting in the inside wall leading into said chamber, being in open communication with the grate, and a damper at the rear of the grate.



2. In a boiler-setting, the combination of an outside wall surrounding the main supporting-wall, inclosed at the top, forming an inclosed space between the two walls from front to rear upon all sides, the doors G G G, covering openings and controlling the supply of air into said space, an arch in the rear wall opening into an inclosed hot-air chamber extending from wall to wall back of the grate, and tubes K K, leading from the hot-air chamber and supplying air to the grate, with a perforated grate-support in front, and a damper closing the space from the boiler down to the platform *i*, operated by a lever from the front, substantially as shown, for the purposes specified.

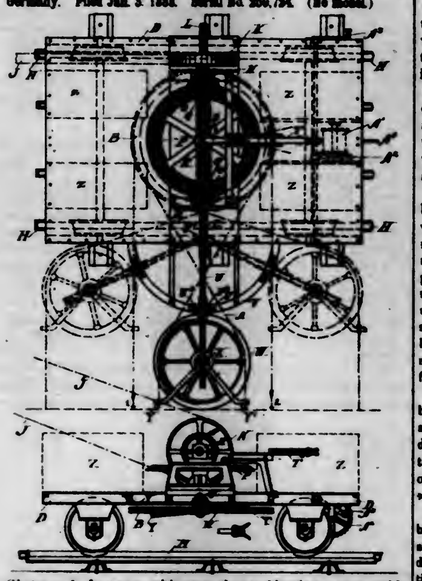
386,160. MANUFACTURE OF SHEET METAL. JOHN ROEBLING, Brooklyn, N. Y. Filed Mar. 26, 1888. Serial No. 268,572. (No model.)

Claim.—1. The process or improvement in the art of manufacturing sheet metal, consisting in first casting the metal into a block; second, densifying the cast block by pressure; third, cutting a cen-

386,160.

tinuous strip of sheet metal therefrom, and, finally, rolling the cut strip between rolls to finish its surfaces, substantially as specified.

2. The process of manufacturing sheet metal, consisting in first casting the metal into a block; second, densifying the cast block by pressure, and, third, cutting a continuous strip or ribbon of sheet metal from the block, substantially as specified.



3. The process consisting in first casting a soft-metal block; second, densifying the cast block by pressure, and, finally, cutting a strip of sheet metal therefrom.

4. The process of manufacturing sheet metal, consisting in first casting the metal into a block, cutting a continuous strip of sheet metal therefrom, and finally rolling the cut strip to finish it, substantially as specified.

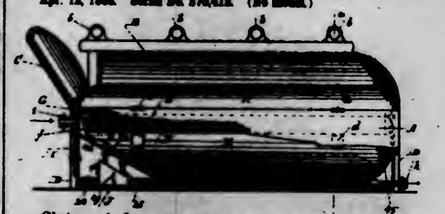
5. The process consisting in first properly tinning or preparing the surface of a hard-metal ring and then casting a soft-metal block upon and around the same, so that it will fuse or metallically unite therewith, and then compressing the soft-metal block to solidify it before it becomes fully set, substantially as specified.

6. The process of casting on a hard-metal ring properly tinned a circular block of solder in a metal mold encircled by water and compressing the block to solidify it before the solder is fully set, substantially as specified.

386,161. STEAM-CULTIVATOR. CHRISTIAN R. SAGE, Leipzic, Germany. Filed Jan. 3, 1888. Serial No. 259,734. (No model.)

Claim.—1. In steam-cultivators, the combination, on a movable carriage, of a horizontal pulley, B, beveled wheel P on shaft of said pulley, shaft L, pulley K on said shaft, bevel-wheels O O', and clutch mechanism Q Q' R S T, together with pulley W and pivoted arm U, substantially as set forth.

2. In steam-cultivators, a movable engine, a carriage having pulley B adapted to be driven by power in either direction by said engine, and having pulley W and arm U, as set forth, and a windlass, A' A^3 A^4, on said carriage, in combination with carriage E, pulley C, and endless rope A, substantially as and for the purpose set forth.



3. In steam-cultivators, the combination of a series of blocks, B', having sockets for the reception of wheels adapted to be revolubly supported in said sockets, a frame, E, adapted to run on said wheels, and pulley C on said frame, substantially as and for the purpose described.

386,162. PLOW-CARRIAGE FOR STEAM-CULTIVATORS. CHRISTIAN R. SAGE, Leipzic, Germany. Filed Jan. 3, 1888. Serial No. 259,735. (No model.)

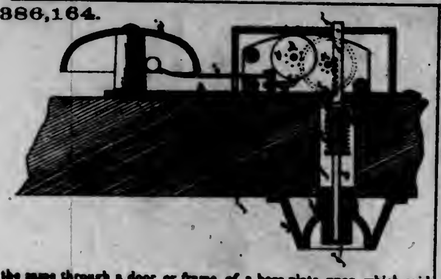
Claim.—In balance-plows, the combination of the beam A with frame E, supported by wheels, screw-spindle D, journaled in said frame, and ball C, threaded for the passage of said spindle, together with cheek-bearings B B' on said beam, adapted to hold said ball C, as and for the purpose set forth.

386,163. LOUNGE. FREDERICK RYAN, Fitchburg, Mass. Filed Apr. 12, 1888. Serial No. 270,412. (No model.)

Claim.—1. In a convertible lounge of the character described, the combination of the following instrumentalities, to wit: a body provided with a water-tight lining and adapted to be used as a bathing-tub, a seat hinged to the upper portion of said body and provided on its under side with an upholstered bed-section adapted to enter the upper portion of said body when the seat is closed, a back secured to one side of said seat, a head-piece secured to one end of said seat, and an upholstered bed-section hinged to one side of the bed-section of the seat and provided with hinged legs adapted to engage the top of the body and support it in a horizontal position when the lounge is arranged as a bed, substantially as set forth.

2. In a convertible lounge of the character described, the combination of the following instrumentalities, to wit: a body provided with a water-tight lining and adapted to be used as a bathing-tub, a seat hinged to the upper portion of said body and provided on its under side with an upholstered bed-section adapted to enter the upper portion of said body when the seat is closed, a back secured to one side of said seat, a head-piece secured to one end of said seat, an upholstered bed-section hinged to one side of the bed-section of the seat and provided with hinged legs adapted to engage the top of the body and support it in a horizontal position when the lounge is arranged as a bed, said body being provided with inlet and outlet pipes for the water, substantially as set forth.

3. In a lounge of the character described, the combination of the body A, having the door H, the zinc lining, 45, disposed in said body and provided with the inclined portion *m* at one end adjacent to said door, the inlet-pipe *i*, opening into said body above the inclined portion *m*, and the guard or deflector *f*, disposed opposite the discharge-orifice of the inlet-pipe *i* over the inclined portion *m*, substantially as set forth.



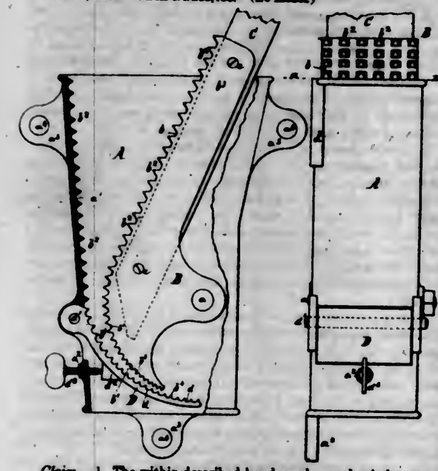
4. In a lounge of the character described, the combination of the body A, having the door H, the zinc lining, 45, disposed in said body and provided with the inclined portion *m* at one end adjacent to said door, the inlet-pipe *i*, opening into said body above the inclined portion *m*, the guard or deflector *f*, disposed opposite the discharge-orifice of the inlet-pipe *i* over the inclined portion *m*, and a lamp disposed in the chamber 46 beneath said inclined portion, substantially as specified.

386,164. DOOR-BELL. FREDERICK SAFFORDS, Prospect Park, Ill. Filed Apr. 6, 1887. Serial No. 233,902. (No model.)

Claim.—1. In an alarm or call bell, the combination, with the bell and its vibrating hammer having a forked end and a train of actuating-gearing, of a cam-wheel interposed between them formed of a single piece of sheet metal stamped or pressed to proper form, substantially as and for the purpose set forth.

2. In an alarm or call bell, the combination, with the bell-striking mechanism and an actuating rod or button for connection with

386,164.

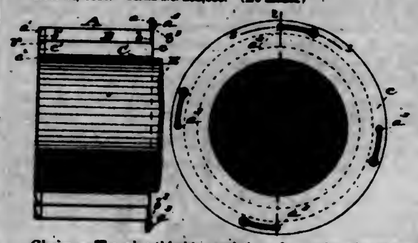


the same through a door or frame, of a base-plate upon which said bell mechanism is secured, provided with openings for the passage of the actuating-rod, and formed with a circular beveled projection or flange to aid in centering the opening in the plate with that in the door or frame through which the actuating-rod is passed, substantially as and for the purpose set forth.

3. In an alarm or call bell, the combination, with the bell mechanism adapted to be secured upon one side of a door or frame, and a connecting-rod for passing through said door or frame, of a push-button formed with a socket to receive said rod nearly to the forward side of the button, whereby side draft and friction are avoided when the pressure is applied, substantially as and for the purpose set forth.

4. The combination, with a bell mechanism secured upon one side of a door or frame, of a push-button for operating the bell, secured upon the opposite side of said door or frame, and connected through the same by a connecting-rod with the bell mechanism, said button having its frame *g* formed with a projecting beveled guide, *g'*, to aid in centering it with the opening in said door or frame, and prevent binding of the operative parts, substantially as shown, and for the purpose set forth.

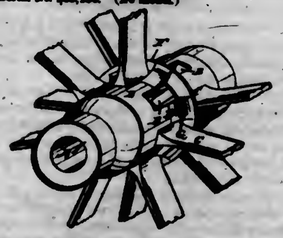
386,165. COMBINED HAND CRUSHER AND GRINDER. WILLIAM R. SANFORD, Flemington, N. J., assignor of two-thirds to Frank R. Mallory, same place, and Gideon C. Sanford, Brooklyn, N. Y. Filed Feb. 11, 1888. Serial No. 263,765. (No model.)



Claim.—1. The within-described hand crusher and grinder, comprising crusher-shell having portion A, with crushing-teeth b^3 on its inner straight surface, *a'*, curved grinding portion D, having gradually-diminishing teeth b^4 on its inner curved surface, *d*, and the pivoted crushing-jaw B, attached to lever-handle C and having crushing-teeth b^2 on its straight surface *b* and gradually-diminishing grinding-teeth b^4 on its curved surface *b'*, substantially as and for the purpose described.

2. The within-described hand crusher and grinder, comprising crushing shell and jaw, with the straight and uniformly-toothed surfaces *a'* and *b* and the curved surfaces *b'* and *d*, one of which is adjustable and both having teeth b^4, gradually diminishing in size toward the ends thereof, substantially as and for the purpose described.

3. The hand crusher and grinder comprising crusher-shell having hopper portion A, with crushing-teeth b^3, curved, pivoted, and adjustable grinding portion D, having grinding-teeth b^4, and the jaw B, having bifting-flanges, and the handle C, arranged behind the toothed surfaces and forming an upward extension of said jaw, substantially as described.



4. The combined hand crusher and grinder, comprising the toothed shell or hopper A, curved toothed jaw B, upwardly-extending hand-lever C, attached to said jaw, swinging curved toothed plate D, pivoted to the lower end of said hopper, having lug d^2, and adjusting-screw d^3, supported in boss a^2 of shell A, substantially as and for the purpose described.

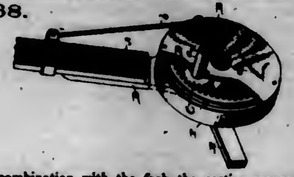
386,166. PIPE-THIMBLE. JOHN J. SCHAAR, St. Louis, Mo. Filed Nov. 21, 1887. Serial No. 255,602. (No model.)

Claim.—The pipe-thimble consisting of a series of concentric thimbles one within the other, the outer thimble flanged inwardly at the inner end and outwardly at the outer end, and the remaining thimbles flanged inwardly and outwardly at the inner end and outwardly at the outer end, and all secured together by their outturned flanges at the outer end.

386,167. HUB. JOHN A. SHIMLER, Millville, Ohio. Filed Feb. 24, 1888. Serial No. 265,130. (No model.)

Claim.—1. A hub for wheels, consisting of a wooden hub, A, provided with two circumferential series of spoke-receiving mortises, B, metallic band D, compressively encircling said wooden hub and provided with mortises corresponding with the mortises in said hub, and flat metallic ring F, separable from said wooden hub and metallic band and compressively encircling said band between said two series of mortises, said band being clamped between the outer circumferential surfaces of said wooden hub and between the circumferential surfaces of said ring, combined substantially as and for the purpose set forth.

2. A hub for wheels, consisting of the wooden hub A, provided with two circumferential series of spoke-receiving mortises, metallic band D, compressively encircling said wooden hub and provided with mortises corresponding with the mortises in said hub, and flat metallic ring F, compressively encircling said band between said two series of mortises and provided with prongs G, reaching outwardly from its face in opposite directions between the spokes, said band being clamped between the circumferential outer surfaces of said wooden hub and the circumferential inner surfaces of said ring and prongs, combined substantially as and for the purpose set forth.



3. A hub for wheels, consisting of the wooden hub A, provided with two circumferential series of spoke-receiving mortises, flat metallic ring F, encircling said hub and acting compressively thereon, and provided with prongs G upon its opposite faces, reaching outwardly between said mortises and exerting compressive force inwardly upon said hub between said mortises, combined substantially as and for the purpose set forth.

386,168. SECTOR. WILBUR W. STRICKER and HORACE STRICKER, Piqua, Ohio. Filed Apr. 28, 1888. Serial No. 271,567. (No model.)

Claim.—1. The combination, with the wheel, of the casting and its contained mechanism and the fork secured to an extension of said casting and braced, substantially as described.

2. The combination, with the fork, of the casting secured to the fork, the clamp on the fork, and the stay-rod secured at one end to the clamp and its other end adjustably secured to the casting, substantially as described.

886,168.

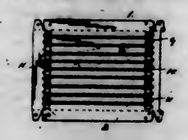
3. The combination, with the fork, the casting secured thereto, and the spur-wheel on the spindle of the wheel, of the crown-wheel journaled in the casting, the crank secured to the spindle of the crown-wheel, and the removable cover, and the brace-rod *b*, connected at one end with the fork and its other end adjustably connected to said casting, all substantially as shown and described.

886,169. TRACTION-WHEEL. JOHN J. STRAUSS, Peoria, Ill. Filed Feb. 14, 1887. Renewed Feb. 16, 1888. Serial No. 264,186. (No model.)

Claim.—1. A traction-wheel provided with sliding radial arms projecting from the periphery of the wheel, rotating shafts provided with geared segments meshing with indentations in the sliding arms, and a cam for imparting motion to the segment.

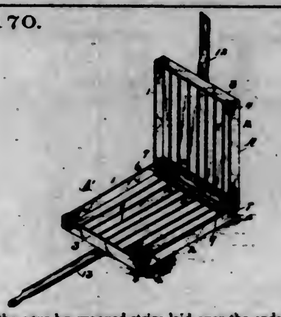
2. A traction-wheel provided with sliding radial arms and with a tire having holes for the reception of the arms, each of said radial arms being provided with racks, segments meshing with the said racks, and an eccentric or cam connected with the segments and operating the sliding arms, whereby the sliding arms are caused to project and retreat, substantially as described.

3. A traction-wheel provided with sliding radial arms provided at their inner ends with racks, a tire for the reception of the arms, segments meshing with the racks, and a shifting eccentric or cam operating the segments, whereby the projection and retreat of the arms relative to the revolution of the wheel are regulated.



4. A traction-wheel consisting of the tire provided with holes, the sliding radial arms resting in the holes, the segments mounted on the shafts, provided with the arm having the bowls, and the plate H, provided with the groove A, arranged eccentrically, mounted relative to the wheel.

5. A traction-wheel consisting of the tire provided with the holes, the spokes, the hub made in parts, the sliding arms having their outer ends resting in the holes and their inner ends provided with racks, the segments gearing with the racks and mounted on the shafts F, the arm G, provided with the bowls, and the plate provided with the eccentric groove receiving the bowls, substantially as described.



6. A traction-wheel comprising a tire provided with holes, sliding radial arms provided on their inner ends with racks, and the segmental racks connected with the eccentric groove in the plate H, and a circular rack and worm for shifting the plate and regulating the position at which the radial arms project and retreat relative to the revolution of the wheel.

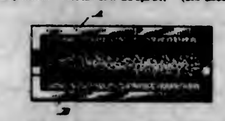
886,170. TOASTING-PAN. WILLIAM T. VAN DUSEN, Lincoln, Nebr. Filed Jan. 14, 1888. Serial No. 260,797. (No model.)

Claim.—The toasting utensil herein described, consisting of the sheet-metal pans A A', pivoted together at the side ends and formed to close with their edges one within the other, and having the flanges at their hinged end lower than the other sides, to form supports when the utensil is opened, and provided with the wire rods S, held in the

886,170.

bottom of the pans by grooved strips laid over the ends of the wires and riveted to the pans, substantially as described.

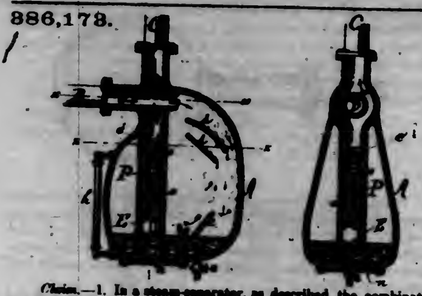
886,171. BUNDLE-CARRIER. HENRY W. VIEHEVER, Columbus, Ohio, assignor of one-half to Matt. Leuthester, same place. Filed July 30, 1887. Serial No. 245,703. (No model.)



Claim.—1. In a sheaf-carrier, the hangers H, secured to the harvester-frame and having bearings B and B', respectively, in combination with a finger-supporting bar, A, and fingers T, pivoted in said bar A, having a crank, C, and shank R, attached to its rear end and pivoted at its rear inner corner in journal-bearing B, and a journal, F, attached to its forward and outer end and pivoted in journal-bearing B' in the front arm, H, the arrangement of said shank R and journal F serving the purpose of throwing the rear end of the finger-supporting bar A toward the harvester-frame when the bar is rocked to unload, all arranged substantially as and for the purpose described.

2. In a sheaf-carrier, the hangers H, secured to the harvester-frame, the finger-supporting bar A, journaled in the rear hanger at its inner corner and in the front hanger at its outer corner, in combination with fingers T, having their ends D bent at right angles and pivoted through the bar A upon axes inclined rearwardly, so that when the bar A is rocked to unload the grain the fingers in striking the ground draw backward, and when the bar is rocked to its receiving position the fingers T, by their own weight, assume a right angle with their supporting-bar, substantially as described, and for the purposes set forth.

3. In a sheaf-carrier, the combination of hangers H, secured to the harvester-frame and having journal-bearings B and B', with a finger-supporting bar, A, having crank C and shank R attached to its rear inner corner and pivot-journal F to its forward outer corner, the said crank C being pivoted in the rear journal-bearing, B, and journal F being pivoted in the front journal-bearing, B', and fingers T, having their inner ends D bent and pivoted through bar A upon axes inclined rearwardly, chain N, retaining-block K, and arch G, all arranged substantially as described, and for the purposes set forth.

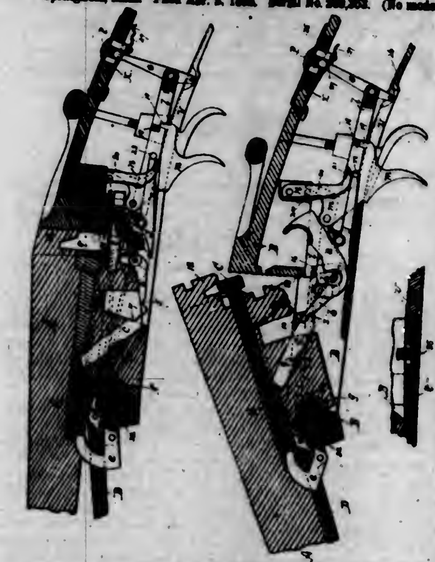


886,172. ANTI-FRICTION BEARING. ELIJAH WARNE, Boston, Pa., assignor of one-half to Marshall T. B. Davidson, New York, N. Y. Filed Sept. 20, 1887. Serial No. 250,247. (No model.)

Claim.—A molded or pressed anti-friction composition bearing consisting, essentially, of gluten and graphite, substantially as herein before set forth.

886,173. SEPARATOR. ERNST G. WHITE, New York, N. Y. Filed Jan. 13, 1888. Serial No. 260,893. (No model.)

886,173.



Claim.—1. In a steam-separator, as described, the combination, with the outlet-pipe C, provided with a valve-seat, *d*, of a floating ball, E, provided with suitable means, as P, for guiding the said ball against the said valve-seat.

2. A steam-separator consisting of a chamber, A, provided with suitable outlet and inlet pipes, baffle-plates, as *d d* and *c c*, and the perforated chamber P, as and for the purposes described.

3. A steam-separator placed intermediate the generator and the engine, consisting of a chamber, A, provided with suitable outlet and inlet pipes, the latter having a valve-seat and containing baffle-plates, as *d d* and *c c*, the perforated chamber P, and the floating ball E.

886,174. BREECH-LOADING FIRE-ARM. ANDREW H. WHITMORE, Springfield, Mass. Filed Apr. 8, 1882. Serial No. 252,252. (No model.)

Claim.—1. The combination, with the extractor, its operating-levers, the fore-end, and the connecting-pin movable in the extractor-stem, of the cocking-pin swinging with the barrel, having cam engagement with the connecting-pin and having endwise travel to engage the cocking-lever, substantially as and for the purposes stated.

2. In combination, the barrel, its locking-bolt, the spring-actuated trip-lever *h* on the hammer-pivot, adapted to engage said bolt to hold it inactive, and the barrel-lug 13, which by its cam-face engages and actuates said trip-lever to release said barrel-locking bolt, as herein specified.

3. In fire-arms wherein the breaking of the weapon serves to cock the hammer, the combination, with the hammer and the sear, of the extension-arm rocker which actuates said sear and the spring-impelled sear-guard operating to block the sear upon movement of the extension-arm rocker, substantially as described.

4. In fire-arms provided with a hammer cocked by the breaking of the weapon, the combination, with the hammer, its co-operating sear, the intermediate extension-arm rocker, and the spring-impelled sear-guard with its stud 24, of the trigger and its prong 20, which operates the sear-guard, substantially as herein set forth.

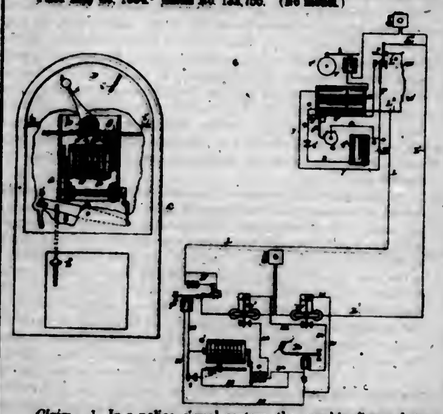
5. In fire-arms having an internal hammer cocked by the act of breaking the weapon, the hammer and the trigger, combined with the intermediate extension-arm rocker, the trigger-locking bolt movable endwise, its lug 13, and the cross-lever to which said locking-bolt is attached, as and for the purposes herein stated.

6. In combination with the hammer and its operating mechanism actuated by the breaking of the weapon, the intermediate extension-arm rocker actuated by said hammer, but not locking it, and engaging the sear, substantially as set forth.

7. In combination with a hammer cocked by the breaking of the weapon, the intermediate extension-arm rocker actuated by said hammer, but not locking it, and the trigger-locking bolt which contacts with said rocker, for purposes herein described.

8. In combination with the fore-end, barrel, and stock, a lever, *f*, pivoted in said fore-end, a lever, *e*, also pivoted in said fore-end and engaging the lever *f*, a connecting-pin, *d*, in contact with the lever *e*, an extractor, *C*, in contact with said connecting-stem, a cocking-pin, *c*, in contact with said connecting-pin, a cocking-lever, *b*, in engagement with said cocking-pin and having an arm, 3, a hammer cocked by said cocking-lever, an extension-arm rocker, *k*, actuated by said hammer, a trigger, and trigger-locking bolt and sear actuated by said rocker, substantially as set forth.

9. The hammer *a* and the sear *j*, engaging therewith, in combination with the extension-arm rocker *k*, provided with a shoulder which is arranged to be moved by said hammer and a shoulder which is arranged to move said sear, and the sear-guard *n*, which has a curved end engaging a stud on said sear, substantially as set forth.



10. In combination with the frame B of a breech-loading fire-arm, the trigger-plate *v* and the lock-cap plate *t*, which overlaps said trigger-plate, both united by a single fastening-screw, substantially as stated.

11. In combination, the lug 29, secured beneath the barrel and with a bolt-notch in its front edge, the fore-end D, slotted to receive said lug, the compensator *r*, likewise in slot behind the lug, and the adjusting-screw *s*, which operates said compensator by the arm 30 upon the latter, for purposes herein specified.

12. In combination, the fore-end, the frame B, the joint-circle *g*, abutting thereagainst on an angle, with flat sides which fit the lug-cut, the barrel 32, which enters the end of the frame, and the fastening-pin 34 transversely of said circle and having its center coincident with that of the recess in said frame B containing the circle, substantially as and for purposes stated.

13. In combination with the frame and barrel, fore-end, and hammer, a cocking-lever attached to said frame and arranged to operate said hammer, and a cocking-pin attached to said fore-end and engaging said cocking-lever, said frame being provided with a stop, 10, arranged to be in contact with said cocking-pin and cocking-lever at their joint when the barrel is tilted, substantially as set forth.

886,175. POLICE SIGNAL APPARATUS. JOHN C. WILSON, Boston, Mass., assignor to the Municipal Signal Company, Portsmouth, N. H. Filed May 26, 1884. Serial No. 132,755. (No model.)

Claim.—1. In a police signal system, the combination, substantially as described, of a main station and sub-stations and main electric circuit connecting them, the said sub-stations each containing a local circuit and a multiple-signal-transmitting apparatus therein, comprising a series of signaling-surfaces adapted to change the condition of the current to transmit a determinate signal corresponding with the particular signaling-surface employed, and an induction apparatus the coils of which form part of the local circuit and also part of the main

circuit, and the said main station containing signal-receiving apparatus the operation of which is effected by the induced currents.

2. A multiple signaling device composed of a series of signaling-surfaces, combined with a contact-pen movable in a direction parallel with the axial centers of the signaling-surfaces and another contact-pen fixed in position to co-operate with one of the signaling-surfaces, a pointer or indicator co-operating with a stationary dial and operatively connected with the movable contact-pen, movement of which indicator moves the pen into position to co-operate with any desired one of the signaling-surfaces to transmit a signal indicated by the position of the pointer on the dial, whereby a determinate signal, with or without a variable signal, may be transmitted, substantially as described.

3. The main station containing relays adapted to respond to currents of different strength and controlling signal-receiving and signal-transmitting instruments, combined with the sub-station containing a local circuit and induction apparatus and independent devices for controlling the said circuit and for introducing resistance therein, and a main circuit connecting the said main and sub stations, transmitting impulses of different strength derived from the local circuit at the sub-station by induction, substantially as described.

4. In a signal-box, a series of signaling-surfaces and means, substantially as described, for revolving the same, combined with a single contact-spring arranged to travel longitudinally across said surfaces to co-operate with any particular one desired, a dial, indicator, and connecting mechanism uniting the indicator to said spring, whereby upon moving the indicator the spring is adjusted to any position desired with reference to the signaling-surfaces, substantially as described.

5. A multiple-signal-transmitting device composed of a series of signaling-surfaces, combined with a slide-bar and contact-pen carried by the slide-bar to bear against one or the other signaling-surfaces as the slide-bar is moved, and a rotatable shaft and pinion fixed to it for moving the slide-bar, substantially as described.

6. A multiple-signal-transmitting device composed of a series of signaling-surfaces, combined with a slide-bar and contact-pen carried by the slide-bar to bear against one or another signaling-surface as the slide-bar is moved, a rotatable shaft and pinion for moving the slide-bar, and a pointer secured to the rotatable shaft which co-operates with a suitable dial, the position of the pointer indicating which signaling-surface shall be employed, substantially as described.

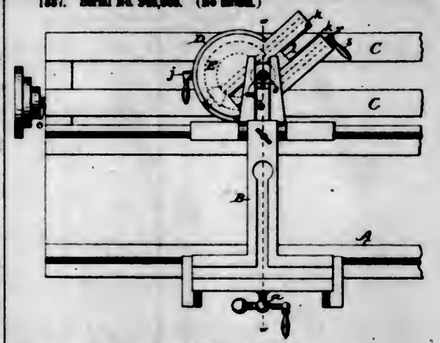
7. A multiple-signal-transmitting device composed of a series of signaling-surfaces, as break-wheels, mounted upon a shaft, and a co-operating contact-pen for transmitting a determinate and also a variable signal, combined with a motor mechanism and starting-lever therefor, and two independent pulls connected with the said starting-lever, movement of one pull effecting the transmission of the determinate signal and movement of the other pull effecting the transmission of the variable signal, substantially as described.

8. In a police signal system, the combination, substantially as described, of the main and one or more sub stations, and a main electric circuit connecting them, and telephonic instruments located at the said main and sub stations to operate in the main circuit, the local circuit located at the sub-station, and a multiple signaling device therein, which includes as a co-operative part of it a series of signaling-surfaces for effecting the transmission of one or another of a series of signals at the will of the operator, and an induction apparatus also at the sub-station, the coils of which form part of both the local and main circuits, respectively, whereby impulses are transmitted from the local to the main circuit, and receiving-instruments at the main station, which respond to the induced currents transmitted from the sub-stations.

9. In a police signal system, the combination, substantially as described, of a main and sub station, and a main electric circuit connecting them, a signal-transmitting device located at the sub-station and constructed and arranged to transmit a signal over the main circuit by induction, a polarized relay located at the main station responsive to the said signals, a non-polarized receiving electro-magnet located at the sub-station, a circuit-controlling instrument, as *p*, located at the main station, and means for moving it to throw a battery-current upon the main circuit, and a signaling device, also located at the main station, to produce a series of interruptions in the main circuit to effect the operation of the non-polarized electro-magnet at the sub-station.

10. In a police signal system, the combination, substantially as described, of a main and one or more sub stations and a main electric circuit connecting them, signal-transmitting devices at the sub-stations, and signal-receiving devices at the main station, and an induction apparatus, one of the coils of which is included in the main circuit, whereby induced currents are employed for the signals, and telephonic instruments included in the main circuit and located at both the main and sub stations, as and for the purposes specified.

386,176. BOTTLE-STOPPER. WILLIAM WRIGHT, Boston, Mass., assignor to himself and Granville O. Avery, same place. Filed May 10, 1888. Serial No. 273,454. (No model.)



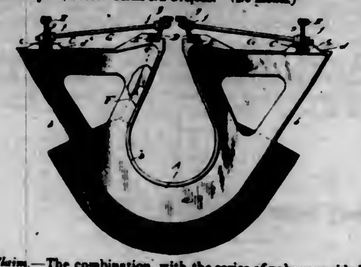
386,176.

Claim.—1. In a bottle-stopper, the stopper proper, *x*, the nozzle *t*, connected with the stopper *x*, and provided with the curved mouth A, and the curved cap C, provided with the pendent arms *k*, having the weights *z* at their lower ends, said arms being pivoted to the sides of the nozzle, all constructed, combined, and arranged to operate substantially as set forth.

2. In a bottle-stopper, the stopper proper, *x*, provided with the cap *m* and bushing *d*, the nozzle *t*, connected with the stopper *x*, and provided with the curved mouth A, and the curved cap C, provided with the stops *i* and arms *k*, having the weights *z*, said arms being pivoted to the nozzle, all constructed, combined, and arranged to operate substantially as set forth.

386,177. UNIVERSAL FEED ATTACHMENT FOR ENGINE-LATHES. EDWARD A. ALPRESS, New Britain, Conn. Filed Aug. 3, 1887. Serial No. 246,263. (No model.)

Claim.—1. The combination of a lathe-bed, the lathe-carriage fitted to slide longitudinally on said bed, and the feeding device herein described, the latter consisting, principally, of the ways *k k*, the sliding feed-block fitted to said ways and pivoted to a slide on the lathe-carriage, and a feed-screw set parallel to said ways *k k* for driving said block along said ways and thereby feeding the lathe-carriage, substantially as described, and for the purpose specified.



2. In a feed attachment for lathes, the combination of a lathe-bed, a lathe-carriage fitted to slide longitudinally on said bed, the slide *b*, fitted to slide with the upper part of the lathe-carriage in a line at right angles to the main ways of said lathe-bed, the bars or ways C C, the lower bed or block of the feed attachment mounted on said bars or ways C C and adapted to be adjusted and secured at the desired position thereon, the upper bed or block of the feed attachment pivotally mounted on said lower bed and provided with ways *k k*, and the sliding feed-block within the ways of said pivotally-mounted upper bed and pivoted to the slide *b* on the aforesaid lathe-carriage, substantially as described, and for the purpose specified.

3. In a feed attachment for lathes, the combination of the lower bed or block adapted to be adjusted and secured in a stationary position by one side of the lathe-bed, the beveled wheel *g*, mounted within said lower bed, the upper bed or block pivotally mounted on said lower bed and having ways *k k*, the feed-screw *p*, mounted within said upper bed and provided with pinion *q*, which engages the wheel *g*, the sliding block for traveling on said ways *k k*, the worm-gear *n*, carried by said sliding block, the stationary screw or rack *r*, and mechanism for driving the wheel *g*, substantially as described, and for the purpose specified.

4. In a feed attachment for lathes, the combination of the upper bed or block having ways *k k*, the feed-screw *p*, attached to said bed, the sliding block for traveling on said ways, the worm-gear *n*, mounted on said sliding block, and the stationary screw or rack *r*, having a threadless portion and adapted to be partially rotated to engage and disengage its threads from said worm-gear, substantially as described, and for the purpose specified.

5. In a lathe, the combination of adjustable ways *b k*, the sliding feed-block fitted to said ways, a slide to which the sliding feed-block *l* is pivoted and by which said slide is driven, the lower part of the lathe-carriage having guides for said slide, which also necessitate the simultaneous movement of the lower part of the carriage with said sliding block in the longitudinal direction of the lathe-bed, and the upper part of the lathe-carriage connected to said sliding feed-block through the slide to which said sliding feed-block is pivoted and necessarily moving with said block transversely to the lathe-bed, substantially as described, and for the purpose specified.

386,178. CABLE RAILWAY. FREDERICK F. BARR, St. Paul, Minn. Filed Apr. 9, 1888. Serial No. 270,022. (No model.)

Claim.—The combination, with the series of yokes provided with the flanges *b* and formed with seats for the slot-rails, of the concrete bottom, the slot-rails secured in said seats, and the lining-pieces between said concrete and slot-rails independent of said rails and supported by said flanges, substantially as described.

386,179. BOLDBACK FOR VEHICLES. THOMAS W. BARRY, Manitou, Mich. Filed Feb. 7, 1887. Serial No. 226,867. (No model.)

Claim.—1. The combination, with the slide having beveled edges and a series of openings or depressions in its length, of the thill-lock provided with a keeper embracing the edges of the slide, the pin adapted to move at right angles to the slide, and means for moving the pin, substantially as and for the purpose described.

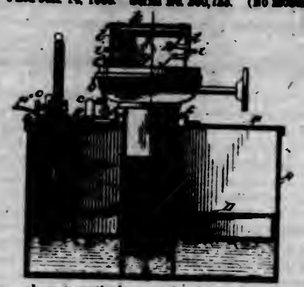
2. The combination, with the slide and the thill-lock provided with a keeper placed on and adapted to be adjusted on the said slide, of the pin constructed to move at right angles to the slide, and the lever pivoted between its ends and having its forward end engaging with the said pin, substantially as described, for the purpose specified.

3. The combination, with the slide and thill-lock, of the pin having a slot in its side, and the lever having its inner end fitting in the slot and having its other end expanded to form a thumb-rest, and the spring, substantially as and for the purpose specified.

4. The combination, with the slide having undercut edges and having a stop formed at one end, as shown, of the thill-lock embracing the edges of the slide and limited in its movement by the said stop, substantially as set forth.

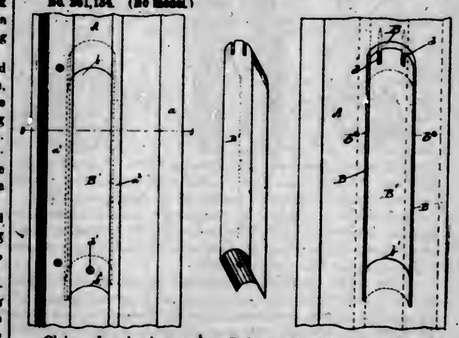
5. The herein-described device, composed of the slide having beveled edges and a stop at one end, the thill-lock embracing the edges of the slide and provided with a keeper, the slotted pin adapted to travel in a straight line, and the lever having one end fitting in the slot in the pin and the other end expanded to form a thumb-rest, substantially as and for the purpose described.

386,180. CHURN. JOSEPH R. BENJAMIN, Hubbell, Nebr. Filed May 10, 1888. Serial No. 273,472. (No model.)



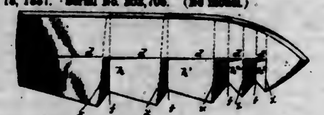
Claim.—1. In a churn, the combination, with the dasher, of the tube having its inner walls roughened, substantially as and for the purpose described.

2. In a churn, the combination, with the dasher, of the tapering tube having its inner walls roughened, substantially as and for the purpose specified.



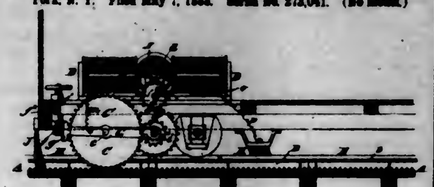
3. The combination, with the churn-body and the dasher fitting snugly within the churn-body, of the rod, the valves opening downward, the disk-block, and the tapering tube having its inner walls roughened, substantially as specified.

386,181. LAMP-EXTINGUISHER. MARCUS H. BLISS, Belle Plain, N. J. Filed Jan. 14, 1888. Serial No. 260,733. (No model.)



Claim.—In automatic lamp-extinguishers, the float D, concentrically encircling the wick-cylinder C, having a spindle or rod, F, rigidly affixed thereto, in combination with a plate, *p*, having arms *c c'*, the latter provided with a scale encircling the graduated rod F, the spring *t*, maintained between said plate *p* and the ring *q*, having a set-screw, *s*, the rod *o*, rigidly secured to the upper surface of the plate *p* at one end and terminating in a bent arm, *n*, at the other end, which oscillates in the slot *F'* of the curved extension *F'* of the hood *h*, having a bracket or back, *h*, and extinguishing-curtain *k'*, pivotally suspended from the front of said hood, whereby each vertical movement of the float D synchronously effects a like motion of the rods *F o*, thus oscillating the hood *k* in the arc of a circle, for the purpose and in the manner specified.

386,182. WINDOW-JAMB. JAMES BOOTH, Taunton, Mass., assignor of one-half to John H. Moore, same place. Filed Jan. 18, 1888. Serial No. 261,134. (No model.)



Claim.—In a jamb, a pocket, B, in combination with a cover, B', and fastenings *d d'*, the ends of the pocket and cover being formed by two inclined circular cross-kerfs, *b b'*, which are intersected by two side kerfs, *b²*, forming the sides of the pocket and cover, all substantially as and for the purpose set forth.

386,183. HAY-KNIFE. CHAPIN C. BROOKS, Hallowell, Me. Filed Oct. 18, 1887. Serial No. 252,708. (No model.)

Claim.—A blade for hay or analogous knives, having teeth, the plain or smooth side of the blade being ground to a straight bevel at or near the cutting-edge, as shown, in combination with angular grooves on the opposite side, arranged transversely to the length of the blade, forming two-edged teeth, the two angles of the cutting-edges of each being substantially of the same length, whereby as the blade is ground or sharpened on the straight beveled side only the identity of the teeth is preserved, substantially as and for the purpose specified.

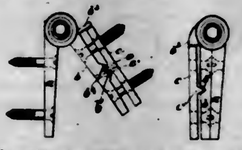
386,184. ELECTRIC RAILWAY. ROBERT A. CHEESEBROUGH, New York, N. Y. Filed May 7, 1888. Serial No. 273,041. (No model.)

Claim.—1. The combination, with a railway-track, a car running thereon, and an electric motor on said car, of a stationary toothed rack adjacent to the track, and a toothed wheel carried by the car and gearing in said rack and geared with and driven by said motor, the said rack and toothed wheel forming portions of the conducting-circuit by which an electric current is transmitted to said motor for driving the car, substantially as herein described.

2. The combination, with a railway-track, a car running thereon, and an electric motor on said car, of a slotted channel or trough between the rails of the track, a stationary toothed rack in said channel, a toothed wheel carried by the car, geared with and driven by the said motor, passing through the slot of said channel or trough and gearing with the toothed rack therein, the said rack and toothed wheel forming portions of the conducting-circuit by which an electric current is transmitted to said motor for driving the car, substantially as herein described.

3. The combination of a railway-car, a toothed wheel, and an electric motor for driving the same, both on said car, a stationary toothed rack beneath the car, with which the said toothed wheel gears, and which, with the said toothed wheel, form portions of the electric conductor for conveying electricity to said motor, and a brush attached to said car for sweeping the said toothed rack, substantially as herein described.

386,185. DRILL-CHUCK. JOHN C. CRABB, Auburndale, Ohio. Filed Apr. 16, 1888. Serial No. 270,749. (No model.)



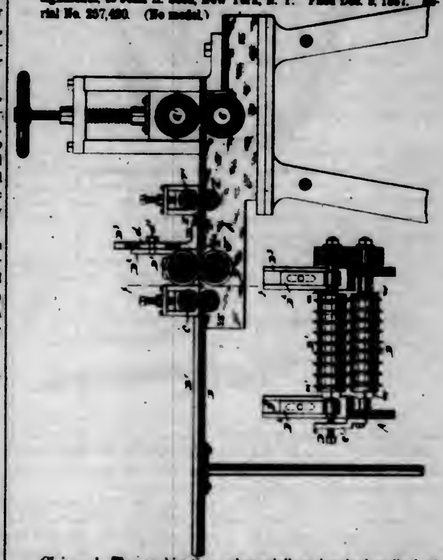
Claim.—1. In a drill, in combination with a bifurcated chuck-body, insertible drill-holders held within the chuck-body by the frictional engagement of the same, as and for the purpose set forth.

2. In a drill provided with a contractible chuck-body, the combination of interchangeable drill-holders formed with an irregular exterior in cross-section and a central aperture for holding a portion of drill, as and for the purpose set forth.

3. In a drill, a threaded chuck-body formed with tapered jaws having a circular exterior in cross-section and forming a central aperture of irregular form in cross-section, and a threaded ring embracing the chuck-body, adapted to compress the same, in combination with interchangeable drill-holders of corresponding exterior to the central aperture, as and for the purpose set forth.

4. In a drill, a chuck-body formed with a central aperture inclosed by yielding jaws contracted by the movement of a compression-ring, in combination with a drill-holder having a contractible end, as and for the purpose set forth.

386,186. HINGE. GEORGE DAHLMAN, Englewood, Ill. Filed Dec. 27, 1887. Serial No. 258,608. (No model.)



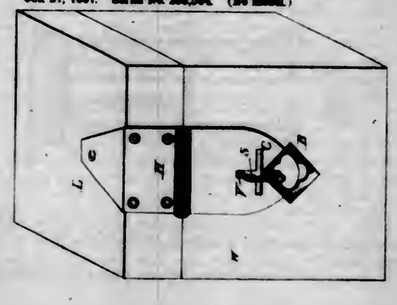
Claim.—1. In combination with a door-hinge, a plate upon the back of the wing and a ridge between said wing and plate, and longitudinal rows of screws on both sides of said ridge, substantially as specified.

2. In combination with a door-hinge and its screws, said hinge having a groove about midway between the longitudinal rows of screws, placed near its inner and outer edges, a rocking plate having a ridge or bearing fitting into said groove, and enlarged screw-holes registering with those of the hinge, substantially as specified.

3. In combination with a door-hinge having a guard, a plate placed upon the back of the wing, and a ridge between said wing and plate, and longitudinal rows of screws on both sides of said ridge, substantially as specified.

4. In combination with a door-hinge, a plate upon the back of the wing, united thereto by a rivet, and a ridge between said wing and plate, and longitudinal rows of screws on both sides of said ridge, substantially as specified.

386,187. MACHINE FOR MAKING LEATHER HOOPINGS, &c. JOHN J. DALEY and GEORGE J. DALEY, Brooklyn, assignors, by mesne assignments, to John H. Seed, New York, N. Y. Filed Dec. 9, 1887. Serial No. 257,620. (No model.)

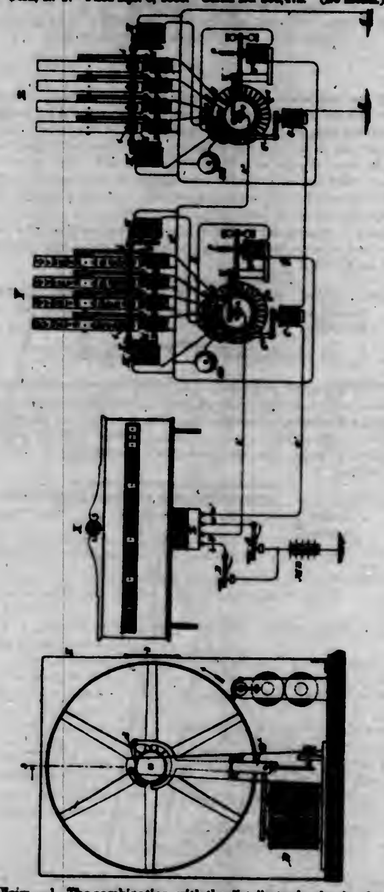


Claim.—1. The combination, substantially as herein described, of a pair of feed-rolls, a pair of cutter-rolls provided with circular cutting-knives, a series of folders, a second pair of feed-rolls, and a pair of creasing or ornamenting rolls.

2. The combination, substantially as herein described, with a feed-table, of a pair of feed-rolls, a pair of cutter-rolls, a series of folders arranged beyond said cutter-rolls, a second pair of feed-rolls beyond the folders, and a pair of creasing or ornamenting rolls.

3. In a machine for making leather edgings, the combination of the lower cutter-roll having circular cutting-knives, the upper cutter-roll having circular cutting-knives arranged in contact with the cutting-knives of the lower roll, vertically-adjustable bearings for said upper roll, slotted supporting-standards for adjusting said bearings, clamp-screws for said bearings, and a stationary set-screw bearing against the end of the upper cutter-roll for adjusting the knives of the same laterally toward the knives of the lower cutter roll, substantially as herein shown and described.

386,188. BOX-FASTENER. JOSEPH DAVY, Oakland, Cal. Filed Oct. 27, 1887. Serial No. 253,564. (No model.)



386,188.

Claim.—In a box-fastening, the combination, with a staple, S, secured to one portion of the box, and a bolt, B, having the central portion cut out and loosely pivoted on or held by said staple, of the loop H, attached to the other portion of said box and having therein the cuts or slots V and C, the former to engage the staple, and the latter adapted to pass over the bolt when said bolt is raised at right angles to said staple, substantially as described.

386,189. ELECTRICAL BULLETIN. PATRICK B. DELANY, New York, N. Y. Filed Apr. 3, 1888. Serial No. 269,672. (No model.)

Claim.—1. The combination, with the distributer having insulated segments and a step-by-step-actuated trailer which during its intervals of rest passes upon a segment, of the bulletin-wheels, their actuating-magnets included in the circuits of the segments, and a transmitter, a line and source of electric energy, from which intermittent currents may be transmitted through each distributing-segment and its bulletin-wheel magnet and the wheel thereby rotated to expose the desired character.

2. The combination of the bulletin-wheels, their actuating-magnets, the distributer-segments in circuit with which said magnets are connected, the step-by-step-actuated trailer which traverses said segments and during its intervals of rest passes upon a segment, the source of electric energy, line, and circuit-connections whereby the bulletin-wheels may be individually operated.

3. The combination of the bulletin-wheels, their magnets, the distributer-segments with which the magnets are connected, the intermittently-actuated trailer, which during its intervals of rest passes upon a segment, and the trailer-unison having its magnet connected with one of the distributer-segments and the main line or source of electric energy.

4. The combination of a line, a source of electric energy, an intermittently-operated trailer connected in the line, insulated segments traversed by the trailer, bulletin-wheel-actuating magnets connected with some of said segments, a magnet for throwing on a bulletin-wheel unison connected with one of said segments, a magnet for throwing off the bulletin-wheel unison connected with another of said segments, and circuit-connections, substantially such as described.

5. The combination of the transmitter, a line, a source of electricity, the distributer having insulated segments and a step-by-step-moving trailer which passes upon the segments, a gang of bulletin-wheels arranged side by side in parallel vertical planes, the actuating-magnets of the bulletin-wheels each included in the circuit of a segment, whereby each bulletin-wheel may be individually operated when the trailer is upon its segment, and a signaling device included in the circuit of one of the segments, substantially as and for the purpose set forth.

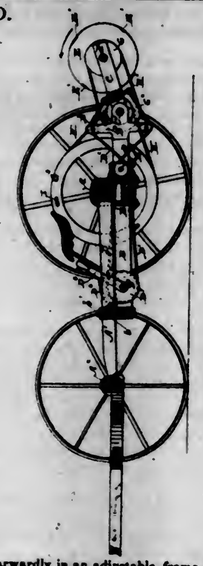
6. The combination, with a gang of bulletin-wheels arranged in parallel vertical planes and each carrying a unison-stop, of a gang of opposing stops, and a magnet and its circuit-connections for simultaneously removing the unison from all the bulletin-wheels.

7. The combination of a line, the opposing batteries MB MP, a switch or lever by means of which current from portions of said batteries of alternating polarity may be thrown upon the line, one or more polarized relays connected in the line and operated by such reverse currents, a trailer or circuit-completer in the line operated by each relay, a circle of segments traversed by each trailer, a branch circuit connected with each segment, electro-magnetic devices in each circuit adapted not to respond to each impulse, and keys or transmitting devices for transmitting currents of increased strength to operate said electro-magnetic devices.

8. The combination of a source of electric energy, a transmitter, a line extending to an intermittently-actuated trailer, a circle of segments traversed by said trailer, a branch line connected with each segment and with a common conductor leading to the next trailer and circle of segments in the line, a unison device for each trailer, and electro-magnetic devices in the branch lines of each circle of segments, corresponding electro-magnets being included in the circuits of corresponding segments, substantially as set forth.

9. In an electrical bulletin, the combination, substantially as set forth, of a source of electric energy, a transmitter, a line extending to an intermittently-actuated trailer, a circle of segments traversed by said trailer, the branch lines connected to the segments and to a common conductor leading to the next trailer and circle of segments in the line, a set of bulletin-wheels arranged in parallel vertical planes located at each circle of segments, bulletin-wheel-actuating magnets included in the branch circuits of the circles of segments, magnets of corresponding wheels being included in corresponding branch circuits at the different circles of segments, and unison-magnets for the bulletin-wheels, also included in branch circuits.

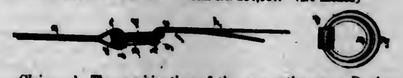
10. The combination of a line, a source of electric energy, a transmitter, polarized relays connected in the line, trailers, one for each relay, also in the line and operated by the relays, a circle of segments traversed by each trailer, a branch circuit connected with each segment and with a common conductor leading to the next relay and trailer, and independent bulletin-actuating magnets in the respective branch circuits at the different circles of segments, which magnets do not respond to the relay-actuating currents, but not when currents of increased strength are transmitted, corresponding magnets being included in the circuits of corresponding segments, substantially as and for the purpose set forth.



11. The combination, with a central station where current news or items of general interest are reported, of sub-stations for the visual display or communication of such news-items, where are located electrically-actuated bulletins, each having a series of wheels or rotating bodies upon which are placed the letters of the alphabet, of such size that they may be read from convenient distance, a source of electric energy, electrical conductors connecting the central and sub stations, a transmitter at the central station for sending currents to the sub-stations to actuate the bulletin-wheels to spell out and expose to view any desired communication, and bulletin-wheel-actuating devices located at each bulletin, by means of which the central-station operator may operate the bulletin-wheel at pleasure to display any desired item of news.

12. The combination, with a gang of bulletin-wheels arranged side by side in parallel vertical planes, of a corresponding gang of individually-adjustable unison-stops.

386,190. STALK-CHOPPER. ALEXANDER PERRIN, Terrell, Tex. Filed Apr. 14, 1888. Serial No. 270,614. (No model.)



Claim.—In a stalk-chopper, the ordinary form of running-gear, A, in combination with the main frame B, secured thereto, as shown,

386,190.

terminating rearwardly in an adjustable frame, C, operated from the seat by a lever, D^4, and cords D D', passing over pulleys D^2 D^3 and head-wheel D^5, the reels E, pivotally mounted in said frame C on the shaft and carrying knives E', the shaft K, carrying the sprocket-wheel G^2, respectively communicating rearwardly with the wheel G by chain H' and forwardly with the wheel G^3 by chain H, whereby the rotation of the wheel G^3 is transmitted mediately to the reels E, for the purpose and in the manner set forth.

386,191. CLASP OR BUCKLE. SHERWOOD B. FERRIS, Lakewood, N. J. Filed Dec. 15, 1887. Serial No. 257,931. (No model.)

Claim.—1. The combination of the supporting-strap D, rings A B, having straight parts *a b*, and rigid loop *d*, said rings being held one upon the other by said loop, substantially as described.

2. The combination of the two rings A B and the single rigid loop *d*, for holding them together, with the strap F, said strap being looped over the ring B and passed thence through the ring A, all arranged for operation substantially as herein shown and described.

386,192. OBTAINING OXYAZOIC COLORING-MATTER FROM TETRAZO DIPHENYL AND DITOLYL. SYLVESTRE FOREL, Mulhouse, Alsace, Germany. Filed Nov. 29, 1887. Serial No. 256,494. (Specimens.) Patented in France Oct. 20, 1887, No. 186,490, and in England Nov. 11, 1887, No. 15,469.

Claim.—1. The process of manufacturing oxyazoic compounds from tetrazo-diphenyl and tetrazo-ditolyl by the action of tetrazo-ditolyl on phenol, or of tetrazo-diphenyl and tetrazo-ditolyl on phenol and orthocresylol in alkaline solution, substantially as herein described.

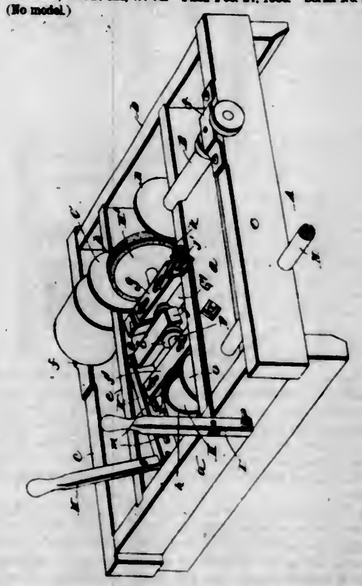
2. A coloring-matter having the properties of yielding on vegetable fiber bright yellow when applied on a bath containing alkali or soap, the shade of the fiber when leaving the dyeing-bath being orange, but after washing with water or diluted acid and drying turning up into yellow, the salts resulting by the combination thereof with the salts of the alkaline earths being hardly soluble in water.

386,193. EMBROIDERING ATTACHMENT FOR SEWING-MACHINES. JOHN W. FOSTER, Washington, D. C. Filed May 27, 1887. Serial No. 239,502. (Model.)

Claim.—1. In an embroidering attachment for sewing machines, the combination, with two co-operating thread-carrying arms or levers, one of which is provided with the bearing-surfaces l^2 l^3, of a lever operated from the needle-bar of the machine and alternately engaging said bearing-surfaces, the forward end of said lever in its normal position lying to one side of a line joining its fulcrum, and the fulcrum of the lever provided with said bearing-surfaces, and a spring for returning said actuating-lever into its normal position when moved out of it to either side, as and for the purpose specified.

2. In an embroidering attachment, the combination, with the base

386,193.

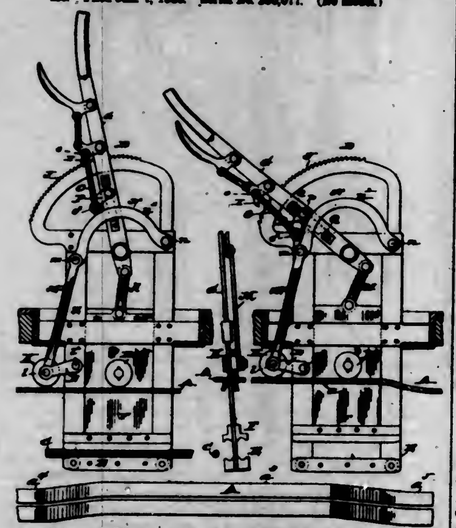


f of the attachment having the side wall, f^6, the levers L, pivoted to the base and provided with intermeshing teeth, one of said levers being provided with bearing-surfaces, as described, of the lever L', pivoted at one end to the base and projecting at its other end through a slot in the side wall, the lever L^2, pivoted at one end to the lever L' and its forward end lying in position to engage one of the bearing-surfaces, the levers L^3 L^4, pivoted to the side wall, one end of lever L^4 being forked or slotted and embracing the projecting end of lever L', and the lever L^3 being also forked or slotted at one end, and the needle-bar and its screw, the latter being embraced by the slotted end of lever L^3, as described.

386,194. SAFETY-PIN FOR BROOCHES. JOSEPH FRIEDGOESER, Landsberg-on-the-Loch, Bavaria, Germany. Filed Jan. 26, 1888. Serial No. 261,968. (No model.)

Claim.—In a safety-pin for brooches, the combination consisting of the main body of the brooch, provided with two depending guides, each having catches integral therewith, and the two pins provided with grooves engaging said catches and guides, the lower groove being less in length than the upper groove, substantially as shown and described.

386,195. FEED MECHANISM FOR SAW-MILLS. ALEXANDER P. GIBSON, Mount Ida, W. Va. Filed Feb. 27, 1888. Serial No. 265,630. (No model.)



Claim.—1. The combination, with the feed-shaft provided with the disks C D, of the transversely-movable bearing-boxes, a shaft, F, journaled in said boxes and longitudinally movable therein, friction-wheels H H', of different diameters, secured on said shaft, a lever connected to said shaft F to move the same in its bearings, and a drive-disk contacting with the wheel H, substantially as specified.

2. The combination, with the feed-shaft provided with the disks C D, of the shaft F, bearing in bars and longitudinally movable therein, friction-wheels H H', of different diameters, secured on said shaft, a frame, K, slotted to play on guide-bolts and having a portion embracing said shaft F, and a lever for shifting said frame and shaft, substantially as specified.

3. The combination of the longitudinally-movable shaft F, having the friction-wheels H H', a drive-shaft having a disk contacting with the wheel H, a journal-box receiving the shaft F, a horizontal bell-crank lever arranged near one end of said journal-box, a link connecting said lever to the journal-box, and an operating-lever connected to the bell-crank lever, as set forth.

386,196. CABLE-GRIP DETACHER. HERMAN C. GRAWE, St. Louis, Mo. Filed Jan. 7, 1888. Serial No. 260,077. (No model.)

Claim.—1. The elevated and bent cable-tube slot, in combination with a vertically-movable part upon the car-grip, as and for the purpose described.

2. A cable-tube slot having an elevated and bent portion, as and for the purpose described.

3. The combination of a tube-slot elevated and bent, as described, with the movable jaw of the grip, said movable jaw having a roller or other projection for encountering said elevated and bent tube-slot, as and for the purpose described.

4. The combination of a tube-slot elevated and bent as described with a car-grip having two rollers or projections, said rollers or projections being adapted to encounter said elevated and bent tube-slot successively, and being respectively and either directly or indirectly connected with the grip-lever pawl, and the movable jaw of the grip, substantially as described.

5. The combination, in a car-grip, of the segment, the grip-lever and pawl, the curved and pivoted lever N, the rod O, and arm P, substantially as described.

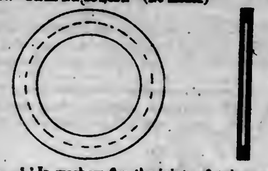
6. The combination of the elevated tube-slot, the car-grip having the grip-lever and pawl, the roller K, the arm L, the arm M, the curved and pivoted lever N, the rod O, and the arm P, substantially as described.

7. The combination of the elevated and bent tube-slot, the car-grip having the movable jaw, the grip-lever and pawl, the rollers K R, the arm L, the rod M, the curved and pivoted lever N, the rod O, and the arm P, substantially as described.

8. The combination of the grip, the grip-lever, the keeper, the curved lever, the rod M, the arm L, and the roller K, substantially as described.

9. In a cable-grip, the bent lever N, pivoted to the frame-work of the grip and combined with the grip-lever, said lever N being shaped and arranged to occupy the arc of a circle whose center is the fulcrum of the grip-lever, substantially as described.

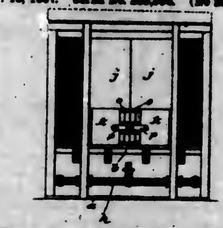
10. In a cable-grip, the bent lever N, pivoted at one end, to be moved as described, said lever being shaped and arranged to occupy the arc of a circle whose center is the fulcrum of the grip-lever, and being combined with and operated by a part leading downward therefrom to encounter an elevation in the tube-slot, substantially as described.



11. In a cable-grip, the bent lever N, pivoted to the frame-work of the grip, having a segment, and combined with and engaging on its convex surface the extension of the pawl, and having connected with it a part leading downward therefrom, operated by an elevation in the road-bed, whereby in operation the pawl is disconnected with the segment and the grip-lever is released, substantially as described.

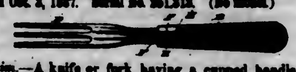
386,197. HOB. GRANT HAIN, Dudley, Mich. Filed Mar. 10, 1888. Serial No. 266,883. (No model.)

Claim.—The herein-described hoe-blade comprising the wedge-shaped horizontal blade A, and the integral vertical blades D D at the ends of the horizontal blade and tapered toward their lower ends, substantially as specified.



386,198. WASHER. THOMAS R. HALFORD, Bedford Park, and EDGAR W. EDMUNDSALE, Grove Park, County of Middlesex, England. Filed Nov. 1, 1887. Serial No. 254,251. (No model.)

Claim.—1. In washers for the joints of tubes and fittings, with a glass or other lining, a washer having a groove, *a*, round its internal edge, substantially as shown, and for the purposes specified.

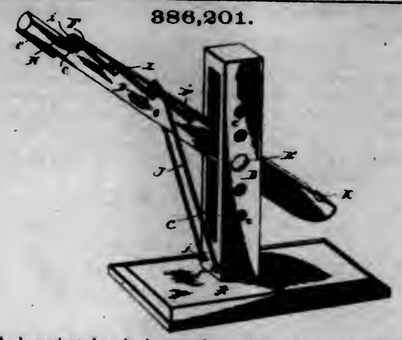


2. In washers for the joints of tubes and fittings, with a glass or other lining, the combination of two or more washers, recessed or plain, substantially as shown and described, for the purposes specified.

386,199. DEVICE FOR EXTINGUISHING FIRES IN THEATERS AND OTHER BUILDINGS. WILLIAM HASSELMAYER, Philadelphia, Pa. Filed Nov. 18, 1887. Serial No. 255,966. (No model.)

Claim.—The combination of the sliding doors, the safety-doors hinged thereto, and the springs secured to the outer faces of the sliding doors and the safety-doors, as set forth.

386,200. KNIFE OR FORK. HERBERT C. HART, Unionville, Conn. Filed Oct. 3, 1887. Serial No. 251,313. (No model.)

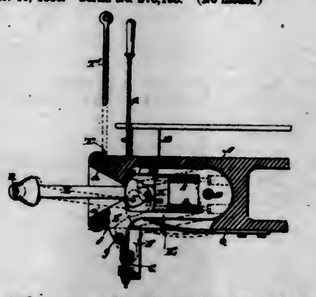


Claim.—A knife or fork having a cupped handle, the forward ends of the flange whereof are drawn down and over the opposite edges of the blade or tine shank, so as to firmly clasp such shank and hold the two parts together, substantially as set forth.

386,201. LIFTING-JACK. ARCHIBALD HINKHAM, Jefferson, Pa. Filed Apr. 13, 1888. Serial No. 270,895. (No model.)

Claim.—1. In a lifting-jack, the combination, with the base-block and the standard rising therefrom, of the lever pivoted in the slot of said standard and provided with the shoulders F, groove G, and slot

386,201.



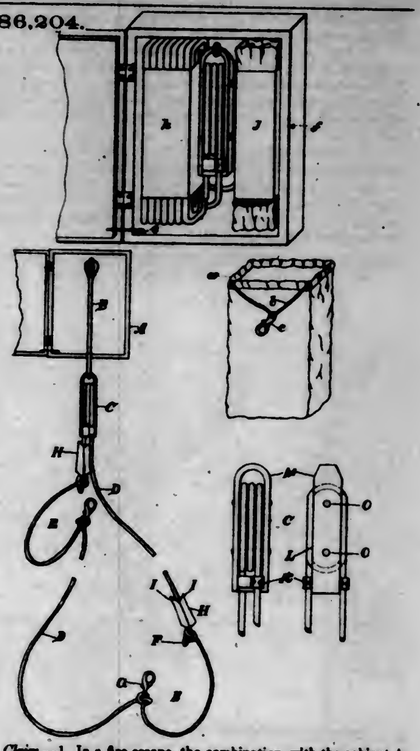
H, the loop pivoted at its lower end on said standard and with its front end passing over the lever, and the rod I, pivoted at its inner end in said groove below the upper end of the loop J, and provided with the rectangularly-bent portion *i* and the arm *i'* below the outer end of the lever, substantially as specified.

2. The combination of the base-block A, the standard B, rising therefrom and provided with the slot C and series of aligned openings *c*, the pivotal pin E, the lever provided with the shoulders F, groove G, and slot H, the rod I, provided with the arm *i'* and rectangularly-bent portion *i*, and the loop J, substantially as specified.

386,202. BLEACHING EDIBLE NUTS. FRANCIS M. INGERSOLL, Brooklyn, N. Y. Filed Dec. 24, 1887. Serial No. 258,911. (No specimens.)

Claim.—The process of bleaching and improving edible nuts, as described, consisting in subjecting the nuts to a bath of a mixture of tartaric and oxalic acids and then drying them, all substantially as described.

386,203. CAR-COUPLING. PIERRE A. JOUE, Napoleonville, La. Filed Apr. 10, 1888. Serial No. 270,195. (No model.)



Claim.—1. In a car-coupling, the combination, with the draw-bar recessed on the under side and having the bell-mouth and the shoulder for engaging the link, of the movable jaw pivoted in said recess and having the forwardly-extending portion forming the other shoulder for engaging the link, the overhanging portion for disengaging the link when the movable jaw is depressed, and the spring for holding said jaw up in operative position, substantially as described.

2. In a car-coupling, the combination, with the draw-bar recessed on the under side and having the bell-mouth, as described, of the movable jaw pivoted in said recess and held up in operative position by spring-pressure, and having the forwardly-extending hook and the overhanging portion and the spring-pressed block moving in said head for keeping the link pressed forward, as and for the purpose set forth.

3. In a car-coupling, the combination, with the draw-bar recessed on the under side and having the bell-shaped mouth, of the movable jaw pivoted in said recess, consisting of the hook portion forming one of the inclines of the bell-mouth and having the shoulder or *stop f* thereon, the overhanging portion and spring-pressed sliding block between said hook and overhanging portion, and the lever for operating said movable jaw against the pressure of the spring which holds it in operative position, substantially as described.

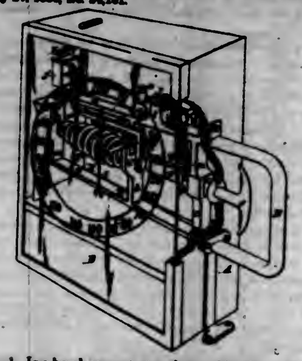
4. The combination, with a car-coupling, substantially as described, of a link for co-operating therewith, having the enlarged ends and the anti-friction roller mounted thereon, as set forth.

386,204. FIRE-ESCAPE. GEORGE W. KEELER, Trenton, N. J. Filed Apr. 10, 1888. Serial No. 270,208. (No model.)

Claim.—1. In a fire-escape, the combination, with the cabinet A, having a hinged door, of the parts of the fire-escape, the fixed part thereof being fixedly secured in said cabinet and the moving or running parts thereof being folded in an orderly manner and secured in paper wrappers within said cabinet, as and for the purpose set forth.

2. The combination, with the cabinet A, having a hinged door, and said door being opened by the spring *e*, of the movable parts of the fire-escape, arranged and secured with paper wrappers in said cabinet, the friction-block C, secured to the cabinet by the rope B, the endless rope D, one or more bolts, E, ring F, and snap-hook G, and pad H, secured to the rope D and having two free ends, J, substantially in the manner and for the purpose shown and described.

3. The combination, in a fire-escape, with the cabinet A, having a hinged door, said door being opened by the spring *e*, of the movable parts of the fire-escape contained, arranged, and secured in said cabinet by paper wrappers, the friction-block C, secured to the cabinet by the rope B, the endless rope D, with one or more bolts, E, with ring F and snap-hook G, the pad H, secured to the rope D and having two free ends, J, friction-block C, having the band M secured to the oblong block L by the bolts O, and having the guide-tubes K at the lower end, the canvas bag with loose hem *a*, through which hem rope *b* is passed, adapted to drawing the mouth of the bag shut, and rope *b*, having the snap-hook *c*, substantially in the manner shown and described, and for the purpose set forth.



386,205. PIPE-CUTTER. ROBERT D. LOCKE, Titusville, Pa. Filed Mar. 15, 1888. Serial No. 267,262. (No model.)

Claim.—1. In a flue-cutter, the mandrel carrying the cutting-knife surrounded by a sleeve filling the space between the outside of the mandrel and the inside of the flue, the sleeve being eccentric and having a transverse slot through which the cutting-knife projects, the mandrel and sleeve being so arranged and connected that the cutting-edge of the knife is projected through and beyond the sleeve more or less, as desired, by the revolution of the mandrel within the sleeve, substantially as shown and described.

2. A flue-cutter consisting of the mandrel A, carrying the cutting-knife B and surrounded by the eccentric sleeve C, the motion of the sleeve on the mandrel being governed and controlled by the collar D, all the several parts working in combination and connected substantially as shown and described.

386,206. COIN-CONTROLLED HAND-POWER TESTER. ADELARD P. MARTIN, Montreal, Canada, assignor, by mesne assignments, to the Hand Power Test Machine Company, of New Jersey. Original application filed May 2, 1888, Serial No. 273,035. Divided and this application filed Apr. 3, 1888. Serial No. 270,038. (No model.) Patented in Canada May 27, 1886, No. 24,161.

Claim.—1. In a hand-power tester, the combination, with a frame, of a stationary handle secured thereto, a rod mounted in the frame and provided with a handle within the stationary handle, and a spring operated by said rod, substantially as shown.

2. In a hand-power tester, the combination, with a frame or box, of a stationary handle secured thereto, a rod mounted in the frame and provided with a handle, a spring secured to and operated by said rod, and a register operated by said rod at the latter is pulled outward, substantially as shown.

3. In a hand-power tester, the combination, with a frame, of a fixed handle secured thereto, a rod mounted in the frame and provided with a handle, a spring adapted to be operated by said rod, and an automatic locking device arranged, substantially as shown, to prevent said rod from being operated.

4. In a hand-power tester, the combination, with a frame, of a rod mounted therein and provided with a handle, a spring adapted to be operated by said rod, a registering device or index operated through the movement of said rod, substantially as shown, and an automatic locking device arranged to prevent said rod from being operated.

5. In a hand-power tester, the combination of a frame, a fixed handle, and a movable handle, arranged one within the other, the movable handle being provided with a registering device, constructed and arranged to operate substantially as and for the purpose set forth.

6. In a hand-power tester, the combination, with a frame, of a rod, F, provided with a spring, *g*, and a notch, *p*, pivoted lever J, provided at one end with a coin-receptacle, *m*, and at the other end with a dog, *n*, to engage with the notch, substantially as shown, whereby when a coin is placed in the receptacle the lever is rocked and raises the dog out of the notch and permits the rod to be operated.

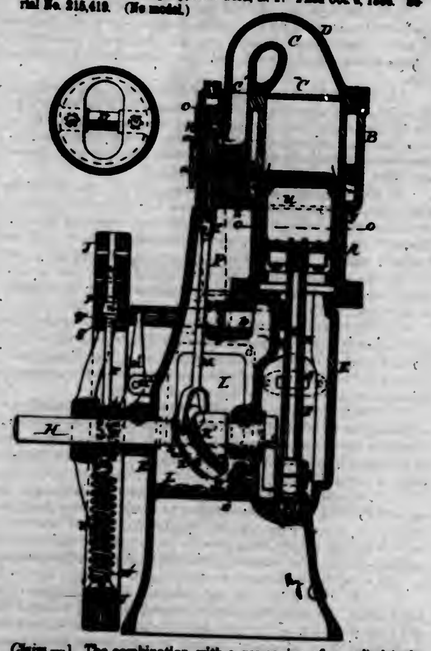
7. In combination with box A, frame E, secured thereto, fixed handle B, rod F, provided with spring *g*, rack-bar G, and handle *f*, pinion H, meshing with the rack-bar, finger I, and dial-plate C, arranged and operating substantially as shown.

8. In combination with box A, frame E, handle B, and rod F, constructed and operating substantially as shown, lever J, provided with coin-receiver *m* and dog *n*.

9. In a hand-power tester, the combination, with a box, A, provided with coin-tube L, receiving-tube K, and drawer D, of a rod, F, provided with a spring, *g*, and a notch, *p*, and a pivoted lever, J, provided with a coin-receptacle, *m*, and a dog, *n*, all arranged to operate substantially as described, whereby when a coin is placed in the receptacle the lever is rocked to unlock the rod and to discharge the coin into the receiving-tube.

10. In combination with box A, having glass dial C, receptacle D, and fixed handle B, frame E, rod F, mounted in said frame and provided with notch *p*, spring *g*, and rack-bar G, shaft I, mounted in the frame and provided with pinion H, index-finger I, and pivoted lever J, provided with dog *n* and coin-receptacle *m*, all arranged to operate substantially as shown.

11. In a hand-power tester, the combination, with the reciprocating rod F and the pivoted lever J, having coin-receptacle *m*, arranged to operate substantially as explained, of the guard *j*, adapted to prevent the escape of coin from the receptacle and operated through the movement of the rod F, as described, whereby the guard is retained in place until the tipping of the lever to discharge the coin releases the rod.



12. In a hand-power tester, the combination, with the rod F, having spring *g* and notch *p*, of the pivoted lever J, provided with a single coin-receptacle, *m*, and with a dog to engage with the notch *p*, and a weight, *c*, adjustable upon the lever, whereby the coin necessary to release the rod may be varied, as desired.

386,207. CORN-PLANTER. JOHN HOBAN, Adair, Mo. Filed Feb. 24, 1888. Serial No. 265,114. (No model.)

Claim.—The combination, with the main frame having the rear supporting and driving wheels, of the seed-dropping tubes having the extending guide-plates for the grain, the wheels F, journaled in suitable supports on the forward portion of the main frame and having the laterally-extended periphery provided with seed-dropping apertures, the hoppers arranged so as to have their discharge-apertures within the perforated periphery of the said wheels, the fixed pulleys, and endless guide-belt, connecting the seed-dropping wheels with the main driving-wheels, substantially as specified.

386,208. GAS-ENGINE. LEWIS H. HASH, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Oct. 6, 1886. Serial No. 215,612. (No model.)

Claim.—1. The combination, with a gas-engine, of a cylindrical plunger-valve, and a case having ports for operating the engine, and operating-connections for said valve, consisting of the oblique eccentric, the strap therefor, and a connecting-rod pivoted to said strap and having a universal-joint connection with said valve, substantially as herein set forth.

2. The combination of the power-cylinder of a gas-engine, having exhaust-ports placed in the middle of its length, and having its supply-passage entering at its back end, with a piston controlling the discharge of the waste gases, a sliding supply-valve controlling the flow into said cylinder, actuated by positive connecting mechanism, a compressor supplying a uniform combustible mixture for the engine, a supply-passage conveying the mixture to the engine-valve, and a throttle-valve for said supply-passage, actuated by a governor, substantially as described.

3. The combination, with the power-cylinder of a gas-engine, having ports opened by the piston on its forward stroke, and a compression-chamber, of a supply-passage leading from said chamber, a plunger-valve having provision for controlling the supply and igniting the charge, and an external lighter, substantially as herein set forth.

4. The combination, with a gas-engine, of a valve-chamber having a port entering the combustion-chamber, and a separate supply-port, a valve having bearing-faces operating said ports, an escape-passage, a cylinder having exhaust-ports uncovered by the piston on its forward stroke, and suitable valve-operating connections, substantially as herein set forth.

5. The combination, with the power-cylinder of a gas-engine, having exhaust-ports uncovered by the piston on its forward stroke, of a compression-chamber, a mixing-valve supplying a uniform mixture, a governor controlling the flow from said chamber, and a plunger-valve supplying the charge, substantially as herein set forth.

6. The combination, with the power-cylinder of a gas-engine, of a slide-valve, a valve-case having a cylinder-port, a separate supply-port, and an escape-port separating said ports, substantially as herein set forth.

7. The combination, with the power-cylinder of a gas-engine, of a slide-valve having divided bearing-surfaces, a valve-case having separate ports for the supply and for the combustion chamber, and an escape-port placed between them, substantially as described, for the purpose specified.

8. The combination, with the piston of a gas-engine, of a compression-chamber, a mixing supply-valve therefor, a supply plunger-valve, a fly-wheel governor, and a valve operated by the latter to control the flow from said compression-chamber to the supply-valve, substantially as described.

9. The combination, with the power-cylinder, the piston, and a supply slide-valve, of a plunger-chamber containing an elastic fluid and oil, and a supply-conduit leading from said chamber to the bearing-surfaces of said cylinder, piston, and valve, substantially as herein set forth.

10. The combination, with the power-cylinder, the piston, and the valve, of the compression-chamber containing oil, an elastic fluid, and the piston-operating connections, the chamber L, containing the valve-operating connections, and a conduit for oil leading from the compression-chamber to the bearing-surfaces of said cylinder, piston, and valve, substantially as herein set forth.

11. The combination, with the power-cylinder, the piston, the slide-valve, and the operating connections for the working parts, of the engine-frame having a compression-chamber containing an elastic fluid and oil, and inclosing the piston-operating connection, and also having a chamber inclosing the valve-operating connections, a conduit for the oil leading from the compression-chamber, and a valve-controlled communication between the said chambers, substantially as described, for the purpose specified.

12. The combination, with the power-cylinder having the inner wall-groove, *y*, and a supply slide-valve having a wall-passage, *z*, leading to said groove, of the compression-chamber F, containing an elastic fluid and oil, and a tube leading therefrom to the said wall-passage, substantially as described, for the purpose specified.

13. An engine-frame having the chambers F and L, the former containing an elastic fluid and oil, in combination with the power-cylinder, the piston, the supply-valve, the conduit *y z*, for supplying oil to the operating parts, the check-valve 22, and the cock 23, substantially as herein set forth.

14. The combination, with the power-cylinder, the piston, and the supply-valve, of a compression-chamber, of which the piston forms the compressor, having a mixing-valve supplying a uniform mixture, a valve-controlled supply-passage for the power-cylinder, and an automatically oil-supplying conduit for the cylinder, and valve N, controlled by said piston, substantially as herein set forth.

15. The combination, with the piston and other working parts of a gas-engine, of a plunger-chamber containing an elastic fluid and oil, and a supply-conduit for the oil leading from said chamber to the bearing-surfaces to be lubricated, whereby the oil is forced through said passage by the gas under the action of the piston, substantially as described.

16. The combination of the power-cylinder of a gas-engine, having exhaust-ports placed in the middle of its length, having its supply-passage entering at its back end, and a compression-chamber at its forward end forming a reservoir for the compressed charge, with a piston controlling the discharge of the waste gases and compressing the combustible mixture on its forward stroke, a supply-passage leading to the main valve, having a throttle-valve controlled by a governor, and a sliding supply-valve controlling the flow into said cylinder supply-passage, actuated by positive connecting mechanism, substantially as described.

17. In a gas-engine, a compression-chamber and a reservoir constantly in free communication therewith, combined with ports provided with a valve for controlling the supply of the mixture to the reservoir solely by the back expansion of the gases contained in said reservoir, substantially as described.

18. In a gas-engine, a compression-chamber, a reservoir constantly in free communication therewith, and an automatic governor combined with ports, and provided with a valve for automatically controlling the supply of mixture to the reservoir solely by the back expansion of the gases contained in said reservoir, substantially as described.

19. In a gas-engine, the combination of an entrance-passage of constant capacity, a compression-chamber in free communication with a reservoir, a combustion-chamber, and a conduit provided with a valve for controlling its capacity, leading from said compression-chamber to said combustion-chamber, substantially as described.

20. In a gas-engine, the combination of an entrance-passage of constant capacity controlled by a check-valve, a compression-chamber in free communication with the reservoir, a combustion-chamber, and a conduit provided with a valve for controlling its capacity, leading from said compression-chamber to said combustion-chamber, substantially as described.

21. In a gas-engine, a combustion-chamber having entrance and discharge ports at opposite ends of said chamber, both open at the same time, combined with a compression-chamber, and a reservoir in free communication therewith, a conduit connecting said combustion-chamber and said compression-chamber, provided with a valve for automatically closing said conduit, and a valve controlled by an automatic governor for controlling the capacity of said conduit, substantially as described.

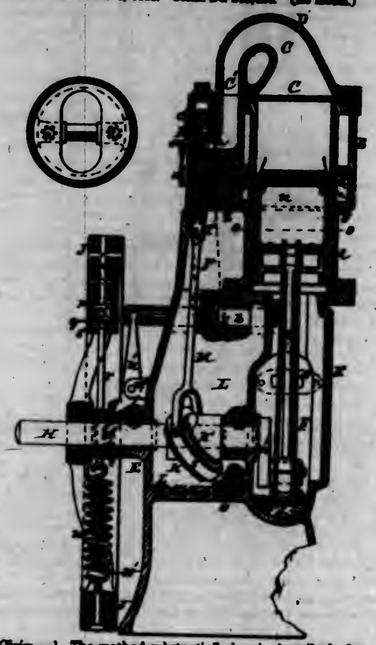
22. In a gas-engine, a combustion-chamber having entrance and discharge ports at opposite ends of said chamber, both open at the same time, combined with a positively-moving supply-valve, a compression-chamber, and a conduit provided with an automatic governor for controlling its capacity, connecting said compression-chamber and said combustion-chamber, substantially as described.

23. In a gas-engine, a combustion-chamber having entrance and discharge ports at opposite ends of said chamber, both open at the same time, combined with a valve operating to stop the flow of gas during an interval of time between the reduction of the old charge within the said chamber to atmospheric pressure and an introduction therein of a fresh charge, for the purpose set forth.

24. In a gas-engine, a combustion-chamber having entrance and discharge ports at opposite ends of said chamber, both open at the same time, combined with a positively-moving supply-valve operating to cause an interval of time to elapse between the reduction of the old charge in said chamber to atmospheric pressure and the introduction therein of a fresh charge, for the purpose set forth.

25. In a gas-engine, a combustion-chamber having entrance and discharge ports at opposite ends of said chamber, both open at the same time, combined with a valve for controlling the supply-passage of said chamber, said valve being provided with an escape-passage, substantially as and for the purpose set forth.

26. In a gas-engine, the combination of a compression-chamber and a reservoir constantly in free communication therewith, gas and air supply ducts, and a valve, said gas and air supply ducts and said valve all being controlled by the back expansion of gas contained in said chamber, substantially as described.



27. In a gas-engine, a compression-chamber and a reservoir constantly in free communication therewith, combined with ports provided with a valve for controlling both the density of the gas admitted to said chamber and also the volume thereof by means of the back expansion of gas contained therein, substantially as described.

28. The combination, with the piston and other working parts of a gas-engine, of a plunger-chamber containing an elastic fluid and oil, and a supply-conduit for the oil leading from said chamber to the bearing-surfaces to be lubricated, whereby oil is forced through said passage by the action of the piston, substantially as described.

29. The combination, with the piston and other working parts of a gas-engine, of a plunger-chamber containing an elastic fluid and oil, and a plurality of conduits for the oil leading from said chamber to the bearing-surfaces to be lubricated and back to said chamber, whereby oil is forced through said passage by the action of the piston, substantially as described.

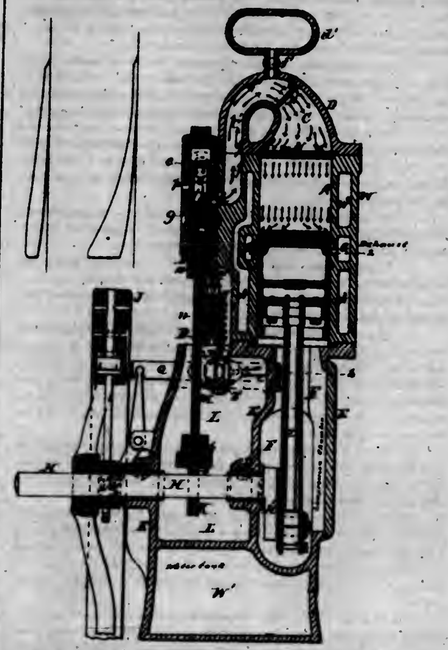
30. The combination of the power-cylinder and piston of a gas-engine with a compression-pump, a reservoir into which each charge is compressed, having free communication with said compression-pump, and a governor controlling the quantity of the charge from said compression-pump, whereby the excess of the charge contained in the reservoir expands upon the back-stroke of the piston to properly limit the supply for said reservoir for supplying the engine.

386,209. METHOD OF OPERATING GAS-ENGINES. Lewis H. Nash, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Oct. 6, 1888. Serial No. 216,693. (No model.)

Claim.—1. The method substantially herein described of operating a gas-engine, which consists in admitting a combustible mixture to a compressor, compressing it into a reservoir having free communication with the compression-chamber, admitting some of the compressed charge to the power-chamber in quantities controlled by a valve, and regulating the supply to said compression-chamber solely by means of the back expansion of the gases contained therein.

2. The method substantially herein described of operating a gas-engine, which consists in compressing a combustible mixture, exhausting the waste gases at one end of the combustion-chamber, delaying the admission of fresh gases to the cylinder until a period of time after the shock of the exhaust is over and until the intense heat of the waste gases is reduced, and admitting the fresh charge at the other end of the cylinder to drive out the remaining gases.

3. The method substantially herein described of operating a gas-engine, which consists in drawing a combustible mixture in successive charges of uniform density into a compression-chamber during the back-stroke of the piston, compressing the mixture in said chamber during the forward stroke of the piston, controlling the flow from said compression-chamber to the supply-valve by a governor, admitting the charges to the combustion-chamber during a compound movement of the plunger-valve, compressing the charge during the back-stroke of the piston, and igniting the charge during a twisting movement of the valve.



4. The method substantially herein described of operating a gas-engine, which consists in drawing into a compression-chamber successive charges of a combustible mixture by the back-stroke of the piston, compressing the charge in said chamber by the forward stroke of the piston, admitting the charge in the power-cylinder, closing communication between the combustion-chamber and the supply-chamber, closing their connecting-passages, opening between said chambers an escape-passage for the leakage, and igniting the charge upon the next forward stroke of the engine.

5. The method substantially herein described of operating a gas-engine, which consists of admitting to the compression-chamber of said engine, by means of an admission-valve controlled solely by the back expansion of gas contained in said chamber, a quantity of mixture of uniform density at each stroke of the piston equal to the quantity consumed in the engine by the preceding stroke of the piston.

6. The method substantially herein described of operating a gas-engine, which consists in compressing a combustible mixture within a compression-chamber at each stroke of the compressor, drawing from said compression-chamber a quantity of mixture at each stroke of the piston proportioned to the power developed, and regulating the supply to said chamber solely by means of the back expansion of said surplus mixture.

7. The method substantially herein described of operating a gas-engine, which consists of admitting to the compression-chamber of said engine, by means of an admission-valve controlled by the back expansion of gas contained in said chamber, a quantity of mixture of uniform density at each stroke of the piston equal to the quantity consumed in the engine by the preceding stroke of the piston.

386,210. GAS-ENGINE. Lewis H. Nash, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Dec. 30, 1886. Serial No. 223,003. (No model.)

Claim.—1. In a gas-engine, a power-chamber, A C, having ports at opposite ends of said chamber, both open at the same time, combined with a perforated plate extending entirely across said chamber proper, for the purpose of breaking up eddies in the inflowing charge and causing the charge to flow through the power-chamber in uniform volume without eddies, substantially as and for the purpose set forth.

2. The combination, in a gas-engine, of a piston and a power-cylinder having ports adapted to be uncovered by the piston on its forward stroke, with a charge-supplying passage and combustion-chamber having a curved-horn shape provided with a perforated partition placed across the junction of said passage, with the cylinder and one or more similar partitions placed across the supply-passage between the said junction-partition and the charge-supplying port, substantially as described, for the purpose specified.

3. In a gas-engine, a power-chamber, A C, having ports at opposite ends of said chamber, both open at the same time, combined with a perforated plate extending entirely across said chamber, the perforations in said plate flaring in the direction of the inflow of the charge, for the purpose of breaking up eddies in the inflowing charge and causing the charge to flow through the power-chamber in uniform volume without eddies, substantially as and for the purpose set forth.

4. In a gas-engine, a compression-reservoir, a power-chamber, A C, having ports at its opposite ends, both open at the same time, a duct provided with a positively-moving valve for controlling the communication between said compression-reservoir and power-chamber, combined with a perforated plate extending entirely across said power-chamber, for the purpose of breaking up eddies in the inflowing charge

and causing the charge to flow through the power-chamber without eddies, substantially as described.

5. The combination, with the piston and power-cylinder of a gas-engine, of one or more perforated plates placed in the charge-supplying passage of the combustion-chamber, and a reservoir, *d'*, having valved communication with said combustion-chamber, operating substantially as described.

6. The combination, in a gas-engine, of the power-cylinder, a piston operating as a charge-supplying compression-pump on its forward stroke, a reservoir for the combustible mixture, and a valve controlling the admission of the charge to the combustion-chamber, with a reservoir communicating with the combustion-chamber through a valve-controlled passage for relieving the pressure in said chamber in starting the engine, substantially as described, for the purpose specified.

7. The combination, in a gas-engine, of the piston and a power-cylinder having exhaust-ports adapted to be uncovered by the piston on its extreme forward stroke, with a crank-shaft and piston-connections, a cam secured to said shaft, a valve and valve-rod connection operated in one direction by said cam, and a spring holding the valve-connection against said cam, substantially as described.

8. The combination, with the piston and its crank-shaft connections of a gas-engine, of the cam K, the roller *i*, the rocker-arm 6, the valve-rod M, the spring 11, and a reciprocating plunger-valve for admitting the charge and igniting the same, substantially as described.

9. The combination, in a gas-engine, of the power-cylinder and the piston, with a reciprocating plunger-valve for admitting and igniting the charge, having the ports *d*, *g*, *h*, *r*, and *e*, with a valve-case having corresponding co-operating ports, substantially as described, for the purpose specified.

10. In a gas-engine, an ignition-chamber having a tangential supply, combined with an ignition-passage and an independent escape-passage, substantially as and for the purpose set forth.

11. In a gas-engine, a power-chamber, A C, combined with a plurality of perforated partitions arranged across said chamber at intervals to divide the same into a series of separate chambers, substantially as and for the purpose set forth.

12. The combination, with a valve and a valve-case, both having ports for supplying the charge and for igniting the same, and an external lighter-jet, with a supply-passage and combustion-chamber having a curved-horn shape, of one or more perforated partition-plates placed therein, a piston, and a power-cylinder having ports adapted to be uncovered by the piston on its forward stroke, substantially as and for the purpose described.

13. The combination, with a gas-engine having a fixed lighter-jet, of a lighter-jet chamber of circular form, having a tangential gas-supply port, a central end lighter-port, and a central end back port to discharge the waste gases from said chamber.

14. The combination, with a gas-engine having a permanent lighter-jet, of a slide-valve having a circular lighter-chamber, having a gas-supply port entering said chamber tangentially, a central end ignition-port of less area than the said chamber, and a back end discharge-port of less area than the said ignition-port, for the purpose stated.

15. In a gas-engine, the combination of an ignition-chamber, a device for causing a jet of combustible gas to whirl about within said chamber, a lighter-port, and a back passage opened before the ignition-passage to discharge the waste gases from such chamber, substantially as described.

16. In a gas-engine, the combination of an ignition-chamber, a device for causing a jet of combustible gas to whirl about within said chamber, a lighter-port, and a back passage to discharge the waste gases from said chamber, substantially as described.

17. In a gas-engine, a lighting device, an ignition-chamber, and a device for causing a jet of combustible gas to whirl about within said chamber, combined with a passage communicating with said lighter and an escape-passage, substantially as described.

18. In a gas-engine, a lighter device, an ignition-passage, and a device for causing a jet of combustible gas to pass through said passage with a spiral or whirling current, producing therein a reverse central current, along which the flame is transmitted, combined with an escape-port, substantially as set forth.

386,211. GAS-ENGINE. LEWIS H. HAHL, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Nov. 5, 1888. Renewed Oct. 5, 1888. Again renewed June 21, 1887. Serial No. 242,615. (No model.)

Claim.—1. The power-cylinder having the inlet and exhaust ports arranged to be operated by the piston, in combination with a combustion-chamber divided into separate passages and having a curved interior end wall, whereby the charge is directed into the chamber toward its curved wall and returned by the action of the latter, substantially as described.

2. The combination, in a gas-engine, of a power-cylinder having inlet and exhaust ports, and a piston adapted to uncover the said cylinder-ports at the end of its power stroke, with means, substantially such as described, whereby the waste gases are expelled by the incoming charge.

3. The combination, with the power-cylinder having its inlet and discharge ports formed in the walls thereof, of a piston adapted to operate said ports, having a face projection for dividing the combustion-chamber, substantially as described, for the purpose specified.

4. The combination, with the power-cylinder having its inlet and discharge ports formed in the walls thereof, of a piston adapted to operate said ports, having a face projection for dividing the combustion-chamber, and a perforated plate arranged to form an interior extension of the inlet-port, substantially as described, for the purpose specified.

5. The combination of the power-cylinder and a cap thereof forming the combustion-chamber, having its inner wall curved, with a piston having a central face projection co-operating with said curved wall to divide the combustion-chamber, substantially as described, for the purpose specified.

6. In combination, in a gas-engine, the power-cylinder having wall inlet and exhaust ports and a curved cap, the piston having a central face projection, the supply-passage *h*, a governor controlling the latter, the reservoir B, and the valves *i j*, constructed for operation substantially as described.

386,212. IGNITOR FOR GAS-ENGINES. LEWIS H. HAHL, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Jan. 20, 1888. Renewed June 21, 1887. Serial No. 242,604. (No model.)

Claim.—1. An igniter for gas-engines having an ignition-chamber provided with a jet-supply passage conveying the gases in a tangential whirl within said chamber, and having an ignition-port formed at one side of the ignition-chamber to direct the inflowing gases in a whirling movement within said chamber, substantially as described, for the purpose specified.

2. An igniter for gas-engines having an ignition-chamber, *c*, provided with a tangential supply-passage, *h*, an exterior ignition-port, *d*, and a tangential port, *g*, having the relation and operating substantially as described, for the purpose specified.

3. The combination, in an igniter for gas-engines, of the ignition-chamber *c*, having a tangential jet-passage, *h*, and an exterior ignition-port, *d*, with an annular passage, *e*, controlling said ignition-chamber, and a tangential port entering said annular passage in communication with the combustion-chamber of the engine.

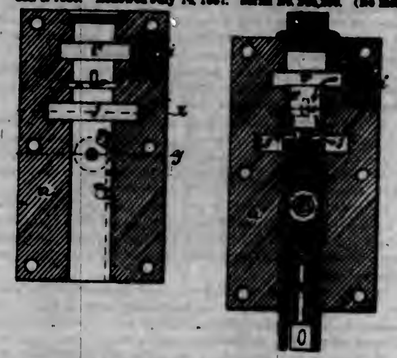
4. An igniter device for gas-engines, consisting of a case having a port, *h*, communicating with the cylinder, a permanent external lighter, *i*, and a slide having an ignition-chamber, *c*, the tangential jet-passage *h*, and the tangential charge-ignition passage *g*, substantially as described.

5. The combination, in an igniter for gas-engines, of a case having the port *h* and the external lighter, *i*, with the slide *A*, having an interior chamber forming ring-bushing *c*, having the port *f*, and forming a cover for an annular passage surrounding said bushing, a tangential jet-passage, *h*, and a tangential supply-port, *g*, substantially as described, for the purpose specified.

6. An ignition-chamber for a gas-engine igniting device, having a tangential supply-port, *g*, and an ignition-chamber arranged with its axis parallel to the face containing the seating ports, substantially as described, for the purpose specified.

7. In an igniter for gas-engines, an igniter-slide, and an inclosing-case therefor constructed of metals having different rates of expansion, substantially as described, for the purpose specified.

8. The combination, in an igniter device for gas-engines, of an igniter slide or valve, with an inclosing-case therefor, having a greater rate of expansion than the slide or valve, for the purpose specified.



9. The combination, in an igniter device for gas-engines, of an igniter slide or valve and a bearing-piece for the latter, with an inclosing-case formed of metal having a greater rate of expansion than said slide or valve, and an adjustable connection between said bearing-piece and case, substantially as described, for the purpose specified.

10. In a gas-engine, the combination of an igniter-chamber, a power-chamber in valved communication therewith, and a device for causing a whirling jet of combustible mixture within said chamber supplied from said power-chamber, substantially as described.

11. In a gas-engine, the combination of a power-cylinder in valved communication with a lighter device, an igniter-chamber provided with a tangential passage through which communication for the passage of the flame is established with said power-cylinder, and means, substantially as described, for igniting the charge contained in said igniter-chamber.

12. In a gas-engine, the combination of an ignition-chamber, a device for causing a whirling jet of combustible mixture within said chamber, an igniter, a combustion-cylinder in valved communication with said chamber, said whirling jet of combustible mixture being augmented by the charge entering said chamber from the combustion-cylinder, substantially as described.

386,213. IGNITOR FOR GAS-ENGINES. LEWIS H. HAHL, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Oct. 6, 1888. Renewed July 14, 1887. Serial No. 244,302. (No model.)

Claim.—1. An igniting device for gas-engines, provided with an external lighter and a plunger-valve having a circular ignition-chamber, a tangential supply-port, *e*, a tangential ignition-port, *d*, a central ignition-port, *f*, and a lateral port, *g*, in combination with an inclosing-case having the ports *j*, *k*, and *m*, substantially as herein set forth.

2. An igniting device for gas-engines, consisting of an inclosing-case having the ports *j*, *k*, and *m*, a cylindrical plunger-valve having the ports *d*, *e*, *f*, and *g*, a circular ignition-chamber, *c*, means, substantially such as described, whereby said valve is caused to have a compound movement, and an external lighter.

3. An igniting device for gas-engines, consisting of a plunger-valve having a circular ignition-chamber provided with a central ignition-port, *f*, and one or more tangential ports for supplying the said chamber, and a case having a port leading to an external lighter and a port leading to the combustion-chamber, substantially as herein set forth.

4. The combination, with an igniting device for gas-engines, of a valve having a compound reciprocating and rotatory movement, and provided with alinable ports and with an ignition-chamber, substantially as described.

5. The valve-case having the annular supply-port *i* i^2 and the annular supply-port *j*, the ignition-port *k*, and an escape-port, 15, arranged between the said supply-ports, in combination with a plunger-valve of two parts, *b* b^2, having the circular ignition-chamber *c*, its tangential ports *d* and *e*, and a central port, *f*, and means for imparting to said valve a compound reciprocating and turning or twisting movement.

6. The combination, with a plunger-valve having two separate joint-forming faces, of a valve-case having a port, i^2, opening into the fuel-supply passage, a port, *j*, communicating with the combustion-chamber, and an escape-port, 15, opening to the air between the said ports i^2 and *j*, whereby when the latter are closed the division-space of the valve is open to the escape-port, for the purpose described.

7. The combination, with a gas-engine, of a plunger-valve and an inclosing-case therefor, having provision for supplying the charge, for igniting the same, and for preventing the back passage of the flame to the supply-port, substantially as described.

8. The plunger-valve having two joint-forming faces and an intermediate space, 16, the part b^2 of said valve having a central passage opening into the division-space, and the part *b* having a circular ignition-chamber, its tangential ports *d* and *e*, its central port, *f*, and a lateral port, *g*, and a central passage open to the air, in combination with a valve-case having the supply-ports *i*, i^2, and *j*, the ignition-port *k*, and the escape-port 15, and means, substantially such as described, for operating said valve with a compound reciprocating and turning movement, for the purpose stated.

9. The combination, with the power-cylinder of a gas-engine, of a cylindrical plunger-valve having a circular ignition-chamber having tangential ports, and a case having supply and ignition ports, and an external lighter, with mechanism for imparting a combined reciprocating and turning or twisting movement to said valve, substantially as herein described.

10. The combination, with a power-cylinder of a gas-engine, of a cylindrical plunger-valve provided with an ignition-chamber and a suitable device for causing a whirling jet of combustible mixture within said chamber, substantially as described.

386,214. METHOD OF IGNITING THE CHARGES IN GAS-ENGINES. LEWIS H. HAHL, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Oct. 5, 1888. Renewed July 14, 1887. Serial No. 244,303. (No model.)

Claim.—1. The method substantially herein described of igniting a charge of combustible gases, which consists in supplying a jet of gas to an ignition-chamber having a valved communication with an external lighter through a supply-passage, closing communication with said external lighter and effecting the ignition of the charge in the engine from the ignition-chamber through the said supply-passage.

2. The method substantially herein described of effecting the ignition of the charge in a gas-engine, which consists in supplying the ignition-chamber through a passage open to an external lighter to effect the ignition in said chamber, closing such igniting communication, and causing the flame to pass back and ignite the charge in the engine through the same supply-passage, as described.

3. In an igniting device for gas-engines, the method substantially herein described of effecting the ignition of the charge along a connecting-passage, which consists in causing the gases to flow through said passage in an unbroken spiral or whirling current to the igniter, thereby creating a reverse central current in said passage along which the flame is transmitted, for the purpose specified.

4. The method substantially herein described of igniting a combustible charge for a gas-engine, which consists in causing some of the gas to flow into a circular ignition-chamber with a tangential motion, igniting the gases through a valve-port by an external burner, closing said port, and igniting the charge in the engine from said ignition-chamber through a tangential supply-passage, for the purpose specified.

5. The method hereinbefore described of effecting the ignition of a combustible charge of gas in the engine, which consists in effecting the combustion of a portion thereof in an intermediate ignition-chamber having valved communication with an external lighter, effecting

the ignition of the charge through a passage entering said ignition-chamber tangentially and connecting it with the combustion-chamber of the power-cylinder.

6. The method of igniting the charge in a gas-engine, which consists in causing a portion of the charge to flow into an ignition-chamber with a spiral whirling jet to an external burner to effect the ignition in said chamber, closing communication with said chamber, closing communication with said external burner, and opening communication with the power-cylinder to effect the ignition of the charge.

7. The method herein described of igniting the charge in the combustion-chamber of a gas-engine from an intermediate ignition-chamber, which consists in causing a portion of the charge from the former to float into the latter with a whirling motion, igniting the gases therein by an external burner and effecting the transmission of the flame in a direction opposite to that of the flowing current by stopping the flow of the latter.

8. The method substantially herein described of effecting the ignition of the charge in the combustion-chamber of a gas-engine from an ignition-chamber, which consists in opening communication between them through a passage having a tangential relation to the ignition-chamber, whereby the entering gases are caused to circulate around said chamber in whirling currents, substantially as and for the purpose specified.

9. The method substantially herein described of igniting the charges in a gas-engine, which consists in causing gas to flow through an ignition-chamber with an unbroken spiral whirling jet to an igniter to effect the ignition in said chamber, closing communication with said igniter, and opening communication with the power-cylinder to effect the ignition of the charge.

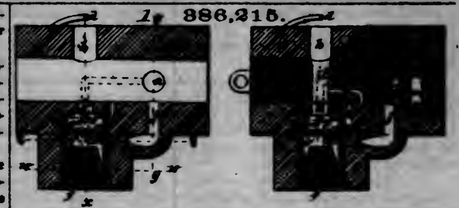
10. The method substantially herein described of igniting the charge in the power-cylinder of a gas-engine, which consists of igniting a charge of combustible gases through a passage having an unbroken spiral or whirling current flowing toward a lighter, and a centrally-returning current leading to an igniter-chamber and igniting the charge in said power-cylinder from the flame in said ignition-chamber.

11. The method substantially herein described of igniting the charges of a gas-engine, which consists in causing gas to flow into an ignition-chamber with an unbroken spiral or whirling motion, igniting said whirling gas by applying a lighting device to the center of the whirling gas within said chamber and igniting the charge of the engine from said ignited gas.

12. The method substantially herein described of igniting the charges in the power-cylinder of a gas-engine, which consists in supplying the ignition-chamber with gas caused to impinge with a rotary flow upon its walls, and igniting such rotating body by a flame transmitted from an external light to the center of such whirling body.

13. The method herein substantially described of igniting the charge of a gas-engine, consisting of causing gas to enter and whirl about an igniter-chamber, igniting said whirling gases and opening communication between said chamber and the power-cylinder, and causing the back-pressure of the gases contained in said power-cylinder to enter and whirl about said igniter-chamber.

14. The method substantially herein described of igniting the charge of a gas-engine, consisting of supplying an igniter with a charge of gas, igniting said gas and opening communication between said chamber and the power-cylinder and causing the back-pressure of the gases contained therein to enter and whirl about said igniter-chamber.



15. The method substantially herein described of igniting a charge of combustible gases, which consists in supplying a jet of gas to an ignition-chamber having a valved communication with a lighter through a supply-passage, so as to cause said gas to whirl about said chamber, closing communication with said lighter and effecting the ignition of the charge in the engine from the ignition-chamber through said supply-passage.

16. The method substantially herein described of igniting the charge of a gas-engine, consisting of supplying an igniter with a charge of gas, igniting said gas, opening communication between said chamber and the power-cylinder, and also between said chamber and an escape-passage, and causing the back-pressure of the gases contained in said cylinder to enter and whirl about said igniter-chamber.

386,215. IGNITOR FOR GAS-ENGINES. Lewis H. Nash, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Oct. 3, 1888. Renewed July 14, 1887. Serial No. 244,261. (No model.)

Claim.—1. The igniting-chamber arranged to receive its supply and ignite the charge through one and the same port, *i*, in combination with the valve B, the external lighter, *d*, and the combustion-chamber, substantially as described.

2. The combination, in an igniting device for a gas-engine, of a circular ignition-chamber, a supply-passage having valved connection with the combustion-chamber of the power-cylinder, entering said ignition-chamber tangentially, and a passage having valved communication with the external lighter, operating substantially as described, for the purpose specified.

3. The combination, in a gas-engine igniting device, of a circular ignition-chamber, one or more tangential supply-passages therefor having valved communication with the combustion-chamber of the power-cylinder, and an ignition-passage opening centrally into said ignition-chamber, having valved communication with an external ignition-burner, operating substantially as described, for the purpose specified.

4. The combination, in an igniting device for gas-engines, of a circular ignition-chamber having one or more tangential supply-passages communicating with the combustion-chamber of the power-cylinder, an ignition-passage having valved communication with an external lighter, and an escape-passage for the products of combustion from the ignition-chamber, controlled substantially as described.

5. In an igniting device, the combination of an ignition-chamber formed of joining communicating spaces c' c^2, escape-ports *g*, and ignition-ports having valved communication with an external lighter-jet and with the combustion-chamber of the power-cylinder, operating substantially as described.

6. In an igniting device for gas-engines, the combination, with an ignition-chamber, of a port having valved communication with an external lighter, a tangential supply-passage arranged to supply said chamber when the external lighter-port is open, and a tangential ignition-passage having valved communication with the combustion-chamber of the power-cylinder, operating substantially as described for the purpose specified.

7. In an igniter device for gas-engines, the combination, with the valve B, having the ports i^2 and *m*, with a valve-case having the ports *a b* and *j k*, and an ignition-chamber communicating with said case and valve ports, having a conical projection whereby to form an enlarging passage therein, substantially as described, for the purpose stated.

8. The combination, in an igniter device for gas-engines, of an external lighter-jet and a valve controlling its communication with the combustion-chamber of the power-cylinder, with an ignition-chamber of two spaces c' and c^2, having central communication with each other, a tangential communication with said combustion-chamber, and a central communication with said external lighter.

9. In an igniter device for gas-engines, a circular ignition-chamber divided into two communicating spaces, each having passages communicating with valve-ports, substantially as described.

10. The combination, in an igniting device, of an ignition-chamber formed with a bushing, *e*, having one or more tangential supply-passages, *i* and *k*, a central ignition-port having valved communication with an external lighter, and passage *j*, having valved communication with the combustion-chamber, for the purpose specified.

11. In an igniter device for gas-engines, the combination, with the valve B, having the ports i^2, *m*, *n*, and *p*, of a valve-case having the ports *a*, *b*, *b'*, *j*, and *k*, and a circular ignition-chamber communicating with said case and valve ports, substantially as described, and for the purpose stated.

12. In an igniter device for gas-engines, the combination, with a valve, B, having ports i^2 and *m*, of a case having ports *a j* and *b b'* and a passage, *k*, and a circular ignition-chamber communicating with said case-ports, substantially as described, and for the purpose specified.

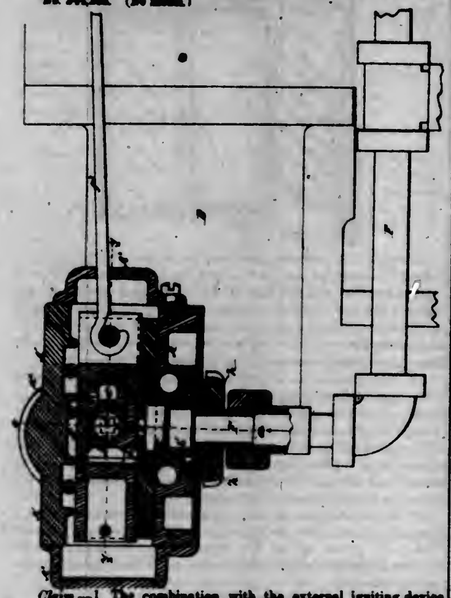
13. In an igniter device for a gas-engine, the combination of a valve, B, having ports i^2, *m*, and *p*, with a case having ports *a*, *b*, *b'*, and *j*, and an ignition-chamber communicating with said case-ports and operating substantially as described.

14. In an igniter device for a gas-engine, the combination, with an ignition-chamber having valved communication with an external lighter and with the combustion-chamber, of relief-ports *g*, *k*, and *n*, for continuing the flow of the gas while the valve is closing communication with the external lighter and opening communication with the combustion-chamber, for the purpose specified.

15. In a gas-engine, the combination of an ignition-chamber, a lighting device, a suitable device for causing a current of combustible mixture to flow from the ignition-chamber toward said lighting device, and a suitable device for causing a current to flow simultaneously toward said igniting-chamber, along which the igniting-flame is transmitted, substantially as described.

16. An igniter device for gas-engines, consisting of an ignition-chamber provided with a passage leading to a lighting device and a passage leading to the power-chamber, combined with a suitable device for causing a current to flow toward said chamber along which the lighting-flame is transmitted, substantially as described.

17. The combination, in a gas-engine, of a power-cylinder, a lighter, an igniter-chamber, an intermediate chamber and communicating passage, with a suitable device for causing a current of gas to flow through said passage in one direction and suitable device for causing a central current to flow therethrough in opposite direction, substantially as described.



18. In an igniter device for a gas-engine, the combination of a retarding-passage and a device for causing a whirling jet of combustible mixture within said passage, substantially as described.

19. In combination with a power-cylinder of a gas-engine, an ignition-chamber, a lighting device, a communicating passage between said chamber and lighting device, and a device for causing a current of gas to flow through said passage in one direction and a device for causing a reverse current therein, along which the flame from the lighting device is transmitted, substantially as described.

20. The combination of an igniter-chamber in valved communication with a power-cylinder of a gas-engine, a charge-supply valve, an igniter, and an escape-passage in communication with said igniter-chamber, said power-cylinder and said igniter-chamber being intermittently in communication, and a device for causing a whirling jet of combustible mixture within said chamber, substantially as described.

21. In a gas-engine, the combination of an ignition-chamber, an external lighter, and a device for causing a current intermittently to flow from said lighter toward said chamber, along which the lighting-flame is transmitted, substantially as described.

386,216. IGNITOR AND SUPPLY-VALVE FOR GAS-ENGINES. Lewis H. Nash, Brooklyn, assignor to the National Motor Company, New York, N. Y. Filed Aug. 4, 1886. Renewed July 14, 1887. Serial No. 244,262. (No model.)

Claim.—1. The combination, with the external igniting device of a gas engine, of a valve having a circular lighter-jet chamber having a gas-supply port entering into said chamber tangentially, for the purpose of giving a whirling motion in a circular path to the lighting-jet within the lighter-chamber.

2. The combination, with a gas-engine having a permanent lighter device, of a lighter-jet chamber of circular form having a tangential gas-supply port and a central end lighter-port, for the purpose stated.

3. The combination, with a gas-engine having a permanent lighter-jet, of a slide-valve having a circular lighter-chamber having a gas-supply port entering said chamber tangentially, and a central end lighter-port of less area than the said chamber, for the purpose stated.

4. The combination, with a gas-engine having a fixed lighter-jet, of a slide-valve having three port-faces, a circular lighter-jet chamber, d', having a tangential gas-supply port, d^6 a central end lighter-port, d^5, a central back end port, d^3, discharge-ports d^4 d^3, operating in connection with said chamber, and a supply-port, a^2, operating in connection with the tangential supply-port.

5. The combination, with a gas-engine having a permanent igniting device, of a slide-valve having three port-operating faces, and a circular lighter-jet chamber having a tangential gas-supply port.

6. The combination, with a gas-engine having a permanent external igniting device, of a slide-valve having a lighter-chamber of circular form supplied by a tangential port placed between the supply and the discharge ports d^4 d^3, substantially as described.

7. The combination, with a gas-engine, of a slide-valve having three port-operating faces, and an igniting-chamber of circular form having a tangential supply-port, substantially as described.

8. The combination, with a slide-valve, of a seat therefor having grooves in its bearing-faces surrounding its case-ports, and the exhaust port or passage communicating therewith, whereby the leakage from said case-port is carried to the exhaust and the pressure between the bearing-faces of said seat and valve confined to a limited area of the valve-surface, and thereby reduce the force tending to separate their surfaces.

9. The combination, with the slide-valve B, of a movable seat-plate therefor having a port-forming-plunger projection, b^2, the flexible joint-closing diaphragm *h*, its binding-nut *h'*, and the passage-forming piece b^3, whereby said diaphragm is secured to the movable valve-seat plunger and to the fixed valve-case to seal the joining of these parts, substantially as described, for the purpose specified.

10. The combination, with a slide-valve having three port-operating faces, of movable seat-plates for two of said port-faces, each having a port-forming-plunger projection, joint-closing diaphragms for said plunger projections, and bearing-rolls for the two other faces of said valve, substantially as described, for the purpose specified.

11. The combination, with a slide-valve maintained upon its port bearing-seats by a counter-pressure, of one or more surface grooves or channels surrounding the ports in the bearing-surfaces, whereby to limit the extent of the valve bearing-surface upon which pressure can act to separate the bearing-surfaces, substantially as described, for the purpose specified.

12. The slide-valve herein described, having the ports and passages d^7 d^6 d^5 d^3 d^4, and the circular lighter-jet chamber d', having the central back port, d^5, in combination with the supply-cylinder and exhaust ports, and an external permanent lighter-jet, *z*, substantially as herein set forth.

13. The combination, with a gas-engine, of a slide-valve having ports in three faces, the ports in one face operating the cylinder-supply port, the ports in the other face operating the supply-port for the combustible mixture, and the third face having the discharge-port, substantially as described.

14. The combination, with a gas-engine having a permanent external burner, of a slide-valve having an internal jet-chamber placed between the exhaust-port and the supply-port in said valve, substantially as described.

15. The combination, with a slide-valve, of a movable seat-plate therefor having a port surrounded by an extended passage leading to said port and forming a joint-forming seal between the valve-case and the extension with which the said passage is formed, substantially as described.

16. An igniter device for gas-engines, consisting of a chamber having a central port leading to the external air, through which the gas is ignited, and a tangential supply-passage for the introduction of gases, substantially as described.

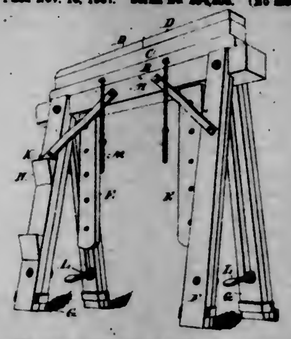
17. An igniting device consisting of an ignition-chamber having an orifice entering said chamber on one side for the introduction of gases, so as to produce a whirling flame in said chamber, substantially as described.

18. An igniter device consisting of a chamber having a central port communicating with a lighting device, combined with a device for causing a whirling jet of gases within said chamber, substantially as described.

19. In a gas-engine, a valve containing an igniting-chamber, and a device for causing a whirling jet of gases within said chamber, substantially as described.

20. In a gas-engine, the combination of a power-chamber in valved communication with a lighter device, an ignition-chamber provided with a tangential supply-passage establishing communication with said power-chamber, and a device for causing a whirling jet of gases within said chamber, substantially as described.

386,217. CUSPIDOR. James L. O'Connor, New York, N. Y., assignor to the New York In-Floor-Cuspidor Company, same place. Filed July 19, 1887. Serial No. 244,774. (No model.) Patented in England Oct. 18, 1887, No. 13,923.



Claim.—1. The combination, with the fire-proof pan A, projecting below the floor and provided with an integral supporting-ring flush

with the floor, of the removable cuspidor-pan B, funnel G, and grating J, substantially as described.

2. The combination, with the fire-proof pan A, protruding below the floor and provided with an integral supporting-ring flush with the floor, of the removable cuspidor-pan B, substantially as described.

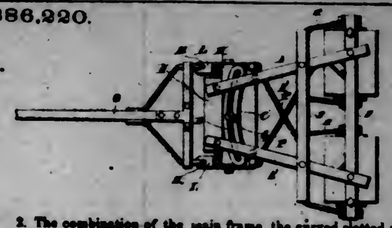
386,218. REVERSIBLE TRESTLE. WILLIAM H. PHILLIPS, Lincoln, Nebr. Filed Nov. 10, 1887. Serial No. 254,892. (No model.)

Claim.—The extension frame or trestle consisting of a cross-bar, two rectangular and perforated arms extending therefrom, and two pivoted arms adapted to fold upon the said cross-bar, in combination with a trestle having its cross-bar perforated, substantially as specified.

386,219. MOLD FOR CASTING METALLIC FORMS. JOHN R. PRICE, Wellesley Heights, Mass., assignor to The Electrical Accumulator Company, of New York. Filed May 2, 1888. Serial No. 272,847. (No model.)

Claim.—1. The combination, in a mold for casting perforated metallic plates or forms, of a series of cores, each in two divisions, located, respectively, upon two divisions of the mold, forming complementary parts of each other, and guide or contact surfaces upon the meeting sides of said divisions of the mold, arranged at an acute angle with the plane of the mold, whereby the two divisions when moved in contact with each other separate in a line forming an acute angle with the plane of the finished product.

2. The combination, in a mold for the described purpose, of a series of square cores separated by channels of uniform dimensions, each core composed of two divisions in the form of equal and similar right-angled triangular divisions having a side adjacent to the right angle of convex outline, said divisions being located, respectively, upon two divisions of the mold, forming complementary parts of each other, and means for moving said triangles with respect to each other in a line parallel to the hypotenuses of the said triangles.



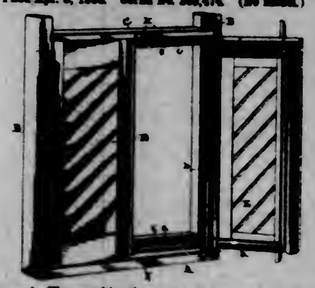
3. The combination, in apparatus for the described purpose, of a series of cores separated by channels of uniform dimensions, said cores being in two divisions, located, respectively, upon two divisions of the mold, forming complementary parts of each other, complementary guide or contact surfaces, located, respectively, upon opposite divisions, and a cam-wheel pivoted to one division and making contact with the other, whereby the series of cores are caused to divide and separate in a direction parallel with a line joining diagonally-opposite edges of the perforation.

4. The combination, in an apparatus for the described purpose, of a series of cores separated by channels or passages, said cores being in two divisions fixed at their bases to two divisions of the mold, respectively, forming complementary parts of each other, a cam-wheel pivoted to one division of the mold and making contact with the other, and registering guide or contact surfaces upon opposite divisions of the mold, whereby a sliding contact of the divisions of the mold is effected and one series of core-divisions is at once raised and moved, substantially as described.

386,220. LAND-ROLLER. JOHN RUSSELL, Troy, Ill. Filed Apr. 6, 1888. Serial No. 269,969. (No model.)

Claim.—1. The combination of the main frame, the curved slotted plate secured thereto, the roller arranged under the main frame, the frame surrounding the said roller, and the headed stud or pin on said frame engaging the slotted plate, as set forth.

386,220.



2. The combination of the main frame, the curved slotted plate secured thereto, the roller, the frame inclosing the said roller, the headed stud or pin thereon engaging the slotted plate, the tongue pivoted to said frame, and the draft-bars having their front ends pivoted to the said frame and their rear ends pivoted to the main frame, as set forth.

3. The combination of the main frame, the curved slotted plate secured thereto, the cross-bar having a stud engaging said plate, the hangers depending from said cross-bar and having journal-boxes at their lower ends, the roller having its axle journaled in said boxes, and the crossed draft-bars connected to the boxes and the main frame as set forth.

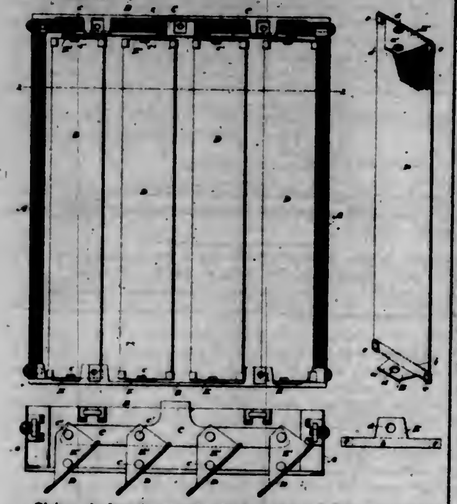
4. The combination of the main frame, one front roller carried thereby and adapted to be moved transversely of the same, and the crossed draft-bars between said roller and the frame, as set forth.

386,221. AIR-TIGHT DOOR. DAVID O. SUTTLEMIRE, Litchfield, Ill. Filed Apr. 3, 1888. Serial No. 269,674. (No model.)

Claim.—1. The combination, with the door-frame having upper and lower cross-strips, and having grooves or channels in the said strips and in the jambs, of the door having its upper and lower ends rabbeted and provided with grooves coinciding with the grooves in the cross-pieces, and having its free and its hinged edge grooved and the packing fitted in the said grooves and adapted to be compressed therein, substantially as and for the purpose described.

2. The combination, with the door-frame having upper and lower cross-strips and having grooves in the cross-strips and in the jambs, of the two doors having their meeting edges rabbeted and provided with corresponding grooves, and having their upper and lower ends rabbeted and provided with grooves coinciding with the grooves in the cross-strips, and having their rear or hinged edges grooved and the packing seated in the said grooves and adapted to be compressed therein between the opposing parts, substantially as described.

3. The combination, with the door-frame and the door having a groove formed between the opposing parts, of the tubular packing fitted in the groove and the strip located within the packing and secured to the bottom of the said groove, substantially as and for the purpose described.



386,222. THILL-COUPLING. DAVID W. SMITH, Wabash, Ind. Filed Nov. 11, 1887. Serial No. 254,937. (No model.)

Claim.—1. The combination, with a clip and thill-iron having lugs, as described, of the shank in composed of the two parallel branches having their inner walls vertically grooved and the apertures at the base thereof for the reception of the thill-iron lugs, the said branches having the connection *f*, which serves the additional function of a stop for the anti-rattler, and also having a rear vertical aperture for the loop of the said anti-rattler, substantially as specified.

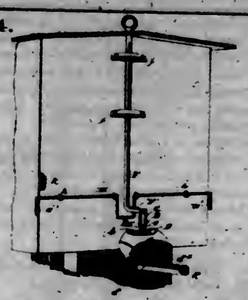
2. The combination of a shank in, substantially as described, having the connection *f* for the two parallel branches, and the vertical slot in rear thereof, and the anti-rattler, of the form shown, its lower end secured to the shank-clip and passing in loop form up through the said vertical slot, and having a forward bearing against the said connection, substantially as specified.

386,223. HOT-AIR AND VENTILATING REGISTER. FREDERICK H. STEVENS, Brooklyn, N. Y. Filed July 25, 1887. Serial No. 245,330. (No model.)

Claim.—1. In a fan or valve for hot-air or ventilating registers, the combination, with a sheet-metal blank, D, of proper dimensions for a fan, of the sheet-metal blanks E E', rigidly attached to the blank D at the ends thereof, said blanks E E' having the lips *a a'* turned up against the end edges of D, and having the holes *d d'* punched in the lips, all substantially as and for the purposes set forth.

2. In a fan for hot-air or ventilating registers, the combination, with a rectangular sheet-metal blank, D, of proper length and breadth for a fan, and thick, so as to be stiff without fluting or other alteration of form, of thin sheet-metal blanks E E', having the tips *e e*, bent over the side edges of the blank D, and having the lips *a a'*, said lips being punched with holes *d d'*, and being turned up against the end edges of blank D at or nearly at an angle of ninety degrees, all substantially as and for the purposes set forth.

3. In hot-air or ventilating registers, the combination, with a register-frame, suitable means for moving the fans, and pivots *e e'*, cast on the frame and connection, of the sheet-metal blank D, and rigidly attached to blank D, at the ends thereof, the sheet-metal blanks E E', having lips *a a'*, said lips being punched with holes *d d'*, and being turned up against the end edges of blank D at an obtuse angle to D, whereby when the fan is in position the lips *a a'* will spring outward, and pressing against the connection and the frame will move with frictional contact thereon, all substantially as and for the purposes set forth.

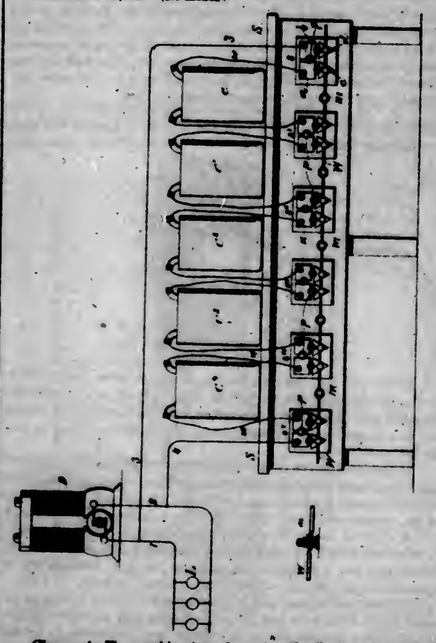


4. In hot-air or ventilating registers, the combination, with a register-frame, suitable means for moving the fans, and pivots *e e'*, of the rectangular sheet-metal blank D, of proper length and breadth for a fan, and thick, so as to be stiff without alteration of form, and the thin sheet-metal blanks E E', having tips *e e*, bent over the side edges of blank D, and having lips *a a'*, punched with holes *d d'*, said lips *a a'* being turned up against the end edges of blank D at an obtuse angle to D, whereby when the fan is in position the lips *a a'* will spring outward, and pressing against the connection and the frame will move with frictional contact thereon, all substantially as and for the purpose set forth.

386,224. CAR-COUPLING. MARCUS F. THE STOE, Paterson, N. J. Filed Nov. 14, 1887. Serial No. 255,117. (No model.)

Claim.—1. In a car-coupling, the combination of the draw-head, the vertically-movable pin engaging in openings therein, the uncoupling-rod F, mounted on the end of the car and connected to the pin, and the rockable bar H, mounted transversely on the end of the car and connected to the uncoupling-rod, substantially as and for the purpose hereinbefore specified.

2. In a car-coupling, the combination, with the draw-head A and



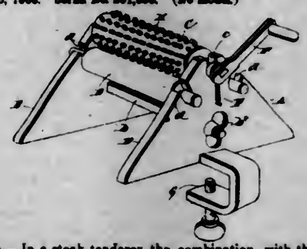
386,224.

the pin D, engaging in vertically-aligned openings therein, of uncoupling-rod F, having the horizontal arm F' connected at the extremity to the upper end of the coupling-pin, and the bar H, mounted in bearings on the end of the car and having the operating-arms H' H' on the ends, and the arm or loop I at the center to engage the arm F' and raise the same when the bar H is turned, substantially as specified.

3. In a car-coupling, the combination, with the draw-head A and the coupling-pin D, engaging in openings therein, of the uncoupling-rod F, connected to the said pin, the transverse bar H, having the arms or handles H' H' on its ends, and the arm or loop I at the center, adapted to engage the uncoupling-rod when the bar is turned, and the loop K, adapted to engage one of the arms or handles H' when the uncoupling-rod is in the raised position, substantially as and for the purpose specified.

386,225. ELECTRICAL DISTRIBUTION BY STORAGE-BATTERIES. GEORGE W. WALKER, Bethlehem, Pa. Filed Mar. 19, 1888. Serial No. 267,782. (No model.)

Claim.—1. The combination of a series of cells of secondary battery, a series of switches consisting of three or more contacts and means for uniting any two contacts, one switch between each pair of cells, electrical connections between two contacts of each switch and the adjacent terminals of its pair of cells, respectively, and electrical connections between the third contact of each switch and an electrical conductor.



2. The combination of a series of cells of secondary battery, a series of switches consisting of three or more contacts and means for uniting any two contacts, one switch between each pair of cells, electrical connections between two contacts of each switch and the adjacent terminals of its pair of cells, respectively, electrical connections

between the third contact of each switch and an electrical conductor, and means for dividing said conductor between any pair of switches.

3. The combination of a series of battery-cells, an electric circuit containing translating devices to be fed by said cells, a series of switches or cut-outs for connecting or disconnecting individual cells with respect to said circuit, and a conductor uniting one contact on each of said series of switches, substantially as described.

4. The combination of a main circuit, a series of cells of secondary battery, and a series of switches or cut-outs, one cut-out being assigned to a pair of cells and consisting of three or more contacts, one of which contacts is connected to a terminal of one cell, the second contact connected to a terminal of the second cell, and the third contact connected to an electrical conductor common to one contact of the series of switches.

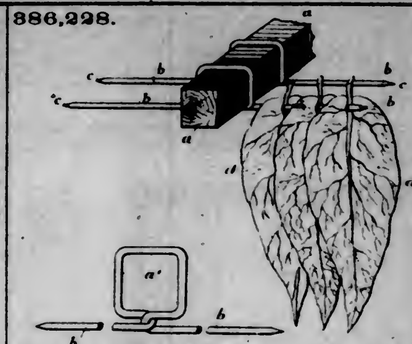
386,226. BEEF-TENDERER. LEE L. WELCH, Leggett, Tex. Filed Jan. 26, 1888. Serial No. 261,893. (No model.)

Claim.—In a steak-tenderer, the combination, with the triangular end plates, B, having the bearing-notches *c d d*, the detachable connecting-bar *b*, provided with the threaded ends and shoulders *b'*, the thumb-nuts *b²*, the smooth rollers D, and the coiled springs E, of the crank-handle F and the roller C, provided with the teeth H, having square flat faces and flat sides at right angles to said faces and arranged in aligned longitudinal series and spirally arranged circumferentially, the areas of the teeth being one-fourth of an inch and the distance between the series of teeth and the teeth in each series being one-fourth of an inch, substantially as specified.

386,227. STOVE-PIPE THIMBLE AND CAP. ARVILLA WILLIAMS, Saratoga, Kans. Filed Feb. 6, 1887. Serial No. 226,621. (No model.)

Claim.—1. In a cap or cover for stove-pipe holes, the combination, with a fixed thimble having the threaded portion, of a rotatable threaded tube adapted to be screwed into the thimble, and having the cone-shaped inner end and a fixed cap at its outer end, as and for the purpose set forth.

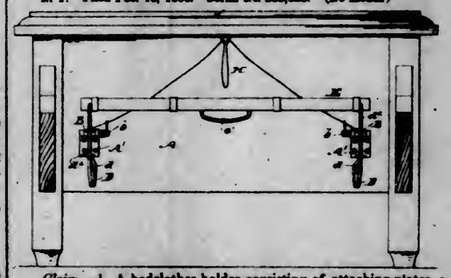
2. The combination, with a threaded thimble having the open inner end, of a second threaded tube provided with a cone-shaped inner end which is extended through the open end of the thimble, the outer end of the second tube being closed by a cap, substantially as described.



3. A cover or cap for stove-pipe holes, having a tube adapted to be fitted and held in the pipe-hole and provided with the inner cone-shaped end, and a depending drip-plate at the inner terminal end of the cone-shaped portion, as and for the purpose set forth.

4. The combination, with a fixed threaded thimble having an annular flange at its outer end and an open inner end, of a second rotatable threaded tube adapted to be screwed into the thimble, to be held in position thereby, and having its inner end so proportioned that it may extend into the smoke-space of a chimney, the outer end of the second tube being closed by a fixed cap, and the inner extended end of said tube having a depending drip-plate, as and for the purpose described.

386,228. TOBACCO-HANGER. THOMAS Y. ALLEN and LEE J. ALLEN, Shipwith, Va. Filed Jan. 3, 1888. Serial No. 259,703. (No model.)

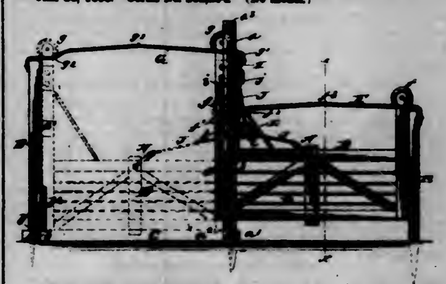


Claim.—The tobacco-hanger consisting of the wire formed about at its center, with a closed rectangular loop slipped upon a supporting-bar, which wire, after the formation of said loop, is twisted

386,228.

upon itself and extended in opposite directions, in a horizontal plane, into arms which are provided with pointed ends, substantially as set forth.

386,229. BEDCLOTHES-HOLDER. G. OSSCAR ANDREWS, New York, N. Y. Filed Feb. 10, 1888. Serial No. 263,633. (No model.)

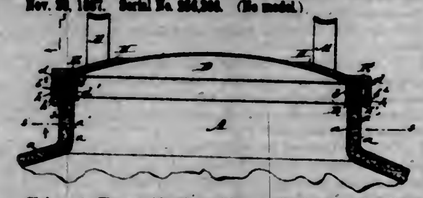


Claim.—1. A bedclothes-holder consisting of attaching-plates, a spring-actuated latch hinged upon said plates, U-springs having one member secured to the respective attaching-plates, a clamping-bar carried by the U-springs, and means, substantially as described, for elevating the latches, as and for the purpose specified.

2. In a bedclothes-holder, the combination, with attaching-plates and spring-actuated latches hinged thereto, of U-springs having one member secured to said plates, a clamping-bar attached to said springs, and a cord secured to said latches, substantially as and for the purpose specified.

3. In a bed-clothes holder, the combination, with attaching-plates and spring-actuated latches hinged thereto, of U-springs having one member secured to said plates, a clamping-bar attached to said springs, provided with a facing of corrugated rubber, and a cord secured to said latches, substantially as and for the purpose herein set forth.

386,230. GATE. HARRY L. BAKER, Wilton Junction, Iowa. Filed Jan. 28, 1888. Serial No. 262,204. (No model.)



Claim.—1. The combination, with the posts A B E, of the tracks F G, secured to the posts A E and A B and provided with depressions f^a g^a, respectively, and the gate D, provided with rollers on the upper ends of its end uprights, substantially as described.

2. The combination of the posts A B E, the post E being of less height than the posts A B, double-inclined track F, secured to the posts A E and provided with the depression f^a, the double-inclined

track G, secured to the posts A B and provided with the depression g^a, the gate D, having its end uprights of unequal heights and provided with the rollers *f g* on the said uprights, the bar I, secured to the post A, the guide-pulleys *j k* L M, and the cords or ropes J K, attached to the gate and passing over the said pulleys, substantially as herein shown and described.

3. The combination, with the posts A B E, the post E being of less height than the posts A B, and the bar I, secured to post A, of the double-inclined track F, provided with the depression f^a and having its ends secured to the posts A E, the double-inclined track G, provided with the depression g^a and having its ends secured to the post E and to the bar I, the gate D, having its end posts, *d d'*, of unequal length and provided with the rollers *f g*, the guide-pulleys *j k* in the ends of the bar I, the pulleys L M in bearings on the post A, and the ropes J K, connected to the center of the gate and passing around the said pulleys, substantially as herein shown and described.

386,231. MILK-CAN. JOHN H. RAMBLER, Myerstown, Pa. Filed Nov. 28, 1887. Serial No. 256,266. (No model.)

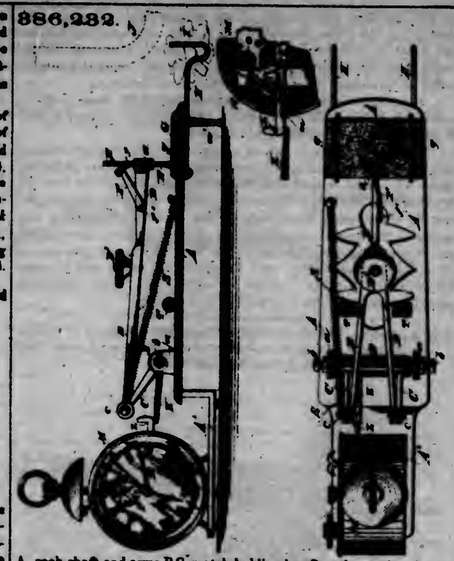
Claim.—1. The combination, with a can having spaced walls, the outer wall being notched, of a binding-ring fitting in the space between the walls of the can and provided with lateral projections fitting in the notches of the outer wall of the can, a lid fitting on the binding-ring, and a detachable flanged capping-ring resting upon the lid and provided with inwardly-projecting lugs, substantially as described.

2. The combination, with a can having spaced walls, the outer wall being notched, of a binding-ring fitting in the space between the walls of the can and provided with a central rib on its upper surface, and laterally-projecting lugs having straight horizontal top and bottom faces, a lid provided with an elastic washer, a detachable capping-ring provided with downwardly-projecting flange having inwardly-projecting lugs, the top and bottom faces of which are straight, and stops for limiting the movement of the capping-ring, substantially as herein shown and described.

3. The combination, with a can having spaced walls and an intervening packing of non-heat-conducting material, a substantially U-shaped binding-ring between said walls at the top provided with an upper continuous rib, a series of spaced lugs on the outer surface of said binding-ring near the top having horizontal top and bottom surfaces, a lid fitted to said can having spaced side walls, and an elastic washer held between said walls, of a cap-ring fitting over the lid and projecting beyond the edge, a downwardly-extending flange integral with said ring, a series of spaced lugs integral with the inner side of the flange, and means, substantially as described, for limiting the movement of said ring, all as herein set forth.

386,232. AUTOMATIC FIRE-LIGHTER. FRANK J. BIRD, Dubuque, Iowa. Filed Oct. 19, 1887. Serial No. 252,515. (No model.)

Claim.—1. The combination, in an automatic fire-lighter, of a bed-plate or support, A, a rock-shaft, B, journaled thereto and carrying arms C K, a bar, D, adapted to carry a match, a spring, S, adapted to draw the parts D E forward for lighting the match on a friction-surface, and a catch adapted to retain the trip-arm to hold the device set ready for action, substantially as herein set forth.

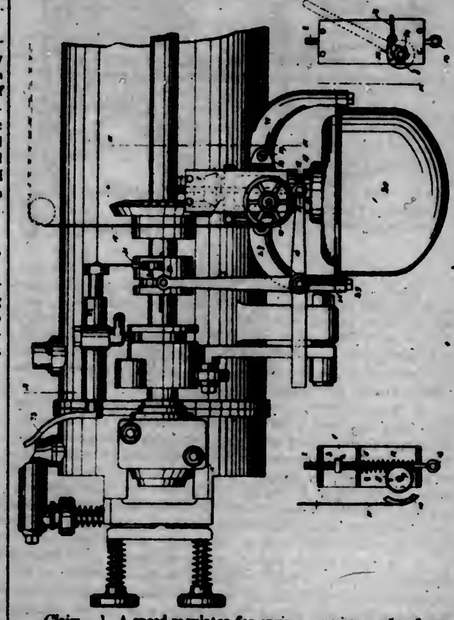


2. The combination, in an automatic fire-lighter, of a bed-plate or support, A, a rock-shaft, B, journaled thereto and carrying arms C K, a bar, D, adapted to carry a match, a spring, S, adapted to draw the parts D E forward for lighting the match on a friction-surface, and a catch-bar, L, adapted to retain the parts K C D S, and fitted for withdrawal by a clock mechanism, substantially as described, for the purposes set forth.

3. The combination, in an automatic fire-lighter, of a bed-plate, A, a rock-shaft, B, journaled thereto and carrying arms C K, a match-carrying bar, D, a spring, S, adapted to draw the parts D E forward for lighting the match on a friction-surface, hooks H, for holding a binding-wad adapted to be lighted by the match, and a catch-bar, L, adapted to retain the parts K C D S, and fitted for withdrawal by a clock mechanism, substantially as described, for the purposes set forth.

4. In an automatic fire-lighter, the match-holding bar or device formed with an eye, *d*, and provided with a pivoted hook, F, adapted to wedge the match in the eye, substantially as herein set forth.

5. In an automatic fire-lighter, the combination, with a bed-plate,

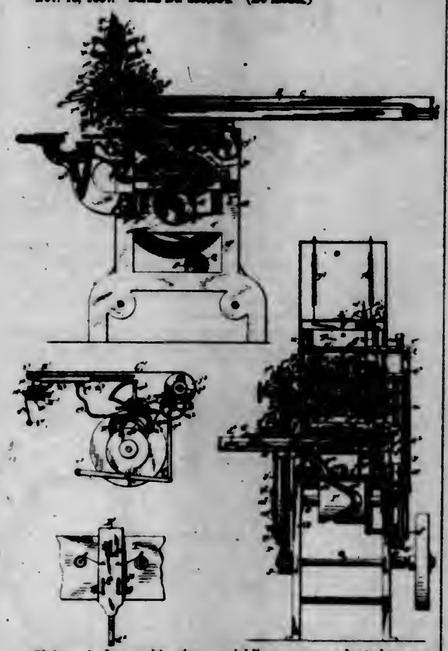


386,232.

A, rock-shaft and arms B C, match-holding bar D, and a spring device drawing the parts B C D forward for lighting the match, of buffers T, substantially as described, for the purposes set forth.

6. In an automatic fire-lighter, the combination, with the winding-mechanism shaft *o* of alarm-clock, of a cam disk or wheel, O, on said shaft, a lever, N, pivoted to the frame, and a catch-bar, L, connected to said lever, substantially as described, for the purposes set forth.

386,233. GAS-ENGINE SPEED-REGULATOR. JOHN BRADLEY, Philadelphia, Pa. Filed Oct. 20, 1887. Serial No. 252,692. (No model.)



Claim.—1. A speed-regulator for engines, consisting of a frame attached to an engine, provided with a sliding rod with sleeved end, an adjustable stop, a sliding cross-bar having operating cords and pulleys and a retracting-spring, with a main operating-pulley on the shaft

of the operating-pulleys, and means, substantially as described, for controlling the same, the sleeved end of the sliding rod engaging a pin located in a grooved collar connected with the governors, said pin being connected with mechanism for opening and closing the supply-valve of the engine, substantially as shown and described.

2. A speed-regulator for engines, consisting of the frame 1, sliding rod 2, nut 4, spring 12, sliding bar 5, ribs 6, cords 7, pulleys 8, shaft 9, and wheel 10, substantially as described.

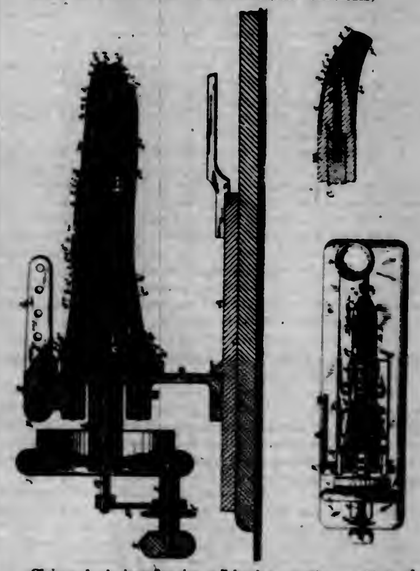
3. The combination, with an engine motive-force-supply-controlling mechanism consisting of crank-lever 16, having sleeve 15, sliding sleeve 21, having cam 30, and slot 21', engaging pin 17 on lever 16, double-crank connection 22, having arm 31, resting on cam 30, and arm 23, connected with the supply-valve, of a speed-regulator consisting of the frame 1, having sliding rod 2, with sleeve 13 engaging pin 14, projecting through sleeve 15 on lever 16, and engaging groove 18 in collar 19, connecting with the governors, nut 4, ribs 6, spring 12, sliding bar 5, cords 7, pulleys 8, shaft 9, wheel 10, and ratchet 24, pawl 25, and handle 26, substantially as described.

386,234. CIGAR-BUNCHING MACHINE. EDWARD A. BESSEY, Providence, R. I., assignor to Walter A. Peck, trustee, same place. Filed Nov. 16, 1887. Serial No. 255,254. (No model.)

Claim.—1. In combination, a yielding presser adapted to press upon the filler being measured, a friction-clutch, mechanism for feeding the fillers against said yielding presser by power transmitted through said friction-clutch, and a stop operatively connected with the said yielding presser, and adapted to engage with one member of the friction-clutch to stop the feed upon the proper movement of the yielding presser, substantially as described.

2. In combination, a yielding presser adapted to press upon the filler being measured, a friction-clutch, mechanism for feeding the fillers against said yielding presser by power transmitted through said friction-clutch, and a stop operatively connected with the said yielding presser and adapted to engage with one member of the friction-clutch to stop the feed upon the proper movement of the yielding presser, and also operatively connected with the driving mechanism to cause the release of the engaged member of the friction-clutch upon the continued movement of the machine, substantially as described.

3. In combination, a yielding presser adapted to press upon the filler being measured, a friction-clutch, mechanism for feeding the fillers against said yielding presser by power transmitted through said friction-clutch, a stop operatively connected with the said yielding presser and adapted to engage with one member of the friction-clutch to stop the feed upon the proper movement of the yielding presser, and means for adjusting the pressure of the yielding presser upon the filler, substantially as described.



4. In combination, a yielding presser adapted to press upon the filler being measured, a friction-clutch, mechanism for feeding the fillers against the said yielding presser by power transmitted through said friction-clutch, a stop operatively connected with the said yielding presser and adapted to engage with one member of the friction-clutch to stop the feed upon the proper movement of the yielding presser, and means for adjusting the movement of the yielding presser, substantially as described.

5. In combination, the throat-passage and means for feeding tobacco through the same, the knife or gate, the measuring-chamber, the chamber-carrying slide, the supplementary slide attached thereto, the yielding back plate of the measuring-chamber, means for connecting the said back plate with the supplementary slide, the limiting-stop to the downward movement of the outer portion of the chamber-piece with the chamber-carrying slide, and mechanism for first operating the knife or gate to cut off the quantity of tobacco in the measuring-chamber, then conjointly moving the measuring-chamber and knife or gate toward the required point for depositing the filler, and also causing the required movement of the supplementary slide to expel the filler from the measuring-chamber, substantially as described.

6. In combination, the rolling belt attached at one end to the reciprocated bed, the oppositely-reciprocated bed and roller, and means for drawing upon the opposite end of the said belt to cause the contraction of the rolling pocket toward the completion of the bunch, substantially as described.

7. In combination, the rolling belt and means for operating the same, the sliding carrier provided with a spring-operated holding-plate, the mechanism for causing the backward movement of said plate against the action of the spring, the fixed tongue for preventing the bunch from passing through the carrier, means for reciprocating the carrier, and the forcer for pressing the completed bunch out of the carrier, substantially as described.

386,235. ROLL FOR CIGAR-WRAPPING MACHINES. EDWARD A. BESSEY, Providence, R. I., assignor to Walter A. Peck, trustee, same place. Filed Dec. 3, 1887. Serial No. 256,503. (No model.)

Claim.—1. A cigar-forming roll having a section provided with a comparatively rigid surface adapted to operate upon the body portion of the cigar, and an attached spiral wire coil, which forms a continuation of the surface of the roll, for operating upon the head portion of the cigar, and means for imparting a deflected form to the wire coil, substantially as described.

2. A cigar-forming roll having a roll-section provided with a conoidal end, a spiral wire coil operatively connected to the said roll-section, and having its forward end supported for revolution upon an axis at an angle with the axis of the said roll-section, substantially as described.

3. A cigar-forming roll having a fixed core provided at its outer end with a supplementary deflected core, a roll-section adapted to revolve upon the fixed core to form the body portion of the cigar, and having a conoidal end, and a spiral wire coil operatively connected to the said roll-section and supported for revolution upon the conoidal end of the roll-section and the deflected core, substantially as described.

4. A cigar-forming roll having a fixed core provided at its outer end with a supplementary deflected core, a roll-section adapted to revolve upon the fixed core to form the body portion of the cigar, and having a conoidal end, and a spiral wire coil operatively connected to the said roll-section and covering the conoidal end of the same, a revoluble thimble for supporting the forward end of the spiral wire coil upon the supplementary deflected core, and a head or collar at the end of the said core, substantially as described.

5. A cigar-forming roll having a fixed core provided with a loosely-revolving gear, a flexible hollow shaft, and a roll-section which is operatively connected to the said gear by means of the universal joints formed at the opposite ends of the flexible hollow shaft, the fixed collar located between the hollow shaft and the said roll-section, the supplementary deflected core, the spiral wire coil operatively connected to the said roll-section, the revoluble thimble for supporting the forward end of the spiral wire coil upon the deflected core, and the head or collar at the end of the said core, substantially as described.

6. A cigar-forming roll having a fixed core provided at its outer end with the supplementary deflected core, a roll-section adapted to revolve upon the fixed core to form the body portion of the cigar, and having a conoidal end provided with a recess adapted to receive the angle of the deflected core, the thimble recessed to fit at one side against the conoidal end of the roll, the deflected spiral coil operatively connected to the said roll-section and thimble, and the head or collar at the end of the supplementary deflected core, substantially as described.

7. The combination, with the cluster of conoctedly-driven hollow rolls having a centrally-enlarged section adapted for operation upon the tuck end of the bunch, of the supplementary connectedly-driven rolls having a rearwardly-tapered section to fit between the centrally-enlarged sections of the cluster-rolls, the stationary cores for supporting the said cluster-rolls, and the stationary yielding cores for the supplementary rolls, substantially as described.

386,236. BURGLAR-ALARM. THOMAS J. HARRIS, Baltimore, Md. Filed Apr. 16, 1888. Serial No. 270,926. (No model.)

Claim.—1. In an alarm substantially as described, the combination, with the shaft G, the gears D, for operating said shaft, and the crank $g\,g'$, secured to the shaft G, of the lever H, centrally pivoted to the frame F, provided with a forked arm, h, adapted to receive the crank projection g', an arm, h', and the bell-hammer J, connected to the arm h', substantially as shown.

2. In an alarm substantially as described, the combination, with the shaft G, the gears D, for operating said shaft, the crank-arm $g\,g'$, and the lever H, centrally pivoted to the frame F, said lever connected to the shaft G, as shown, of the bell-hammer J, pivoted at its rear end to the frame and provided with an elongated slot, J^3, adapted to receive the downwardly-projecting arm h' of the lever H, as and for the purposes described.

3. In an alarm substantially as described, the combination, with the spring-operated gears, the lever H, connected to said gears, and the hammer J, connected to the lever H and operated as described, of the spring-actuated trigger L, said trigger adapted when forced inward in the path of the movement of said hammer to stop the motion of the hammer, and when released from pressure to spring back out of such path, substantially as described.

4. In an alarm substantially as described, the combination, with the spring-operated gears, the lever H, connected to and reciprocated by said gears, said lever provided with a downwardly-projecting arm, h', and the hammer J, pivoted to the frame F at its rear end and operated by said arm h', of the rock-shaft N, provided with an arm, n^2, adapted to be turned in the path of the movement of said arm h', and means, substantially as shown, for operating said shaft, as and for the purpose described.

5. In an alarm substantially as described, the combination, with the bell, the spring-operated gears, the lever H, and the hammer J, said hammer and lever connected to and operated by said gears, the lever H having a downwardly-projecting arm, n', of the shaft N, having an arm, n^2, adapted to be turned in the path of said arm h', and provided with an extension, N' and N^3, substantially as and for the purposes set forth.

386,237. FIRE-ESCAPE. THOMAS R. BOND, Carthage, N. Y. Filed Aug. 25, 1887. Serial No. 247,888. (No model.)

Claim.—1. A fire-escape consisting of an open frame formed of side and end bars, and provided with a projecting hook on its lower end bar, and with a central bar having one end pivotally connected to the lower end bar of the frame, with its free end resting upon the upper end bar of the said frame, substantially as herein shown and described.

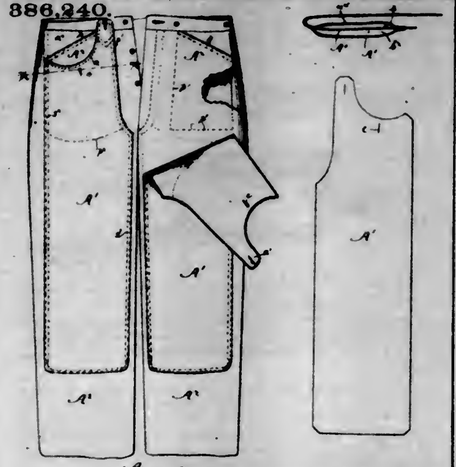
2. In a fire-escape, the open frame A, formed of the side bars, A^4, and end bars, A^2 A^3, and provided with the hook A' on its lower end bar, and with the bar C, pivoted to the lower end bar and having its free end resting upon the upper cross-bar, in combination with the rope B, coiled around the pivoted bar and passed through the said hook, substantially as herein shown and described.

386,238. MECHANICAL TELEPHONE. FRANCIS B. CLARKE, New York, N. Y., assignor of one-half, by direct and mesne assignments, to George B. Van Brunt, Charles A. Rase, and William J. Townsend. Filed Mar. 9, 1888. Serial No. 266,603. (No model.)

Claim.—1. In an acoustic or mechanical telephone, the combination of a box or casing divided by a diaphragm into two chambers, C and C', the chamber C', or receiving-chamber, having upon its interior surface a lining of felt with a diaphragm, substantially as and for the purposes described and shown.

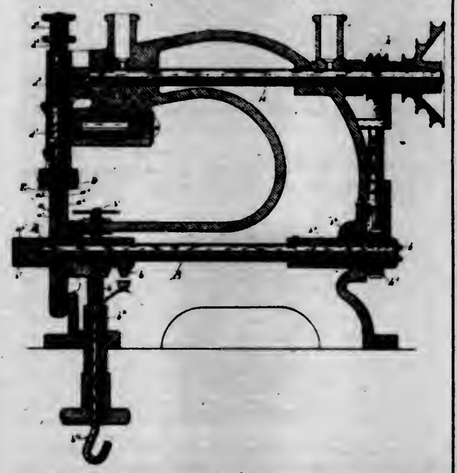
2. In an acoustic or mechanical telephone, a diaphragm composed of two or more layers of pressed board with an interposed layer or layers of hair-cloth cemented by gelatine, in combination with a sounding-box and line, substantially as and for the purposes described and shown.

386,239. WASHING-MACHINE. LOUIS DUCHARME and GILBERT BRARD, Woonsocket, R. I. Filed Feb. 14, 1888. Serial No. 264,003. (No model.)



Claim.—1. The combination, with a boiler or suds-case, of a rotative cylinder therein, buckets arranged transversely on the periphery of the cylinder, and tubes connected with the opposite ends of the buckets alternately and leading to the interior of the cylinder, substantially as specified.

2. A rotative cylinder having spray-chambers in its side walls, divided partitions, and tubes leading from the respective compartments of the said chambers and connected with buckets secured to the periphery of the cylinder, substantially as specified.



386,240. OVERALLS. CHARLES BELANGER, Baltimore, Md. Filed Apr. 14, 1888. Serial No. 270,616. (No model.)

386,240.

Claim.—A pair of overalls provided upon the front of each leg with a detachable re-enforce, A', covering the whole upper surface of each leg-piece A^2 from side to side, and reaching from the waistband down to, over, and beyond the knee portion thereof, said re-enforce at one side of its upper edge shaped to conform with the pocket-placket and composing the outer wall of an upper two-cell side pocket, and having at its side adjacent to the upper part of the fork-opening of the garment an upwardly-extending button-holed tab, a', integral with the fabric composing the re-enforce, said re-enforce sewed flatly upon said leg-front A^2 by vertical rows of stitching $a' a^3$, leaving the intermediate area of the re-enforce loosely overlying the leg-piece A^2, whereby said re-enforce is adapted to be detached without separation of any of the connections proper of the garment, substantially as described.

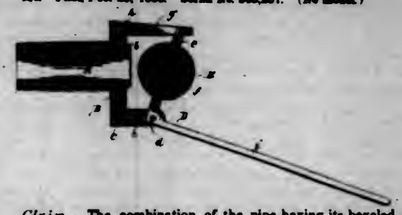
386,241. SEAM-RUBBING MACHINE. CHARLES S. PITFIELD, Revere, Mass. Filed Nov. 14, 1885. Serial No. 182,831. (No model.)

Claim.—1. In a seam-rubber, the support A, composed of the metal disks a a' a^3 and the rings a^3 a^4, of vulcanized rubber or like material, clamped in place, substantially as set forth.

2. In a seam-rubbing machine, the movable box b of the shaft B, carrying the support A, in combination with the adjustable spring b' and stop b^2, substantially as and for the purpose specified.

3. In a seam-rubber, the support A and presser E, mounted, substantially as described, to move sidewise relatively either to the other, to suit work in which pieces of different thicknesses are joined by a seam, substantially as described.

4. In a seam-rubbing machine, the spool-shaped presser E, in combination with the U-shaped rubbing-tool D, substantially as described.



5. In a seam-rubbing machine, the seam-rubbing tool D, made U-shaped and having tang d projecting from one of its legs, substantially as described.

6. In a seam-rubber, the tool-holder d', in combination with the spring d^2 and the adjusting-screws d^3 d^4, substantially as and for the purpose specified.

7. In a seam-rubber, the guide-fingers G, with their lower edges, g, parallel with the periphery of the support A, substantially as and for the purpose specified.

8. In a seam-rubber, the combination of main shaft H and feed-shaft B by means of worms h h' and their gears h^2 h^3, one of the worms having a straight portion, h^4, as and for the purpose specified.

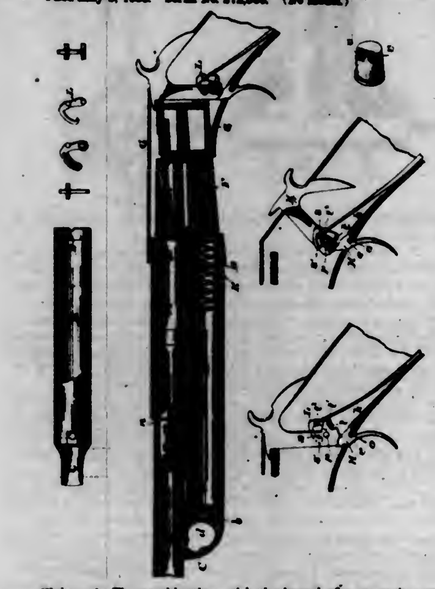
386,242. TANK FOR WATERING STOCK. GEORGE FEY, Memphis, Mo. Filed Feb. 20, 1888. Serial No. 265,257. (No model.)

Claim.—The combination of the pipe having its beveled end forming a valve-seat, the casting having its ring part fitted securely on the pipe just within its end, and having the integral arms C and A, the former having the open slot C and the latter having the longitudinal slot g, the angle-lever pivoted at its bend in the slot c and having its upstanding arm projecting in the slot g, the float on the outstanding arm of said lever, and the rubber ball-valve, of larger diameter than the pipe and rotatable on the upstanding arm of the lever, substantially as specified.

386,243. DOOR-KNOB. WILLIAM A. GAY, Newark, N. J. Filed Sept. 26, 1887. Serial No. 250,663. (No model.)

Claim.—1. In a knob, in combination, a core having a shank and a flange with notches or recesses at its periphery, a shell covering said core and impressed into said notches or recesses, and a front plate, substantially as set forth.

2. The improved knob herein described, combining therein a core having a shank and a notched flange, a shell covering said core and held thereto at its periphery, and a front casting having an ornamental front face and on the rear a lug, d', to engage said notched flange, a shoulder, d^3, and a turned edge overlapping the edge of the shell to conceal the same, and holding the front and back parts of the knob against withdrawal, the lug d', shoulder d^3, and turned edge being integral parts of the ornamental casting, substantially as set forth.



386,244. WATER-COOLER. SOLOMON GLICK, Temple, Tex. Filed Nov. 1, 1887. Serial No. 253,962. (No model.)

Claim.—1. In a water-cooler, the combination, with an outer casing, a central ice-receptacle having a perforated bottom, a water-reservoir surrounding the ice-receptacle, provided with a packing of filtering material in the bottom, of an auxiliary reservoir held beneath the ice-receptacle and main reservoir and connected with the latter by a series of tubes, and a tank in the bottom of the casing surrounding said auxiliary reservoir adapted to receive the drip from the ice, as set forth.

2. In a water-cooler, the combination, with an outer casing, a central ice-receptacle having an open top and perforated bottom, and a water-reservoir surrounding the ice-receptacle, provided with an interior packing of filtering material, of an auxiliary reservoir held beneath the ice-receptacle and main reservoir, a series of tubes provided with strainers at the upper end connecting the main and auxiliary reservoirs, a tank in the bottom of the casing surrounding the auxiliary reservoir, and faucets connected with said tank and reservoir, substantially as shown and described, whereby the water is cooled by contact with the ice-receptacle and contact of the reservoir with the drip, as set forth.

386,245. MAGAZINE-GUN. MYRON E. GREEN, Washington, D. C. Filed May 3, 1888. Serial No. 272,580. (No model.)

Claim.—1. The combination, with the barrel of a magazine-gun provided with a rib, angle, or lug, of the detachable magazine constructed as described, and having a sling-opening in its outer end of a form to span or inclose the barrel and its rib, thereby adapting the magazine when detached for use as a wrench for shipping and unshipping the barrel, substantially as described.

2. The combination, with the mainspring and hammer provided with the vertical slot or opening in its stem and the transverse post, of the elbow-shaped stirrup having its forward arm projecting through the slot in the hammer and provided with a hook adapting it to engage with said transverse post, substantially as and for the purpose described.

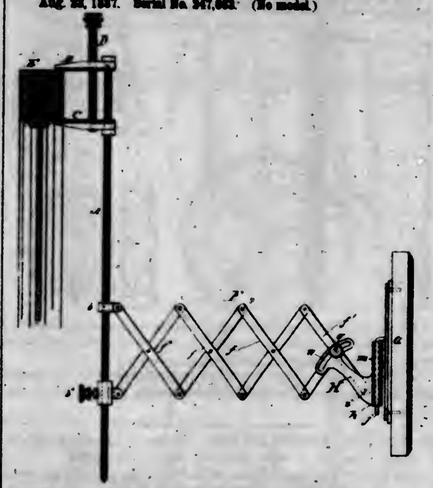
3. In combination with the shell or casing provided with a trigger-opening beneath, having its rear edge swaged and rounded to form a trigger-seat, the trigger provided on its rear side with the recess e, adapting it to fit and rest upon said seat at the rear edge of the opening, whereby it is wholly supported and operated independently of the casing at the front edge of said opening, substantially as and for the purpose described.

4. The combination, with the barrel and its breech-piece, provided, respectively, with the exterior and the interior screw-threads, of the inclined faces corresponding in direction with the screw-threads and the opposite right-angled shoulders, substantially as and for the purpose described.

5. In combination with the magazine constructed as described, the hollow cylindrical follower inclosing the outer end of the cartridge-spring and having the perforated annular recess at its end, substantially as and for the purpose described.

386,246. WEED-CUTTER. GERAVUS HAMMERLE, Topeka, Kans. Filed Nov. 3, 1887. Serial No. 254,333. (No model.)

Claim.—1. A weeding attachment, substantially as described, consisting of the stock or body A, the arms B B, extended from said body, one of said arms being longer than the other, and the scraper-blade extending between and secured to said arms, substantially as set forth.



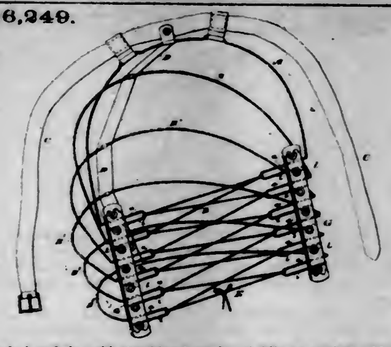
2. A weeding attachment consisting of the stock or body A, having a groove, a, in its rear side and provided with a bolt-opening, d, the forward end of which is enlarged and provides an angular socket for the head of the connecting-bolt, the arms extended from said stock or body part, and the blade extended between and secured to the free ends of said arms, all substantially as and for the purposes specified.

386,247. PROCESS OF DYEING. THOMAS HOLLIDAY, Huddersfield, County of York, England, assignor to Read Holliday & Sons, same place. Filed Jan. 17, 1887. Serial No. 224,868. (No specimens.)

Claim.—1. The dyeing of cotton or other vegetable fiber by the formation thereon of the colored products of the combination of the nitroso compounds of alpha or beta naphthol with metallic oxides, substantially as described.

2. Cotton or other vegetable fiber colored with the combination of the nitroso compounds of alpha or beta naphthol with metallic oxide.

386,248. BRACKET. HELEN M. HUMPHREY, Cayuga, N. Y. Filed Aug. 22, 1887. Serial No. 247,662. (No model.)



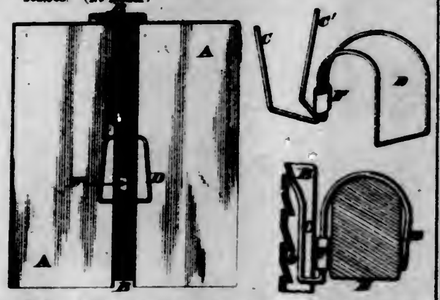
Claim.—1. The mirror G, having a fastening-rod, j, at its back, in combination with the lazy-tongs F, adjustable plate H, and set-screw n, the said plate being formed with a curved slot, o, to receive the screw n, and with a sleeve, m, to receive the rod j, substantially as described.

2. As a new article of manufacture, the rod A, provided with a clamping device at one end, the lazy-tongs F, attached to the rod A, and the mirror G, in combination with the adjustable plate H and set-screw o, the said plate being formed with a curved slot, n, and pivoted to one of the bars of the lazy-tongs, substantially as described.

386,249. BUSTLE. FRANK H. JEFFERY, Jersey City, N. J. Filed Aug. 10, 1887. Serial No. 246,576. (No model.)

Claim.—1. In a bustle, the combination, with the stiff uprights or side pieces, G G, of the bows made from spring-wire and having inwardly-turned loops bent on their ends, one side of each loop forming a torsional spring, e, and the other side forming an attaching

386,249.



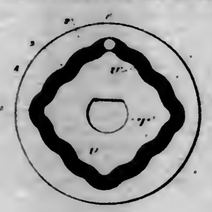
branch, *i*, and the said attaching branches rigidly secured to said side pieces, as set forth.

2. In a bustle, the combination, with the two stiff uprights G G, each formed of two strips, *k k*, of the several bows made from spring-wire, and having inwardly-turned loops bent on their respective ends, each loop forming a torsional spring, *e*, and an attaching branch, *i*, the said strips *k* embracing said loops, as shown, and clamping and secured rigidly to the said attaching branches *i*.

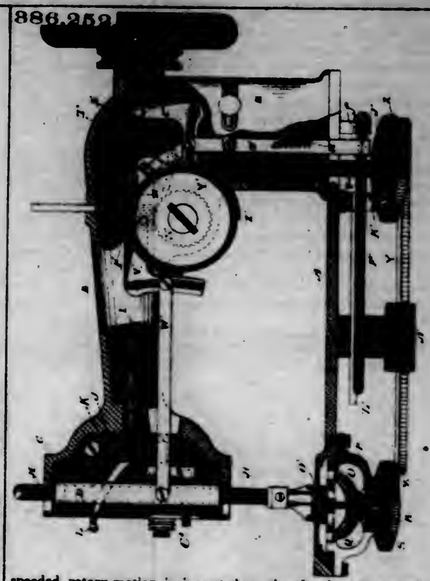
386,250. MEDICATED OR TONIC BEER. MOSES H. KLEIBER, Dodge City, Kans. Filed Dec. 3, 1887. Serial No. 257,236. (No specimens.)

Claim.—A beverage composed of malt, rye-flour, calamus, spearmint, hops, alcohol, lemon extract, yeast, lemon-peel, sugar, and water, in about the proportions above stated.

386,251. DETACHABLE SHADE FOR SEWING-MACHINES. WILLIAM H. LAWRENCE, Cincinnati, Ohio. Filed Jan. 31, 1888. Serial No. 262,505. (No model.)



Claim.—1. The shade A, having a vertical groove, B, in combination with the detachable spring-clip D, having laterally-spreading prongs C C, for the purpose described.



2. The shade A, having a notched vertical groove, B *b*, in combination with the detachable spring-clip D, having prongs C C, for the purpose described.

386,252. SEWING-MACHINE. FRANCIS T. LEILICH, Bridgeport, Conn. Filed Nov. 6, 1885. Serial No. 182,013. (No model.)

Claim.—1. The combination, with the needle-bar and the main shaft and its link-connection, whereby the needle-bar is reciprocated, of the horizontal rotary shuttle, the two-armed shuttle-driver whose plane of rotation is oblique to that of the shuttle and its race, the short shaft journaled in the bottom of the shuttle-race casting, the oblique connecting-shaft V and its gears, and the oscillating lever-pitman connecting the disks beneath the bed of the machine, whereby a variably-

386,252.

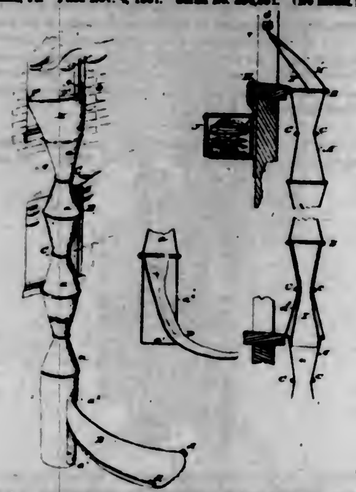
speeded rotary motion is imparted to the shuttle, substantially as specified.

2. The combination of the main shaft journaled in the arm, the needle-bar and the link-connection, the oblique connecting-shaft geared to the main shaft, the driver-shaft of the same obliquity as the connecting-shaft and journaled in the race-casting, the shuttle-race at right angles to the line of descent of the needle-bar, the shuttle, the two-armed shuttle-driver, and the oblique disks and their connecting oscillating lever-pitman, said disks and pitman being at a plane oblique to the plane of the bed and at right angles to the oblique plane of the driver and connecting shafts, substantially as described.

3. The combination, with the main shaft and the crank-disk mounted thereon, of the needle-bar, the link M, universally jointed at both ends, and the pin C^3, connecting the link and needle-bar, extending through the latter, and with its outer extremity projecting through a slot in the face of the head, substantially as set forth.

4. In a sewing-machine, the combination, with the main shaft, of the worm thereon, the short transverse shaft journaled in the arm and carrying a worm-wheel meshing with the worm, the sinuously-grooved pattern-disk removably secured upon the outer extremity of the transverse shaft, the bell-crank lever pivoted to the arm and actuated by the sinuous groove in the disk, the connecting-rod adjustably secured to the grooved arm of the bell-crank, and the gate carrying the needle-bar and pivotally hung within the head of the machine, all arranged as described, and for the purpose set forth.

5. In a sewing-machine, the combination of the stitch-forming mechanism, the feeding mechanism, the sinuously-grooved pattern-disk driven from the main shaft, and means whereby the latter imparts movement to the needle-bar gate, of a pattern-ring of varied diameter secured upon said disk and adapted to engage with and control the action of the feeding devices, substantially as set forth.



6. The combination, with the needle-bar and the main shaft, of the sinuously-grooved pattern-disk and the means whereby the latter is actuated, the bell-crank lever pivoted to the arm and engaging with the pattern-groove, the connecting-rod and the pivoted gate, the face-cam on the main shaft, the bell-crank lever of the feed, and a pattern-ring secured upon and revolving with the pattern-disk and adapted to engage and hold the said bell-crank out of engagement with its cam, substantially as specified.

7. The combination, with the main shaft, of the face-cam mounted thereon, the bell-crank lever pivoted within the arm and engaging with the cam, the vertical and spring-detained connecting-rod, the pivoted rock-shaft and its arms, the curved and pivoted lever actuated by the eccentric-groove in the disk, the bar L', the feed-bar and feed-dog, the adjustable and inclined bracket, and a pattern-ring of varying diameter actuated from the main shaft, and adapted by its engagement with the bell-crank lever of the feed to permit or prevent contact of the latter with its cam, substantially as described.

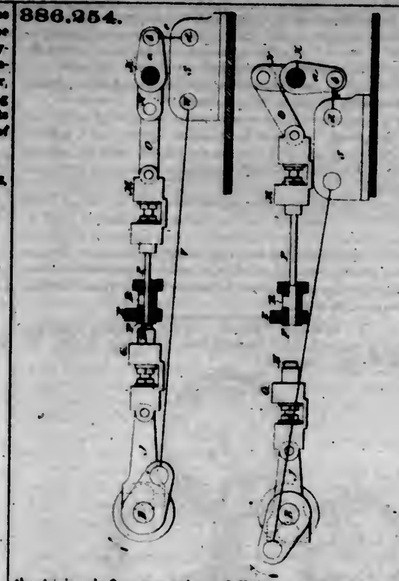
8. In a sewing-machine, the combination of the main shaft, the needle-bar hung in the pivoted gate, the transverse rotary shuttle, the

two-armed shuttle-driver, the driver-shaft and connecting-shaft oblique to the main shaft, the disks and oscillating lever-pitman oblique to the bed-plate, the worm, worm-wheel, and transverse shaft, the sinuously-grooved and removable pattern-disk, the bell-crank and the rod connecting the latter with the gate, the cam-actuated bell-crank lever, the feed mechanism, as shown and described, and the pattern-ring secured upon and revolving with the pattern-disk and adapted by its varying contour to alternately permit and prevent the actuation of the bell-crank by its cam, substantially as specified.

386,253. FIRE-ESCAPE. MOSES H. MASSEY and OTIS G. MOSES, Knox, Pa. Filed Nov. 4, 1887. Serial No. 254,931. (No model.)

Claim.—1. A fire-escape consisting of a flexible chute held extended by rings and surrounded by elastic bands or rings between said extension-rings, substantially as described.

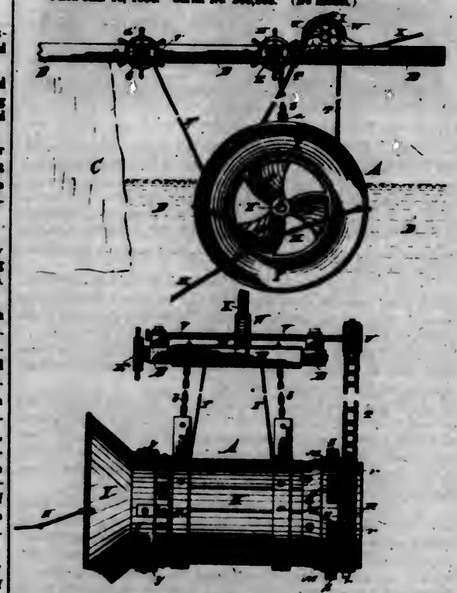
2. A fire-escape consisting of a zigzag-shaped flexible chute formed of a series of sections and provided with rings at the joints for holding the same extended and with elastic bands or rings intermediate said extension-rings, substantially as described.



3. The combination, with a flexible chute having a closed lower end and provided with an opening near said closed end, of a blanket or sheet secured to the chute at the opening to receive the person emerging from the said opening, substantially as herein shown and described.

386,254. MACHINE FOR HEADING CARTRIDGE-SHELLS. WILLIAM MASON, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed May 26, 1888. Serial No. 275,276. (No model.)

Claim.—1. In a machine for heading cartridge-shells, which consists of a stationary die, a slide on one side of the heading-die carrying a follower-punch, a slide on the opposite side carrying a heading-punch, and a driving-shaft, with a connection therefrom to said heading-punch slide to impart a reciprocating movement to said heading-punch slide, the combination therewith of a shaft, K, parallel with said driving-shaft, having a crank, N, with a connecting-rod therefrom to the said heading-punch slide, a second crank, *a*, on said shaft K, but in the opposite direction to the crank N, a crank, T, on the driving-shaft, a connecting-rod, V, hung by one end to said crank T on the driving-shaft, a link, *c*, hung by one end to said crank *a*, and a movable guide between the other end of said link *c* and the other end of said connecting-rod V, and to which the corresponding ends of the said link *c* and the connecting-rod V are hung, substantially as described.



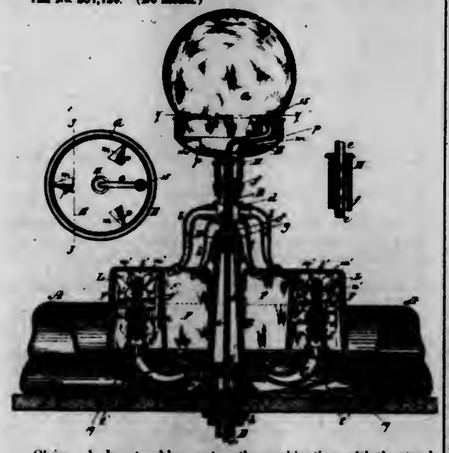
2. In a cartridge-shell-heading machine, consisting of a stationary die, a reciprocating slide carrying a heading-punch upon one side of said die, a reciprocating slide carrying the follower or holding punch upon the opposite side of the said die, and a driving-shaft with connection therefrom to the said heading-punch slide to impart reciprocating movement to said heading-punch slide, combined with a crank-shaft parallel with the driving-shaft, provided with a crank, N, and a connection therefrom to the follower-punch slide, the said shaft K also provided with a second crank, *a*, but in the opposite direction to the crank N, a slide, S, arranged in longitudinal bearings parallel with the path of movement of the said punch-carrying slides, the crank T on

386,254.

the driving-shaft, a connecting-rod, V, from said crank T to said slide S, and a link, *c*, hung by one end to said crank *a* and by the other end to said slide S, substantially as and for the purpose described.

386,255. CURRENT-MOTOR. MICHAEL MCCARTY, Montrose, Colo. Filed Jan. 16, 1886. Serial No. 208,882. (No model.)

Claim.—1. The combination, in a current-motor, of a frame fixed to the bank of a stream and projecting over the water, a current-wheel comprising a casing suspended from said frame and a bladed shaft fitted for rotation in said casing, and flexible connections between the frame and casing, substantially as shown and described, whereby the wheel may be adjusted bodily in a lateral curvilinear direction, as set forth.



2. The combination, in a current-motor, of a frame fixed to the bank of a stream and projected over the water, a current-wheel com-

prising a casing suspended by a windlass from said frame and a bladed shaft fitted for rotation in said casing, cord or chain connections from the current-wheel to a windlass arranged on the frame behind the wheel-suspending windlass, a driving-shaft on the frame, and pulley-and-belt connections from the current-wheel to said driving-shaft, substantially as described, for the purposes set forth.

3. In a current-motor, the current-wheel constructed with a casing, K, a blade shaft, I J, fitted for rotation therein, and a skeleton head, N, and driving-wheel R fitted to the bladed shaft for rotation at opposite ends of the casing, substantially as described, for the purposes set forth.

4. In a current-motor, the combination, with the casing K and a bladed wheel, I J, fitted for rotation therein, of a skeleton head, N, on the upstream end of the wheel and working against the casing, a drive-wheel, R, fixed to the downstream end of the casing and adapted to receive a driving-belt, and anti-friction rollers S, fitted to the casing and forming bearings for the driving-wheel, substantially as described, for the purposes set forth.

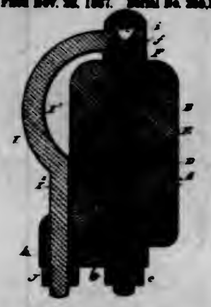
386,256. TUMBLER-WASHER. JOHN F. MCGRAIRL, Somerville, assignor to James W. Tufts, Medford, Mass. Filed Dec. 12, 1887. Serial No. 257,720. (No model.)

Claim.—1. In a tumbler-washer, the combination, with the standard B, of the independent chamber *d*, closed at its bottom and having an inlet-opening at its top, whereby it is adapted to receive the waste water flowing back after its discharge from the jet-pipe *e*, and a series of jet-pipes, *l*, connected with the chamber *d* and adapted to discharge the waste water from the jet-pipe *e* upon the exterior of the inverted tumblers when placed upon their supports, substantially in the manner and for the purpose set forth.

2. In a tumbler-washer, the combination of the standard B, the independent chamber *d*, having the sleeve or pipe *f* extending up through the same, the jet-pipe *e*, passing up through the sleeve *f*, the stuffing-box H on the sleeve *f*, the receiver E, dome G, and jet-pipes *l*, connected with the chamber *d* and adapted to discharge the waste water from the jet-pipe *e* upon the exterior of the tumblers, substantially as and for the purpose set forth.

3. In a tumbler-washer, the combination, with the dome G and basin or receiver E, having the waste-water openings *m*, of the guards or shields *p*, placed over said openings, and having knife-edges at their tops forming rests for supporting the lower edge of the dome, whereby the maximum vibration of the latter when struck by the water is produced, substantially as described.

4. In a tumbler-washer, the combination, with the valve-casing and valve-spindle of the tumbler-washing device, of a relief-valve placed within said valve-casing and closing an outlet-aperture therein, through which the water may escape when said relief-valve is raised, whereby an additional outlet is afforded, through which the water is discharged against the interior of the tumbler, substantially as set forth.



5. In a tumbler-washer, the combination, with the valve-casing I, having the valve-seats *w* and *b'*, of the tubular valve-spindle *u*, carrying the main valve *v* and relief-valve *a'* and having the aperture *g* above the valve *v*, communicating with its interior and provided on its exterior surface with grooves or channels *i'* for the passage of the water to the relief-valve, whereby an additional outlet is afforded for the water when the pressure of the same is increased, substantially as and for the purpose set forth.

6. In a tumbler-washer, the combination of the valve-casing I, tubular valve-spindle *u*, carrying the valve *v* and having an opening, *g'*, above said valve leading to its interior, the tube *d'*, with its jet-pipes *f'*, the spring *r'*, and a tumbler-supporting device rotating upon a pin or point at the top of the tube *d'*, all operating substantially in the manner and for the purpose set forth.

7. In a tumbler-washer, the combination, with the valve-casing I, tubular valve-spindle *u*, carrying the valve *v* and having an opening, *g'*, above said valve, and the tube *d'*, with its jet-pipes *f'*, of the tumbler-supporting water-wheel L, rotating upon a vertical pin or point projecting from the top of the tube *d'* and having the apertures *n'* in its top and the downwardly-projecting fans or buckets *n'* on its sides, all constructed and arranged to operate substantially as set forth.

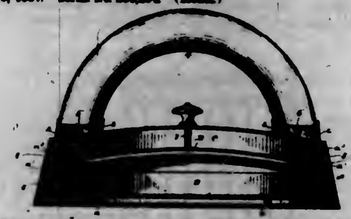
8. In a tumbler-washer, the combination, with the standard B, branch pipes C, and the valves of the tumbler-washing devices connected with the said branch pipes, of an air-chamber common to all of said branch pipes, whereby the force required to open said valves is diminished, substantially as set forth.

386,257. WHIFFLETREE-COUPLING. LAFAYETTE A. MELSHER, Denver, Colo. Filed Nov. 22, 1887. Serial No. 255,957. (No model.)

Claim.—1. In a coupling substantially as described, the combination of the support, the whiffletree, the top plate having a conical hub, the central interlocking plates, the pivot-bolt, the lower plate, and the clip having its upper portion arched rearwardly and its upper forward end formed with a tapering opening fitted over the conical hub of the top plate, the lower portion of such clip being formed straight and non-circular and terminating in a threaded portion, and the nut for securing such clip and by which it may be tightened up, substantially as set forth.

2. In a coupling substantially as described, the combination of the support, the whiffletree, the pivot-bolt C, the plates between said whiffletree and support, the lower plate secured to the under side of the support and having an extension projected in rear of said support and provided with an opening for the shank of the clip, the top plate secured on the whiffletree and provided with a hub having an opening for the bolt C and its exterior made conical, forming a tapering bearing, the clip having its shank extended through the opening in the rear extension of the lower plate and threaded to receive the securing-nut, and provided at its upper end with a ring-like portion having its opening formed with a tapering portion fitted to the tapering hub of the top plate and with a portion fitted to the angular portion of bolt C, all being substantially as and for the purpose specified.

386,258. HYDROCARBON VAPORIZER AND BURNER. FRANK B. MEYERS, Fort Plains, N. Y. Filed Sept. 8, 1887. Serial No. 249,079. (No model.)



Claim.—In a hydrocarbon-burner, the combination, with the combustion-chamber, the burner, and the retort, consisting of the case or body C, of the vaporizing-tube D, having the spiral or scroll shaped wings D', and the rod E, provided with the spiral scroll E', substantially as and for the purpose set forth.

386,258.

386,259. SAD-IRON. ROSSER GAY, Wakefield, Mich. Filed Dec. 19, 1887. Serial No. 258,254. (Model.)

Claim.—1. In a sad-iron, the combination, with the box or receptacle and the copper disposed therein, provided with end recesses, of the removable lid or cover, the spring-plate located within said lid or cover and having hooks projecting through lower apertures of said lid or cover and designed to enter said end recesses and the knobbed rod secured to said spring-plate and projected through a central aperture in said lid or cover, substantially as shown and described.

2. The combination, with the box or receptacle having shoulders at its ends, of the removable lid or cover, the spring-plate located within said lid or cover and having its ends projecting through end apertures thereof and designed to engage with said shoulders, and the knobbed rod secured to said spring-plate and projected through a central aperture in said lid or cover, substantially as shown and described.

3. The combination, with the box or receptacle having the shoulders at its ends, of the copper provided with recesses, the lid or cover, the spring-plate having projecting ends and depending hooks, and the knobbed rod, substantially as shown and described.

386,260. UMBRELLA OR SUNSHADE. LEWIS H. PEARCE, Coalbournbrook, Stourbridge, County of Worcester, England. Filed Mar. 8, 1887. Serial No. 230,103. (No model.) Patented in England July 14, 1886, No. 9,169; in France Mar. 2, 1887, No. 181,913; in Belgium Mar. 2, 1887, No. 76,549; in Germany Mar. 2, 1887, No. 41,266; in Italy Mar. 31, 1887, XLII, 168, and in Austria-Hungary Aug. 3, 1887, No. 9,576 and No. 36,493.

Claim.—1. An umbrella or sunshade having its ribs formed each in two parts hinged together and arranged to fold in opposite directions, one part being of channel-steel receiving the other part when extended, substantially as described.

2. In combination with an umbrella or sunshade having the ribs jointed and arranged to fold toward the point of the stick, the ring *c*, attached by means of a cord passing through an eye on the sliding socket and fastened to the stick, so that the said ring may be easily applied from below to surround the body of the fabric near the top when the apparatus is closed, and is automatically carried up into the dome thereof when the same is opened.

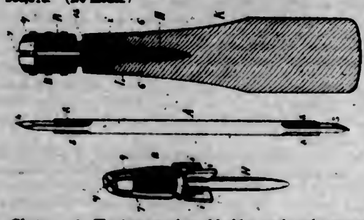
386,261. RATCHET-DRILL STOCK. JOHANNES T. PEDERSEN, Brooklyn, N. Y. Filed Aug. 16, 1887. Serial No. 247,003. (No model.)

Claim.—1. The combination, with the tool-holder having ratchet-teeth thereon, of a stock surrounding the same, and pawls having cylindrical axes, from which the pawls project laterally in opposite directions, the cylindrical axis being parallel to the axis of the tool-holder and capable of movement endwise to bring the pawl into or out of action, substantially as set forth.

2. The combination, in a ratchet-drill, of a tool-holder having teeth thereon, two separate pawls, each having a cylindrical axis, from which the pawl projects laterally, a stock surrounding the tool-holder and having a separate hole for the reception of each pawl-axis and a space in which the pawl may be moved laterally and in the direction of its axis, and a bow-spring to press the oppositely-acting pawls toward the teeth, substantially as set forth.

3. The combination, with the tool-holder having teeth upon its surface, of a stock surrounding the tool-holder and having a cylindrical recess, and the pawls standing in opposite directions and having cylindrical axes received into holes in the stock, and an arched spring within the stock and acting against the pawls, and having the parallel edges 14 and projections 16, for the purposes and substantially as set forth.

386,262. TOOL-HOLDER AND TOOLS FOR THE SAME. JOHANNES T. PEDERSEN, Brooklyn, N. Y. Filed Aug. 16, 1887. Serial No. 247,004. (No model.)



Claim.—1. The combination, with the tubular handle A and tubular screw B thereon and notched at the end, of the chuck E at the end of the screw B and divided longitudinally into four parts by slots that cross each other, and provided with projections at the rear to pass into the notches of the screw, and the tubular case C, surrounding the chuck and the screw B, substantially as set forth.

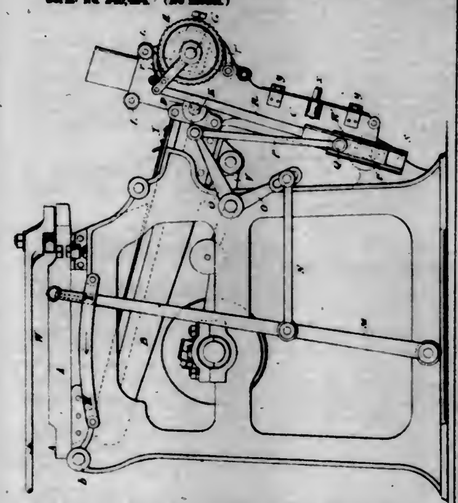
2. The combination, with the handle A and screw B, of the tubular case C, having an internal screw-thread and recessed at 6, and the chuck E, having a screw-thread around its base, substantially as set forth.

3. The tool and its shank formed of a straight metal bar that is a cross in its sectional shape throughout its length, except at the end, where the metal is removed more or less to form the operative portion of the tool, substantially as set forth.

4. A screw-driver formed of metal which is a cross in its sectional shape, with two of the arms of the cross notched at their end, as at 13, at the sides of the screw-driver end, substantially as set forth.

386,263. TOOL-HOLDER AND TOOLS FOR THE SAME. JOHANNES T. PEDERSEN, Brooklyn, N. Y. Filed Jan. 16, 1888. Serial No. 260,818. (No model.)

Claim.—1. The improved tool-holder and tool composed of a chuck-stock having an exterior screw-thread and a long mortise or incision, 7, through said stock to form spring-jaws, and short intermediate mortises or incisions, 9, through said stock, and a screw-sleeve surrounding such stock and tapering near the end to close the spring-jaws, in combination with a reversible tool having two end por-



tions or blades flattened and of a thickness adapted to pass into the long mortise 7 of the stock, and having one or more ribs, 8, upon the flattened end portions adapted to pass into the incisions 9 of the stock, substantially as set forth.

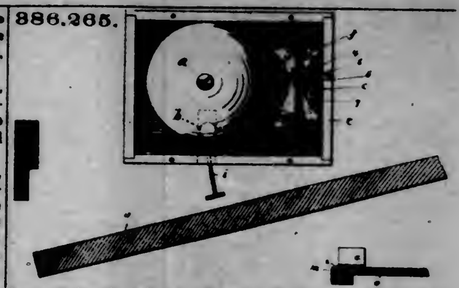
2. The combination, with a stock, B, having a long mortise, 7, and a short mortise, 9, of a tool having flattened ends or blade portions of a thickness adapted to pass into the long mortise 7 of the stock, and the ribs on one side of the flattened blade portions and adapted to pass into the incision 9, substantially as set forth.

3. The combination, with a stock, B, having a long mortise, 7, and a short mortise, 9, of a tool having flattened ends or blade portions of a thickness adapted to pass into the long mortise 7 of the stock, and the ribs on one side of the flattened blade portions and adapted to pass into the incision 9, the length of the flattened end portions of the tool being less than the depth of the mortise 7, so that the pointed ends of the tool do not come into contact with the bottom of the mortise, substantially as set forth.

4. The combination, with the screw-sleeve and the handle slotted crosswise at one end, of the tool-holding chuck B, having a short solid tang, H, and the four projecting wings I, passing into the slots in the handle K, substantially as set forth.

386,264. MATCH-MAKING MACHINE. KARL PERNITZ, Durlach, Baden, Germany, assignor to the Badische Maschinen und Bisenginesserei, vormals G. Schmid and Schmid and Hoff, same place. Filed June 6, 1887. Serial No. 240,494. (No model.)

Claim.—1. In a match-making machine, the combination, with a shaking-frame, of a box-frame pivoted to the main frame and connected to the lower end of the said shaking-frame, and means for holding and lowering the filling-box in the said box-frame, substantially as described.



2. In a match-making machine, the combination, with a shaking-frame and a pivoted box-frame connected to said shaking-frame, of a shaft journaled in the box-frame and provided with wheels for engaging the filling-box, and means for imparting motion to the said shaft, substantially as herein shown and described.

3. The combination, with the filling-box K, of the ratchet-wheel H, rod R, slide-plate R', guide S, hand-lever M, and rods N O P, all substantially in the manner and for the purpose as described and shown.

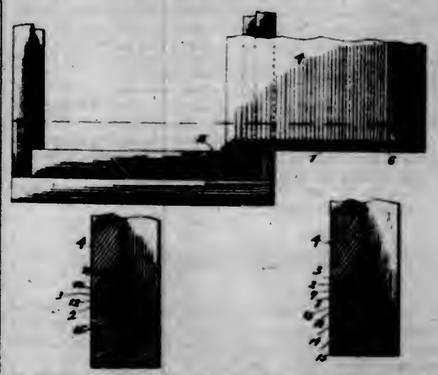
4. In a match-making machine, the combination, with a shaking-frame and a box-frame connected to the lower end of the shaking-frame, of a hinged cover on the shaking-frame projecting into the box-frame and provided with downwardly-projecting tongues, substantially as described.

5. In a match-making machine, the combination, with the shaking-frame and box-frame on the lower end of the shaking-frame, of a hinged cover projecting into the box-frame and having its lower end slotted and provided with the pins *r*, and the plate U, secured on the said pins and provided with the tongues *s*, projecting through the slots in the said cover, substantially as herein shown and described.

386,265. BURGLAR-ALARM. CHARLES PHELPS, Salem, Mass. Filed Jan. 27, 1888. Serial No. 262,267. (No model.)

Claim.—1. In a burglar-alarm, the combination of the portable box or casing, the bell, the spring-motor having an arbor extending through one side of the box, said arbor having a handle at its outer end, the hammer arranged to be vibrated by said motor, and the arm *i*, attached directly to and vibrated with the hammer and projecting through an orifice in the box, the arrangement being such that said arm when vibrated by the hammer moves substantially at right angles with the side of the casing through which it projects, and when prevented from so moving by contact with an object outside of the box holds the hammer to which it is attached away from the bell, as set forth.

2. The combination of the casing, the alarm mechanism therein, consisting of the bell, the hammer, and the spring-motor having an arbor extending through one side of the box, a pivoted handle on said arbor outside of the box, the recess *g*, formed to hold said handle and the motor, and a hammer-controlling arm or detent projecting outwardly from the alarm, as set forth.

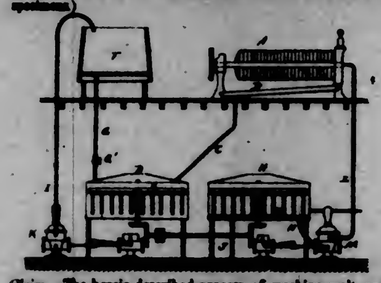


386,266. CALF-WEANER. WILLIAM H. PERSONS, Walworth, New. Filed Mar. 14, 1888. Serial No. 267,173. (No model.)

Claim.—1. As an improvement in calf-weaners, the plate provided with a series of rods or bars pivotally secured thereto by having their flattened ends passed through holes or apertures of said plate, substantially as shown and described.

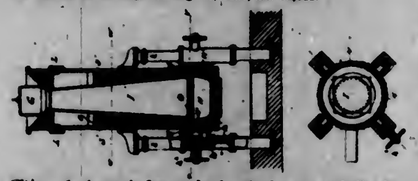
2. The combination, with the plate having the rearwardly-projecting barbs, and the rods or bars pivotally secured thereto, of the curved arm pivoted to said plate at one end and removably secured thereto at its other end, substantially as shown and described.

386,267. WEATHER-STRIP. ROBERT C. REDMAN, Salem, Oreg. Filed Feb. 20, 1888. Serial No. 265,264. (No model.)



Claim.—1. A weather-strip consisting of an angular strip loosely pivoted in a recess in the bottom of a door and having a slot in the upper edge of one of its angular portions loosely engaging a depending spring in said recess, and its other angular portion projecting outward through a recess in the door and having a pin adapted to engage an inclined slot in a plate on the threshold, substantially as described.

2. A weather-strip comprising the following parts: an angular strip loosely pivoted on a support in the bottom of a door, with one of its angular portions projecting upward into a recess in the lower edge of the door and the other angular portion projecting outward through a recess in the lower edge of the door, a depending spring loosely engaging a slot in the first-named angular portion, and a plate on the threshold having an inclined slot with which a pin in the weather-strip engages, substantially as described.



3. In a weather-strip, the combination, with threshold 15, having plate 14, with inclined slot 16, of door 4, having recess 3, strip 1, located in said recess, with portion 2, having slot 12, engaging spring 10, secured in block 11, and portion 5, projecting through recess 6 and having depending pin 13, and the recesses 9, engaging supporting-lugs 7, secured in recesses 8, substantially as described.

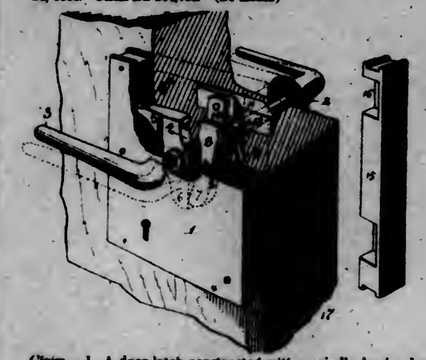
386,268. PROCESS OF PREPARING MASHES IN BEER-MAKING. GOMEAY SAHOLA and JAMES BARKER, Brooklyn, and WILLIAM H. DAVIS, Long Island City, N. Y. Filed Apr. 12, 1887. Serial No. 234,971. (No specimens.)

Claim.—The herein-described process of mashing malt and unmalted grain, consisting in mixing the ground malt with water at an ordinary temperature to obtain an infusion of malt, separating said infusion from the malt by filtering, mixing the residual malt with cornmeal and water and heating it nearly to the boiling temperature, mixing the infusion of malt with ryemeal at ordinary temperature, and adding the hot corn-mash to said ryemeal, and then allowing the mash obtained to cool for treatment, substantially as described.

386,269. CUPOLA-FURNACE. CARL SAHLIN, Cologne, Germany, assignor to Friedrich August Herberts, same place. Filed Sept. 6, 1887. Serial No. 248,774. (No model.) Patented in Germany Aug. 11, 1887, No. 42,888, and in England Aug. 26, 1887, No. 11,612.

Claim.—1. A cupola-furnace having the lower part built of masonry and its upper part of sheet metal, a sheet-metal casing around said upper part, forming an air-heating chamber, the masonry being provided with conduits extending from said air-heating chamber downwardly and opening vertically at the lower end of said masonry, a hearth below and concentric with the lower end of said masonry, and means for raising and lowering said hearth to open or close the lower end of said hot-air conduits to any desired extent, substantially as described.

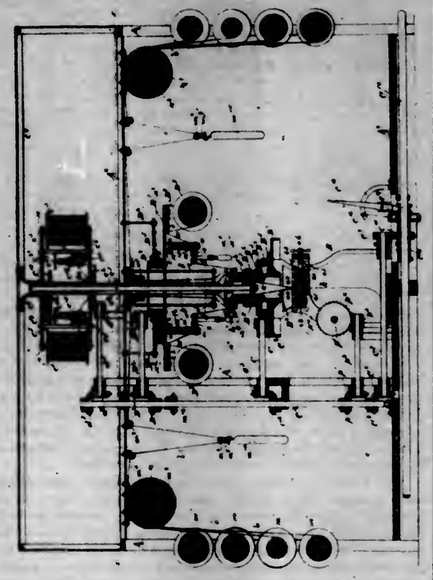
2. A cupola-furnace having its lower part built of masonry and its upper part of sheet metal, a sheet-metal casing around said upper part, forming an air-heating chamber, the masonry being provided with conduits extending from said air-heating chamber downwardly and opening vertically at the lower end of said masonry, a hearth below and concentric with the lower end of said masonry, forming an annular opening extending from the exterior of the furnace into the fire-pot, adjustable segments covering said opening upon the exterior of the furnace for regulating the admission of cold air, and means for raising and lowering said hearth to open or close the lower end of said hot-air conduits to any desired extent, substantially as described.



386,270. WIRE FENCING. CHARLES SHAW, Wolverhampton, County of Stafford, England. Filed Nov. 4, 1887. Serial No. 254,572. (No model.)

Claim.—1. A fence-bar having a slotted opening through which a fence-wire is passed, which opening communicates with a larger circular aperture in which the fence-wire is retained, in combination with a fastener having a hollow cylindrical part bent or formed to fit in and conform in shape with the walls of said circular aperture, said cylindrical part being greater in diameter than said slotted opening, and said cylindrical part extending around only a part of the periphery of said circular aperture, and said fastener also having side flanges of greater diameter than said slotted opening, which rest against the bar on opposite sides of said circular aperture when the fastener is applied to the bar, the flange on one side at least being constructed to be bent down against the bar, substantially as set forth.

2. A fence-bar having a slotted opening through which a fence-wire is passed, which opening communicates with a larger circular aperture in which the fence-wire is retained, in combination with a fastener which has a hollow cylindrical part of greater diameter than the width of said slotted opening, said cylindrical part fitting and turning within said circular aperture, and said cylindrical part having an open slot communicating with its central bore, said slot, when the cylindrical part is turned, coinciding with said slotted opening in the bar, and said fastener having on one end of said cylindrical part a fixed flange, which rests against said bar on one side of said aperture, and said fastener having on its opposite side a tongue, which is passed through said aperture, and which is bent down against the bar on the opposite side of said aperture, substantially as set forth.



386,271. LATCH. LAUREN S. SUMAY, Steelton, Pa. Filed Feb. 21, 1888. Serial No. 264,703. (No model.)

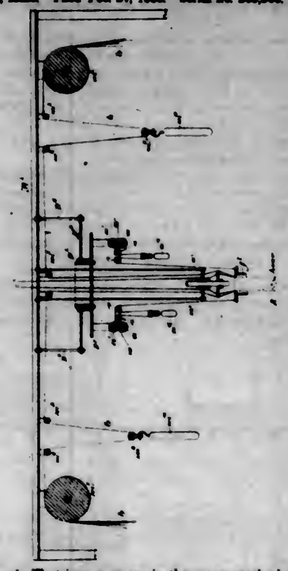
Claim.—1. A door-latch constructed with a spindle having handles, a dog mounted on the spindle and having an angular projection at one end, a stop projecting from the side of the casing adapted to limit the movement of the dog, a lever pivoted to the side of the casing having a reacting-spring bearing against its lower end, which in turn bears against the lower end of the dog, a stop-pin secured to the casing, which limits the return movement of the lever, and a sliding latch-bolt pivotally connected to the upper end of the latter, substantially as described.

2. A door-latch consisting of the following parts: a spindle, 2, having handles 3 and dog 4, with angular projection 5 integral therewith, stop-pin 6, secured to the side of the casing 1, a lever, 8, having its lower end bearing against the lower end of the dog 4 and its upper end pivoted to the sliding latch-bolt 11, a stop-pin, 12, secured to the casing 1, and a reacting-spring, 9, bearing against the lower end of the lever 8, substantially as described.

386,272. KNITTING-MACHINE. Edwin R. Sibley, Chelsea, Mass. Filed June 13, 1887. Serial No. 241,726. (No model.)

Claim.—1. The combination, with a needle-cylinder, a cam-cylinder, suitable means to move the cam-cylinder, a series of reciprocating needles, and means, as feed-rolls, to positively feed the warp-threads from their source of supply on their way to the needles, of means, as weights, substantially as described, to produce uniform tension upon the individual warp-threads between the feeding-rolls and the needles, whereby the warp-threads introduced into the fabric being knitted by the needles are subjected to uniform tension, substantially as and for the purpose set forth.

2. The needle-cylinder, a series of needles therein, means to reciprocate the said needles, feeding-rolls to act upon and feed the knitting-threads to be supplied to the needles, guides for the weft-threads feeding-rolls to feed the weft-threads from their spools or bobbins preparatory to entering the said guides, and a tension device to act upon each weft-thread between the feeding-rolls and its guide to hold the said weft-thread under uniform tension, substantially as described.



3. The needle-cylinder, a series of needles therein, means to reciprocate the said needles, feeding-rolls to feed the knitting-threads, guides for the weft-threads, means to feed the weft-threads forward to the fabric, and a tension mechanism, substantially as described, to act upon each weft-thread between its feeding-rolls and the said guides to subject the weft-threads to uniform tension, combined with a feeding mechanism, substantially as described, for the warp-threads, a contracting device to bring the warp-threads into a circle, a warp-spreading device, means to operate it, and a series of weights, one acting upon each individual warp-thread, to hold the same under like and uniform tension on their way to the fabric, substantially as described.

4. The needle-cylinder, a series of needles therein, means to reciprocate the said needles, a circle-contracting device to support a series of warp-threads on their way to the fabric, and a warp-spreader and means to operate it, combined with a comb, m^7, substantially as described, to receive the said warp-threads and guide them while being acted upon by the warp-spreader, as and for the purpose set forth.

5. The needle-cylinder, a series of needles therein, means to reciprocate the said needles, and a circle-contracting device to support a series of warp-threads on their way to the fabric, a warp-spreader, means to operate it, and a comb, m^7, to support the warp-threads on their way to the spreader, the said comb being provided with a thread guide or eye, 30, to control the knitting-thread and move it within the comb m^7, substantially as described.

6. The needle-cylinder, a series of needles therein, and means to actuate them, combined with two pairs of drawing-rolls to take the knitted fabric from the needle-cylinder, and with a presser-roll, as 43, to act simultaneously upon one roll of each pair of drawing-rolls and force them uniformly against the fabric passing between them and their opposed rolls, substantially as described.

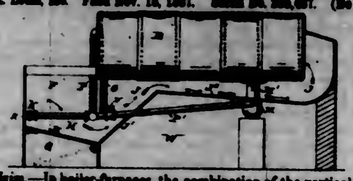
386,273. ART OF KNITTING HOSE-PIPE. Edwin R. Sibley, Chelsea, Mass. Filed Feb. 27, 1888. Serial No. 265,366. (No model.)

Claim.—1. That improvement in the art or method of producing a uniformly-strong knitted hose pipe or fabric containing warp and weft threads which are incorporated with a knitting-thread, which consists in feeding the warp-threads positively from their source of supply, forming slack therein, and thereafter subjecting said slack threads independently to a uniform constant strain until united with the weft-thread in the fabric, thus always maintaining the warp-thread under the same tension throughout the fabric, substantially as set forth.

2. That improvement in the art or method of producing a uniformly-strong knitted hose pipe or fabric containing warp and weft threads which are incorporated with a knitting-thread, which consists in feeding both the warp and weft threads positively from their source of supply, thus forming slack therein, and thereafter subjecting said slack threads independently to a uniform constant strain until the warp-thread is united with the weft-thread in the fabric, thus always maintaining the warp and weft threads under the same tension throughout the fabric, substantially as set forth.

386,274. BEARING-LUBRICATOR. Frank S. Sohm, Lawrence, assignor to Dudley M. Holman, Boston, Mass. Filed Sept. 16, 1885. Renewed Oct. 6, 1887. Serial No. 251,662. (No model.)

Claim.—1. The combination, in a lubricator, of the cup having the discharge-nozzle, the cut-off sleeve for opening and closing the openings leading to the nozzle, and the regulating-valve for controlling the quantity of oil fed from the cup, substantially as described.



2. The combination, in a lubricator, of the cup, the tube C, having the openings F, and the discharge-nozzle forming a tapered valve-seat, with the cut-off sleeve N, for opening and closing the openings F, and the tapered valve O in the valve-seat, to regulate the quantity of oil fed from the cup, substantially as described.

3. The combination, in a lubricator, of the cup, the tube C, having the openings F, and the discharge-nozzle forming a tapered valve-seat, with the cut-off sleeve N, and the tapered valve O, having the stem extending through the sleeve, and air-passages to permit the flow of oil through the discharge-nozzle, substantially as described.

4. The combination of the oil-cup, the tube C, interiorly and exteriorly screw-threaded and having the openings F, and the discharge-nozzle forming a tapered seat, with the cut-off sleeve N, screwed on the outside of the tube, and the tapered valve O, having the stem O,

of less diameter than the bore of the sleeve and extending therethrough, and having the screw-thread at its lower end working in the tube C, and the air-passages O^2, for the purpose set forth, substantially as described.

386,275. STEAM-BOILER FURNACE. Charles E. Sautelle, St. Louis, Mo. Filed Nov. 18, 1887. Serial No. 255,627. (No model.)

Claim.—In boiler-furnaces, the combination of the vertical screen O, grates L, drop-door N, and rising steps J', constituting a combustion-chamber, all arranged substantially as shown and described.

386,276. THILL-COUPLING. Andrew J. Sykes, Portland, Oreg., assignor to himself, William J. Hazelett, and Edward A. King, all of same place. Filed Dec. 21, 1887. Serial No. 258,668. (No model.)

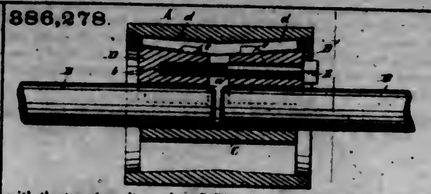
Claim.—1. The combination, with the clip B, provided with the tapering dovetailed groove *d*, of the coupler C, having the tapering dovetailed arm *c*, substantially as described.

2. The combination, with the clip B, having a dovetail groove, *d*, the coupler C, having a dovetail arm, *c*, adapted to enter the groove *d*, of the conically-pointed screw D, substantially as and for the purpose described.

3. The combination of the clip B, provided with the tapering dovetailed groove *d*, the coupler C, having the arm *c*, the conically-pointed screw D, furnished with the eye *g*, and the strap *h*, attached to the axle and extending through the eye *g* of the screw, substantially as described.

4. The combination, with the clip B, having a tapering dovetail groove, *d*, of the coupler C, said coupler consisting of the body portion having a tapering dovetail arm, *c*, adapted to be fitted in the groove *d*, and the forwardly-extending arms terminating in apertured ears K, substantially as and for the purpose described.

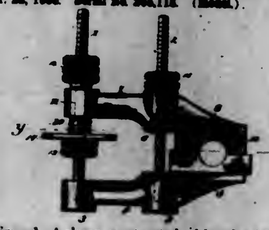
386,277. PACKAGE FOR BUTTER, &c. Lewis Seavers, Binghamton, N. Y., assignor of one-half to Benjamin F. Whitsell, same place. Filed Apr. 21, 1888. Serial No. 271,698. (No model.)



Claim.—1. The improved butter-package composed of the bottomless case A, hoops *b b*, secured to the upper and lower parts of the interior of said case, the tub B, seated upon said hoops, and the veneering *c c c*, placed removably on the interior of the tub, substantially as described and shown.

2. The combination of the bottomless case A, the non-metallic lining *a*, secured thereto by hoops *b b*, attached, respectively, to the exterior of the case and interior of the lining at the upper and lower ends thereof, the tub B, resting upon the upper and lower hoops on the interior of the aforesaid lining, and the veneering *c c c*, placed removably on the interior of the tub, substantially as described and shown.

386,278. SHAFT-COUPLING. Reuben J. Speare, New Hamburg, N. Y. Filed July 21, 1888. Renewed Mar. 3, 1888. Serial No. 266,104. (No model.)



Claim.—1. The casing A, formed with the central bridge or seat, C, for the shafts and with the double-inclined ribs *d*, parallel with each other and projecting from the inner wall of the casing, in combination

with the two opposite wedges D D' and screw-bolts E, for drawing the wedges into the casing, substantially as described.

2. The wedges D, formed with the inclined ribs *c* and studs *e*, in combination with the bolts E and the casing A, formed with the seat C, and with the inclined ribs *d*, substantially as described.

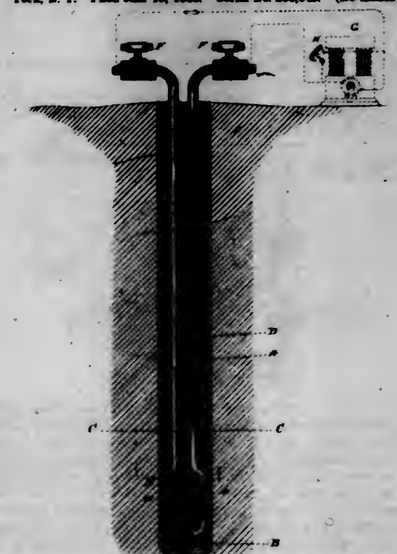
386,279. CLAMP. Wendell P. Tassell, Bedford, N. Y. Filed Mar. 22, 1888. Serial No. 268,113. (Model.)

Claim.—1. A clamp constructed with a fixed jaw having an arm provided with screw-rods, and a movable jaw loosely mounted on one of the screw-rods, which is provided with a clamping-nut, and having an arm provided with a screw-threaded socket engaging a hollow screw loosely mounted on the other screw-rod having a thread different in pitch from the hollow screw through which the rod freely passes, a lever-bar loosely mounted on the latter adjacent to the hollow screw, and an adjusting and clamping thumb-nut also mounted on the same screw-rod adjacent to the lever-bar, substantially as described.

2. In a clamp constructed as herein described, a fixed jaw having an arm with detachable screw-rods, a movable jaw having an arm loosely mounted on one of the screw-rods, which is provided with a screw-threaded clamping-nut, a hollow screw loosely mounted on the other screw-rod and adjustable in the arm of the movable jaw, with a clamping-nut adjustable against the hollow screw, substantially as described.

3. A clamp consisting of the following parts, viz: a fixed jaw, 5, having an arm, 4, screw-threaded sockets 3 3, in which are located removable screw-rods 1 2, the movable jaw 8, having an arm, 7, provided with perforation 6, through which the screw-rod freely passes, a clamping-nut, 15, mounted on the rod 2, the adjustable hollow screw 10, mounted in the screw-threaded sockets 11 of arm 7 and loosely mounted on the screw-rod 1, the lever 14, loosely mounted on rod 1 beneath screw 10, and the clamping-nut 13, screw-threaded on rod 1 beneath lever 14, substantially as described.

386,280. WELL-DRILL. Silas W. Tyus and Cheston C. Clark, San Angelo, Tex. Filed Jan. 18, 1888. Serial No. 261,107. (No model.)



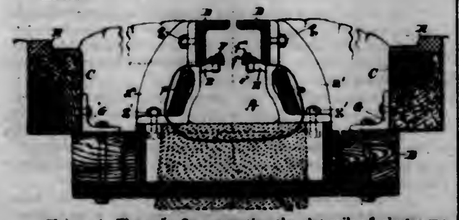
Claim.—1. The combination of the reamer R, provided with the longitudinal slot *a*, terminating with the dovetail *a'* at its inner end, and the club-bit C, having the shank C' formed with the dovetailed head *c* and inserted in the aforesaid slot and detachably secured therein, substantially as described and shown.

2. The combination of the reamer R, provided with the longitudinal slot *a*, the bit C, having the shank C' inserted in said slot, ribs *b b*, rigidly secured to the said shank and abutting against one side of the reamer, and the strip *d*, detachably connected to the shank C' and abutting against the opposite side of the reamer, substantially as described and shown.

3. The combination of the reamer R, provided with the slot *a*, terminating with the dovetail *a'*, the bit C, having the shank C' formed with the dovetailed head *c* and inserted in the aforesaid slot, the ribs

b b, rigidly secured to the shank C and abutting against one side of the reamer, the strip *d*, detachably connected to the said shank and abutting against the opposite side of the reamer, and the band *e*, embracing the reamer and bit-shank, substantially in the manner specified and shown.

386,281. METHOD OF BLASTING. HEPPENSTALL WARNELL, New York, N. Y. Filed Jan. 13, 1888. Serial No. 260,645. (No model.)



Claim.—1. The method of separating rock and like material, consisting in confining a non-explosive electrical conducting body within the mass of material to be acted upon, passing an electric current through said confined body, and thereby causing disruption of the material by the expansion of the confined body without exploding the same, substantially as set forth.

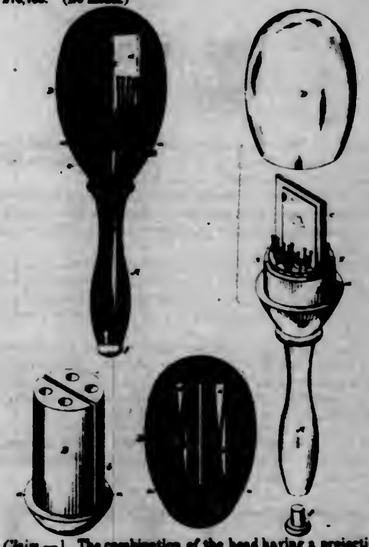
2. The method of separating rock and like material, which consists in boring a hole therein, placing in said hole an electrical conducting material, tamping the hole above said material, and passing an electric current through such material, so that the same is made to expand and to disrupt the rock by such expansion, substantially as set forth.

3. The method of separating rock and like material, which consists in boring a hole therein, placing in said hole an electrical conducting material of high resistance, tamping the hole above said material, and passing an electric current through such material, so that the same is made to expand and to disrupt the rock by such expansion, substantially as set forth.

4. The method of separating rock and like material, which consists in boring a hole therein, placing in said hole an electrical conducting material of high resistance, inserting in said material the ends of electrical conductors, filling the hole with tamping material, so as to separate said conductors, and passing an electric current through said conductors, substantially as set forth.

386,282. TUNNEL-CONSTRUCTION FOR ELECTRIC RAILWAYS. GRANVILLE T. WOODS, Cincinnati, Ohio, assignor to the Woods Electric Company, same place. Filed May 2, 1887. Serial No. 236,777. (No model.)

Claim.—1. The yoke for supporting the slot-rails of electro-motive-railway tunnels, consisting of a base-piece adapted to fit over and upon the sides and top, a cross-tie beneath the roadway-surface, and two removable jaw-pieces adapted to rest upon and be secured to said base and support angle-iron slot-rails, substantially as set forth.



2. The improved yoke for electro-motive-railway tunnels, consisting of a base and two upwardly-projecting jaws, each provided with an inwardly-projecting bracket for maintaining the conductors, and a recessed face above the bracket for maintaining the angle-iron slot-rails, substantially as set forth.

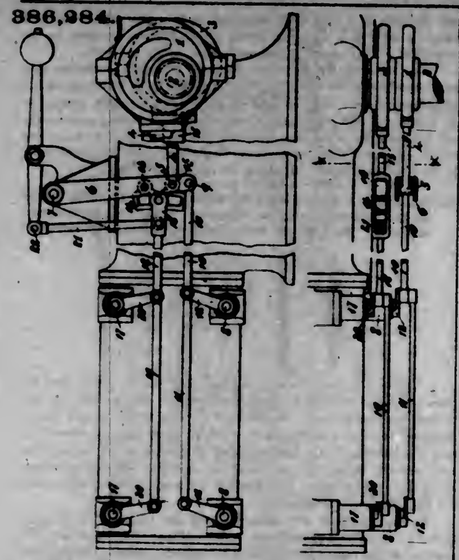
3. In electro-motive railways of the character described, the combination, with suitable tunnel-supports, of two continuous conductors of the same polarity, with independent cross-connections, substantially as set forth.

4. In electro-motive railways of the character described, in combination with insulated tunnel-supports, a conductor embodying an angle-iron strip extending over successive supports and down at the inside of the same, and a copper strip or facing superimposed upon the upper face of the angle-iron, substantially as set forth.

5. The tunnel-construction for electro-motive railways, embodying, in combination, the yokes A, brackets E, insulated supports *f*, and conductors F F', arranged and operating substantially as set forth.

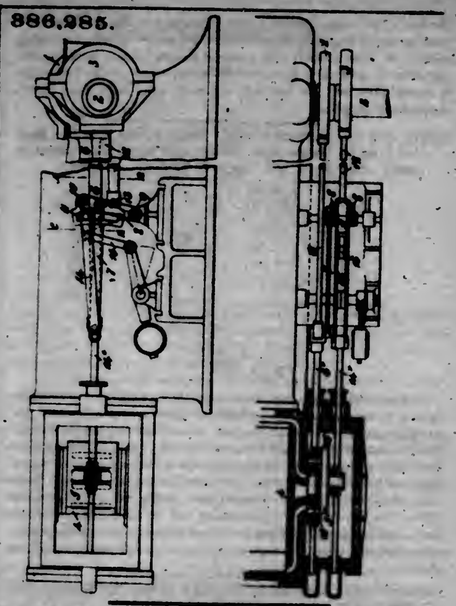
386,288. COMBINED NEEDLE-CASE AND BARBING IMPLEMENT. HERMAN G. ARNTZEN, Bay Shore, N. Y., assignor of one-half to Wilson Pratt, Philadelphia, Pa. Filed Apr. 16, 1888. Serial No. 270,780. (No model.)

Claim.—1. The combination of the head having a projecting portion with a transverse slot extending from side to side of the same and adapted to hold a paper of needles, with a cap or cover fitted to said projecting portion of the head and having a recess of such depth as to receive said paper of needles, all substantially as specified.



2. The combination of the head having a projecting portion with a transverse slot extending from side to side of the same and adapted to hold a paper of needles, and having openings formed therein at the sides of the slot, with the cap or cover fitted to said projecting portion of the head and having a recess of such depth as to receive the paper of needles, all substantially as specified.

386,284. VALVE-GEAR. ROBERT M. BAILY, Jr., Paddington, County of Middlesex, England. Filed Sept. 29, 1886. Serial No. 214,650. (No model.) Patented in England Nov. 17, 1886, No. 14,660, and in Canada Oct. 30, 1886, No. 28,266.



Claim.—1. In an engine having separate admission and exhaust valves, a pivoted lever, 6, connected at its free end to said exhaust-valves, means for imparting motion to said lever, a link connected near its full gear end to said lever intermediately of the ends of the latter, whereby that end of the link has a movement similar to that of the exhaust-valves, but less, the other end of said link being connected to an eccentric which imparts a motion opposite to that of the piston and equal to twice the linear advance of the admission-valves corresponding to the lead opening only.

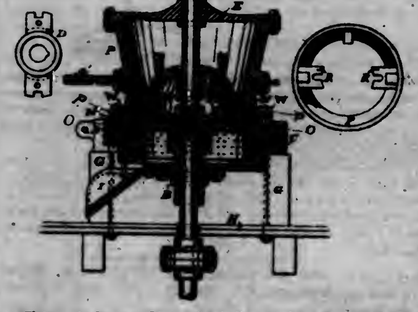
2. In an engine having separate admission and exhaust valves, a link, 14, a block capable of sliding in said link, connection from said block to admission-valves, means for varying the position of the block

386,284.

386,285.

in said link, a pivoted arm or lever, 6, connected to said link, and means for imparting motion thereto, combined and arranged as shown, so that the part of said link attached to said arm or lever has a movement similar to that of the exhaust-valves, but of smaller amplitude, corresponding to latest cut-off, while the other end of said link has a movement opposite in direction to that of the piston and equal to twice the linear advance of the admission-valves corresponding to lead opening only, substantially as hereinbefore described, for the purpose specified.

3. In an engine having separate admission and exhaust valves, the combination, with said valves, of a link, 14, a block capable of sliding therein, connection from said block to the admission-valves, means for varying the position of the block in said link, a pivoted arm or lever, 6, connected to said link 14 at 13, and connected at 9 to rods 10 and 11 for actuating the exhaust-valves, an eccentric, 1, on the crank-shaft, connected to the said arm or lever 6, and means for imparting to that end of the link not connected to said arm or lever 6 movement opposite in direction to that of the piston and equal to twice the linear advance of the admission-valves, substantially as hereinbefore described, for the purpose set forth.



4. In an engine having separate admission and exhaust valves, the combination, with said valves and eccentrics 1 and 3 on the engine-shaft 2, of an arm or lever, 6, working on a pivot or joint, 7, rod 4, operated by eccentric 1 and connected at 5 to said arm or lever 6, a slot-link, 14, connected at 13 to said arm or lever, rods 18 and 19, connected to the admission-valves, lifting-rod 21, a rod, 15, worked by eccentric 3 and connected at 16 to link 14, and rod 10, connected at 9 to the arm or lever 6 and to the exhaust-valves, all substantially as described and shown, for the purpose specified.

386,285. VALVE-GEAR. ROBERT M. BAILY, Jr., Paddington, County of Middlesex, England. Filed Sept. 29, 1886. Serial No. 214,649. (No model.) Patented in England Nov. 17, 1886, No. 14,660, and in Canada Oct. 30, 1886, No. 28,266.

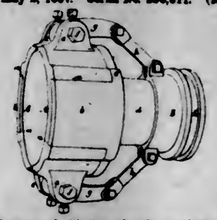
Claim.—1. In a steam or gas engine, in combination with a main valve, 4, and an expansion-valve, 5, a slot-link, 11, connected near its full-gear end to the main-valve rod 6 through a lever, 8, whereby such link has a movement similar in time to that of the main valve, but of greater amplitude, corresponding to the latest cut-off, and its other end connected to a part of the engine having a movement opposite to that of the piston corresponding to the earliest cut-off, all combined and arranged for joint operation substantially as herein specified.

2. In a steam or gas engine, a main slide-valve, 4, and an expansion-valve, 5, riding thereon, a slot-link, 11, a rod, 7, and lever 8, connecting one end of said slot-link with the main-valve rod 6, and a rod, 12, connecting the other end of said slot-link with an eccentric, 3, in combination with each other and with a block sliding in said slot-link and connected with the rod of the expansion-valve 5, and with means 16, for adjusting the position of said block, all substantially as herein specified.

386,286. CRUSHING AND GRINDING MACHINE. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed May 9, 1887. Serial No. 237,555. (No model.)

Claim.—1. In a crushing and grinding machine, the combination, with the grinding-cone and the internally-screw-threaded base-piece, of a shell composed of sections, the lower of which has an externally-screw-threaded flange engaging with said screw-threaded base-piece, the whole entirely surrounding and adjustable with relation to the grinding-cone, substantially as described, and for the purpose set forth.

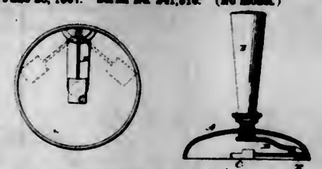
2. In a crushing and grinding machine, the combination, with the shell and the grinding-cone rotating therein, of the half-arms R R, attached to said grinding-cone, and half-arms D D, keyed on the operating-shaft and locking said grinding-cone securely thereto, substantially as and for the purposes set forth.



3. In a crushing and grinding machine, the combination, with the grinding-cone and internally-screw-threaded base-piece, of a shell adjustable on the same and made in sections, and provided with a flange engaging with the internally-screw-threaded base-piece, substantially as and for the purposes set forth.

4. In a grinding and crushing machine, the combination, with the screw-threaded base, and shell provided with the externally-screw-threaded flange L and with projections formed with the cavities *e* therein, for the purposes set forth, of a grinding-cone rotating within said shell, substantially as described.

5. In a grinding and crushing machine, a coarse-toothed shell, P, with external flanges *p* at the bottom, said flanges having bolt-holes



therein, a fine-toothed shell, N, also provided with external flanges O, with corresponding bolt-holes, an externally-screw-threaded elevating-section, M, also provided with external flanges L, with corresponding bolt-holes X, said parts P, N, and M being securely bolted together, in combination with an internally-screw-threaded base-piece, C, substantially as described.

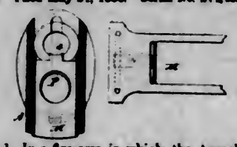
386,287. FRICTION-CLUTCH. HENRY BARNES, Hyde Park, Mass.; ANN L. BARNES, Orange, Mass., administratrix of said Henry Barnes, deceased. Filed May 2, 1887. Serial No. 236,811. (No model.)

Claim.—The improved friction-clutch, consisting of the tubular shank *d*, having a head, *c*, provided with ears *b b*, extending in opposite direction to the shank, the two areal jaws A, grooved at their middles to receive the said ears, and having lugs *e* extending from them, (the said jaws,) as represented, near their ends, the two sets of right and left threaded screws *f*, fixed and arranged, as shown, in the lugs *e*, the internally-screw-threaded arms *g*, adapted to turn on the said screws, the sleeve B, encompassing and movable endwise on the shank, and the toggles *h*, jointed to the said sleeve and the internally-screw-threaded arms, all being arranged and to operate essentially as set forth.

386,288. HAND-BELL. WILLIAM H. BARTON, East Hampton, Conn. Filed June 20, 1887. Serial No. 241,816. (No model.)

Claim.—1. The combination of an open-mouth bell, a handle attached to the back of the bell in axial line therewith, and a hammer supported within the bell, said support extending from the center or axis of the bell, and the hammer arranged to move in a plane at right angles to the axis of the bell, substantially as described.

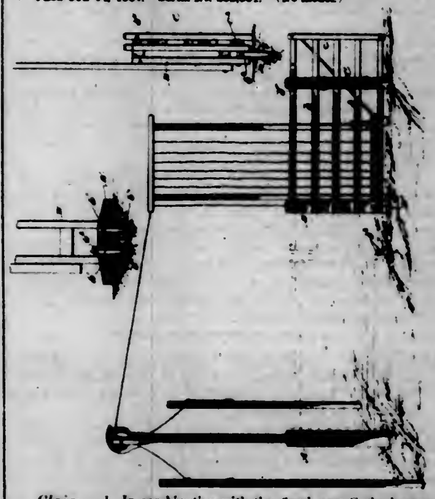
2. The combination of an open-mouth bell, a handle, B, secured to the back of the bell and extending in an axial line therefrom, a bracket fixed to the axis of said bell and extending radially therefrom, and a hammer hung to the outer end of the said bracket and adapted to swing in a plane at right angles to the plane of the bell, substantially as described.



386,289. GONG AND SIGNAL CHAIR FOR HOTELS, &c. MIRIAM E. BELLAMIE, Washington, D. C. Filed Oct. 1, 1887. Serial No. 251,180. (No model.)

Claim.—1. A signal to be displayed on the backs of chairs and the like, consisting of a gong secured to the seat of a chair and within reach of the hand, and having a rod passing therethrough for sounding an alarm, the prolongation of said rod being pivotally attached to a lever fulcrumed on said seat, the opposite end of said lever being attached to a vertically-operating connecting-rod to actuate the same and through it a rock-shaft attached to the chair-back, and upon which is secured a signaling device which may be elevated or depressed at will by means of the mechanism herein set forth.

2. A signaling device of the character described, consisting of a gong attached to the seat of a chair and having its sounding-rod extended to connect with one arm of the lever *e*, pivotally secured to the bottom of said chair, and the vertically-reciprocating connecting-rod *d*, having its lower end attached to the outer end of said lever and its upper end attached to the rock-shaft *e f*, located on the back of the chair to actuate a signaling device secured thereto.

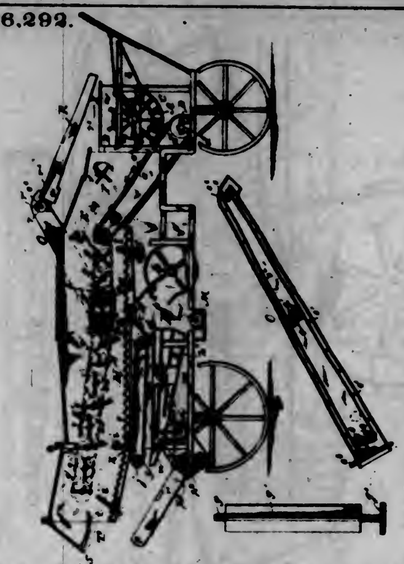


386,290. MAGAZINE FIRE-ARM. THOMAS G. BERGERY, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed May 21, 1886. Serial No. 274,492. (No model.)

Claim.—1. In a fire-arm in which the barrel opens into the receiver at the rear, and which is adapted to employ headless cartridges, the combination therewith of a spring-dog arranged for radial movement with relation to the cartridge-chamber, the nose of the said dog standing in the path of entering cartridges and adapted to automatically engage the groove of the cartridge when the cartridge in the cartridge-chamber is in position for firing, substantially as and for the purpose described.

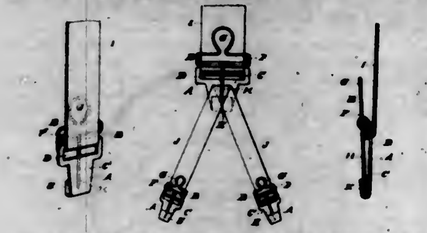
2. In a magazine fire-arm in which the magazine is arranged beneath the barrel and both the barrel and magazine open into the receiver at the rear, and which arm is adapted to employ headless cartridges, the combination therewith of a vertically-sliding spring-dog, M, arranged in the forward end of the receiver, and so as to move in a plane parallel with the plane of the rear end of the barrel and magazine, the said dog constructed with an opening through it corresponding to the opening in the magazine, and with a nose, *d*, which normally stands within the area of the cartridge-chamber, substantially as described, and whereby said nose is adapted to engage the groove in the cartridge-shell.

386,291. GATE. CHARLES W. BIRDSOTHER, Grand Rapids, Ohio. Filed Oct. 14, 1887. Serial No. 252,231. (No model.)



Claim.—1. In combination with the fixed post C, the horizontally-sliding fence-panel B, the stop b^2, to prevent the retreat of said panel, and the vertically-swinging gate pivoted to the sliding panel, as shown.

2. In combination with a pivoted vertically-swinging gate, a horizontally and longitudinally sliding frame having the gate attached to its forward end, and arranged to be sustained when open wholly thereby.



386,292. THRASHING-MACHINE. WASHBURN BRADSLEY, Pine Lake, assignor of one-half to Salmon Brown, Ellsworth City, Wis. Filed Mar. 15, 1884. Renewed Mar. 15, 1888. Serial No. 267,293. (No model.)

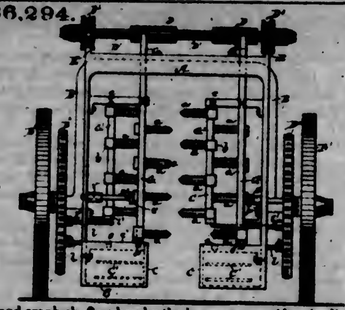
386,292.

Claim.—The combination of the carrier H, having an open portion, a series of beaters arranged above said open portion and having their blades set at right angles to each other, a shoe, K, an endless closed and slatted carrier above the same, and a fan adapted to deliver a current of air above and over said shoe and upward through the carrier H and create a vacuum beneath the shoe, substantially as set forth.

386,293. BUCKLE. GEORGE BRADSHAW, Mattoon, Ill. Filed Nov. 26, 1887. Serial No. 256,260. (No model.)

Claim.—1. The combination of the piece A, of sheet metal, provided at one end with a keeper-socket and at the other end with a a transverse loop, and the piece B, made of wire and provided with the transverse loop, the finger-hold, and the tongue adapted to engage the keeper, substantially as specified.

2. The combination of the piece A, consisting of the plate C, the loop D, and keeper-socket E, with the piece B, consisting of the loop F, the finger-hold G, and the tongue or pin H, substantially as specified.



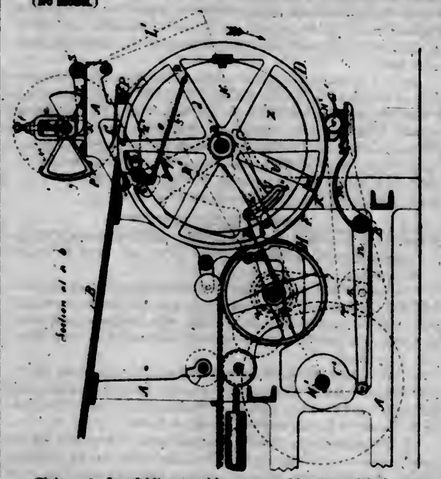
3. The combination of the device composed of the pieces A and B, the former having a transverse loop at one end and a keeper at the opposite end, and the piece B being provided with a transverse loop and a pin or tongue to engage the keeper on the part A, with the strap or web I engaging the pieces A and B, substantially as specified.

4. The combination of the metallic piece provided with a transverse loop and a keeper, the metallic piece B, having a transverse loop and a tongue or pin extending therefrom, and the web engaging said parts, substantially as specified.

386,294. COTTON-HARVESTER. OWEN T. BOSS and WILLIAM L. LASSLEY, Newark, N. J.; said Boss assignor to the United States Cotton Harvester Company, of New York. Filed Jan. 14, 1886. Serial No. 188,884. (No model.)

Claim.—1. In a cotton-harvester, the combination, with a vehicle arched to pass over the cotton-plants, of a stem-carrying bar sustained movably upon the vehicle at each side of the plants, a series of picker-stems journaled upon each bar, the gearing for rotating the stems in one direction to gather the cotton and in the opposite direction to discharge the same, the cams for moving the bar laterally to and from the cotton-plant, and the slotted levers, crank-pins, and crank-shafts, whereby the bars are moved longitudinally at a differential speed, substantially as specified.

386,294.



2. In a cotton-harvester, the combination, with a vehicle arched to pass over the cotton-plants, of a stem-carrying bar sustained movably upon the vehicle at each side of the plants, a series of picker-stems journaled upon such bar, the gearing for rotating the stems in one direction to gather the cotton and in the opposite direction to discharge the same, the cams for moving the bar laterally to and from the cotton-plant, and the slotted levers, crank-pins, and crank-shafts, whereby the bars are moved longitudinally at a differential speed, substantially as specified.

3. In a cotton-harvester, the combination, with the vehicle, of the shafts D D', arranged transversely upon the top of the same, frames suspended from the shafts and movable laterally thereon, picker-stems journaled upon said frames, means actuated by the wheels of the vehicle to reciprocate the shafts and frames lengthwise of the vehicle, and fixed cams and means connecting them with the frames, whereby they are adapted to move the frames laterally when thus reciprocated, substantially as set forth.

4. In a cotton-harvester, the combination, with the reciprocating frame carrying a series of picker-stems, of the cam provided with the outer and inner grooves, and inclined channels at each end, a switch at the end of the rear channel, and a pin upon the frame fitted to such cam, substantially as set forth.

5. In a cotton-harvester, the combination, with a stem-carrying bar having a series of picker-stems journaled therein, of sprocket-wheels upon the arbors of such stems, an endless chain in contact with the sprocket-wheels, and a guard carrying the chains adjacent to the wheels to retain the chain thereon, substantially as specified.

386,295. MACHINE FOR FOLDING AND PASTING SHEETS OF PAPER. CYRUS CHAMBERS, Jr., and WILLIAM MERRIAM, Philadelphia, Pa., assignors to said Chambers. Filed Sept. 30, 1882. Serial No. 73,143. (No model.)

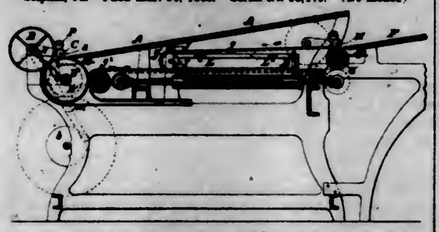
Claim.—1. In a folding-machine, the combination, with the rotary main drum having mechanism for gripping and releasing the sheets of paper, substantially as described, of the rotary feed-segments mounted

in reciprocating bearings, and the blade, all arranged substantially as and for the purpose set forth.

2. The vertically-reciprocating rotary feed-segments and blade, the stop-gages, the cam Z', and the main drum provided with the transverse bar M, and the ostecting gripper-fingers G, and the crossing-blade E, all constructed, combined, and operating substantially as and for the purposes set forth.

3. The combination, with the rotary main drum having mechanism for gripping and releasing the sheets of paper and the cam, both substantially as described, of the adjustable supplemental cam, the rotary feed-segments mounted in the reciprocating bearing, and the adjustable folding-blade, as and for the purpose set forth.

4. The combination, with the main drum and its gripping mechanism, of the feed-segments formed with the blade and having the shaft mounted in movable boxes, and the lever L on rock-shaft S, actuated by mechanism substantially as described, as and for the purpose set forth.



5. In combination with the main drum provided with the paste-blade F in the arc of a circle concentric with the drum, the paste-fountain provided with the roller H', substantially as shown and described.

6. In combination with the main drum provided with the paste-blades F and K, the vibrating fountain G', adapted to receive either a narrow-faced roller for applying paste to the blade F or a long-faced roller for applying paste to the blade K, substantially as set forth.

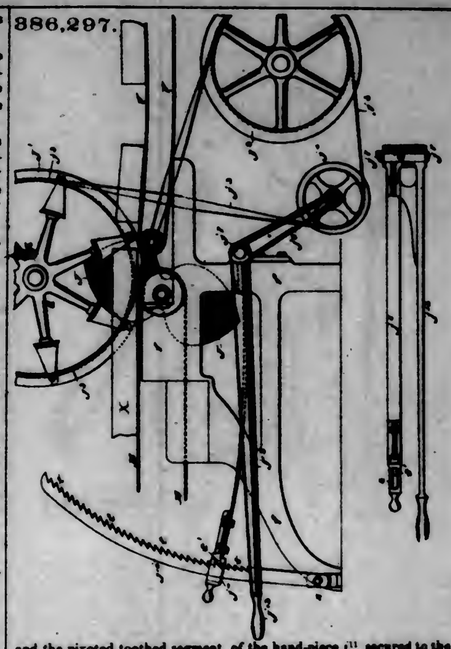
7. In combination with the drum and a pasting-blade thereon, the vibrating paste-fountain G', provided with a roller rotated at a surface speed equal to that of the said drum, substantially as stated.

8. The drum D, having the adjustable crossing-blade E and the grippers G, its shaft D', carrying the gears 1 and 1^a, the feed-segments, their shaft S, with gear 2, the nipper-roll, and its shaft C', having a gear which engages with the gear 1^a on shaft D', all combined, arranged, and operating substantially as and for the purpose described.

386,296. PAPER-FOLDING MACHINE. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Mar. 31, 1888. Serial No. 90,179. (No model.)

Claim.—1. In a folding-machine, the combination of mechanism, substantially as described, for folding the main sheet, the feed-table located at the rear end of the machine from which the supplemental sheets are fed, the tapes, the turn-over roll, the folding-blade, and the folding-rolls, also substantially as described, for feeding in the supplemental or inside sheets at the rear of the machine and conveying and turning them over and folding them with the folded main sheet, as set forth.

2. In a folding-machine, the combination of mechanism, substantially as described, for folding the main sheet and conveying the same toward the rear of the machine, a stop for arresting the folded sheet, the rolls B^s and knife L, arranged at right angles to the first pair of folding-rolls, the roll G and means, substantially as described, for feeding in the supplemental sheet, the turn-over roll I, and means, also substantially as described, for conveying the supplemental sheet into position to be folded in with the main sheet, as set forth.



386,297. BELT-TIGHTENER FOR BRICK-MACHINES. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed July 26, 1887. Serial No. 245,307. (No model.)

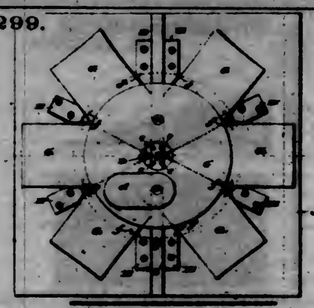
Claim.—1. The combination of the friction-pulley, the friction-belt, the tightener, the spring-regulating arm, the handle having the tooth, and the toothed segment, movable with relation to each other, all constructed and adapted to operate substantially as and for the purpose set forth.

2. The combination of the friction-pulley, the friction-belt, the pivoted tightener, the spring-regulating arm, the handle having the tooth, and the pivoted toothed segment, all constructed and adapted to operate substantially as and for the purpose set forth.

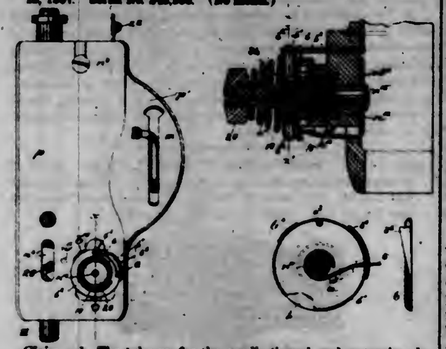
3. The combination of the friction-pulley, the friction-belt, the pivoted tightener, the spring-regulating arm, the handle having the tooth, and the pivoted toothed segment, together with the hand-lever j^{12}, all constructed and adapted to operate substantially as and for the purpose set forth.

4. The combination, with the pivoted tightener, the spring-arm, and the pivoted toothed segment, of the hand-piece j^{11}, secured to the end of said spring-arm and provided with the handle, slot e, and the tooth f, projecting into said slot, substantially as and for the purpose set forth.

386,298. GONG-BELL. JOHN P. CROSBIE, Kensington, Conn. Filed Apr. 23, 1888. Serial No. 271,512. (No model.)



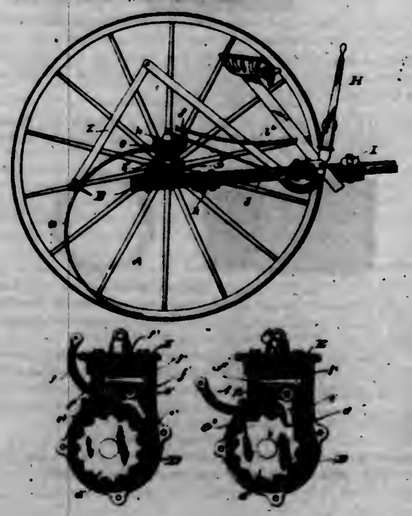
Claim.—In combination, the base-plate formed with a guide-slot, l, the pivoted lever h, the pivoted hammer d, carrying the catch f, the pawl j, pivoted on the lever h, and provided with a pin, k, to engage the guide-slot on the base-plate and draw the latch and pawl apart, and the springs pressing on the lever, hammer, and pawl, all substantially as described, and for the purpose specified.



386,299. ANIMAL-TRAP. THOMAS W. CRESSE, Orangeville, Pa. Filed May 10, 1888. Serial No. 273,411. (No model.)

Claim.—The combination, in an animal-trap, of a board or support, A, having a central opening, B, blocks E E, having ends beveled, said beveled ends projecting within the circumference of the opening B, platforms G, having their inner ends tapered and provided at their parallel sides with pivot-pins f, a cross-bar, E', having a central recess, the platform C, with a central opening, and a pivoted lid to provide a bait-receptacle, located centrally and above the pivoted platforms, substantially as shown, and for the purpose set forth.

386,299.



386,300. THREAD-CONTROLLING MECHANISM FOR SEWING-MACHINES. WILBUR F. BEAL, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed Aug. 15, 1887. Serial No. 246,966. (No model.)

Claim.—1. The take-up for the needle-thread and a tension device, combined with a spring-actuated thread-controlling arm having an open eye, 6, between its ends, and at one end a lock and a stud engaged by the lock, to operate substantially as described.

2. The take up for the needle-thread, a tension device, and the lip applied to one member of the tension device, combined with the spring-actuated thread-controlling arm having an open eye, 6, between its ends and at one end a lock and a stud engaged by the lock, to operate substantially as described.

386,301. RAKE. ROBERT W. RUSH, Springfield, Ohio, assignor to the Springfield Manufacturing Company, same place. Filed June 4, 1887. Serial No. 240,261. (No model.)

Claim.—1. The combination of the rake-head and an axle made in two parts, the inner ends of said parts being journaled in a case secured to the rake-head midway of its length, each of said axle parts being provided at the outer end with a carrying-wheel and at the inner end with a ratchet-wheel, the said ratchet-wheels being inclosed in said case, pawls on said rake-head adapted to engage said ratchet-wheels, and a trip-lever secured to the rake-head and adapted to engage said pawls and withdraw them from their engagements with said ratchet-wheels, substantially as specified.

2. The combination, with the rake-head, a divided axle, and the carrying-wheels, of the case secured to the rake-head midway of its length, in which the inner ends of the respective parts are journaled, ratchet-wheels on said divided axle located in said case, pawls on said rake-head adapted to engage said ratchet-wheels, a trip-lever to engage and disengage said pawls, and a catch for holding the trip-lever in either position of adjustment, substantially as set forth.

3. The combination of the rake-head and the divided axle, the parts of which are provided with ratchets adapted, respectively, to engage pawls on the rake-head, a ratchet-case surrounding said ratchets, and a truss or support attached at either end to the rake-head and extending under and bearing against said ratchet-case, substantially as specified.

4. The combination, with the rake-head and an axle made in two parts, said parts being connected together by a case in which the respective parts are journaled, of the truss or support secured at either end to said rake-head and extending under and bearing against said case to form a truss or bridge therefor, substantially as set forth.

5. The combination, with the rake-head, the divided axle, and the carrying-wheels, of the ratchet-wheels on said divided axle, a case secured to the rake-head and having bearings on the inner ends of the parts of said axle, pawls attached to said rake-head adapted to engage with said ratchets, said pawls being each provided with a projecting leg adapted to come in contact with a trip-lever and thus hold said pawls out of engagement with said ratchets, substantially as set forth.

6. The combination, with the rake-head, the divided axle, and the carrying-wheels, of the ratchet-wheels on said divided axle, the ratchet-case about said ratchet-wheels, the pawl-case secured to the rake-head and provided with pawls adapted to engage said ratchets, a trip-lever pivoted in said pawl-case and adapted to come in contact with said pawls and hold them out of engagement with said ratchets, the catch-lever f^3, adapted to engage with said trip-lever in different positions, and a spring in the top of said pawl-case adapted to bear against said catch-lever, substantially as and for the purpose set forth.

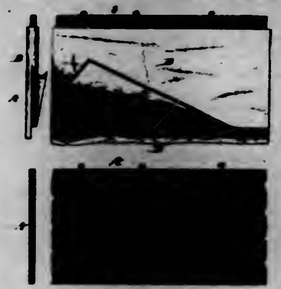
7. The combination, with the divided axle and the ratchet-wheels thereon, of the pawls adapted to engage with the respective ratchet-wheels and provided with projecting legs c^2, the trip-lever provided with a toe, f^4, adapted to engage the said legs c^2, and provided with a projection, f^5, the catch-lever f^3, adapted to engage on either side of the projection f^5, and the spring f^6, substantially as set forth.

8. The combination of the rake-head, the divided axle, and the carrying-wheels, the ratchet-wheels on said divided axle, the case about said ratchets, on which the respective parts of the said axle are journaled, the pawl-case on the rake-head provided with the pawls and trip-lever therein, said pawls being adapted to engage said ratchets, or to be held out of engagement with said lever, and a truss or support passing under and bearing against said case and connected to said rake-head, substantially as set forth.

386,302. APPARATUS FOR BLOWING GLASS. RICHARD B. BOSWAU, FRANCIS HASLETT, and JAMES JOHNSTON, Dublin, County of Dublin, Ireland. Filed July 9, 1887. Serial No. 243,880. (No model.) Patented in England Mar. 3, 1887, No. 3,259.

Claim.—1. In apparatus for blowing glass, the combination of the chamber a, the pipe b, the piston d, and the piston-rod d', said chamber a being provided with the passage a^2 for allowing the free movement of air past the piston when it is fully depressed, as herein specified.

2. In apparatus for blowing glass, the combination of the chamber a, the pipe b, the hollow piston d, and the hollow piston-rod d', with the tubular cap f, for providing for the ingress and egress of air at will in any position of the piston and for the repetition of the stroke of the piston, in the manner substantially as herein specified and set forth.



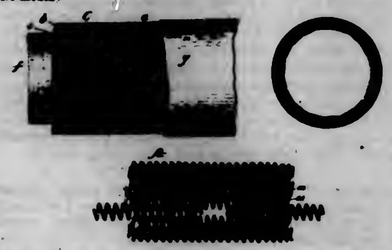
3. In an apparatus for blowing glass, the chamber a, provided with the passages a^2 at its lower end, and the pipe b, in combination with the hollow piston d, hollow piston-rod d', the tubular cap f, having side perforations, g, and sliding upon the upper end of said piston-

rod, whereby said perforations may be opened or closed, as and for the purpose specified.

4. The tubular piston-rod *d'* and lateral pin g^3, in combination with the tubular cap *f*, said cap comprising a body having a longitudinal slot, *h*, engaging said pin, and also having lateral openings *g*, so located as to be opened and closed by the sliding motion of the cap permitted by said slot and pin, and a closed top, *p*, substantially as specified.

5. In an apparatus for blowing glass, the chamber *a*, tube *b*, hollow piston *d*, and hollow piston-rod *d'*, in combination with the tubular cap *f*, fitting and sliding upon the upper end of said tubular piston-rod and provided with lateral openings, as described, the elastic material g^2 within said cap above the end of the piston-rod, the closed top *p*, and transverse pin *g'* for securing it in place, as and for the purpose specified.

386,303. BELTING. JAMES R. BRIDSON and THOMAS MIDGLEY, Beaver Falls, Pa. Filed Jan. 24, 1883. Serial No. 261,709. (No model.)



Claim.—1. As an improved article of manufacture, a belt composed of elongated wire links having the interstices between the links filled with rubber and forming a compound or metallic and rubber surface, substantially as described.

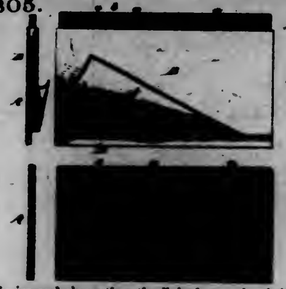
2. As an improved article of manufacture, a belt composed of elongated wire links having the interstices between the links filled with rubber and provided with metallic working-edges, substantially as described.

3. As an improved article of manufacture, a belt the surfaces of which are covered with canvas or rubber cloth and provided with metallic working-edges, substantially as described.

386,304. HOSE OR TUBING. JAMES R. BRIDSON and THOMAS MIDGLEY, Beaver Falls, Pa. Filed Feb. 13, 1883. Serial No. 263,902. (No model.)

Claim.—1. Flexible hose composed of a tubular metallic body formed of interwoven sections of coiled wire and a covering of rubber or its equivalent, substantially as described.

2. Flexible hose composed of a tubular metallic body formed of interwoven sections of coiled wire embedded in and covered with rubber or other flexible plastic material, substantially as described.

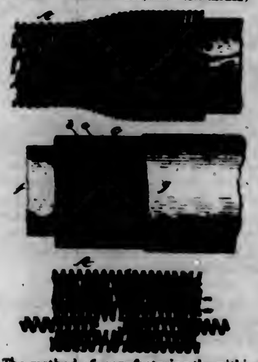


3. Flexible hose composed of a continuous tubular metallic body formed of interwoven elongated links, having the interstices between the links filled with rubber and its outer surface covered with the same, substantially as described.

4. Flexible hose composed of a tubular metallic body formed of interwoven elongated links, having the interstices filled with rubber and provided with a canvas lining and covering, substantially as described.

386,305. MANUFACTURE OF BELTING. JAMES R. BRIDSON and THOMAS MIDGLEY, Beaver Falls, Pa. Original application filed Jan. 24, 1883, Serial No. 261,709. Divided and this application filed Feb. 29, 1888. Serial No. 265,721. (No model.)

Claim.—1. The method of manufacturing belting herein described, which consists in forming a metallic body by intersecting coiled



386,305.

sections of wire and elongating the links by passing it between rolls, then coating the surface of the body with rubber or its equivalent, and finally passing the whole between heated metallic bodies, forcing the rubber into the interstices of the body and forming a compound or metallic and plastic surface.

2. The method of manufacturing belting herein described, which consists in forming a metallic body by intersecting coiled sections of wire and elongating the links by passing it between rolls, then coating the surface of the body with rubber or its equivalent, then passing the coated body between heated metallic bodies under pressure, forcing the rubber into the interstices of the body, then applying canvas or rubber cloth to the surfaces of the filled body, and again subjecting the whole to heat and pressure.

386,306. MANUFACTURE OF HOSE OR TUBING. JAMES R. BRIDSON and THOMAS MIDGLEY, Beaver Falls, Pa. Original application filed Feb. 10, 1883, Serial No. 263,902. Divided and this application filed Feb. 29, 1888. Serial No. 265,722. (No model.)

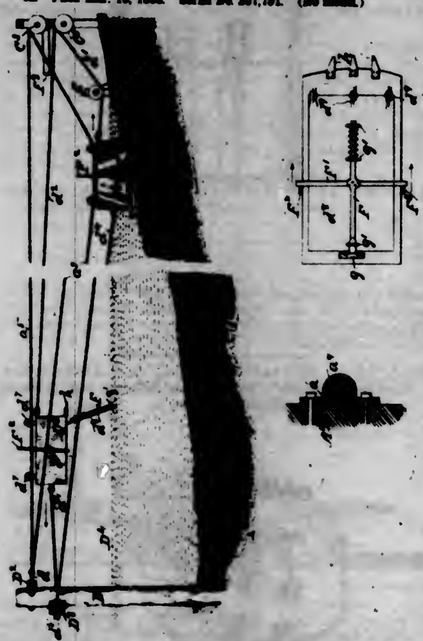
Claim.—The method of manufacturing the within-described flexible hose, which consists in interweaving sections of coiled wire and forming a tube, expanding the tube and elongating the links, then covering the tube with rubber or its equivalent material, and subjecting the whole to heat, for the purpose set forth.

386,307. METALLIC HOSE. JAMES R. BRIDSON and THOMAS MIDGLEY, Beaver Falls, Pa. Filed Mar. 17, 1888. Serial No. 267,800. (No model.)

Claim.—1. Metallic hose or tubing consisting of an outer body or tube of interwoven sections of coiled wire, and a lining of rubber or its equivalent material incorporated with the body, substantially as described.

2. Metallic hose or tubing consisting of an outer body or tube of interwoven sections of coiled wire having the helices compressed in the direction of the length of the tube, and a lining of rubber or its equivalent material adhering to the metallic tube, substantially as described.

386,308. WATCH-CASE SPRING. HUBA J. FELIX, New York, N. Y. Filed Feb. 25, 1888. Serial No. 265,264. (No model.)



386,308.

Claim.—1. A watch-case spring consisting of an arc-shaped supporting-piece, a steel spring having a lip or catch at one end and a shank of greater height than the supporting-piece, said shank being extended over the entire length of the supporting-piece and attached thereto by suitable fastening devices, substantially as set forth.

2. The combination, with a watch-case center having an interior recess and an interior shoulder adjacent to said recess, of a spring formed of an arc-shaped supporting-piece fitting into said recess and a steel spring attached to said supporting-piece and being made of greater height and length than the same, the projecting edge of the spring resting against the above-mentioned shoulder, and said spring being provided at that end extending beyond the supporting-piece with a lip or catch, substantially as set forth.

386,309. DREDGING-MACHINE. MICHAEL GALLAGHER, Chicago, Ill. Filed Mar. 19, 1888. Serial No. 267,751. (No model.)

Claim.—1. In a dredging apparatus, the combination, with the shore framing-timbers, of the main driving-shaft B, provided with journal-bearings *a* in said shore structure, the friction driving-drums $B' B^2$, mounted on the respective ends of said driving-shaft, the counter-shafts B^3 B^4, located above the power-shaft B, the friction-drums $a' a^2$, mounted on the respective counter-shafts, the cable-drums C C' C^2 C^3, the carrying-cables a^3 a^4 a^5 a^6, having their shore ends secured to said cable-drums, the water end of the structure consisting of a number of piles and framing-timbers to which the outer ends of the carrying-cables are rigidly secured, and the dredging-buckets riding upon said cables, substantially as and for the purpose set forth.

2. In a dredging apparatus, the combination, with the shore framing-timbers, of the driving or power-shaft B, provided with journal-bearings *a*, of the counter-shafts B^3 B^4, journaled below said power-shaft, the friction-drums a^7 a^8, mounted on said counter-shafts, the cable-winding drums C^4 C^5, also mounted on said shafts, the pulling cables d' d^3, and the piles E E, the guide-sheaves d^2, the dredging-buckets, the cable d^5, and the pulleys d^3 d^4, one end of said cables being secured to their respective winding-drums, while the opposite end is attached to the inner or front end of the dredging-buckets, substantially as and for the purpose set forth.

3. In a dredging-machine, the combination, with the power-shaft B and the friction driving-drums $B' B^2$, of the several counter-shafts arranged above and below said shaft B, the friction-drums mounted on said counter-shafts, the cam-ring a^{10}, formed on the respective outer ends of said counter-shafts, the brake-blocks b b' b^2 b^3, and the lever or levers b^4, whereby the friction-drums on the counter-shaft may be thrown into and out of contact with the companion drums on the power-shaft and the operation of the same fully controlled, substantially as and for the purpose set forth.

4. The combination, with a dredging-bucket, of the hinged drop-bottom d^6, the locking-bolt F, the socket-catch g, the spring g', the cross-bar F', the vertical levers F^2 F^3, and the tripping-arms F^4, substantially as and for the purpose set forth.

386,310. BRACE. RICHARD D. GALLAGHER, Chicago, Ill., assignor to the Gallagher-Dickinson Broom Company, same place. Filed Jan. 3, 1887. Serial No. 223,212. (No model.)

Claim.—1. A retaining-plate, D, formed of sheet metal, having a socket, *e*, and flange *q*, substantially as and for the purpose set forth.

2. A retaining-plate, D, formed of sheet metal, having a collar, *e*, a flange, *q*, and ears *p*, substantially as and for the purpose set forth.

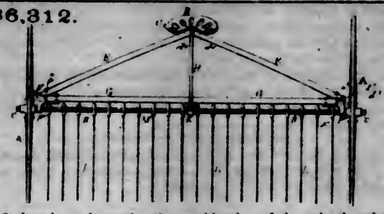
3. A retaining-plate, D, formed of two thicknesses of sheet metal, having a collar, *e*, and lateral flanges *q* and ears *p* on one edge, substantially as and for the purpose set forth.

4. In a broom having the broom-corn bent at its end across a suitable base, C, on the broom-handle, the combination, with the base and broom-corn, of a retaining-plate, D, formed of sheet metal and having a collar, *e*, fitting upon and secured to the end of the broom-handle, and provided with flanges *q* and ears *p* on one edge, held against the bent end of the broom-corn, substantially as and for the purpose set forth.

5. In a broom, the combination of the handle B, enlarged in diameter toward one end to form a shoulder, *f*, a grooved block, C, broom-corn, A, having its end bent crosswise upon the block C, and a retaining-plate, D, comprising two sheet-metal plates secured flatwise together and provided with a collar, *e*, closely fitting the end of the handle, flanges *q*, and ears *p*, and forced and secured into position against the bent end of the broom-corn, substantially as described.

386,311. TWO-WHEELED VEHICLE. FREDERICK W. GAY, Ottawa, Ill. Filed Feb. 28, 1888. Serial No. 265,966. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination, with the thills and the axle, of the converging seat-arms secured to the thills, and the springs having the spiral portion, the flattened portion, and the downwardly and outwardly bent portion, substantially as specified.



2. In a two-wheeled vehicle, the combination, with the thills and the axle, of the converging seat-arms, the spiral spring having the flattened portion secured to the arms, and the opposite downwardly and outwardly bent portions secured by clip-ties, the outer ends of said springs resting on the thills or cross-bar, substantially as specified.

3. In a two-wheeled vehicle, the combination of the thills A, the axle B, the cross-bar bolted to the thills, the iron brace-rods D, the converging arms E, bolted to the thills at *a*, forming a support for the seat, the curved bars G, the transverse slats, and the spiral springs I, having the portion J rigidly attached to the under side of the arms E, and the opposite end portions, *c*, passing through the space *d*, and having the downwardly and outwardly turned portions, the clips, and the clip-tie, substantially as specified.

386,312. HORSE HAY-RAKE. ISAAC H. GORDON, Bellefonte, Pa. Filed July 14, 1887. Serial No. 244,071. (No model.)

Claim.—1. In a horse hay-rake, the combination of the axle B, the triangular supporting-frame composed of the base-beam G and the inclined pieces E E, and the vertical struts H H, extending from the apex of the frame to the base-beam and axle, substantially as and for the purpose described.

386,312.

2. In a horse hay-rake, the combination of the axle, the wheels, the draft-frame having the cross-bar a^7, the triangular supporting-frame, and the brace V, extending from the said cross-bar to the apex of the frame, substantially as described.

3. In a horse hay-rake, the combination of the axle, the wheels, the draft-frame, the triangular supporting-frame composed of the base-beam G and the inclined pieces E E, the abutment-bearings F, upon which the lower ends of the pieces are seated and provided with the grooves J, and the braces T T, extending from the draft-frame into the grooves in the abutment-bearings, substantially as and for the purpose described.

4. In a horse hay-rake, the combination of the axle, the wheels, the draft-frame, the triangular supporting-frame, the abutment-bearings F, the braces T T, reaching from the point of attachment of the whiffletree to the draft-frame to points near the ends of the base-beam of the triangular supporting-frame and then secured thereto by bolts a^4, substantially as and for the purpose described.

5. In a horse hay-rake, the combination of the base-beam G, inclined pieces E E, abutment-bearings F F, the pieces seated at their lower ends on and secured to the latter and to the base-beam by the bolt a^4, the axle, the wheels, the rake-teeth, and means for raising and lowering said teeth, substantially as and for the purpose described.

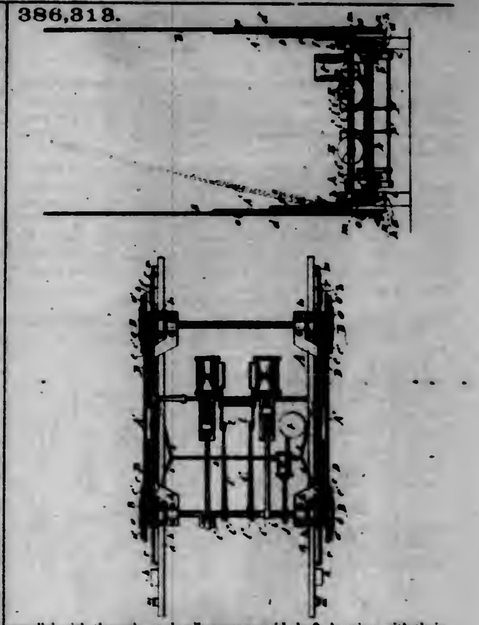
6. The abutment-bearing F, formed with end and side flanges, in combination with the axle and supporting-wheels, rake-teeth, and triangular supporting-frame, substantially as and for the purpose described.

7. In combination with the axle, wheels, and rake-teeth and triangular supporting-frame and braces T, the bearings F, provided with V-shaped grooves J, and the end and side walls, whereby they afford substantial support for the triangular supporting-frame and can be used on either right or left hand end of base-beam G of said frame, substantially as and for the purpose described.

8. The shafts R, provided with bearings S, which are bolted to the base-beam G and straddled upon the axle B, in combination with the said axle and the rake-teeth thereof, substantially as and for the purpose described.

9. The rake-teeth L, curved into semi-encircling form at their upper ends, in combination with the axle having a recess or recesses in its periphery, the half-clasp bearing-plate M, having a groove for the curved part of the teeth, and the half-bearing N, with neck l', stop projection d, and clamp-bolts, substantially as and for the purpose described.

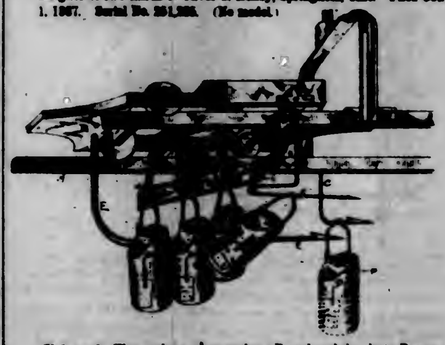
386,313. STONE-CHANNELING MACHINE. CYRIL W. GREEN, West Rutland, Vt., assignor of one-half to Duncan M. Sobell, same place. Filed Dec. 27, 1887. Serial No. 258,944. (No model.)



Claim.—1. A stone-channeling machine, composed of a stationary track, a carriage having carrying-axles, with wheels mounted on said track, cranks or eccentrics on one of said axles, the motor on the carriage, connected with the cranks or eccentrics, levers for reversing the valve-motion of the motor, and cutters sustained rigidly on the carriage, substantially as described and shown.

2. The combination of the track $a\ a$, carriage A, mounted on said track, the cutter-bars B B, supported movably longitudinally on the carriage and provided with racks $d\ d$, shafts $c\ c$, pivoted to the carriage, pinions $c'\ c'$ on one end of the shafts, engaging the racks $d\ d$, ratchet-wheels D D, connected to the opposite ends of the shafts, levers $f\ f$, pivoted to the carriage, pawls $g\ g$, connected to the levers and engaging the ratchet-wheels, and inclines $h\ h$ in the path of the carriage and in position to be encountered by the free ends of the levers $f\ f$, substantially as and for the purpose set forth.

3. The combination of the track $a\ a$, carriage A, provided with the driving-axle i, engines E E on the carriage and connected with the driving-axle, links $l\ l$, connected with the valve-gears of the engines, stops $m\ m$ in the path of the carriage, a lever for shifting said links, and a push-bar adapted to come in contact with the aforesaid stops in the travel of the carriage, and thereby actuate the said shifting-lever, substantially as set forth.



4. In combination with the track-rails $a\ a$, formed with the horizontal flanges $a'\ a'$, the carriage A, having carrying-axles, with wheels mounted on the aforesaid rails, the shaft K, journaled on the carriage

386,318.

parallel with the axle, and rollers $c\ c$ on said shaft, bearing with their peripheries on the under side of the aforesaid flanges of the track-rails, and the cutter-bars B B, secured to the carriage, substantially as described and shown.

386,314. CASH-CARRIER. Gustus F. Gunns, Kalamazoo, Mich., assignor of two-thirds to Oliver S. Kelley, Springfield, Ohio. Filed Oct. 1, 1887. Serial No. 251,333. (No model.)

Claim.—1. The cash-carrier carriage B and cash-bucket D, combined with the track A and station-hook F, permanently attached to said track and provided with the return-bend h in a horizontal plane, or thereabout.

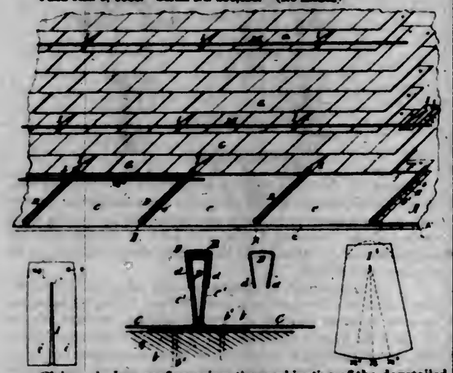
2. The combination of the carriage B, provided with retaining stops or abutments for the balls of the cash-bucket, and with the supporting-hooks G, having the extended fingers k, with stationary projecting trip-fingers and receiving-hooks at the salesmen's stations, all substantially as described.

3. The combination of the carriage adapted for outward and returning trips, having thereon a single gathering-hook and a series of delivering-hooks, each situated and moving in a different line from the others, the cash-buckets, the receiving-hooks at the several stations situated correspondingly to the delivery-hooks, graduated trip-fingers, and a series of supporting-hooks, one at each station, in line with the single gathering-hook, all substantially as described.

386,315. ANTI-FRICTION BEARING. HENRY HARRIS, Boston, Mass. Filed Feb. 14, 1888. Serial No. 263,939. (No model.)

Claim.—1. An anti-friction journal-bearing consisting of two independent boxes, as a^3, each provided with a shaft or arbor, a^2, having

386,315.



hubs or enlarged rollers, as a^6, at its opposite ends, adapted to run free in the said boxes and forming the bearings for the journal of a shaft or axle, combined with a bearing for the shaft or arbor a^2 between the said hubs or rollers, substantially as described.

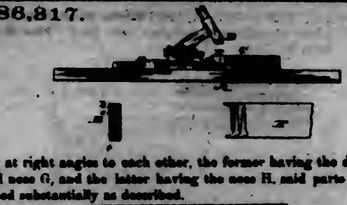
2. An anti-friction journal-bearing consisting of two independent boxes, as a^3, each provided with a shaft or arbor, a^2, having hubs or enlarged rollers, as a^6, at its opposite ends, and forming the bearing for the journal of the shaft or axle, combined with rollers $c\ c'$, of different diameters, interposed between the said hubs and forming the bearing for the arbor a^2, substantially as described.

3. An anti-friction journal-bearing consisting of two independent boxes, as a^3, each provided with a shaft or arbor, a^2, having hubs or enlarged rollers, as a^6, at its opposite ends, and forming the bearings for the journal of the shaft or axle, and collars, as $b^3\ b^3$, mounted on the arbor a^2 between said hubs and each provided with a groove, combined with rollers $c\ c'$, of different diameters, having their journals supported in the said grooves and forming the bearing for the arbor a^2, substantially as described.

386,316. ROOFING. SAMUEL R. HAWKINSON, Middlebury, Vt. Filed Jan. 3, 1888. Serial No. 259,688. (No model.)

Claim.—1. In a roof-covering, the combination of the dovetailed ribs B, the roofing-plates C, having upward-turned edges C' fitted against said ribs, the cap-strips D, having edges $d\ d$ overhanging and locking the edges of said plates to the ribs, and the flashing-point I, covering the upper end thereof, substantially as set forth.

2. In a roof-covering, the combination of the rib B, having attaching-flanges b and the dovetailed upright portion, the roofing-plates C, having the upward-turned edges C' fitted against the sides of said rib, the cap D, having sides $d\ d$ overhanging and locking the edges of said plates to the rib, the flashing-point I, and the straining-strip H, inserted between the cap and top of the rib, for the purpose set forth.



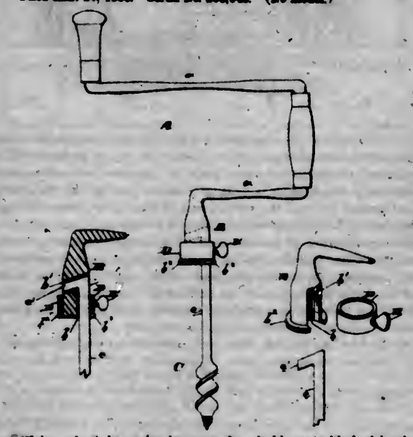
3. In a roof-covering, the combination of the folded metal flanged and dovetailed ribs B, the roofing-plates C, having the upward-turned edges that fit against the sides of said ribs, the cap-strips D, having overhanging edges that lock the edges of said plates to the sides of the ribs, and flashing-points I, substantially as and for the purpose set forth.

4. In a roof-covering, the combination of the ribs B, having attaching-flanges b and dovetailed upright portion, the plates C, having upward-turned side edges, C', and locking-folds at their upper and lower edges, the overhanging cap D, the fastening-strips F, the point-flashings I, and the slates, tiles, or shingles G, as shown and described.

386,317. CUT-NAIL MACHINE. BERNARD HEMANN, Belleville, Ill. Filed Aug. 2, 1887. Serial No. 246,267. (No model.)

Claim.—A cut-nail machine having a bed-plate with the bed-knife C secured thereto, the cutter B, with a cutting-edge having projection b and bevels c and c', the said bed-knife C having a cutting-edge corresponding to said edge of cutter B, and shaping-dies D and E, operat-

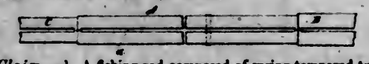
386,317.



ing at right angles to each other, the former having the depression a and nose G, and the latter having the nose H, said parts being combined substantially as described.

386,318. MOWING AND REAPING MACHINE. WILLIAM H. H. HUTCHINS, Philadelphia, Pa. Filed Sept. 26, 1887. Serial No. 250,693. (No model.)

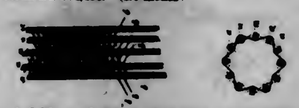
Claim.—The guard-finger B, with front projection, G, and having the shoulders L and S thereon, in combination with the finger-bar A, the rear end of said shoulder L projecting into a notch in the forward edge of said bar, the rocking ledger-plate F, having a grooved channel in its under face, and its rear end projecting above the plane of the finger-bar, and the cutter-bar E, with cutter C, the said cutter-bar abutting against the rear end of the rocking ledger-plate, substantially as and for the purpose set forth.



386,319. BRACE AND BIT. ISAAC HOLLIDAY, San Francisco, Cal. Filed Mar. 27, 1888. Serial No. 268,642. (No model.)

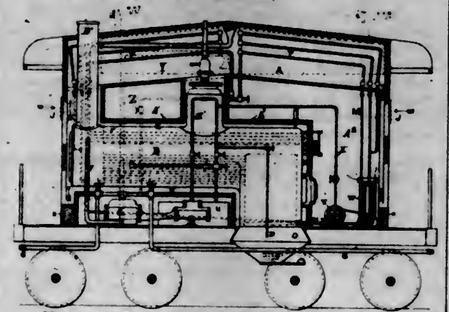
Claim.—1. A brace having a stock or holder provided with a longitudinal groove terminating in a cross socket or hole to receive the shank and bent end of a bit, in combination with a collar loosely fitted on the stock, and having a set-screw for holding it and binding on the bit-shank to secure it in its seat, substantially as herein described.

2. A brace having a stock or holder provided with a longitudinal groove terminating in a cross socket or hole, in combination with a bit having a shank for fitting in the longitudinal groove of the stock, and a bent end for fitting in the cross socket or hole thereof, and a collar loosely fitted on the stock, and having a set-screw for holding it and binding on the bit-shank to secure it in its seat, substantially as herein described.



386,320. FISHING-ROD. EVERETT HOLCOMB, Bristol, Conn., assignor to the Horton Manufacturing Company, same place. Filed May 21, 1888. Serial No. 274,402. (No model.)

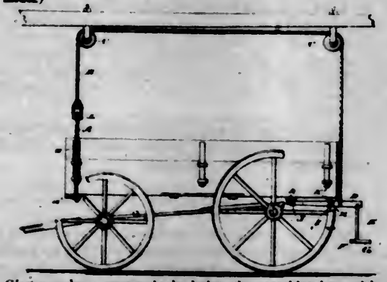
Claim.—1. A fishing-rod composed of spring-tempered tubular sections, the respective sections constructed with a longitudinal slot upon one side, the slot closed at distant points, so as to form a succession of bridges across the slot, substantially as described.



2. A fishing-rod consisting of several spring-tempered tubular sections, the said sections being of polygonal shape in transverse section, and the respective sections constructed with a longitudinal slot upon one of its sides, the said slots closed at distant points to form a succession of bridges across the slot, substantially as described.

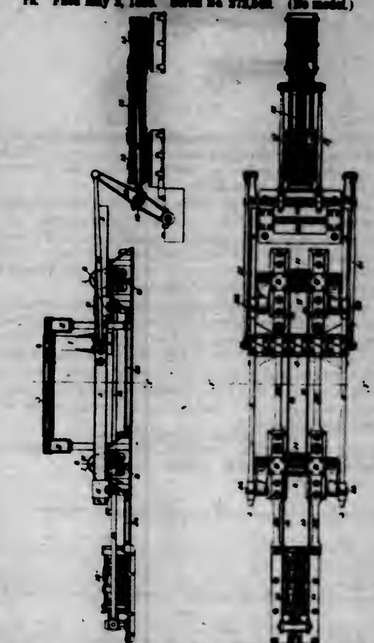
386,321. FISHING-ROD. EVERETT HORTON, Bristol, Conn., assignor to the Horton Manufacturing Company, same place. Filed May 21, 1888. Serial No. 274,461. (No model.)

Claim.—A fishing-rod composed of one or more sections, the said one or more sections composed of several longitudinal elastic wires, *a*, arranged in a circle corresponding to the diameter of the rod required, combined with several strands of wire circumferentially around the said several longitudinal wires, but interlaced with the said longitudinal wires and with each other between the said longitudinal wires, substantially as described.



386,322. CAR-HEATING APPARATUS. THOMAS R. HOWE, Scranton, Pa., assignor of one-half to HARRY DE WITT, same place. Filed Mar. 4, 1887. Serial No. 280,732. (No model.)

Claim.—1. In combination with the main air-passage extending throughout the train, the chamber in communication with the external air, heating devices—such as steam-radiator coils—located therein, a steam-boiler, a passage communicating with the chamber and passing through the steam-space of the boiler above the water-line, an air-forcing apparatus located in said passage, and connections between the passage mentioned and the passage extending throughout the train, whereby when the air-forcing apparatus is operated the air is drawn into the chamber and is there heated, whence it passes through the steam-space of the boiler and is heated to a higher degree, and from thence it is supplied to the main air-pipe and distributed to the cars as desired, substantially as described.



2. In a car-heating plant, the combination, with a fire-proof car divided into compartments, a steam-boiler, and steam-radiator coils communicating therewith located in one of said compartments, and a communication between said compartment and the external air, of an air-pipe leading from the top of said compartment through the steam-space of the boiler to an air-forcing apparatus located in another compartment, from whence the air is distributed throughout the train, substantially as described.

386,323. DEVICE FOR HOISTING WAGON-BEDS. JOHN M. KELSO, Mexico, Mo. Filed Jan. 30, 1888. Serial No. 261,623. (No model.)

Claim.—In a wagon-body hoist, the combination, with the overhead pulleys, the rope provided at one end with a sling and at the other end with a windlass-shaft adapted to fit in bearings secured to the wagon-body at one end, of a crank-arm secured by a transverse pivot to the outer end of said shaft and having a handle projecting at right angles from its outer end and a hook arranged at the opposite thereof to embrace the rope, whereby the shaft may be positively locked against rotation in either direction, substantially as described.

386,324. SHOT-MANIPULATOR. JULIAN KENNEDY, Pittsburg, Pa. Filed May 2, 1888. Serial No. 272,849. (No model.)

Claim.—1. An improvement in manipulators for rolling-mill feed-tables, which consists in a frame having the manipulator-arms mounted thereon, and stationary power-engines connected by intervening mechanism with the frame and operating to move it, together with the manipulator-arms, vertically and horizontally, substantially as and for the purposes described.

2. An improvement in manipulators for rolling-mill feed-tables, which consists in the combination, with a frame having the manipulator-arms mounted thereon, of vertically-movable boxes or supports by which the frame is supported and on which it is movable horizontally, and power-engines by which the boxes or supports are moved vertically and the frame is moved horizontally thereon, substantially as and for the purpose described.

3. An improvement in manipulators for rolling-mill feed-tables, which consists in the combination of a frame carrying manipulator-arms, and cranks which support the frame and which impart to it its vertical motions, said frame being horizontally movable on the cranks, and a power-engine which is connected with the frame and moves it horizontally, substantially as and for the purpose described.

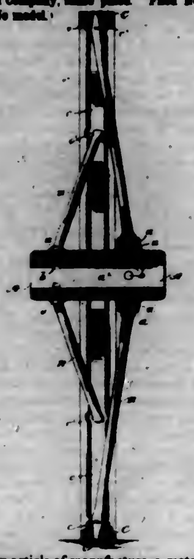
4. In manipulators for rolling-mill feed-tables, the combination, with a horizontally-movable frame on which the manipulator-arms are carried, of a power-engine which moves said frame, and levers keyed to a common shaft and interposed in the connection between the engine and the frame, substantially as and for the purpose described.

5. In manipulators for rolling-mill feed-tables, the combination of a frame carrying manipulator-arms, cranks whereby the frame is moved vertically, and boxes or supports in which the frame is carried, said boxes or supports being pivotally connected with the cranks, substantially as and for the purpose described.

386,325. PROCESS OF MANUFACTURING METAL WHEELS. JAMES R. LITTLE, Quincy, Ill., assignor to the Quincy Metal Wheel Company, same place. Filed Nov. 2, 1887. Serial No. 254,116. (No model.)

Claim.—1. As an improvement in the construction of metal wheels, the method employed for securing a spoke within a hub, which consists in forming a mortise having an outwardly-increasing diameter and a threaded inner portion, and then placing within such mortise the end of a spoke, and by longitudinal compression (and lateral expansion) causing the same to fill said mortise, substantially as and for the purposes specified.

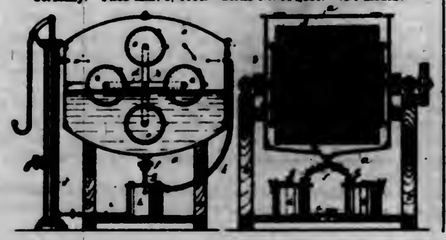
2. As an improvement in the construction of metal wheels, the method employed for securing a spoke within a hub, which consists in



386,325.

forming a mortise that has an outwardly-increasing diameter and a threaded inner end, and then placing within such mortise the threaded end of a spoke, and by longitudinal compression (and lateral expansion) causing such end to closely fill said mortise, substantially as and for the purpose shown.

3. As an improvement in the construction of metal wheels, the method employed for securing a spoke within a hub, which consists in forming a mortise that has an outwardly-increasing diameter and a threaded inner end, and then placing within such mortise the end of a spoke, and by longitudinal compression (and lateral expansion) causing such end to closely fill said mortise and the body of said spoke outside of said hub to be enlarged, substantially as and for the purpose set forth.



386,326. WHEEL. JAMES R. LITTLE, Quincy, Ill., assignor to the Quincy Metal Wheel Company, same place. Filed Nov. 2, 1887. Serial No. 254,117. (No model.)

Claim.—1. As a new article of manufacture, a metal wheel which is provided with tapering hub-mortises that are threaded at their inner ends, in combination with spokes that have their inner ends fitted into and caused to fill such mortises, substantially as and for the purpose specified.

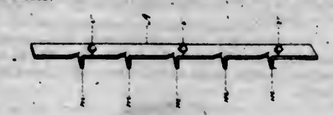
2. As a new article of manufacture, a metal wheel which is provided with inwardly-tapering hub-mortises that are threaded at their inner ends, and a rim which has outwardly-tapering mortises and a centrally-located strengthening-rib that is expanded laterally at and around each mortise, in combination with spokes which are fitted into and by lateral expansion caused to fill said mortises, substantially as and for the purpose set forth.

386,327. WASHING-MACHINE. ERNST LOMMATZSCH, Plauen, Germany. Filed Mar. 6, 1886. Serial No. 194,693. (No model.)

Claim.—1. The cylinder C, formed with the top opening, E, and side openings, G, and the drop-section D, formed with the side piece, *d*, top cross-piece, *d'*, and knob d^3, in combination with the grapple K, cords for elevating the same passed along the top and end of the car, the pivoted and weighted bar L, and the cords for connecting the same to the cord for elevating the grapple, substantially as described.

2. The cylinder C, having side and top openings, and the drop-section formed with side piece, *d*, and top cross-piece, *d'*, and knob d^3, and an elevated grapple for elevating the drop-section, in combination with the pipe and elbow F F', pivoted to the top cross-piece, *d'*, and provided with the spiral flange *f*, fitted in the slot *f'*, formed in the top of the cylinder C, substantially as and for the purposes described.

Claim.—The combination of drum *a*, containing open rotating cylinders *c*, with the reservoirs *h*, cock *f*, tubes *g i*, and pump *j*, substantially as specified.

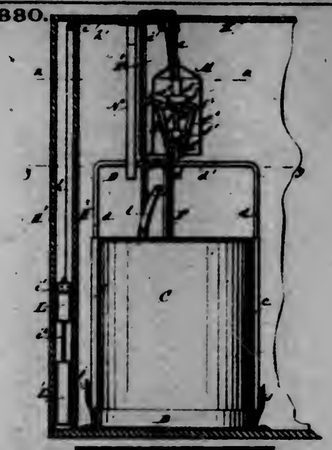


386,328. SCREW-ELEVATOR FOR CURTAINS. WILLIAM S. LOAN, St. Louis, Mo. Filed Aug. 30, 1887. Serial No. 248,193. (No model.)

Claim.—1. In an elevator for curtains, the combination of a rod having a screw-extension, gear-connection between said rod and the curtain-roller, brackets in which the rod is mounted, and an operating device consisting, essentially, of a hand-nut provided with a pendent extension, both of which are provided with a screw-threaded opening, and a hand-swivel fitting around the pendent extension, substantially as and for the purpose set forth.

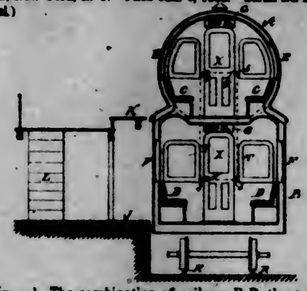
2. In an elevator for curtains, the combination of a rod having a screw-extension, gear-connection between said rod and the curtain-roller, brackets in which the rod is mounted, a stud provided with a socket in which fits the end of the rod, a ratchet-rack extending around the top of the stud, a nut provided with a pendent extension, both of which are provided with a screw-threaded opening to fit the rod, a hand-swivel fitting around the pendent extension, and a projection on the latter adapted to engage said ratchet-rack, substantially as set forth.

386,329. CLAPBOARD-HOLDER. CHARLES J. LOCK and EUGENE K. BECKWITH, Niantic, Conn. Filed Apr. 10, 1888. Serial No. 270,941. (No model.)



Claim.—A clapboard-holder consisting of a flat metallic strip provided with struck-up teeth on one side for attaching the holder to a building and with struck-up teeth at regular intervals on the opposite side for supporting the clapboards, substantially as described.

386,330. STOVE FOR HEATING RAILWAY-CARS. EDWIN W. LOCK, Bolivar, N. Y. Filed Mar. 21, 1887. Serial No. 231,690. (No model.)



Claim.—1. The cylinder C, formed with the top opening, E, and side openings, G, and the drop-section D, formed with the side piece, *d*, top cross-piece, *d'*, and knob d^3, in combination with the grapple K, cords for elevating the same passed along the top and end of the car, the pivoted and weighted bar L, and the cords for connecting the same to the cord for elevating the grapple, substantially as described.

2. The cylinder C, having side and top openings, and the drop-section formed with side piece, *d*, and top cross-piece, *d'*, and knob d^3, and an elevated grapple for elevating the drop-section, in combination with the pipe and elbow F F', pivoted to the top cross-piece, *d'*, and provided with the spiral flange *f*, fitted in the slot *f'*, formed in the top of the cylinder C, substantially as and for the purposes described.

886,330.

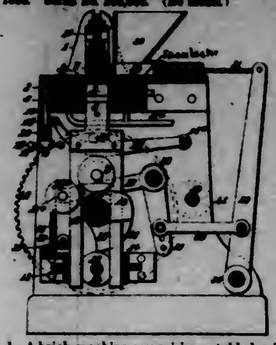
886,331. PASSENGER CAR AND STATION. ALBERT K. MAHAFFIELD, New York, N. Y. Filed Jan. 7, 1888. Serial No. 260,168. (No model.)

Claim.—1. The combination of railway R R, the two-story passenger-car A B, and platforms J and K, arranged one above the other, substantially as and for the purpose set forth.

2. A compartment-car, A B, having compartments vertically above each other, one story apart, the upper story being completely inclosed with side and end walls and roof, and having independent end platforms, M and N, at each end for each story, the whole supported on wheels, substantially as set forth.

3. In a two-story car, the platform-gates O O, arranged one above the other, and connected together by a suitable connection, P, so as to be operated in unison, in combination with platforms M and N, substantially as described.

886,332. WHEEL. MALCOLM MCDOWELL, Pinna, assignor to the Quincy Metal Wheel Company, Quincy, Ill. Filed Feb. 28, 1884. Renewed Sept. 24, 1888. Again renewed June 6, 1887. Serial No. 240,441. (No model.)



Claim.—1. A metal wheel in which the rim is provided with circumferential marginal ribs that are formed upon and integral with the same, substantially as and for the purpose specified.

2. A metal wheel in which the rim is provided with a circumferential central rib and two circumferential marginal ribs, substantially as and for the purpose shown.

3. A metal wheel in which the rim is provided with a central circumferential rib and two circumferential marginal ribs, and between each of the latter and said central rib has an inwardly-increasing thickness, substantially as and for the purpose shown and described.

886,333. BRICK-MACHINE. HENRY W. HEAD, Quincy, Ill. Filed Mar. 21, 1888. Serial No. 268,092. (No model.)

Claim.—1. A brick-machine comprising a table having a suitable mold or molds, an upper plunger carried by a yoke having friction-rolls at its lower part, a lower plunger supported by a frame having a fork within which is journaled a friction-roll, cams acting on the friction-rolls of the upper plunger to depress and hold the same, a central cam on the single cam-shaft raising the lower plunger and co-operating with the cams actuating and holding the upper plunger to lift and eject the molded brick, and a frame having elastic support at one end and pivotal support at the other end and supporting the lower plunger between its ends, substantially as described.

2. A brick-machine comprising a table having suitable molds, a lower plunger having a forked branch provided with a friction-roll, an actuating-shaft having a cam acting on said friction-roll, a yoke pivotally attached to the machine-frame at one end and within which the forked branch of the lower plunger is supported, a threaded rod which engages an aperture in the free end of the yoke, a nut turned on said rod, a spring between said rod and nut, an upper plunger, and means for operating the latter, substantially as described.

3. A brick-machine comprising a table having steam-heated molds, a lower plunger having a forked branch provided with a friction-roll, an actuating-shaft having a cam acting upon said roll, a bell-crank lever having a stirrup at one end provided with a vertically-guided roll, a feed-lever connected to the other arm of said bell-crank and carrying a feed-box over said table, and cams upon the actuating-shaft operating both the plunger above and the feed-lever, substantially as described.

4. A brick-machine comprising a table having molds supported therein, plungers operating above and below in said mold, a yoke pivotally mounted on the machine-frame and supporting the lower plunger, a screw-threaded stud with which the movable end of said yoke engages, a spring supporting said yoke, and a set-nut on the stud supporting the spring, substantially as described.

886,334. LAMP-SHADE. LOUIS MEHARG, Leavenworth, Kans. Filed Nov. 4, 1887. Serial No. 254,327. (No model.)

Claim.—1. A shade-holder having a portion fitted to embrace the burner, provided between its ends with a support for the shade, and having an extension projected outwardly beyond said support, substantially as set forth.

2. A shade-holder made of a length of twisted wire bent at 2 and 3, forming arms or branches one above the other, the twists in said arms being opened or spread at points in line with each other, forming loops one above another to embrace the burner, substantially as set forth.

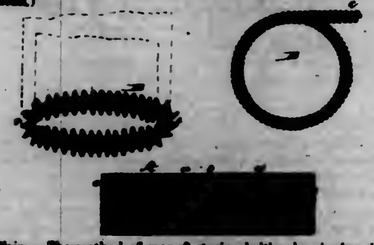
3. A shade-holder comprising a main arm, an upper arm bent from said main arm, and a branch arm extended down from the upper arm to and twisted into connection with the main arm, such branch arm being extended to form the shade-support proper, substantially as set forth.

4. The improved shade-holder herein described, consisting of the main arm, the upper arm connected with and arranged above the main arm, both said arms having loops arranged one above the other, and the shade-support proper, substantially as set forth.

5. The combination of the shade C, having sockets c c, and the holder having a loop or loops whereby to embrace the burner, and provided with prongs b b, fitted to enter the sockets c c, substantially as and for the purposes specified.

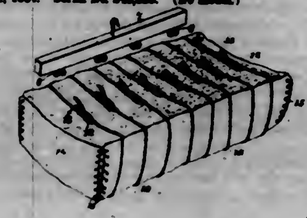
6. The improved shade-holder herein described, formed of twisted wire, and consisting of the main arm, the upper arm bent from said main arm and having a portion carried down and secured to the main arm, and extended thence to form the shade-support B, the main arm being extended at D beyond the shade-support B, forming a handle portion, and the main arm and upper arm being provided with loops arranged in line with each other, substantially as and for the purposes specified.

886,335. WIRE BRAIDING. THOMAS HOWLEY, Beaver Falls, Pa., assignor of one-half to James H. Emerson, same place. Filed Feb. 13, 1888. Serial No. 263,991. (No model.)



Claim.—1. Wire bobbing composed of interwoven transverse sections of wire presenting folded and unbroken edges, substantially as described.

2. Wire bobbing composed of two thicknesses or layers of interwoven sections of coiled bellows presenting folded and unbroken edges, substantially as described.

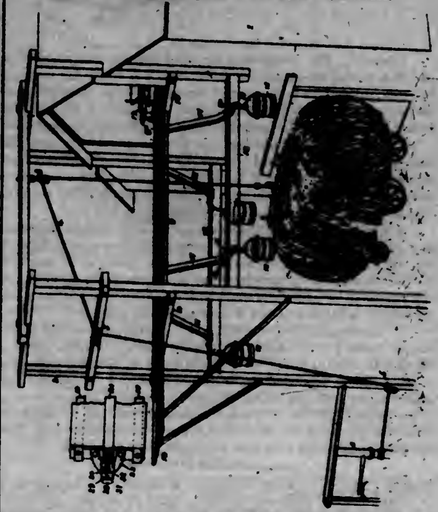


3. Wire bobbing composed of two thicknesses or layers of flattened interwoven sections of coiled wire presenting a continuous wearing-surface with folded and unbroken edges, substantially as described.

886,336. MANUFACTURE OF WIRE BRAIDING. THOMAS HOWLEY, Beaver Falls, Pa., assignor of one-half to James H. Emerson, same place. Original application filed Feb. 13, 1888, Serial No. 263,991. Divided and this application filed Mar. 1, 1888. Serial No. 265,894. (No model.)

Claim.—The method of manufacturing bobbing herein described, which consists in weaving sections of coiled wire into a tube, then compressing the tube and passing it between rolls, whereby a double thickness of bobbing is formed, and the bellows flattened and stretched into elongated links.

886,337. HAY-SLIDE. SAMUEL G. HELLER, Alvin, Tenn. Filed Sept. 1, 1887. Serial No. 248,555. (No model.)



Claim.—1. The combination of beam 7, having a number of hooks, 6, and the ropes 9 and 10, adapted to be supported by the hooks of said beam, substantially as set forth.

2. The combination of the ropes 9 10, the latter adapted to be arranged longitudinally of the wagon-bed, and the former arranged transversely thereto and projecting beyond the same and carrying on their loose ends pulleys and rings, substantially as and for the purpose set forth.

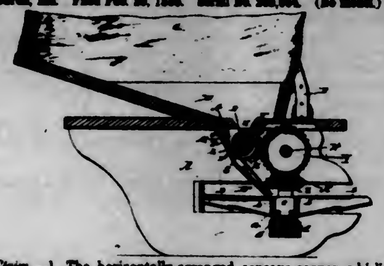
3. The combination of the beam 7, having hooks, the ropes 9 and 10, arranged crosswise each other, and the convex supported by said ropes, substantially as set forth.

886,338. HAY-ELEVATING DEVICE. SAMUEL G. HELLER, Alvin, Tenn. Filed Jan. 14, 1888. Serial No. 261,113. (No model.)

Claim.—1. In combination with a hay-elevating device, an elevated track having an automatically-movable section, between the rails of which latter the hay-elevating device is situated, whereby the load when elevated is adapted to spread the rails, and a hay-carrier on the track, substantially as described.

2. In combination with a hay-elevating device, an elevated track and a combined automatic and gravitating movable section of such track, and a hay-carrier on the track, substantially as and for the purpose set forth.

3. In combination with a hay-elevating device, an elevated track, the track on the latter, the frame for supporting the elevator, and a laterally-movable section of track having its rails mounted on upwardly-extending arms pivoted to the frame considerably to one side of the rails, substantially as and for the purpose set forth.



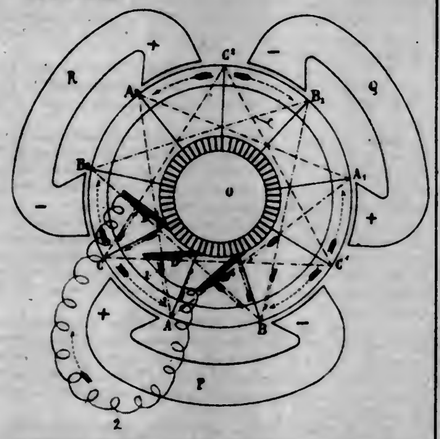
4. In combination with a hay-elevating device, an elevated track, the track mounted thereon, the frame by which the hay-elevating device is supported, an automatically-movable section of track, arms pivoted to the frame, to which the movable track is secured, and weights at the outer ends of said arms, substantially as and for the purpose set forth.

5. In combination with a hay-elevating device, an elevated track, the track mounted thereon, the frame for supporting the hay-elevator, a movable section of track, arms secured thereto extending downwardly and outwardly and pivoted to the frame, and hooks at the outer ends of the arms for supporting weights, substantially as and for the purpose set forth.

6. In combination with a hay-elevating device, a track having a tilting bed with upwardly-inclined sides, a longitudinal beam on which the tilting bed is turned, said beam having bearings in the frame of the track, a locking-rod, and upper and lower brackets, with which the locking-rod is adapted to engage, whereby the tilting bed is locked in its carrying position, substantially as set forth.

7. In combination with a hay-elevating device, a track having a tilting bed, a beam extending longitudinally of said tilting bed, said beam being provided with a perforation, an upper and a lower bracket extending out from the frame of the track and provided with perforations, and a rod received by the perforations in the beam and brackets, whereby the tilting bed is locked, and suitable means for dumping the bed, substantially as set forth.

386,839. BROADCAST SEED-SOWER. WILLIAM I. HELLER, Van Buren, Ind. Filed Feb. 20, 1888. Serial No. 265,004. (No model.)



Claim.—1. The horizontally-arranged concavo-convex whirling seed-disk having the central cup or receptacle in which the seeds are fed and provided with openings in its sides, and the radial wings or blades projecting from said cup beyond the radius of the disk and having their lower edges upwardly inclined, substantially as described.

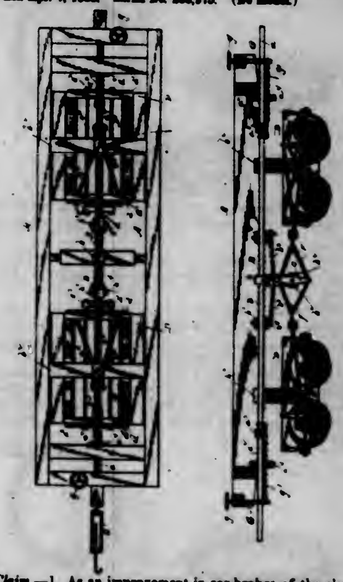
2. The horizontally-arranged concavo-convex whirling seed-disk having the central perforated cup, and the radial wings projecting from the cup beyond the radius of the disk and having their lower edges upwardly inclined, in combination with devices to feed the seeds to the said central cup, substantially as described.

3. The combination of the rotating shaft F, having the force-feed seed-wheel, the case inclosing said seed-wheel and secured to the bottom of the hopper, the horizontally-arranged seed-disk *a*, geared to the shaft F, and having the central cup and the radial wings or blades, and the spout to convey the seeds from the case as they fall from the seed-wheel to the cup of disk *a*, substantially as described.

4. The combination, in a broadcast seed-sowing machine, of the case or frame A, the hopper on the upper side of the same, plates or castings G, secured to the sides of the frame or base, the transverse shafts F and W, journaled in said castings and geared together, said shaft F having the seed-wheels arranged under the discharge-opening in the hopper, and the horizontally-arranged seed-disk *a*, adapted to whirl and geared to the shaft W, and the spout to convey seeds from the seed-wheel to the seed-disk, substantially as described.

386,840. DYNAMO-ELECTRIC MACHINERY. GRAMME MIOT, Paris, France. Filed Mar. 14, 1888. Serial No. 267,126. (No model.) Patented in France Dec. 5, 1887, No. 187,402, and in Belgium Sept. 3, 1887, No. 78,768.

Claim.—1. In a multipolar dynamo and in combination with the armature thereof, a series of field-magnets with simple magnetic poles arranged about the said armature with the several poles or enlarged polar extremities nearer to a pole or enlarged polar extremity of unlike sign of a neighboring magnet than to the other pole or enlarged polar extremity of its own magnet, substantially as described.



2. In combination with the cross-connected armature of a multipolar dynamo and the field-magnets arranged about said armature, with the several magnetic poles nearer to an unlike pole of a neighboring magnet than to the unlike pole of its own magnet, the commutator-brushes consisting of a brush arranged between the poles of neighboring magnets and two electrically-connected brushes arranged at different points between the poles of the same magnet or magnets, substantially as described.

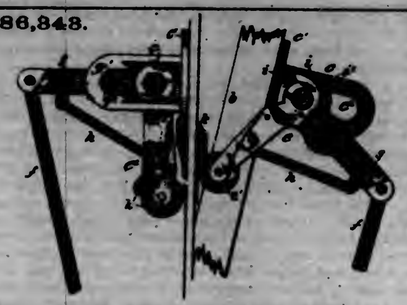
386,841. MOP. JAMES MOORE, Chicago, Ill. Filed Nov. 12, 1887. Serial No. 255,022. (No model.)

Claim.—The hereinbefore-described mop, consisting of the twisted yarn-ropes tied together in bunches at their middle portion to form a mat of suitable width, each bunch being tied independent of the others, then folding said mat longitudinally or in the direction of its length to form a double layer, and the whole securely bound together by a cord passed around its middle, substantially as described.

386,842. CAR-BRAKE. GEORGE G. OLMSTED, Perrysburgh, N. Y. Filed Apr. 7, 1888. Serial No. 269,979. (No model.)

Claim.—1. As an improvement in car-brakes of the class herein described, the brake-rod having the springs encircling the same, the central vertically-disposed lever, the chains connected to the upper and lower ends thereof, and the brakes, to the cross-heads of which said chains are connected, substantially as shown and described.

2. As an improvement in car-brakes, the brake-rod having the central vertically-disposed coil-springs, the sleeves or thimbles, the chains connected thereto, the central lever, and the brakes having head-bars connected to said lever, substantially as shown and described.



3. As an improvement in car-brakes of the class herein described, the vertical lever E, the rods or chains connected to the upper and lower ends thereof, the cross-heads, the brakes, and the brake-rod connected to said cross-heads, substantially as shown and described.

4. The combination, with the brake-rod and the central lever connected to sleeves or thimbles thereof, of the vertical lever, the rods or chains connected thereto, the cross-heads, the brakes, and the series of chains connecting said cross-heads to said central lever, substantially as shown and described.

386,843. TRANSOM-LIFTER. GERHARD S. PERKINS, Hartford, Conn. Filed May 11, 1888. Serial No. 273,803. (No model.)

Claim.—1. In a transom-lifter, in combination with the transom-bracket secured to the transom, the starting-lever pivoted to the transom-bracket, and with one end adapted to thrust against the frame in which the transom is hung when the said lever is moved in opening

386,843.

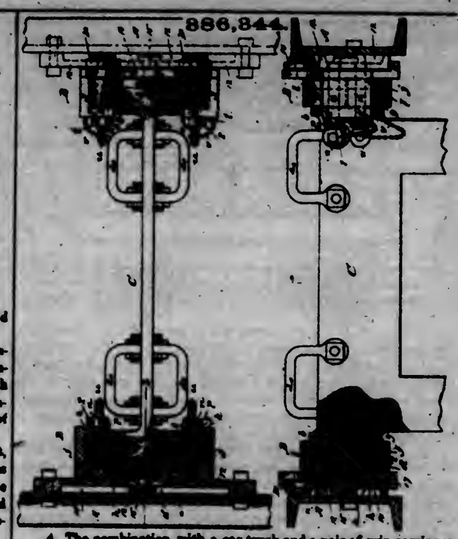
the transom, and the transom-rod pivoted to the outer end of the said lever, all substantially as described.

2. In combination with the transom-bracket secured to the transom and having a pivot-slot, the starting-lever pivoted to the transom-bracket, and with one end adapted to thrust against the frame in which the transom is hung when the said lever is moved in opening the transom, the lever-pivot, and the transom-rod pivoted to the outer end of said lever, all substantially as described.

3. In a transom-lifter, in combination with the transom-bracket, a carrier-block adjustably secured to the said bracket by the means substantially as described, the starting-lever pivoted to said block, the pivot-bolt connecting the above-described parts, and the transom-rod pivoted to the outer end of the starting-lever, all substantially as described.

4. In combination with the transom-bracket, the carrier-block adjustable thereon, the starting-lever pivoted to the carrier-block, the lever-lock that unites the carrier-block and the lever, and the transom, all substantially as described.

5. In combination with the transom-bracket *c*, having slot c^2, the carrier-block *i*, with the tenon i', fitting between the guideways in the bracket and whereby said block is held against rotation thereon, the starting-lever *e*, pivot-bolt *d*, holding said bracket-block and lever together, and the transom-rod attached to the outer end of the starting-lever, all substantially as described.

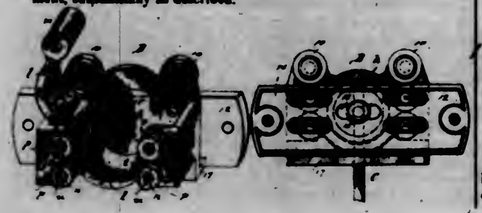


6. In combination with the transom-bracket *c*, the carrier-block *i*, attached thereto, as by means of a pivot-bolt and nut, as described, and provided with the stop and the bolt-socket, the starting-lever *e*, pivoted to said carrier-block, the look *g*, mounted on the starting-lever and having a bolt, g', that is adapted to engage the said bolt-socket in the carrier-block, and the transom-rod attached to the outer end of the starting-lever, all substantially as described.

7. In combination with the transom-bracket, a starting-lever pivoted to said bracket, the anti-friction roller borne on the inner end of the starting-lever, and the transom-rod attached to the said starting-lever, all substantially as described.

8. In combination with the transom-bracket *c*, a starting-lever, *e*, pivoted to the bracket, the anti-friction roller borne on the inner end of the lever, and the striking-block *k*, having the inclined or curved face, all substantially as described.

386,844. CABLE-GRIP BEAM AND SUPPORTING DEVICE THEREFOR. LOUIS PFEIFER, New York, N. Y., and GEORGE A. BIRD, Springfield, Mass. Filed Apr. 11, 1888. Serial No. 270,241. (No model.)



386,844.

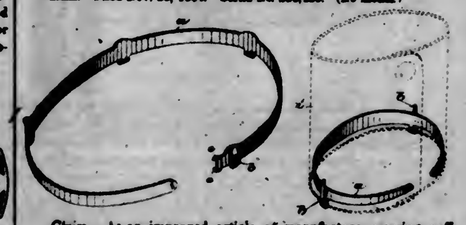
Claim.—1. The combination, with a car-track, of a grip-carriage supported and laterally movable thereon, provided with a rolling bearing for a grip-beam, substantially as described.

2. The combination, with a car-track, of a grip-carriage laterally movable thereon, provided with a rolling bearing for a grip-beam, the walls of which bearing are separable, substantially as described.

3. The combination, with a car-truck and a pair of grip-carriages supported and laterally movable thereon, provided with rolling bearings for the grip-beam, of a grip-beam supported in said bearings and having a length less than the distance between the opposing outer walls of said grip-carriages, whereby it may have an endwise movement, substantially as described.

4. The combination, with a car-trunk and a pair of grip-carriages supported and laterally movable thereon, provided with rolling bearings for the grip-beam, of a grip-beam supported in said bearings and of a length less than the distance between the opposing outer walls of said grip-carriages, and springs between the ends of said grip-beam and said walls of the carriages, substantially as described.

5. The combination, with a car-truck cross-transom provided with a plate, 12, secured thereto and having a horizontal slot, 16, of a grip-carriage having a bearing and support for a grip-beam provided with rollers bearing on said plate 12, and having the stud 15 extending into said slot, substantially as described.

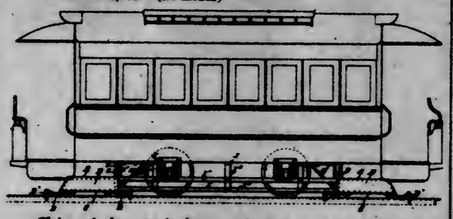


6. The combination, with a car-truck cross-transom provided with a recessed plate, 12, secured thereto, of a bearing and support for a grip-beam provided with rollers bearing on said plate 12, having the headed stud 15 extending into said slot, and the underlying flange 17, substantially as described.

7. A grip-carriage consisting of a wall, *h*, combined with a pair of arc-shaped bars, *l*, having at each end an eye, and pins passing through said eyes and said wall, one or both pins of each of said bars being removable, substantially as described.

8. A grip-carriage consisting in the combination, with a wall, *h*, having the extensions *j*, and lugs *h*, provided with the bosses *p*, of a pair of arc-shaped bars, *l*, having at each end an eye, the pins passing through said carriage lug and wall and said eyes, and the keys *t*, passing through said bosses and said pins, substantially as described.

9. The combination, with the cross-transoms A A of a car-truck, provided with the fixed recessed plates 12, having the horizontal slots 16, of the grip-carriages B B, each comprising the rear wall, *h*, extensions *j*, and lugs *h*, the headed stud 15, secured to said wall *h* and passing through the said slot 16, and provided with the rollers 10 10, the arc-shaped bars *l l*, having the eyes and the removable pins passing through said carriage lugs and wall and said eyes, and the grip-beam C, provided with the cylindrical and socketed heads, and the springs *d*, all substantially as and for the purpose described.

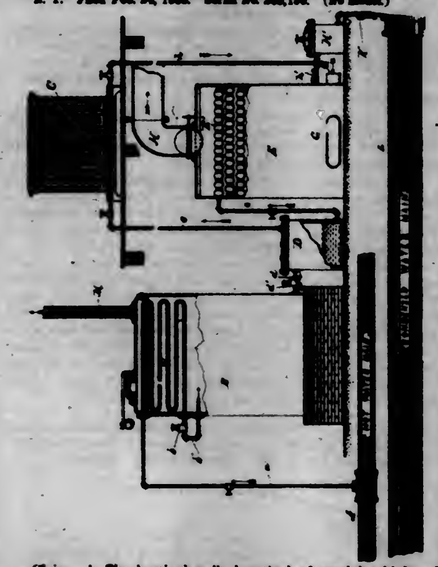


386,845. CUFF-HOLDER. REILE PFENNABY, Islington, assignor to George Frost, George H. Phelps, and George A. Frost, all of Newton, Mass. Filed Nov. 29, 1887. Serial No. 256,609. (No model.)

Claim.—As an improved article of manufacture, a spring cuff-holder consisting of a band or strip, *a*, having two or more spring-clips, *b*, extended substantially at a right angle to the length of the

said billd or strip and adapted to embrace the edge of the cuff, the said cuff-holder being frictionally retained, substantially as described.

386,346. WHEEL-GUARD AND TRACK-CLEARER FOR RAILWAY-CARS. PETER PORTEOUS, San Francisco, Cal. Filed Apr. 18, 1888. Serial No. 271,092. (No model.)



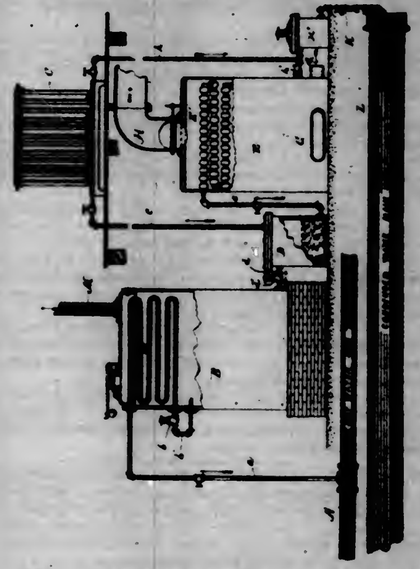
Claim.—1. In a track-clearer and wheel-guard for railway-cars, the combination, with a frame, A, and links or hooks for suspending it, said suspending means being attached to one end of the frame, of a vertical arm, H, forming an abutment for the lower edge of the frame, and curved pilots D, secured to each end of frame A and resting upon the surface of the track, and pivoted depending arms or bars standing and traveling in the gripper-slot, as set forth.

2. The combination, with a track-clearer for railway-cars, of links secured to one end thereof and connecting said end to the car-body, said links having a turn-buckle in them, of a vertical brace, as H, having a set-screw, G, in its lower end against which the lower portion of the frame of the clearer rests, and pilots having pivoted arms or bars for running in the gripper-slot, as set forth.

3. The combination, with a track-clearer and car-body, of links by which the clearer is suspended from said body, adjusting means, as described, for said links, and the thumb-screws operating in steadying-brackets against the lower inner corners of the track-clearer, as and for the purpose specified.

386,347. METHOD OF SUPPLYING STEAM AND HOT WATER FOR POWER AND HEATING PURPOSES. WILLIAM B. PEALL, Washington, D. C., assignor to the National Heating Company, New York, N. Y. Filed Feb. 24, 1888. Serial No. 265,192. (No model.)

Claim.—1. The herein-described method of supplying high and low pressure steam for power and heating purposes, which consists in supplying superheated water at high pressure, converting a portion thereof into high-pressure steam by allowing it to expand, and by converting a portion of the remainder into low-pressure steam by allowing it to expand, substantially as shown and described.



2. The herein-described method of supplying power and heat, which consists in supplying superheated water at high pressure, converting a portion thereof into steam at high pressure, which is supplied for power purposes, by allowing it to expand, converting a portion of the remainder into low-pressure steam, which is used for heating or other purposes, by allowing it to expand, and circulating the water not converted into steam for heating purposes, substantially as shown and described.

3. The herein-described method of supplying high and low pressure steam for power and heating purposes, which consists in supplying superheated water at high pressure, converting a portion thereof into high-pressure steam by allowing it to expand, superheating the steam thus formed, and converting a portion of the superheated water not formed into steam at the first expansion into steam at low pressure by allowing it to expand, substantially as shown and described.

4. The herein-described method of supplying power and heat, which consists in supplying superheated water at high pressure, converting a portion thereof into high-pressure steam for power purposes by allowing it to expand, superheating the steam thus formed, converting a portion of the superheated water not formed into steam at the first expansion into low-pressure steam for heating purposes by allowing it to expand, and circulating the remainder for heating purposes, substantially as shown and described.

5. The herein-described method of supplying steam and hot water for power and heating purposes, which consists in supplying superheated water at high pressure, converting a portion thereof into steam for power purposes by allowing it to expand, superheating the steam thus formed, and circulating the water not formed into steam for heating purposes, substantially as shown and described.

386,348. MEANS FOR SUPPLYING STEAM AND HOT WATER FOR POWER AND HEATING PURPOSES. WILLIAM B. PEALL, Washington, D. C., assignor to the National Heating Company, New York, N. Y. Filed Feb. 24, 1888. Serial No. 265,209. (No model.)

Claim.—1. The combination, in a system for supplying steam for power and heating purposes, of a superheated-water supply, a vessel provided with a pressure-reducing valve, the vessel and valve being in communication with the supply, and a second vessel communicating with the first at or near the bottom, each of said vessels being provided with steam-pipes, substantially as shown and described.

2. In a system for supplying power and heat, the combination of a superheated-water supply, a vessel provided with a differential pressure-reducing valve, the vessel and valve being in communication with the supply and the vessel being provided with a steam-pipe, a second vessel communicating with the first at or near the bottom, and a radiator in communication with the second vessel, substantially as shown and described.

3. In a system for supplying steam and hot water for power and heating purposes, the combination of a superheated-water supply, a vessel provided with a differential pressure-regulating valve, the vessel and valve being in communication with the supply, a second vessel communicating with the first at or near the bottom, a radiator in communication with this vessel by means of a steam-pipe, and a hot-water coil or radiator communicating with the last-named vessel at or near the bottom by means of a water-pipe, substantially as shown and described.

4. In a system for supplying power, the combination, with a superheated-water supply, of a vessel, as B, a coil in the top thereof in communication with said supply, and a pressure-reducing valve in communication with the coil and provided with means for discharging the superheated water into said vessel, substantially as shown and described.

5. In a system for supplying power and heat, the combination of a superheated-water supply, a vessel provided with an outlet for steam and having a coil therein in communication with said supply, said coil being provided with a pressure-reducing valve, a second vessel in communication with the first at or near the bottom, and a radiator or other means for utilizing heat in communication with the second vessel, substantially as shown and described.

6. In a system for supplying power and heat, the combination of a superheated-water supply, a vessel having an outlet for steam and provided with a coil therein in communication with said supply, a second vessel in communication with the first at or near the bottom, a radiator in communication with the top of said second vessel, and a water coil or radiator communicating with the bottom thereof, substantially as shown and described.

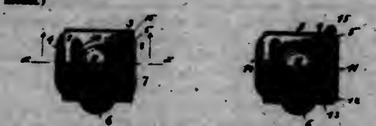
7. In a system for supplying steam for power and heating purposes, the combination of a superheated-water supply, a vessel, as B, in communication with the supply, in which a portion of the superheated water is converted into high-pressure steam by allowing it to expand, said vessel being provided with a steam-pipe for conveying the steam to a stationary engine or other means for utilizing the same, a second vessel, as D, in communication with the first at or near the bottom thereof, in which the superheated water not converted into steam at the first expansion is converted into low-pressure steam by allowing it to expand, a radiator or other means for utilizing the low-pressure steam thus formed, and means for returning the water of condensation to the heater, substantially as shown and described.

386,349. POTATO-PLANTER. JOHN H. PRESSLEY, Horton, Iowa, assignor of one-half to John L. Chapin, same place. Filed Mar. 6, 1888. Serial No. 266,373. (No model.)

Claim.—1. The combination, with the seeder, of a hinged coverer, a bar, J, loosely jointed to the middle of the coverer-frame, and having a marking-tooth, *i*, and a hook-and-eye connection with the box for sustaining the cover in elevated position, and supports arranged on the ends of the coverer-frame for sustaining the bar when turned down for use as a marker, substantially as shown and described.

2. The combination, with the seed-box having the downward projections I and the spouts G, of the coverer H, hinged to the projections, and composed of end bars, *a a*, longitudinal bar *b*, with shovels *c*, longitudinal bar *d*, and covering-bars *e e*, converging to the rear, substantially as and for the purpose described.

386,350. INK-FOUNTAIN FOR PRINTING-PRESSES. GEORGE W. PRESCOTT, Boston, Mass. Filed Nov. 7, 1887. Serial No. 254,492. (No model.)



Claim.—1. An ink-fountain for printing-presses, composed of an inclined plate, two pivoted and movable end pieces, and an intermittently-revolubie roll having its bearings in said movable end pieces, and arranged to be revolved with its periphery in near proximity to the lower portion of the front face of the said inclined plate, and forming one side of the ink-receptacle.

2. The combination of the plate *b*, the movable end pieces, *c c*, the roll *f*, mounted in bearings in said end pieces, the adjusting-screws *k*, the nuts *l*, and the springs *m*, all constructed, arranged, and operating substantially as and for the purposes described.

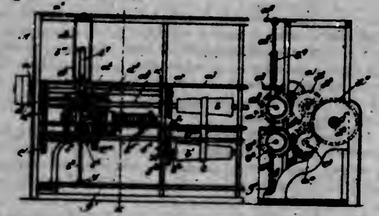
3. The combination of the inclined and pivoted plate *b*, the end pieces *c c*, the roll *f*, the screw-bolt *k*, pivoted to the rear of said plate, the nut *i*, and the bar *d*, provided with the ears *d'' d''* and *k'*, all constructed, arranged, and adapted to operate substantially as described.

4. The combination of the pivoted inclined plate *b*, the pivoted and movable end pieces, *c c*, the roll *f*, mounted on said end pieces, the screws *k*, nuts *l*, and springs *m*, for adjusting the roll *f* relative to the plate *b*, and the screw *k* and nut *i*, for adjusting the roll *f* and plate *b* relative to the inking-rollers *e*, substantially as described.

386,351. NUT-LOCK. HIRAM P. PIERCE, Grand Haven, assignor of one-half to Sherman H. Boyce, Nelson B. Hewitt, and Stephen L. Moore, Ottawa County, Mich. Filed Dec. 14, 1887. Serial No. 257,945. (No model.)

Claim.—1. In a nut-lock as herein described, the combination, with a nut and bolt, of a washer having a projection engaging the nut, and a V-shaped key engaging the bolt and a projection on the washer, substantially as described.

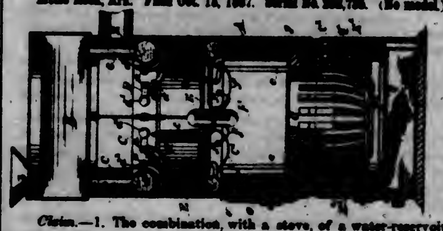
2. In a nut-lock, the combination, with a nut and bolt, of a washer having a lip bent up and resting against the side of the nut, and a V-shaped key straddling the bolt and having a serrated edge engaging a spring projection on the washer, substantially as described.



3. The combination, with bolt 2 and nut 3, of washer 12, having bent-up lip 14 and spring-arm 11, and the V-shaped key 6, having serrated edges 8 and 10 and beveled edge 9, substantially as described.

4. In a nut-lock as herein described, the combination, with a nut and bolt and a washer having a projection adapted to lie against the side of the nut and a projection adapted to engage a key, of a V-shaped key having an outer serrated edge to engage the washer and an inner beveled edge and a serrated edge to engage the bolt, substantially as described.

5. The V-shaped key 6, having serrated edge 8, beveled edge 9, and serrated edge 10, substantially as described.



386,352. ROVING-MACHINE. ALONZO H. EDGARTON, Milford, Mass., assignor to the Hopedale Machine Company, Hopedale, Mass. Filed Aug. 23, 1887. Serial No. 247,962. (No model.)

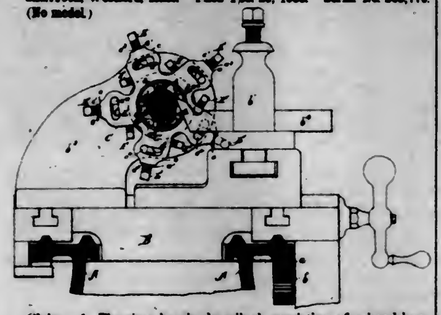
Brief.—The object of the invention is to avoid the backlash and consequent stretching of the roving between the flier and bobbin upon starting the machine.

Claim.—The flier-driving shaft and bobbin-driving shaft of a roving-machine, combined with a friction device and with means to automatically actuate the different portions of the said friction device from the said shafts, whereby the rotation of the said shafts is stopped and started at the same instant of time, thus avoiding backlash.

386,353. STOVE FOR RAILWAY-CARS, &c. JOHN D. SHIELL, Little Rock, Ark. Filed Oct. 13, 1887. Serial No. 252,735. (No model.)

Claim.—1. The combination, with a stove, of a water-reservoir exterior of the stove, a series of water-reservoirs communicating with the interior of the stove, and pipes connecting the series of reservoirs with each other and with the exterior reservoir, substantially as specified.

2. The combination, with a stove and one or more water-reservoirs having openings communicating with the interior of the stove,



of a series of bent levers pivoted to said reservoir, overlapping plates attached to said levers, and valves attached to said levers to close the openings in the reservoir, substantially as specified.

3. The combination, with a stove and water-reservoir having openings communicating with the interior of said stove, of a series of bent levers pivoted to said reservoir, a series of overlapping plates attached to one of the ends of said levers and extending around the interior of the stove against the sides thereof, valves secured to said levers to close the openings in the reservoir, and weights or springs on the free ends of said levers, substantially as specified.

4. The combination, with a stove and a water-reservoir having tubes or conduits extending and opening into the interior of the stove, of a weight centrally suspended within said stove from the top thereof to have a free lateral swing, plugs normally closing communication from the reservoir into the stove, and chains or the like connecting the plugs and weight, whereby when the weight is swung laterally the plugs are forced from their seats and communication is opened from the reservoir into the stove, substantially as described.

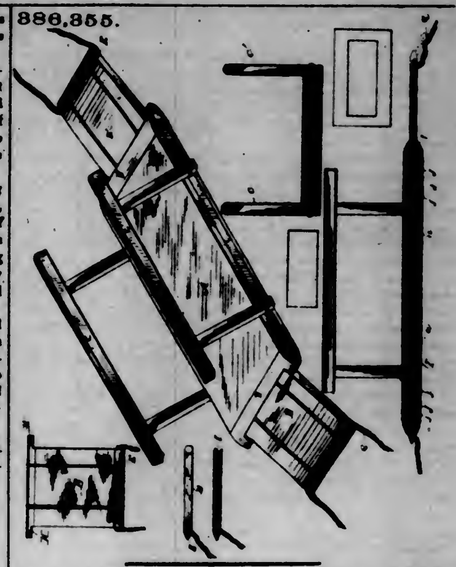
5. The combination, with a stove and a basket-grate suspended within said shell, of a reservoir exterior of the stove, a reservoir within the stove in communication with the exterior reservoir and surrounding the grate, said interior reservoir being provided with openings into the interior of the stove, and valves or plugs normally closing said openings, and levers for opening communication, substantially as described.

386,354. ADJUSTABLE SIZER FOR SHAFTING. DAVID H. BRATTON, Westfield, Mass. Filed Feb. 29, 1888. Serial No. 265,770. (No model.)

Claim.—1. The sizer herein described, consisting of a head having an opening to admit a piece of shafting, and cutters secured in said head at equal angular distances from each other and projecting into said opening and adapted to be held from turning, and to be carried by the follower-rest, or by an arm projecting vertically from the lathe-carriage and to center itself automatically with said shafting, as and for the purpose specified.

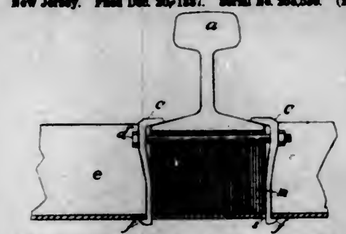
2. The combination of the head provided with radial holes having screw-threaded outer portions, and with a central opening connecting with said holes, cutters arranged in said holes and extending into said opening, means, substantially as described, of holding said cutters, and adjusting-screws turning in the threaded portions of said holes and thrusting against the outer ends of said cutters, as and for the purpose specified.

386,355. GANG-PLANK FOR VESSELS. FRANK W. SEELY, Hampton, assignor of one-half to Thomas R. Cooke, Norfolk, Va. Filed Mar. 27, 1888. Serial No. 268,619. (No model.)



Claim.—1. The combination, in a gang-plank, of the main portion, with the sliding end pieces pivoted as described.

2. A gang-plank consisting of a body portion and end sliding pieces pivoted and hinged substantially as described, and provided with friction-rollers, as shown.

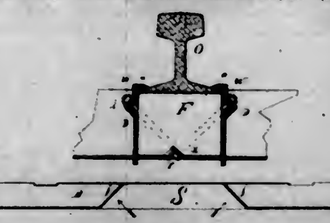


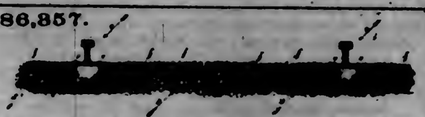
3. A gang-plank consisting of the main body portion provided with chambers between its flat sides, transverse supporting and stop pieces, and hinged metal protecting-pieces, substantially as described.

4. The combination, in a gang-plank, of the main body portion provided with end protecting-irons, which serve also for hinges, with pivoted end pieces having projections H H on their ends, said ends being also recessed to receive the edge of the protecting-irons, whereby the sections are secured together in the manner shown and described.

5. The combination, in a gang-plank, of the hollow main body portion provided with hinged irons, protecting-pieces, and anti-friction rollers, with the pivoted end sliding pieces having journal or pivoted projections, the said sliding pieces being adapted, to be telescopically adjusted, and stops for the said end pieces, substantially as set forth.

386,356. METAL RAILWAY-TIE. HENRY SPEISSER, Elizabeth, N. J., assignor to the Standard Metal Tie and Construction Company, of New Jersey. Filed Dec. 20, 1887. Serial No. 258,589. (No model.)





Claim.—1. The combination of a metal tie and the clamps *c*, constructed with hooks or clips, as *f f*, standing in a reverse direction to the jaws, packing-block *m*, and bolt *d*, as described and specified.

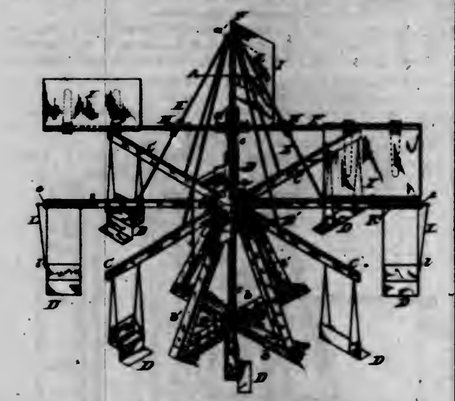
2. A packing-block, as *m*, constructed of wood with its grain running in a vertical direction, in combination with a metal tie and adjustable spring-clamps provided with the clips *f f*, standing in a reverse direction to the jaws, for holding the rail in position on the said block against its end grain, the said clamps so constructed as to exert a force against the sides of the block independent of the force applied to the rail-base, whereby the said block is completely bored and prevented from splitting or spreading under pressure.

3. In combination with a metal railway-tie, the clamp *c*, constructed with a jaw on its upper side adapted to engage with the rail-base, its body portion made thin and curved, so as to throw its upper portion outward, its lower portion being suitably engaged with the bottom of the tie, so that the clamp will have a fulcrum-foundation, as shown at m^2 and n^2, Fig. 6.

386,357. RAILWAY METAL TIE. HENRY SPEISSER, Elizabeth, N. J., assignor to the Standard Metal Tie and Construction Company, of New Jersey. Filed Feb. 21, 1888. Serial No. 264,753. (No model.)

Claim.—1. A railway metal tie constructed of channel-beam iron having resisting or anchor plates bent at angles opposed to the direction of the disturbing lateral force of a train up from the tie-bottom, to form within the tie sloping ends of an open pocket, of which the sides of the tie are the vertical sides, substantially as herein shown and described.

2. A railway metal tie constructed, substantially as herein shown and described, with an open pocket diminishing in area from the bottom upward and having two sides vertical and two sides sloping inward toward each other from the bottom, as and for the purpose described.



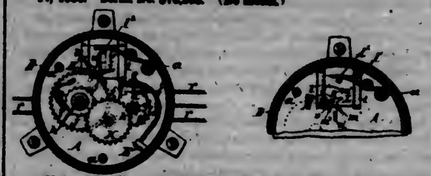
3. A railway metal tie constructed from a form, as shown in Fig. 4, the sides B B being bent upward on the longitudinal dotted lines *v v* at right angles to the bottom, and with resisting-plates *f f*, bent upward on the transverse dotted lines *q q*, substantially as shown and described, whereby when the tie is laid in position said resisting-plates will, when backed by the road-ballast, offer resistance to the lateral disturbing forces of the moving train, as set forth.

4. In a railway metal tie, the combination, with bolding-bolts passed diagonally through the clips, of burrs or washers struck from the tie-bottom and forming an integral part thereof, and bent upward at right angles to the direction of said bolts, substantially as shown and described.

5. In a railway metal tie constructed of channel-beam iron, as a means for holding a rail to the tie, a clip with jaw formed nearly at a right angle to its body, with beam or shoulder formed on its back at an angle to its vertical portion, and with straight fingers prolonged from its lower edge, substantially as and for the purposes set forth.

6. The combination, with a railway metal tie constructed substantially as herein shown and described, of blocks F, set in the channel of the tie, clip C, arranged on opposite sides of said blocks, and bolts D, provided with nuts, passed diagonally from opposite directions through the tie-bottom, the blocks, and the clips, substantially as and for the purpose set forth.

386,358. WIND-PROPELLED SWING. THOMAS J. SMITH, Worthington, Minn. Filed Apr. 13, 1887. Serial No. 234,720. (No model.)

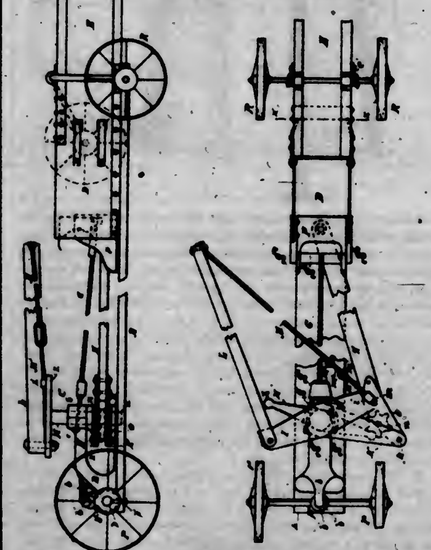


Claim.—1. The improved roundabout hereinbefore described, consisting of a series of radial arms mounted on a central mast, suitable seats carried by said arms, a horizontal wind-wheel mounted on said mast above said arms, and one or more levers pivoted to said arms and adapted to be engaged with the wind-wheel to regulate its speed, substantially as set forth.

2. The combination of the revolving mast A, the radial arms C, the shafts F, carrying wind-sails I, arranged at right angles with each other, as shown, and one or more levers, K, pivoted to the arms C and provided with the legs *k k'*, substantially as shown and described.

3. The combination of the frame-work *b b'*, supporting the step B and collar B', the mast A, mounted in said step and collar, the radial arms C, carrying swings D, the stay-rods E, bearings G H, shafts F, provided with wind-sails I, forked levers K, pivoted near the outer ends of the arms C, and the cords L, attached to said levers and to the swings D, substantially as shown and described.

386,359. BURGLAR-ALARM. HARRY W. SPELLER, Buffalo, N. Y., assignor of one-half to George H. Gaskamp, same place. Filed Apr. 17, 1888. Serial No. 270,933. (No model.)



Claim.—1. The combination, with the supporting-plates of the alarm, the bell, and the vibrating hammer, of a hammer-actuating mechanism composed of a suitable clock-work, one of the wheels of which is provided with a stop-pin, a sliding plate provided with a projection adapted to engage with said stop-pin and with a lug projecting through a slot in the adjacent supporting-plate, and an actuating-lever pivoted to said supporting-plate and engaging against the lug of said shifting plate, substantially as set forth.

2. The combination, with the supporting-frame of the alarm, the bell, and the vibrating hammer, of a hammer-actuating mechanism consisting of a suitable clock-work, one of the wheels of which is provided with a pin or projection, a sliding plate, L, a star-wheel mounted on said sliding plate and provided with one or more long teeth and several short teeth, a stop, *n*, secured to the supporting-frame, against which the long teeth of the star-wheel engage, and an actuating-lever, whereby said sliding plate is shifted, substantially as set forth.

3. In a burglar-alarm, the combination, with the supporting-frame, the bell, and the vibrating hammer, of a clock-work whereby said hammer is operated, and having a wheel provided with a pin or projection, a sliding plate, L, provided with a projection, *q*, and spring *l*, a star-wheel, M, journaled upon said sliding plate, a stop, *n*, secured to the main frame, and an actuating-lever, P, engaging against the projection *q* of the sliding plate, substantially as set forth.

4. In a burglar-alarm, the combination, with the supporting-plates A A', the bell D, and hammer E, mounted on a spindle having pallets *f f'*, of a ratchet-wheel, G, actuating said pallets, a mainspring, H, secured to a winding-spindle, A, having a ratchet-wheel, *j*, a main gear-wheel, J, having a pin, *e*, and a pawl, *j'*, engaging with the ratchet-wheel *j*, gear-wheel K, and pinions *k k'*, connecting said main gear-wheel with the spindle of the ratchet-wheel G, the sliding plate L, carrying the star-wheel M, stop *n*, secured to the plate A, and actuating-lever P, whereby the sliding plate is shifted, substantially as set forth.

386,360. BALING-PRESS. BENJAMIN C. SEAY, Kansas City, Mo. Filed Aug. 6, 1887. Serial No. 246,004. (No model.)

Claim.—1. The combination, in a baling-press, with a carrying shaft and its crank, of a rebounding plunger, a pitman, guide-arms

loosely mounted on said shaft and pivotally connected to the said pitman, a gear-wheel on said pitman, and a crank on said shaft in the path of said gear-wheel, for the purpose specified.

2. The combination, in a baling-press, with the driving-shaft, of a yoke on said shaft and a draft-pole pivotally attached thereto and having a yielding support beyond the pivotal point of said pole on said yoke adapted to permit an accelerated speed of the shaft in passing a dead-center to relieve the tension on the draft-pole without shock, for the purpose specified.

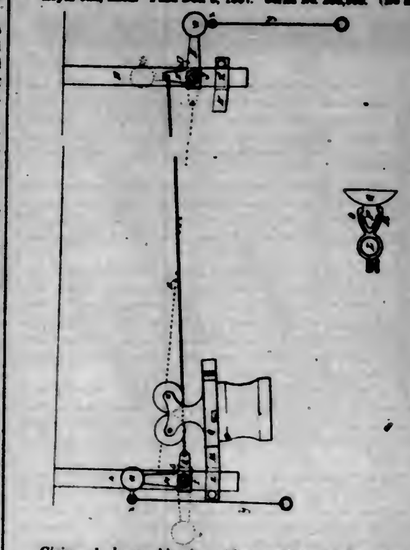
3. The combination, in a baling-press, with the driving-shaft, of a yoke on said shaft and a draft-pole pivotally attached thereto, and a divided rod having one portion attached to said yoke and an opposite portion to said pole, and an intermediate yielding joint connected with said opposite portions of said rod, as described.

4. The combination, in a baling-press, with the driving-shaft, of a yoke on said shaft and a draft-pole pivotally attached at one end to one end of said yoke and provided with a lug on the opposite end of said yoke, a divided rod having one portion connected with said draft-pole and the opposite portion with said lug and loops on the said divided portion of the rod, and a link connected with said loops, for the purpose described.

5. The combination, with a baling-press having traction-wheels, of an axle having opposite parts bent in an upward direction and connected together, and a baling-press suspended therefrom, and a keeper, as and for the purpose described, on the side of said press, and a locking device on said keeper.

6. The combination, with a baling-press having traction-wheels, and journal-boxes upon the top of said press, of an axle for suspending said press extending from one of said wheels to the opposite wheel in the vertical and transverse direction described by the sides and top of said baling-press and continuous through said journal-boxes, a keeper on the lower side of said press, and a locking device on said keeper, for the purpose described.

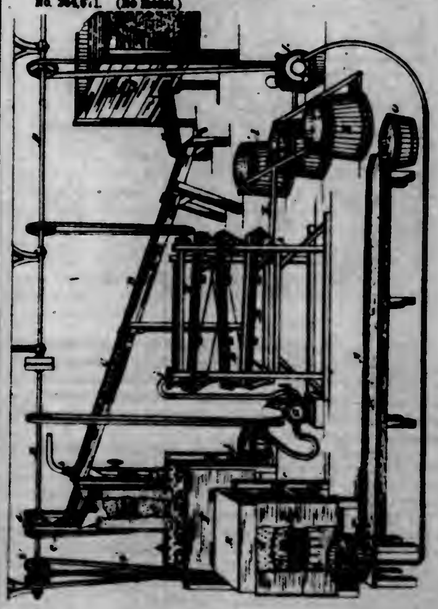
386,361. CORN-SHOCK BINDER. MOSES SPAULDING, Orleans, Mich. Filed Feb. 9, 1888. Serial No. 263,511. (No model.)



Claim.—1. The combination, with the supporting-bars A and the arms D, of the shaft B, pivotally connecting said bars and arms, and the bars G, connecting the outer ends of said arms, cylinder *c* on said shaft, the cords I, formed with hook and eye and secured at one end to said cylinder and the other ends adapted to engage the shocks, and the inclined bar F, pivoted at one end to the arms D and at its other end provided with a plurality of holes by which it is adjustably secured to the bars A by a pin, substantially as and for the purpose specified.

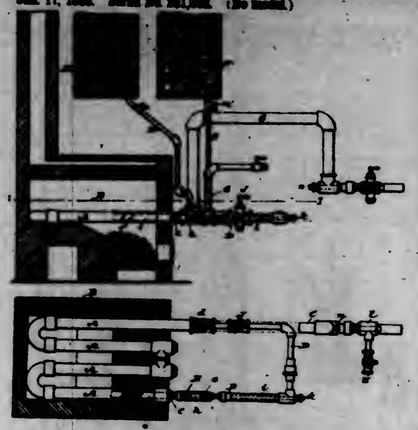
2. The combination, with the supporting-bars A, and arms D, pivotally connected thereto and carrying the compressing mechanism, the crank, and the bars G on the outer ends of the arms D, of the brace-bar F, pivotally connected at one end with the arms D and at the other end provided with a plurality of holes, *f*, and the pin *e*, connecting said brace-bar with the bars A and forming a support for the spool *g*, substantially as described.

3. The combination, with the supporting-bars A, the arms D, and the shaft B, pivotally connecting said bars and arms, provided with a crank, of the cylinder *c* on said shaft, the cross-bars G, connecting the outer ends of said arms, the pulleys H, journaled between said cross-bars, the cords I, secured at one end to said cylinder and the other ends passed over said pulleys, and the knife K on one of said arms, all substantially as and for the purpose specified.



386,362. STORE-SERVICE APPARATUS. ERNEST H. STRINGHAM, Royal Oak, Mich. Filed Dec. 2, 1887. Serial No. 256,926. (No model.)

Claim.—1. In combination with two pivoted bell-crank levers, each having a weight on one of its arms, a single wire stretched between the other arms of said levers, and a wheeled carriage on said track, substantially as shown and described.



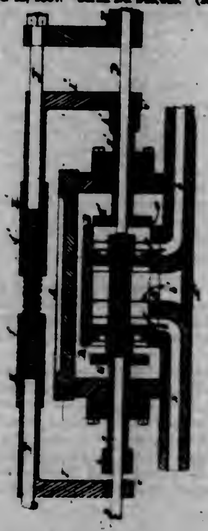
2. In combination with the pivoted bell-crank levers C D, each having the weight W on its long arm, the single wire R, connected with the short arms of said levers, the car Q, and a stationary catch supported below each lever, composed of two converging spring-arms so arranged that the car can be lifted vertically out of engagement therewith, substantially as described.

386,363. PLANT FOR THE MANUFACTURE OF STARCH FROM GRAIN. EDWARD STRONG, New York, N. Y., assignor to the Vienna Wheat Starch Company of West Virginia. Filed Feb. 20, 1888. Serial No. 264,671. (No model.)

Claim.—The plant for the manufacture of starch herein described, consisting of the saturating-receptacle A for the grain, the trough B, the conveyer therein, the crushing-rolls E, the separating apparatus F, having beaters *g*, the pump G, and series of sieves H, with the pipes K and settling-vats I, the force-pump L, the vat M, and trough N, all arranged in the manner and for the purpose herein shown and specified.

386,364. APPARATUS FOR THE MANUFACTURE OF VAPOROUS AND GASEOUS FUEL. CHARLES SELDEN, Truxton, N. J. Filed Jan. 17, 1888. Serial No. 261,082. (No model.)

Claim.—1. The circulating-pipe D, containing the pipe *h*, in combination with the fluid-supply pipe E, the escape-pipe C, and the retort A, containing the pipe *e*, substantially as shown and described.



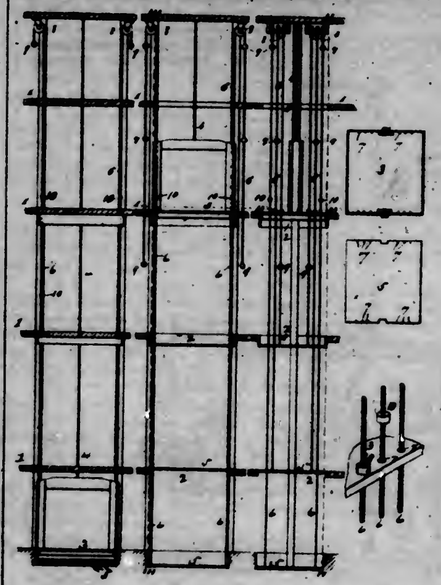
2. The circulating-pipe D, containing the pipe *h*, in combination with the fluid-supply pipe E, the pipe G, the escape-pipe C, and the retort A, containing the pipe *e*, substantially as shown and described.

3. The retort A, containing the pipe *e*, in combination with the escape-pipe C, containing the pipe *f*, the circulating-pipe D, containing the pipe *h*, and the pipe E, substantially as shown and described.

4. The retort A, containing the pipe *e*, in combination with the escape-pipe C, containing the pipe *f*, the circulating-pipe D, containing the pipe *h*, the pipe E, and the pipe G, substantially as shown and described.

5. The retort A, containing the pipe *e*, in combination with the pipe C and the pipe D, said pipe D being located in substantially the same plane as the retort and connecting the delivery end of the retort with the inlet-pipe, substantially as shown and described.

386,365. CUT-OFF VALVE. WILLIAM W. ST. JOHN, Brooklyn, N. Y. Filed Sept. 12, 1887. Serial No. 249,449. (No model.)



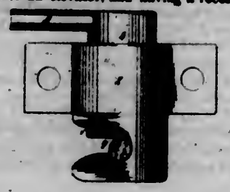
Claim.—1. A piston-valve having the bisected heads placed loosely on a valve-stem, having collars for limiting their motion toward each other, and operated as and for the purpose herein specified.

2. A piston-valve provided with heads C C, arranged in a casing, E, having steam and exhaust ports, and the cut-offs G and G', in combination with a solid stem, D, and hollow stems and tappets, as and for the purpose specified.

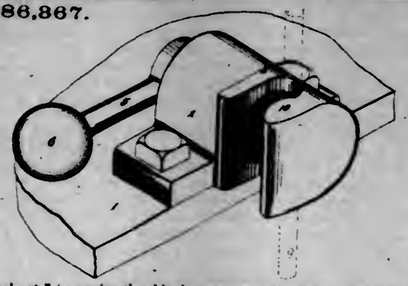
3. A piston-valve provided with heads C C, attached to a solid stem, D, and arranged in a casing, E, having steam and exhaust ports, in combination with the loose cut-offs G G', provided with hollow stems and operated by tappets, in the manner shown and set forth.

4. The combination of a piston-valve, arranged in a casing and provided with heads C C, attached to a solid stem passing through hollow stems of the cut-offs G G', operated by tappets, with the right and left hand screws and sleeve-nuts, all arranged as shown and specified.

386,366. SELF-CLOSING HATCHWAY. RICHARD D. TRAGESER, St. Louis, Mo., assignor to the Safety Hatch-Door Company, same place. Filed Oct. 26, 1887. Serial No. 253,493. (No model.)



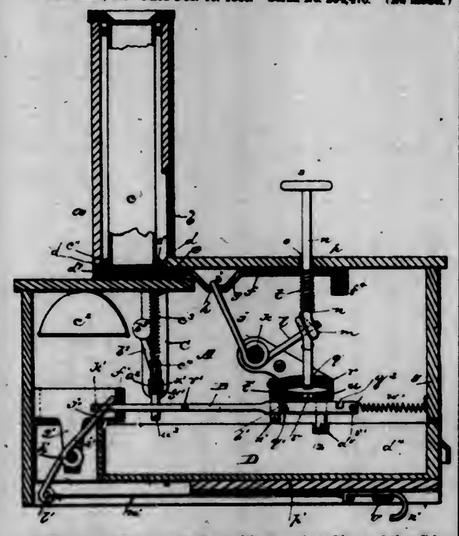
Claim.—1. In combination with an elevator-shaft, pulleys or sheaves at the top thereof, ropes passing over said pulleys, doors each attached to the lower end of independent ropes, blocks or projections on the ropes, and a cage adapted to contact with and lift the blocks successively as the cage rises, and with them the independent ropes and doors, substantially as and for the purpose set forth.



2. In combination with an elevator-shaft, pulleys or sheaves at the top thereof, ropes passing over said pulleys or sheaves and weighted at their upper ends, doors each attached to the lower ends of independent ropes, blocks or projections on the ropes, and a cage adapted to contact with and lift the blocks successively as the cage rises, and with them the independent ropes and doors, substantially as and for the purpose set forth.

386,367. SAFETY-LOCK FOR ELEVATORS. RICHARD D. TRAGESER, St. Louis, Mo., assignor to the Safety Hatch-Door Company, same place. Filed Oct. 26, 1887. Serial No. 253,492. (No model.)

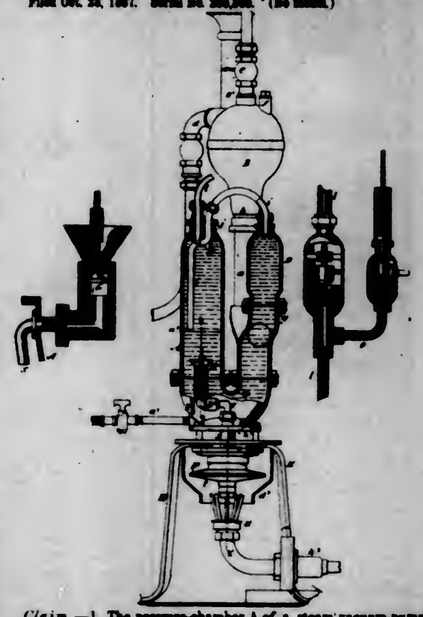
Claim.—The combination, with bracing 2, secured to the lower part of the cage of an elevator, and having a recess opening trans-



386,867.

versely at 7 to receive the shipping rope or cable, of screw 4, engaging in said housing, having a smooth end for bearing on the cable, and weighted lever or handle 5, rigid therewith, to be operated by the foot, substantially as described, to clamp the shipping-rope when the latter is passed through opening 7 into recess 8.

386,868. DEVICE FOR DELIVERING COIN. GEORGE WEBSTER, Christiana, Pa. Filed Feb. 18, 1888. Serial No. 264,470. (No model.)



Claim.—1. The combination, with the coin-holders, of the slides formed with the central depression having the perforation through it, and the arms *j* and *l*, forming a continuous piece, provided with the intermediate coil encircling the transverse rod *k* and turning thereon, the vertical rods *n*, having the eye *m*, the spring *t*, for retracting said rod, and the fixed bar *r* and bar *u*, having perforations, whereby said rods are guided, as and for the purpose set forth.

2. The combination, with the vertically-movable rods having push-buttons, the slide, and operating-spring, of the fixed transverse bar, perforated as described, the sliding bar having the perforations, the teeth, angular thumb-piece, and downwardly-projecting arms *a' z*, the spring *c'*, for retracting this bar, said fixed bar having the slots d^3, and the movable bar having the bolts whereby they are loosely connected together, the fixed bar provided with the short bar *t'*, having the notches *a'*, the operating-rods B, having flattened end and notches q' q^3, and beveled pins *r'*, spring *w'*, connected to the end of said rods and to the frame, the pivoted and laterally-movable rack-bar having the hammer and beveled arms a^2, spring c^2, gong, and bar *f'*, pivoted on the rod *h'*, one end connected by its slot to the rod and the other end to the wire, and the thumb-slide and money-drawer, substantially as and for the purpose set forth.

3. The coin counter and deliverer herein described, consisting of the main frame provided with the casing and coin holders or cylinders, the plate therefor having the lugs on its upper face and slideways on its under face, the movable slides constructed with the depression having the perforation, the operating-arms having the intermediate coil and pivoted to the transverse rod, vertically-movable rods having the eye and push-button, the spring for operating these rods, the fixed transverse bar, perforated as described, and provided with the slots at each end, and the notched short bar, the sliding bar having perforations, teeth, and arms *a' z w*, spring *c'* for retracting said bar, the rods B, having flat ends provided with notches and beveled pin, the pivoted and laterally-sliding rack, constructed as described, having the spring c^2, the frame for the rods secured to the main frame, gong c^3, pivoted arm i^2, having at one end the slot j^2 and at the other end the eye *l'*, wire *m'*, thumb-slide *n'*, and the drawer having the notch in one side and the hook in the other side, the whole constructed, combined, and arranged as shown and described.

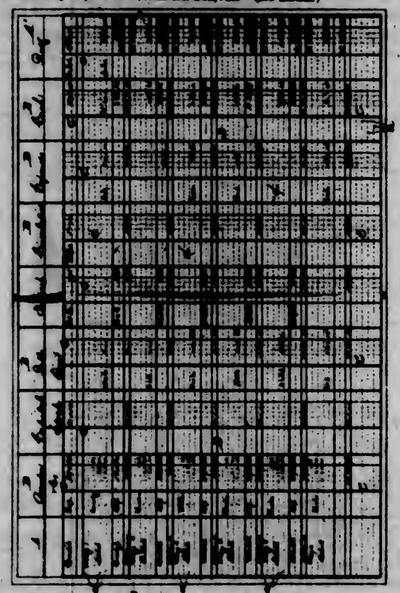
386,869. STEAM-PUMP. ANSON P. WESTON, New York, N. Y. Filed Oct. 26, 1887. Serial No. 253,203. (No model.)

Claim.—1. The pressure-chamber A of a steam vacuum-pump, combined with a condensing-chamber, D, by means of a pipe, *i*, passing from the upper part of the condensing-chamber into the interior of the working-chamber, said pipe *i* having the nipple i^3 near the top of the working-chamber A, substantially as herein shown and described.

2. In a steam vacuum-pump, the pressure-chamber A and condensing-chamber D, and the pipe *i*, connecting said chambers at their upper ends, said pipe having an opening in the pressure-chamber near the upper end and another at a distance therefrom, said chambers being also connected at their lower ends, combined with the boiler feed-pipe *x*, containing a valve, G, said pipe *x* entering the chamber A, the parts being so arranged that the pressure of steam from the boiler will press said valve to its seat to prevent an inflow of water to the boiler, and by which the pressure of water in the working-chamber will open said valve, when the steam-pressure upon said valve is reduced to admit water through the feed-pipe to the boiler, as set forth.

3. The combination, in a steam vacuum-pump, with a pressure-chamber, of a condensing-chamber, connected at their lower ends, and a pipe connecting said chambers at their upper ends, and having two openings within said pressure-chamber—one near the upper end of said chamber and the other at a distance therefrom—whereby all the steam may be exhausted from said pressure-chamber, substantially as described.

4. In a steam vacuum-pump, the combination of a pressure-chamber, A, a boiler, F, a steam-pipe, *l*, connecting the boiler to the chamber A, a valve, *m*, in the pipe *l*, and the pipe *x*, leading from the chamber A to the boiler and provided with the valve G, substantially as described.



5. The combination of the working-chamber A, water-chamber B, separate condensing-chamber D, pipe *i*, leading from the condensing-chamber D into the working-chamber A, and having two openings in said chamber, generator F, pipe *l*, leading from the generator to the chamber A, and valve *m* in the pipe *l*, substantially as described.

6. The combination of the chambers A, B, and D, generator F, pipe *x*, connecting the generator with the chamber A, and valve G in the pipe *x*, all arranged for operation substantially as described.

7. The boiler F, its water-supply pipe *x*, and steam-discharge pipe *l*, combined with the pump-chambers A *a* B D and with the intervening air-space A, as specified.

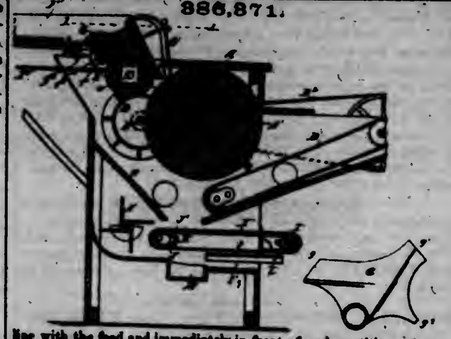
8. In a steam-pump, the pressure-chamber A, combined with the steam-supply pipe *l* at its top, the steam-discharge pipe *i* near its lower end, the steam-discharge nipple i^3 near its upper end, and the water-discharge pipe *x* in its lower end, so as to utilize the pressure of steam and the weight of water in said chamber A, as set forth.

386,870. ACCOUNT-BOOK. ARTHUR A. WEBSTER, Kansas City, Mo. Filed May 20, 1886. Serial No. 202,762. (No model.)

Claim.—1. A combined cash-book, ledger, and balance-book having its pages provided with an up-and-down individual-account column, and credit, balance, and debit spaces, in said up-and-down column, one below another, the latter spaces provided at one side of the page with headings indicating credits, balances, and debits.

2. A combined cash-book, ledger, and balance-book having its pages ruled with up-and-down columns for individual accounts and with lines extending across the pages from side to side to form spaces for debits, credits, and balances in the same up-and-down column one below another, said cross-spaces being furnished with headings indicating credits, balances, and debits in their order.

3. A combined cash-book, ledger, and balance-book having its pages provided with a single up-and-down column for each account, and cross-spaces, one below another, in each column for entries in said up-and-down column of the debits, balances, and credits, the balance-space running between and separating the debit and credit spaces, substantially as set forth, and the cross-spaces being furnished with headings indicating credits, balances, and debits.



4. A combined cash-book, ledger, and balance-book having its pages furnished with a single up-and-down column for each account and an up-and-down column at the outer end of the page for footings, and a series of cross-spaces extending uniformly across the columns of the page, one below another, to receive the credits, balances, and debit entries, one below another in each column, and the footings of the balances at the side of the page, the cross-spaces being provided with headings indicating credits, balances, and debits.

386,871. CORN-SHELLER. HENRY A. ADAMS, Sandwich, Ill. Filed Jan. 3, 1888. Serial No. 259,722. (No model.)

Claim.—1. In a corn-sheller having two or more shelling-holes, the shelling devices, in combination with the feeding devices, the stationary partitions between the shelling-holes, a movable piece mounted in advance of the partitions, and mechanism for moving said piece back and forth in the line of the feed, substantially as and for the purposes specified.

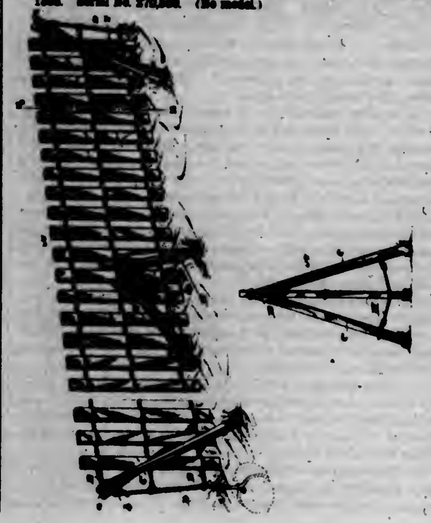
2. In a corn-sheller having two or more shelling-holes, the shelling devices, in combination with the feeding devices, the stationary partitions between the shelling-holes, and a vibrating arm arranged in

386,871.

line with the feed and immediately in front of each partition, substantially as and for the purposes specified.

3. In a corn-sheller having two or more shelling-holes, the shelling devices, in combination with a force-feed beater arranged in advance of the shelling devices, a vibrating bridge-breaking arm arranged in advance of the beater, and feeding devices, substantially as and for the purposes specified.

4. In a corn-sheller having two or more shelling-holes, the shelling devices, in combination with the feed-trough arranged in a horizontal position, the feed-chains running in said trough, and a vibrating bridge-breaker arranged between the feeding devices and the shelling devices, substantially as and for the purposes specified.

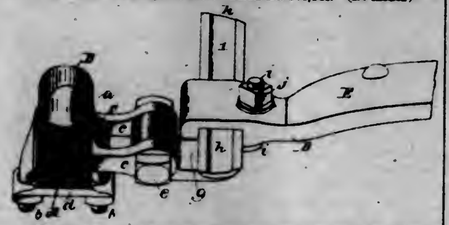


5. In a corn-sheller, the hopper and feed-chains F, in combination with the shaft *f*, provided with sprocket-wheels *f'* for the feed-chains, the vibrating arm G, mounted on said shaft *f*, and the beater E, provided with projections engaging with said arm to vibrate it, substantially as and for the purposes specified.

6. In a corn-sheller, the feed-trough and feed-chains running therein, in combination with a vibrating arm, G, mounted and arranged to vibrate in line with the feed, and a revolving shaft provided with projections arranged to engage said arm at suitable intervals and throw it outward contrary to the direction of the feed, substantially as and for the purposes specified.

7. In a corn-sheller, the feed-trough and feed-chains running therein, in combination with the vibrating arm G, and a shaft having projections for engaging said arm and turning it outward at suitable intervals, and a stop for arresting this outward movement of the arm, substantially as and for the purposes specified.

8. In a corn-sheller, the vibrating arm G, provided with the front and rear extensions *g* g^4, the revolving beater E, provided with lugs or projections e^4, and the stop g^4 on the feed-hopper, substantially as and for the purposes specified.



386,872. FENCE. RICHARD T. ALDEN, Lodi, Mich. Filed Apr. 12, 1888. Serial No. 270,602. (No model.)

Claim.—1. The combination, in a fence, substantially as described, of the main longitudinal wires, the end stakes inclined and crossed to receive the ends of the top main wire, the anchor-wires, also secured to the crossed ends of the inclined end stakes, the said top main wire having its ends secured to the anchor-wires, the lower loop-wires for the stake-post and the intermediate cross-stakes embracing one of the pickets and bound by a loop-wire at their crossed portions, a loop-wire securing their lower ends to the fence, and a binding-lever having its upper end in the loop of the wire uniting the said intermediate stakes, and the opposite ends of this binding-lever secured to the lower portion of the fence, substantially as specified.

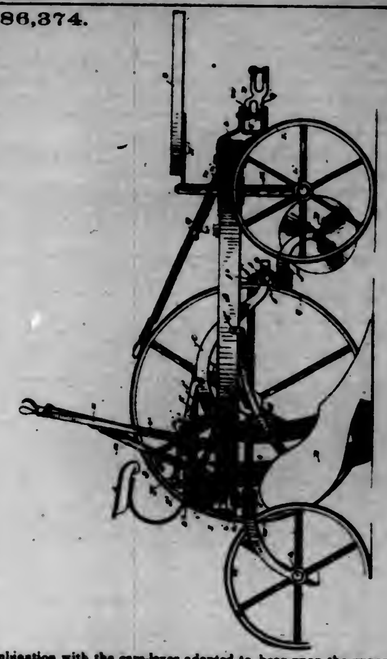
2. The combination, with a fence, substantially as described, of longitudinal wires, end stakes crossed and inclined, anchor-wires secured to the upper crossed ends of the said stakes and also to the ends of the fence-wires, and the brace-wire connecting the lower ends of the said stakes with the lower portion of the fence, substantially as specified.

386,373. SHIFTING-POLE COUPLING. SAMUEL R. BAILEY, Amesbury, Mass. Filed Apr. 9, 1888. Serial No. 270,141. (No model.)

Claim.—1. A vehicle-shackle draft-eye having a bar formed thereon with its longitudinal line parallel with the axis of the pivot-bolt, substantially as specified.

2. The bar *h*, in combination with the draft-eye, and having its edges or planes 2 2 oblique to and at an acute angle to plane 1, substantially as specified.

3. The bar *h*, formed integrally with the draft-eye and raised above arm *g* to allow iron D to move over said arm, substantially as specified.



4. The combination, with the draft-eye of a vehicle-shackle having bar *h*, of extension-iron D, formed with a transverse groove or slot to receive said bar, substantially as specified.

5. In a shaft-shackle, the combination, with bar *h*, formed upon shaft-eye *f*, and extension-iron D, formed to engage said bar, of key-bolt *i*, formed and arranged to operate substantially as specified.

6. The stop *k*, formed upon bar *h*, as and for the purposes specified.

7. In a vehicle-shackle, the combination of draft-eye *f*, its bar *h*, extension-iron D, and key-bolt *i*, all adapted to coact substantially as specified.

386,374. PLOW. JOHN W. BARTLETT, Maine, Ill. Filed Apr. 16, 1887. Renewed Jan. 5, 1888. Serial No. 260,904. (No model.)

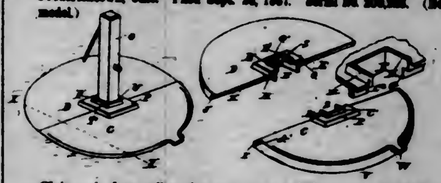
Claim.—1. The combination, with the parallel frame-bars, of the colter and plow-beam of an approximately goose-neck shape, the same being adapted to carry at its rear end a plow and at its forward end a colter, substantially as set forth.

2. The combination, with the parallel frame-bars and the plow and colter, of the beam curved upward, forward, and downward between the frame-bars and provided with a forward extension which receives an adjustable collar having a vertical sleeve provided with an adjusting-screw and receiving the colter-carrying-frame spindle, substantially as and for the purpose set forth.

3. The combination, with the approximately goose-neck-shaped beam carrying a plow, of the parallel bars receiving between them said beam and having a pendant or standard, to which the heel end of the plow is pivoted, and the manipulating-lever linked to said beam, substantially as shown and described.

4. The combination with the pivoted plow, with its curved beam guided between parallel bars, and the crank-axle-adjusting lever, with its retaining pawl or detent, of the pivoted rack engaged by said detent or pawl and connected to the beam-adjusting lever, substantially as and for the purpose specified.

5. The combination, with the parallel frame-bars having a clip at their forward ends, of the lever having a plate-like form at its pivotal point and its end curved beyond a clip form thereof, and the clevis secured in said end of the lever between a U-shaped piece, substantially as shown and described.



6. The rear caster-wheel with its carrying-frame spindle provided with a projection or lug and the sleeve applied to rear end of the frame-bars and provided in its lower edge with a notch or recess, in

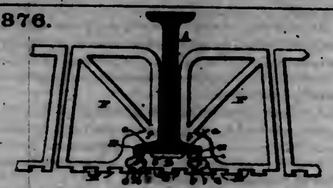
386,374.

combination with the cam-lever adapted to bear upon the upper end of the caster-wheel-frame spindle and to raise and lower the spindle and wheel, substantially as and for the purpose specified.

7. The combination, with the plow-beam having an approximately goose-neck shape and carrying a plow, and the cranked axle carrying a wheel at its other end, of the frame consisting of the parallel longitudinal bars, which receive between them said beam, and the third bar having an end bar at a right angle thereto offset about at its mid-length and contracted toward its ends, the same being bolted to the parallel bars, substantially as and for the purpose described.

386,375. WELL OR CISTERN COVER. JAMES E. BLACKBURN, Fredericktown, Ohio. Filed Sept. 26, 1887. Serial No. 250,222. (No model.)

Claim.—1. In a well or cistern cover, two halves, each of which is provided with a central recess and a flange, one of the halves being further provided with the legs having seats or recesses between them, and the other half having the hooks adapted to engage with the sides of the legs, and the two blocks in the central recesses of the halves, substantially as and for the purpose shown and set forth.



2. In a well or cistern cover, the combination, with two halves, each of which is provided with an upwardly-flanged recess at the middle of its inner or straight side, of the retainer-blocks for fitting within said recesses, each of which has a downwardly-extending flange around its outer edge adapted to fit over the upward flange around the recess of the cover, said blocks being further provided with a recess around which is formed an upwardly-projecting flange for securing and retaining the pump in position.

386,376. TILE CEILING. JAMES E. BENNET, St. Louis, Mo. Filed Feb. 25, 1888. Serial No. 265,247. (No model.)

Claim.—1. The herein-described tile B, having a longitudinal channel, *b*, in its upper surface and longitudinal grooves C C in its edges, substantially as and for the purpose described.

2. The combination of the double-flanged joint A and the tile B, having longitudinal channel *b* in its upper surface and grooves C C in its side edges, with the bent clips E E, engaging the flanges of the

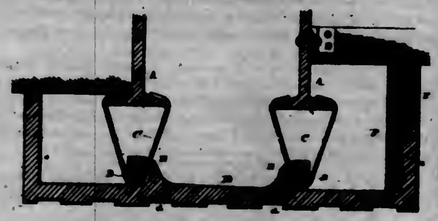
386,376.

girder, and in the grooves of tile B, suspending the latter from the girder, and the shouldered skew-tiles holding said clips in position, all constructed and arranged substantially as and for the purpose described.

3. The combination of joint A, clip E, said tiles B, having grooves C in their side edges, with the skew-tiles F, having shoulders *f*, and grooves *f'*, coinciding with grooves C of the tiles B when in position, as and for the purpose specified.

386,377. TILE FOR CEILINGS. JAMES E. BENNET, St. Louis, Mo. Filed Feb. 25, 1888. Serial No. 265,248. (No model.)

Claim.—1. The combination of the tiles provided with shoulders at their adjoining edges with metal ties engaging said shoulders and locking the tiles together, substantially as described.



2. The combination of the tiles B C, formed with oppositely-inclined shoulders at their adjoining inner edges, with ties engaging said shoulders and securing the tiles together, substantially as described.

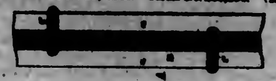
3. A column for buildings, composed of a central metal post, and inclosing-tiles having shoulders at their inner edges and arranged to leave an air-space between their inner faces and the post, and metal ties engaging the tile-shoulders and locking the tiles, substantially as and for the purpose described.

4. The herein-described concavo-convex tile formed with oppositely-inclined shoulders or projections at its side edges, substantially as and for the purpose described.

5. The combination of the semicircular tiles C and B, formed, respectively, with oppositely-inclined shoulders *b* and *b* at their adjoining edges, with the ties F engaging said shoulders and locking the tiles together, substantially in the manner and for the purpose described.

386,378. CEILING-TILE. JAMES E. BENNET, St. Louis, Mo. Filed Feb. 25, 1888. Serial No. 265,249. (No model.)

Claim.—1. The combination of the girders and the rods suspended therefrom by hangers with the tiles having curved flanges on their upper faces engaging said rods, the edges of said tiles extending beyond the rods, substantially as and for the purpose described.



2. The herein-described tile D, having oppositely-curved flanges E E on its upper surface, the edges of the tiles extending beyond the flanges on each side, substantially as and for the purpose described.

3. The combination of the girders A and rods B suspended therefrom with the tiles D formed with oppositely-curved flanges E E on their upper faces, engaging rods B and suspending the tiles thereon, the side edges of the tile extending beyond the rods, substantially as and for the purpose described.

4. The tile D, provided with upstanding flanges *e e* at its edges, and intermediate oppositely-curved flanges E E on its upper surface, all constructed and arranged substantially in the manner and for the purpose described.

5. The combination of the flanged girder and rods B, suspended therefrom, with the tiles D, having curved flanges E E engaging on rods B, and upstanding flanges *e e* at their side edges, and the plain tile F, all constructed and arranged substantially in the manner and for the purpose described.

386,379. HANGER FOR CEILING-TILES. JAMES E. BENNET, St. Louis, Mo. Filed Feb. 25, 1888. Serial No. 265,250. (No model.)

Claim.—1. The combination of the flanged girders with the rods parallel with and below said girders and bent hangers supporting said rods and arranged alternately on opposite sides of the girders and rods, substantially as and for the purpose described.

2. The combination of the flanged girders with rods B and the hangers C, hung upon the flanges of the girders alternately on opposite sides thereof, and suspending the rods B therefrom, and the tiles suspended from said rods, substantially as and for the purpose described.

386,380. TELEPHONE-TRANSMITTER. CHARLES W. BROWN, Montreal, Quebec, Canada, assignor to the American Bell Telephone Company, Boston, Mass. Filed May 18, 1888. Serial No. 274,302. (No model.)

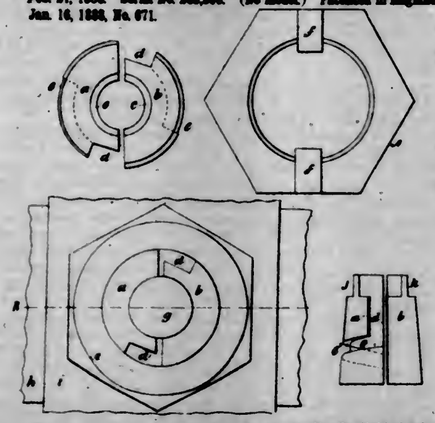
Claim.—1. In a telephone-transmitter employing granulated conducting material as the current-varying medium, the combination of a vibratory diaphragm having free edges with a vertically-mounted granulation-containing cell comprising a vertical metal back plate, a rigid non-conducting annular side wall, an elastic and yielding metal front plate acting as an auxiliary vibrating diaphragm, a mass of granulated conducting material inclosed between the said plates and thereby included in an electric circuit, a centrally-perforated metal gland clamping the same, and a rod attached to the center of the said front plate and passing through the central perforation of the gland to a mechanical connection with the outer diaphragm, whereby the vibrations of the outer diaphragm are transmitted to the front plate of the said cell and to the granulations, substantially as described.

2. The combination, substantially as hereinbefore described, of the compound granular carbon button comprising a mass of granulated carbon inclosed between a rigid metal plate and an elastic and centrally-vibrating metal plate, the said plates being separated electrically by a rigid non-conducting ring, with an external vibrating diaphragm, the said compound button being mounted vertically in proximity to the vibratory diaphragm, the center of the button being approximately opposite to the center of the said diaphragm, and the centers of the vibrating diaphragm and the elastic front plate of the button being mechanically united by a rod, whereby the vibrations of the former are transmitted to the latter, as described.

3. In a telephone-transmitter, the combination, with a vibratory diaphragm loosely supported in a ring-seat and adapted to receive sound-waves, of a hollow button supported opposite thereto, having an elastic metal front plate serving as an auxiliary diaphragm, a rigid metal back plate separated electrically therefrom by a ring of hard rubber and carbon granulations interposed in the chamber thus formed, and a rod attached to the center of the auxiliary diaphragm and in contact with the main diaphragm, so that the vibrations of the latter may be communicated to the former, both diaphragm and hollow button being vertically mounted, substantially as hereinbefore described.

4. In a granular carbon transmitter, the compound containing-cell and contents comprising an external cylinder, a rigid metal back plate closing one end of said cylinder, constituting one electrode of the said cell and centrally perforated for the introduction of the granulations, a rigid and non-elastic ring within the external cylinder and in contact with the said rear wall and forming the non-conducting side wall of said cell, an elastic metal front plate supported by said ring and clamped at its edges by a metal ring, and a screw-gland closing the other end of the external cylinder, whereby the said elastic plate is fixed opposite to the back plate, the central portion thereof being free to vibrate, granular carbon interposed between the said plates.

and a screw-plug closing the central aperture of the back plate for the purpose of retaining the carbon therein.



5. The combination of an ordinary Blake transmitter-case, diaphragm, and adjustment lever and screw with the hereinbefore-described granulation-containing cell, the granulations being contained between a rigid back plate and a centrally-elastic front plate, forming electrodes of an electric circuit, separated electrically at their edges by a rigid and non-conducting ring in such a manner as to form a shallow chamber for the reception of said granulations, the said cell being suitably mounted upon the central portion of the adjusting-lever opposite the central portion of the Blake diaphragm, and the front plate or auxiliary diaphragm thereof being provided with a light rod attached to its center and projecting outwardly therefrom to a delicate but permanent mechanical contact with the center of the main diaphragm, whereby the vibrations of the latter are communicated to the former, for the purpose specified.

6. The combination, with the vibratory diaphragm and adjusting-lever of a Blake transmitter, of a compound granular carbon button mounted upon the center of the said lever so that its center is in the same horizontal plane as the center of the said diaphragm, the said button comprising carbon granulations inclosed between a rigid back electrode and a vibratory elastic front electrode clamped at its edge and adapted to serve as an auxiliary diaphragm, the said electrodes being separated by a non-elastic and non-conducting ring, and means, as indicated, for producing in the auxiliary diaphragm the vibrations of the main diaphragm, substantially as described.

7. In combination with the vibratory diaphragm and adjusting lever and screw of an ordinary Blake transmitter, (so called,) the hereinbefore-described hollow button containing granular carbon and closed in front by a metal elastic vibrating plate constituting an auxiliary diaphragm, the said hollow button being mounted upon the central portion of the adjusting-lever in line with the center of the main diaphragm, the center of the auxiliary diaphragm having a mechanical connection with the center of the main diaphragm, so as to participate in its vibrations, and the hollow button being provided with suitable electrical connections whereby it is adapted for inclusion in an electric circuit, substantially as described.

8. In a telephone-transmitter, a shallow chamber containing granular current-varying material inclosed between two metal plates constituting the electrodes of an electric circuit and uniting the same electrically, one of the said plates being rigid and the other elastic, an adjustable lever supporting the said chamber vertically by means of the rigid plate thereof, a vibratory diaphragm loosely mounted to vibrate freely in a vertical plane, a rod extending outwardly from the elastic plate of the said chamber, an adjusting-screw controlling the said lever and adapted to adjust the same and to bring the free end of the rod into contact with the said vibratory diaphragm for the purpose of forming a mechanical connection between the said diaphragm and the front plate of the carbon-containing chamber, and electrical connections whereby the granulations and their inclosing-plates may be included in an electric circuit, substantially as described.

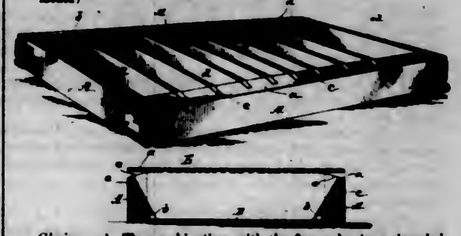
386,381. NUT-LOCK. RICHARD CLAY, London, England. Filed Feb. 27, 1888. Serial No. 265,399. (No model.) Patented in England Jan. 16, 1888, No. 671.

Claim.—1. A lock-nut consisting of a longitudinally-divided tube adapted to engage a screw, rod, or shaft, and provided with recesses *d d* and *e e*, and a ring or collar provided with studs adapted to engage said recesses to bind the tube on the screw, rod, or shaft, substantially as described.

2. The combination of the two gripping-pieces adapted to engage a screw, rod, or shaft, and provided with the longitudinal recesses *d d* and recesses *e e*, formed at an obtuse angle to said recesses, and a ring or collar provided with studs and adapted to engage said recesses *e e*, substantially as described.

3. A lock-nut consisting of a longitudinally-divided tube adapted to engage a screw, rod, or shaft, one portion of said tube provided with a recess, *d*, and a recess, *e*, and a ring or collar provided with a stud, *f*, adapted to engage said recess *e* to bind the tube on the screw, rod, or shaft, substantially as described.

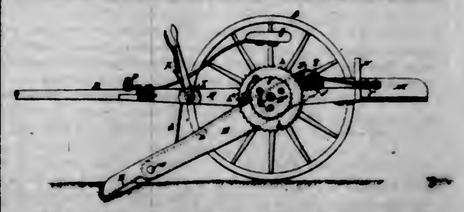
4. The combination of the rod *l*, having a recess, *m*, the gripping-pieces *a b*, having the ribs *n n* and the recesses *d e*, and a locking ring or collar adapted to engage said recesses *e*, substantially as described.



386,382. CUFF-HOLDER. GEORGE J. GLEIM, Goshen, Ind. Filed Sept. 29, 1887. Serial No. 251,024. (No model.)

Claim.—1. As an improved article of manufacture, a cuff-holder consisting of a spring-clamp and a rod having a hook on one end, and its opposite end forming the hinge-pintle for the jaws of the said clamp, substantially as specified.

2. As an improved article of manufacture, a cuff-holder consisting of a spring-clamp and a rod forming the pintle therefor, and having its opposite end turned in hook form with its terminal provided with the enlargement, substantially as specified.



386,383. FEEDING PAN OR TRAY FOR FISH, &c. RALPH CORNABLE, Petoskey, Mich. Filed Nov. 30, 1887. Serial No. 256,803. (No model.)

Claim.—1. The combination, with the frame having a beveled upper edge and slanting notches in the inner face of the frame, of a set of partitions having beveled ends, said partitions adapted to rest in the notches and drop out of the same on the inversion of the frame, substantially as set forth.

2. The combination, with a frame, a metallic bottom secured thereto, and a removable metallic lid or cover, said frame having a beveled upper edge and slanting notches in its inner faces, of a set of removable partitions having beveled ends adapted to rest in the notches of the frame, the upper edges of these partitions being higher than the ends of the frame, for the purpose described and set forth.

386,384. POTATO DIGGER AND PICKER. WILLIAM F. CONWAY, Sheffield, Mass. Filed June 20, 1887. Serial No. 241,562. (No model.)

Claim.—1. A single pair of driving-wheels, the frames A and E, supported solely upon the axle of said driving-wheels in such manner as to vibrate thereon independently of each other, the frame A, having transverse shaft I, and the frame E, having a shovel at its front end, in combination with clutch and chains K *d*, substantially as set forth.

2. The frames A E, suspended solely upon the driving-axle F, so as to vibrate thereupon independently of each other, combined with the endless platform, shafts *e f*, the latter arranged in the rear of the driving-axle F and projecting at each end beyond the sides of frame E, and pinion *g*, cog-wheels A, and a pawl-and-ratchet mechanism, substantially as set forth.

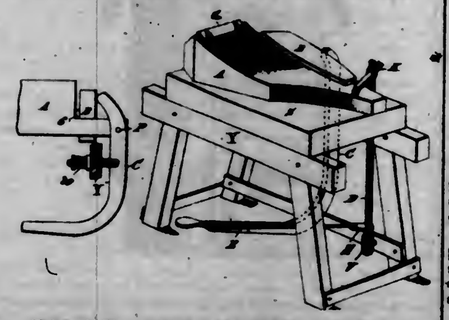
3. The driving-axle F, wheels G, the inner surfaces of whose hubs are provided with ratchet-teeth, and the cog-wheels A, mounted on said driving-axle and provided upon their outer surfaces with spring-pressed pawls, in combination with the pinion *g*, shaft *f*, traveling platform, and frame E, substantially as set forth.

4. The frames A E and traveling platform L, in combination with the frame N, secured to the rear ends of the side bars of frame A, and the vibrating shaker supported by said frame N, substantially as set forth.

5. The frames A E, traveling platform L, and shaft *f*, in combination with gearing *g* A, shaker and supporting frame M N, crank *q*, and bell-crank lever and connecting-rod, substantially as set forth.

6. In combination, in a potato digger and picker, a shovel, a revolving platform, and a vibratory shaker provided with horizontally-projecting teeth or bars A, substantially as set forth.

386,385. SPARK-ARRESTER. GARY H. COOPER, Port Huron, Mich., assignor of one-half to Daniel Wood, East's Station, Ind. Filed Feb. 16, 1883. Serial No. 264,264. (No model.)



Claim.—1. The combination, with a locomotive-engine having an extension-front, B, and the blank plate I, extending under the smoke-stack, of the exhaust-pipes passing through the blank plate and having an opening below said plate for the escape of a part of the exhaust-steam into the extension-front beyond the blank plate, substantially as described.

2. In combination with the extension-front B of a locomotive-engine and the exhaust-pipes D K, the slotted tubes F H, connected with said exhaust-pipes, substantially as shown and described.

386,386. COMPOSITION FOR PRESERVING FOOD. WILLIAM H. DARBEE, Chicago, Ill. Filed June 2, 1888. Serial No. 275,203. (No specimens.)

Claim.—The hereinbefore-described antiseptic compound or composition adapted to be used for the preservation of perishable articles in the manner described, said compound or composition consisting of sulphur, sugar, cassafras, cinnamon, and nitrate of potassium, mixed in about the proportions set forth.

386,387. WELDING-BENCH FOR PLOWS. JERRY DION, North Bend, Nebr. Filed Aug. 1, 1887. Serial No. 245,993. (No model.)

Claim.—1. The combination of the bed-plate A, having jaws *a a* and curved on its upper face, with the clamp B, having tongue *b*, and foot-lever C, the top edge of which bears against the said clamp, whereby the said clamp is brought against the plate to hold the land-side while being welded, substantially as described.

2. The combination of the bed-plate A, curved on its upper face, with the clamp B, the lever C, moving said clamp, the upright shaft D, having bent lever K on its upper end, and the rod E, connecting said shaft to the lever C, substantially as and for the purposes described.

3. The combination of the curved bed-plate A, the gage G at one end of it, the clamp B, the lever C, and spring W, connecting therewith, the rod D, having lever K at its upper end and the short lever H at its lower, the rod E, and the spring X, acting on the clamp, substantially as described.

4. In a welding-bench, a plate fixed to the bed-block and adapted to hold the share, a clamp for holding the landside against said plate, and a spring adapted to operate on said plate, a lever for moving said clamp, and a spring for drawing said lever back, substantially as described.

5. The bed-plate A, having jaws *a* and spring X thereon, and the gage M, combined with the clamp B, having a flipped tongue, *b*, a lever operating said clamp, and a swinging lever to hold the share on the bed-plate, substantially as described.

386,388. TOE-WEIGHT FOR HORSESHOES. SAMUEL H. DODMAN, Newport, Vt. Filed Jan. 16, 1888. Serial No. 260,810. (No model.)

Claim.—1. A detachable toe-weight which is contained wholly within a recess in the upper side of a horseshoe, substantially as and for the purpose specified.

2. A horseshoe which is provided within its upper side with a recess, in combination with a toe-weight that fits into and is contained wholly within such recess and is adapted to be placed in and removed from position while the shoe is secured upon the hoof of a horse, substantially as and for the purpose shown.

3. The combination of a detachable toe-weight and a recessed horseshoe which is adapted to receive and contain said toe-weight and to wholly cover and protect its lower side, substantially as and for the purpose set forth.

4. A horseshoe which is provided within its upper side with a recess, in combination with a detachable toe-weight that fits into and is contained wholly within such recess, and with means for fastening said parts together, substantially as and for the purpose shown and described.

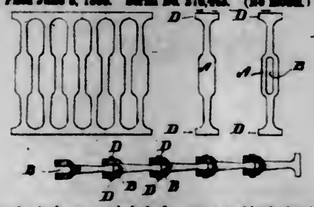
386,389. RAILROAD-TIE. ARTHUR DURAND, Washington, D. C., assignor to M. A. Ballinger, same place. Filed Oct. 22, 1887. Serial No. 252,697. (No model.)

Claim.—1. A railroad tie or sleeper formed of sheet metal or steel plate having an approximately inverted-U shape throughout its length and having an inclination at its end and central portions, as shown and described.

2. A railroad tie or sleeper formed of a sheet metal or steel plate provided with an approximately inverted-U shape throughout its entire length and slightly inclined on its upper surface, and having its sides flared, and open at its ends and throughout its length, as shown, and for the purpose stated.

3. A metallic railroad tie or sleeper of approximately inverted-U shape throughout its length and having central inclined connecting-neck and horizontal webs or flanges projecting therefrom, as shown and described.

4. A metallic railroad tie or sleeper having gutters or approximately inverted arches in its upper surface and running longitudinally

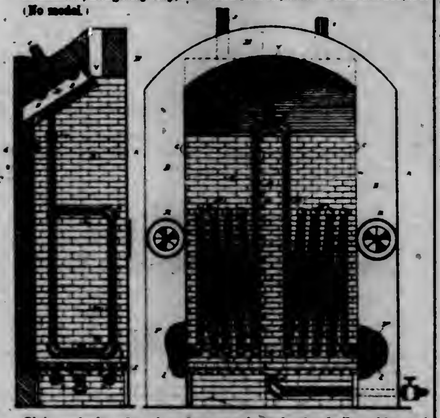


the length of the tie in the end portions thereof, substantially as shown, and for the purpose stated.

5. The combination, with a metallic tie or sleeper having V-shaped oppositely-disposed flanges or raised portions, of the fastening-bolts having threaded shanks and bottom heads provided with upper and lower shoulders, the former being designed to bear against the under side of said flanges and the latter in contact with the lowermost portion thereof, and the retaining-nuts, substantially as shown and described.

6. The herein-described railroad tie or sleeper, consisting of the metallic plate of approximately inverted-U shape having the downwardly-projecting sides flared and open at the ends, the longitudinal gutters or inverted arches formed in the end portions of said tie or sleeper, the upwardly-projecting V-shaped flanges having apertures, the connecting-neck, and the horizontal webs or flanges, all constructed and arranged substantially as shown and described.

7. A railroad tie or sleeper formed of a sheet metal or steel plate of approximately inverted-U shape having a corrugated or waved upper surface running longitudinally the length of the tie or sleeper, as and for the purpose stated.

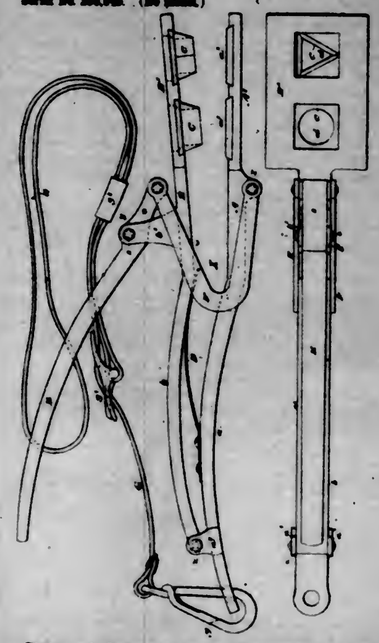


386,890. SHEET-METAL CHAIN. FREDERICK ROSE, Bridgeport, Conn., assignor to the Smith & Rose Manufacturing Company, same place. Filed June 8, 1888. Serial No. 276,463. (No model.)

Claim.—1. A sheet-metal chain formed from blanks having heads at each end and a slot in the middle, said blanks being folded to constitute links, the heads of each link being connected to the succeeding link through the slot in the latter, substantially as set forth.

2. In a sheet-metal chain formed from blanks having heads at each end and a slot in the middle, the links formed by folding the blanks so that the heads register, the heads of each link being inserted within and turned athwart the slot of the succeeding blank prior to the folding of the latter, substantially as shown and set forth.

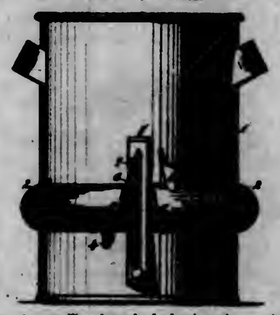
386,891. NATURAL-GAS HEATER FOR FIRE-PLACES. JOHN M. ELLISON, Allegheny City, Pa. Filed Feb. 20, 1888. Serial No. 265,250. (No model.)



Claim.—1. In a fire-place for natural gas having hollow sides and top, a sectional pipe heater, L L, in said fire-place having lateral pipe-connections leading to said sides and upwardly-extending pipe-connections leading to said top, substantially as specified.

2. The combination, with a fire-place having natural-gas burners and hollow side walls, of the sloping hollow top and the pipe heaters connected by pipe-extensions to said sides and top, substantially as specified.

3. The natural-gas fire-place heating apparatus having hollow sides and top and registers R, in said sides, coil-pipe in said fire-place above the natural-gas burner, and extensions of said coil-pipe to the chambers in said side walls and to the chamber in said top, substantially as specified.



386,892. PUNCH. CHARLES J. HERMAN, Salt Lake City, Utah, assignor to William Grant Van Horne, same place. Filed May 18, 1887. Serial No. 238,068. (No model.)

Claim.—1. In a punch, the combination, with two jaws hinged together and a spring arranged between them, of an operating-lever with arms of unequal length fulcrumed on the upper one of said jaws, and two U-shaped connecting-links, F F, coupled at their ends, respectively, to the short arm of the operating-lever and to the lower jaw, as set forth.

2. In a punch for marking cattle, the combination, with the long jaw A, provided with a head, A', and a cutting-plate, *a'*, of the long jaw B, provided with a head, B', and cutters C, mounted on said head, said jaws being hinged together at *x*, the spring between the jaws, the operating-lever E, fulcrumed on the top of jaw B at *y*, and the U-shaped links F F, each coupled at one end to the short arm of lever E and at the other end to jaw A at *z*, whereby the room is provided for the ear of the animal, as set forth.

386,893. CHURN. JAMES M. FLACK, Shelby, N. C. Filed Feb. 7, 1888. Serial No. 263,220. (No model.)

Claim.—A metallic churn-body having the semicircular closed trough 2, provided with closed ends and extending horizontally around it and composed of a strip of metal bent transversely into semicircular form and soldered along its upper and lower horizontal edges to the vertical wall of the churn about midway between its top and bottom, said closed ends of the trough being arranged directly opposite each other and separated by an intervening channel containing a thermometer supported by the wall of the churn, one end portion of the trough carrying directly on its upper side an inlet and the opposite end portion carrying directly on its lower side an outlet, substantially as shown and described.

386,894. GRAIN-DRILL. CHARLES FOSTER, East Dubuque, Ill. Filed June 6, 1888. Serial No. 276,262. (No model.)

Claim.—1. In a seeder, a series of independent levers, B, pivoted on a transverse bar of the frame, each provided with a toothed segment and a pawl and connected severally to the runners by rods and springs, substantially as described.

2. In combination with the main lifting-bar A, a series of levers, B, pivoted thereon and connected severally to the runners, toothed segments on the bar A, to hold the pawls of the levers B, and a lever and pawl on the bar A, with toothed segment on the frame, whereby any of the runners may be moved separately or all together, substantially as described.

3. In combination with the runners or shoes of the seeder, the pressure-wheels and the spring-rods connecting the wheels and runners, all substantially as described.

4. In combination with the pressure-wheel and runner of a seeder, a spring connecting-rod, said spring-rod having its end connected adjustably to the runner or fluke, whereby the pressure may be regulated, all substantially as described.

5. In combination with the pressure-wheels and runners, the spring connecting-rod C, coiled about a stud, F, and having its end projecting beyond said stud and bearing on a fastening device, all substantially as described.

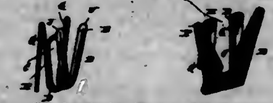
6. The combination, with the wheels and runners of the seeder, of the spring-rod C, one upon each side of the wheel, the rods having a spring-coil between the wheel and the runner, substantially as described.

7. The series of levers B, mounted upon the main adjusting-bar, and rods H, having spring *i*, and legs upon the fluke to receive the lower ends of the rod H, whereby the runners in whatever position are always under the same pressure, substantially as described.

386,895. APPARATUS FOR FIRING CHINA. ISAAC S. FRANCISCUS, Milwaukee, Wis. Filed Nov. 17, 1887. Serial No. 255,263. (No model.)

Claim.—1. An apparatus for firing china, comprising a kiln having an opening in its bottom, a gas-burner in register therewith provided with an outwardly-extended hollow arm, and a nipple provided with a screw-threaded tip that passes through the outer end of said arm and has a conically-reduced inner end, substantially as set forth.

2. In a china-firing apparatus, the combination of a supporting-stand, a suitable kiln provided at its bottom with an opening, a hearth



having a centrally-located circular bead, and a heat-generator arranged on the hearth within and in contact with the bead to register with the bottom opening in the kiln, substantially as set forth.

3. In a china-firing apparatus, the combination of a supporting-ring mounted on legs, a suitable kiln provided at its bottom with an opening, a hearth having a circular outer bead and a smaller inner bead, and a heat-generator arranged on the hearth within and in contact with said inner bead to register with the bottom opening in the kiln, and the said stand in contact with the said outer bead, substantially as set forth.

4. In a china-firing apparatus, the combination of a supporting-stand, a kiln having legs thereon that rest upon the stand, and a removable top, an inner receptacle, and a heat-generator for firing said kiln, substantially as set forth.

5. In a china-firing apparatus, a kiln comprising a china-containing receptacle, and a double-walled outer shell filled with sand or other analogous material, substantially as set forth.

386,896. HEDGE-FASTENER. LOUIS C. P. PIERRE, New York, N. Y. Filed Apr. 27, 1888. Serial No. 272,551. (No model.)

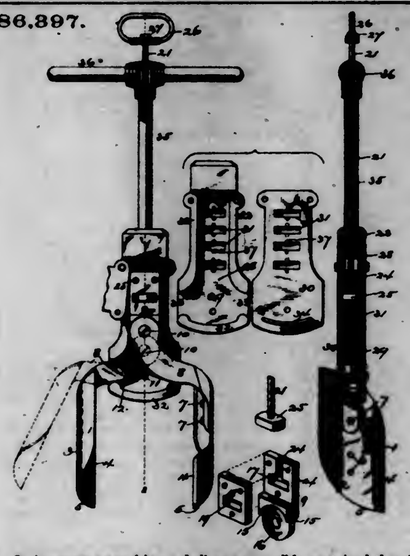
Claim.—The herein-described cockle-fastener, formed from a single thickness of wire or strip of sheet metal, having a central pear-shaped loop contracted at one end so as to form V-shaped or diverging prongs, which said prongs are bent approximately parallel to the loop, and having the downwardly-projecting prongs G G adapted to overlap the center piece of the tie and bear against the back part of the same, substantially as and for the purpose herein shown and described.

386,897. BARTH-AUGER. PAUL GARVENS, Troy, Ohio. Filed Feb. 23, 1888. Serial No. 265,265. (No model.)

Claim.—1. An auger having reversible blades or cutters.

2. An auger having reversible outwardly-curved blades or cutters provided with straight-cutting side edges.

3. An auger having reversible outwardly-curved blades having straight-cutting side edges and vertically-curved ends.



4. An auger having reversible blades having straight-cutting side edges and curved ends.

5. An auger having reversible blades or cutters, curved arms removably connected thereto and pivotally connected together, an inclosing case having side openings in its lower portion, a slide connected to said arms, and a rod adapted to reciprocate said slide within the case for the purpose of covering the expansion and contraction of said arms and the thereto-connected cutters, substantially as set forth.

6. An auger comprising a box or case, a slide having bearing therein, a rod adapted to reciprocate said slide, curved arms pivotally connected to said slide, reversible cutting-blades removably connected to said curved arms, and means for rotating the auger.

7. An auger comprising a shell or case having grooves or projections on its inner faces and side openings therein, means for rotating said shell or case, a slide contained within said case and having a transverse slot therein, a rod connected to and adapted to reciprocate said slide, a turnable button or eccentric secured to the lower end of said rod and adapted to engage the grooves or projections in the case or shell, curved arms pivotally connected to said slide, and cutting-blades secured to the lower ends of said curved arms.

886,397.

8. An auger comprising a shell or case, a slide contained therein, cutting-blades, arms pivotally connected together and to said slide and attached to said cutting-blades, a rod for rotating said auger, and a rod adapted to reciprocate said slide and expand and contract the cutting-blades and arms connected thereto and lock the same in position.

9. An auger comprising a shell or case having curved guideways in its lower end, an operating-rod connected to said case, a slide contained within said case, a plurality of curved arms pivotally connected together and to said slide at their upper ends, a plurality of reversible cutters removably connected to the lower ends of said curved arms, a rod connected to said slide for the purpose of reciprocating the same, a slide-lock adapted to be operated by the rod connected to the slide, and lock-engaging devices carried by said shell or case, substantially as set forth.

10. An auger having a plurality of boring or cutting blades, arms connected thereto and pivotally connected together, a slide connected to said arms and adapted to reciprocate the same and cause the expansion and contraction thereof and of the thereto-connected cutters, a shell or case inclosing said slide, and a lock adapted to hold said arms and cutters in their adjusted positions.

11. An auger comprising a box or shell having lock-engaging devices in its interior, a two-part slide contained within said box and having in the inner faces of its respective sections a vertical groove to receive the slide-reciprocating rod, a transverse slot extending through said sections and a bottom extension, a plurality of blades or cutters, arms connected at their lower ends to said blades and at their upper ends pivotally connected together and to the extension on the slide, a slide-operating rod connected with said slide and having at its lower end a slide-locking eccentric or button, and an auger-operating rod, all substantially as and for the purpose set forth.

12. In an auger, the combination, with a plurality of cutters, cutter-carrying arms, a slide to which said arms are pivotally connected, and a slide-operating rod, of a box or case adapted to receive said slide and arms and permit of their reciprocation therein, and consisting of a bottom portion having flanged sides and outwardly-extending ears or flanges, and a lid having similar ears or flanges, connecting-bolts or similar devices securing said eared portions of the box together, and an auger-operating rod, substantially as set forth.

886,398. WATCH-CASE. CHARLES K. GILBS, Chicago, Ill. Filed Apr. 27, 1888. Serial No. 169,660. (Model.)

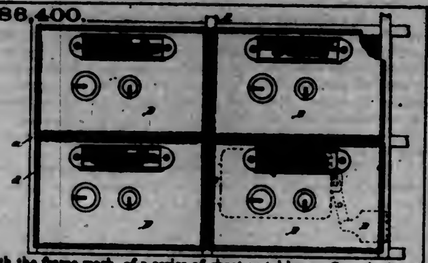
Claim.—1. The circular shell and back cap, A, provided with an external horizontal flange, and an external thread extending from its front edge nearly to the flange, in combination with a front bezel or cap, B, internally threaded to fit the threaded portion of the shell, and an independent ring-center, C, also internally threaded and adapted to be turned upon the threaded shell and retained in position between the flange and the front bezel, substantially as and for the purpose specified.

2. The circular shell and back cap, A, provided with an external horizontal flange, and at its outer edge with an external thread, in combination with a front bezel or cap, B, internally threaded to fit the threaded shell, an independent ring-center, C, adapted to be applied to the shell and clasped between the flange on the latter and the front bezel, and a movement-ring hinged to the upper edge of the shell, substantially as and for the purpose specified.

3. The circular shell and back cap, A, provided with a horizontal external flange, A', in combination with the cup-shaped plate D, provided with an elastic grooved edge, *d*, adapted to fit over the back plate and to be sprung over the flange A', substantially as and for the purpose specified.

886,399. GLOBE. WILLIAM H. GOLDTHWAITE, Chicago, Ill. Filed Dec. 1, 1887. Serial No. 256,512. (No model.)

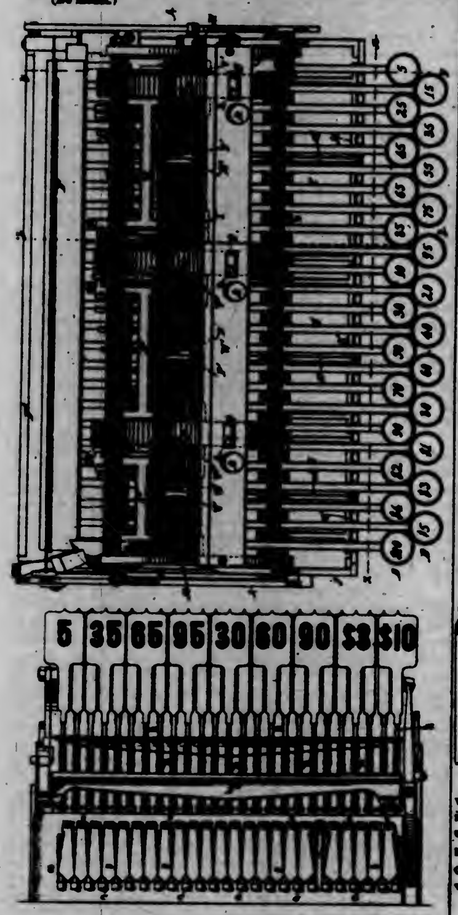
Claim.—1. The combination, with a globe, of a semicircular arm upon the opposite ends of which the axis of the globe is rotatively mounted, an upright hollow standard having inside bearings at the upper and lower extremities thereof, a rod or post, B, rotatively mounted in said bearings and having a head, *b*, to which the said semicircular arm is attached, resting normally upon the upper end of the standard, a groove, *c*, formed around the upper bearing-surface of the rod, and a set-screw, *d*, mounted in the standard opposite to and entering within the groove, substantially as and for the purpose herein specified.



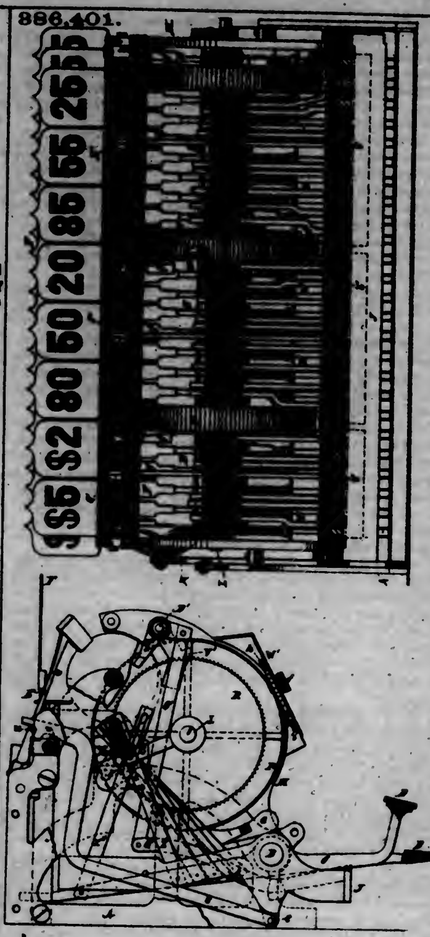
2. The combination, with a globe, of an upright hollow standard, an upright rod rotatively mounted in inside bearings at the top and bottom thereof, and having a head extending above and resting upon the upper end surface of the standard, a dovetail-shaped groove formed across the top of the head of the rod, and a semicircular arm between the opposite ends of which the axis of the globe is mounted, the outer semi-circumference of said arm forming a flange of dovetail shape to correspond with said groove, substantially as and for the purpose herein specified.

886,400. SAFETY-DEPOSIT BOX. HENRY GRAM, Chicago, Ill., assignor to the Chicago Safe and Lock Company, same place. Filed Sept. 27, 1887. Serial No. 250,262. (No model.)

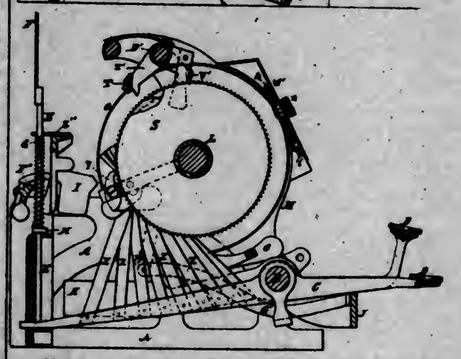
Claim.—1. In a system of safety-deposit boxes, the combination,



886,400.



with the frame-work, of a series of sheet-metal boxes, C, each closed at its inner end and having permanently fixed to the outer end thereof a thick metal plate, D, having a shoulder or rabbet, *d*, substantially as described.



2. In a system of safety-deposit boxes, the combination, with the frame-work, of the series of sheet-metal deposit-boxes, each having permanently fixed to the outer end thereof a thick metal plate, D, having a shoulder or rabbet, *d*, and having fixed to said plate D a suitable lock provided with bolts B and B', each of said boxes being provided with openings to permit the passage of said bolts, substantially as described.

886,401. CASH INDICATOR AND REGISTER. JOHN F. KRAFT and JOHN H. PATTERSON, Dayton, Ohio, assignors to the National Cash Register Company, same place. Filed Nov. 14, 1887. Serial No. 255,312. (No model.)

886,401.

Claim.—1. In a cash register and indicator, the combination, with a registering-wheel and a dog for actuating said wheel, of a series of pivoted keys, a series of arms secured to said keys at points unequally distant from the fulcrum of said keys, and mechanism connecting all of said arms to said actuating-dog, whereby the operation of any one of said keys causes said dog to actuate the registering-wheel to register the value of each key, substantially as described.

2. In a cash register and indicator, the combination, with a reg-

istering-wheel and a series of operating-keys, of a vibrating dog-carrier provided with a dog for actuating said registering-wheel, and a series of arms secured at their lower ends to said keys and provided at their upper ends with slots which embrace said vibrating dog-carrier, whereby upon operating any one of said keys its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

3. In a cash register and indicator, the combination, with a registering-wheel and a series of pivoted operating-keys, of a vibrating dog-carrier provided with a dog for actuating said registering-wheel, and a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys and connecting said keys with the vibrating dog-carrier, whereby upon operating any one of said keys its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

4. In a cash register and indicator, the combination, with a registering-wheel and a series of pivoted operating-keys, of a vibrating dog-carrier provided with a dog for actuating said registering-wheel, and a series of arms pivoted at their lower ends to said keys at points unequally distant from the fulcrum of said keys and provided at their upper ends with slots which embrace said vibrating dog-carrier, whereby upon operating any one of said keys its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

5. In a cash register and indicator, the combination, with a registering-wheel and a series of pivoted operating-keys, of a vibrating dog-carrier pivoted concentric with the axis of the registering-wheel and provided with a dog for actuating said wheel, and a series of arms pivoted at their lower ends to said keys and engaging at their upper ends directly with said dog-carrier for communicating different degrees of movement thereto, accordingly as one or another of the keys is operated, substantially as described.

6. In a cash register and indicator, the combination, with a registering-wheel and a series of keys, of a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms pivoted at their lower ends to said keys and provided at their upper ends with slots which embrace said vibrating dog-carrier, whereby upon operating any one of said keys its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

7. In a cash register and indicator, the combination, with a registering-wheel and a series of pivoted keys, of a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms pivoted at their lower ends to said keys at points unequally distant from the fulcrum of said keys and connected at their upper ends with said vibrating dog-carrier, whereby upon operating any one of said keys its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

8. In a cash register and indicator, the combination, with a registering-wheel and a series of pivoted operating-keys, of a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys and provided at their upper ends with slots engaging with said vibrating dog-carrier, whereby upon operating any one of said keys its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

9. In a cash register and indicator, the combination of a series of keys indicating odd multiples of five above the first power, a ten-cent-registering wheel actuated by each of said keys, a five-cent-registering wheel, and connecting mechanism between all of said keys and five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

10. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dog for actuating said ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, connecting mechanism between all of said keys and actuating-dog, and connecting mechanism between all of said keys and the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

11. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating said ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, connecting mechanism between said keys and vibrating dog-carrier, and connecting mechanism between said keys and the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

12. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating said ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, a series of arms connecting said keys and vibrating dog-carrier, and connecting mechanism between said keys and the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

13. In a cash register and indicator, the combination, with a five-cent-registering wheel and a ten-cent-registering wheel, of a series of operating-keys indicating odd multiples of five above the first power, connecting mechanism between all of said keys and the ten-cent-registering wheel, and a five-cent bar actuated by all of said keys and arranged to actuate the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

14. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dog for actuating the ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, connecting mechanism between all of said keys and actuating-dog, and a five-cent bar actuated by all of said keys and arranged to actuate the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

15. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dog for actuating the ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, a series of arms secured to said keys, connecting mechanism between said arms and actuating-dog, and a five-cent bar actuated by said keys and arranged to actuate the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

16. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dog for actuating the ten-cent wheel, of a series of pivoted operating-keys indicating odd multiples of five above the first power, a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys, connecting mechanism between said arms and actuating-dog, and a five-cent bar actuated by said keys and arranged to actuate the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

17. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, connecting mechanism between said keys and vibrating dog-carrier, and a five-cent bar actuated by said keys and arranged to actuate the five-cent wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

18. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating odd multiples of five above the first power, a series of arms connecting said keys and dog-carrier, and a five-cent bar actuated by said keys and arranged to actuate the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

19. In a cash register and indicator, the combination with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of pivoted operating-keys indicating odd multiples of five above the first power, a series of arms pivoted to the keys at points unequally distant from the fulcrum of the keys and connecting said keys with the vibrating dog-carrier, and a five-cent bar arranged to actuate the five-cent wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

20. In a cash register and indicator, the combination of a series of operating-keys indicating even multiples of five, another series of keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and connecting mechanism between said wheel and all of the keys of both series, a five-cent-registering wheel, and connecting mechanism between said wheel and all the keys of the odd-numbered series, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

21. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dog for actuating said ten-cent wheel, of a series of operating-keys indicating both even and odd multiples of five above the first power, connecting mechanism between all of said keys and actuating-dog, and connecting mechanism between each of said odd-numbered keys and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

22. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating said ten-cent wheel, of a series of operating-keys indicating both even and odd multiples of five above the first power, connecting mechanism between said keys and vibrating dog-carrier, and connecting mechanism between each of said odd-numbered keys and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

23. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating both even and odd multiples of five above the first power, a series of arms connecting said keys with the vibrating dog-carrier, and connecting mechanism between each of the odd-numbered keys and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

24. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of pivoted operating-keys indicating both even and odd multiples of five above the first power, a series of arms secured to said keys at points unequally distant from the fulcrum of said keys and connecting them with the vibrating dog-carrier, and connecting mechanism between each of the odd-numbered keys and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on a ten-cent wheel and the five on the five-cent wheel, substantially as described.

25. In a cash register and indicator, the combination of a series of operating-keys indicating even multiples of five, another series of keys indicating odd multiples of five above the first power, a ten-cent-registering wheel, and connecting mechanism between said wheel and all the keys of both series, a five-cent-registering wheel, and a five-cent bar actuated by each of the odd-numbered keys and arranged to actuate the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

26. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dog for actuating said ten-cent wheel, of a series of operating-keys indicating both even and odd multiples of five above the first power, connecting mechanism between all of said keys and actuating-dog, and a five-cent bar actuated by the keys indicating odd multiples of five and arranged to actuate the five-cent wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

27. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating said ten-cent wheel, of a series of operating-keys indicating both even and odd multiples of five above the first power, connecting mechanism between said keys and vibrating dog-carrier, and a five-cent bar actuated by the keys indicating odd multiples of five and arranged to actuate the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

28. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating both even and odd multiples of five above the first power, a series of arms connecting said keys with the vibrating dog-carrier, and a five-cent bar actuated by the keys indicating odd multiples of five and arranged to actuate the five-cent wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

29. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of pivoted operating-keys indicating both even and odd multiples of five above the first power, a series of arms secured to said keys at points unequally distant from the fulcrum of said keys and connecting said keys with the vibrating dog-carrier, and a five-cent bar actuated by the keys indicating odd multiples of five and arranged to actuate the five-cent wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

30. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating five and the odd multiples thereof, connecting mechanism between said vibrating dog-carrier and each of said keys excepting the five-cent key, and a five-cent bar actuated by said keys and provided with a dog engaging with the five-cent wheel, whereby upon operating the five-cent key its value is registered on the five-cent wheel, and upon operating any other one of the keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

31. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating five and the odd multiples thereof, a series of arms connecting said dog-carrier to all of the keys excepting the five-cent key, a five-cent bar actuated by each of the keys and provided with a dog engaging with the five-cent wheel, whereby upon operating the five-cent key its value is registered on the five-cent wheel, and upon operating any other one of the keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

32. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of operating-keys indicating five and the even and odd multiples thereof, a series of arms connecting said dog-carrier to all of the keys excepting the five-cent key, and a five-cent bar actuated by each of the odd-numbered keys and provided with a dog engaging with the five-cent wheel, whereby upon operating the five-cent key its value is registered on the five-cent wheel, and upon operating any other one of the keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

33. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a vibrating dog-carrier and dog for actuating the ten-cent wheel, of a series of pivoted operating-keys indicating five and the even and odd multiples thereof, a series of arms secured to all of said keys excepting the five-cent key at points unequally distant from the fulcrum of said keys and connecting said keys with the vibrating dog-carrier, and a five-cent bar actuated by each of the odd-numbered keys provided with a dog engaging with the five-cent wheel, whereby upon operating the five-cent key its value is registered on the five-cent wheel, and upon operating any other one of the odd-numbered keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, and whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, substantially as described.

34. In a cash register and indicator, the combination, with a series of registering-wheels and a series of vibrating dog-carriers and dogs for actuating said registering-wheels, and each of said dog-carriers being pivoted concentric with the axis of its registering-wheel, of a series of groups of pivoted operating-keys, one group for each registering-wheel, and a series of arms for each group pivoted at their lower ends to the keys of each group and engaging at their upper ends directly with the vibrating dog-carrier of each group for communicating different degrees of motion to said dog-carrier, whereby upon operating any key of a group its arm vibrates its dog-carrier to actuate its registering-wheel to register the value of such key, substantially as described.

35. In a cash register and indicator, the combination, with a series of registering-wheels and a series of vibrating dog-carriers and dogs for actuating said registering-wheels, of a series of groups of pivoted operating-keys, one group for each registering-wheel, and a series of arms pivoted to said keys at points unequally distant from the ful-

cum of said keys and connecting the keys of each group with the vibrating dog-carrier of each group, whereby upon operating any key of a group its arm vibrates its dog-carrier to actuate the registering-wheel to register the value of such key, substantially as described.

36. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, and vibrating dog-carriers and dogs for actuating the ten-cent and dollar registering wheels, of a series of operating-keys indicating cents in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, connecting mechanism between the cent-keys and the vibrating dog-carrier of the ten-cent wheel, and connecting mechanism between the dollar-keys and the vibrating dog-carrier of the dollar-wheel, and a five-cent bar actuated by the cent-keys, indicating odd multiples of five and arranged to actuate the five-cent-registering wheel, whereby upon operating any odd-numbered cent-key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, whereby upon operating any even-numbered cent-key its value is registered on the ten-cent wheel, and whereby upon operating any dollar-key its value is registered on the dollar-wheel, substantially as described.

37. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, and a dollar-registering wheel, and vibrating dog-carriers and dogs for actuating the ten-cent and dollar registering wheels, of a series of operating-keys indicating cents in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, a series of arms connecting the cent-keys to the vibrating dog-carrier of the ten-cent wheel, and a series of arms connecting the dollar-keys to the vibrating dog-carrier of the dollar-wheel, and a five-cent bar actuated by the cent-keys indicating odd multiples of five and arranged to actuate the five-cent-registering wheel, substantially as and for the purpose set forth.

38. In a cash register and indicator, the combination, with a five cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, and vibrating dog-carriers and dogs for actuating the ten cent and dollar registering wheels, of a series of pivoted operating-keys indicating cents in even and odd multiples of five above the first power, a series of pivoted keys indicating dollars in multiples of one, a series of arms pivoted to the cent-keys at points unequally distant from the fulcrum of said keys and connecting said keys to the vibrating dog-carrier of the ten-cent wheel, a series of arms pivoted to the dollar-keys at points unequally distant from the fulcrum of said keys and connecting said keys to the vibrating dog-carrier of the dollar-wheel, and a five-cent bar actuated by the cent-keys indicating odd multiples of five and arranged to actuate the five-cent-registering wheel, substantially as and for the purpose set forth.

39. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a series of keys pivoted on a horizontal shaft at the front of the machine for actuating said wheel, and a vibrating bar pivoted on said shaft and actuated by the operation of any one of said keys, of a brake-dog arranged to engage with the teeth of said wheel, and connecting mechanism between said brake-dog and vibrating bar, whereby upon the operation of any one of said keys the brake-dog is actuated to engage with the teeth of the registering-wheel and form a positive stop therefor, substantially as described.

40. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a series of keys pivoted on a horizontal shaft at the front of the machine for actuating said wheel, and a vibrating bar pivoted on said shaft and actuated by the operation of any one of said keys, of a rock-shaft, a brake-dog secured thereto and arranged to engage with the teeth of said wheel, and connecting mechanism between said rock-shaft and vibrating bar, whereby upon the operation of any one of said keys the rock-shaft is oscillated to cause its brake-dog to engage with the teeth of said wheel, substantially as described.

41. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a series of keys for actuating said wheel, and a vibrating bar provided with a rearward extension and arranged to be actuated by the operation of any one of said keys, of a rock-shaft, a brake-dog secured to said rock-shaft and arranged to engage with the teeth of the registering-wheel, an arm secured to said rock-shaft, and a link connecting said arm and the rearward extension of the vibrating bar, whereby upon operating any one of said keys said rock-shaft is oscillated to cause its brake-dog to engage with the teeth of the registering-wheel, substantially as described.

42. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, and a series of arms secured to said keys and independently connecting each of them to said vibrating dog-carrier, of a brake-dog arranged to engage with the teeth of the registering-wheel, a vibrating bar actuated by the operation of any of said keys, and connecting mechanism between said vibrating bar and brake-dog, substantially as and for the purpose described.

43. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a vibrating dog-carrier and dog for actuating said wheel, a series of pivoted operating-keys, and a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys and connecting said keys with the vibrating dog-carrier, of a brake-dog arranged to engage with the teeth of the registering-wheel, a vibrating bar actuated by the operation of any one of said keys, and connecting mechanism between said vibrating bar and brake-dog, substantially as and for the purpose described.

44. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, and a series of arms connecting said keys and vibrating dog-carrier, of a rock-shaft, a brake-dog secured to the rock-shaft and arranged to engage with the teeth of the registering-wheel, an arm secured to said rock-shaft, a vibrating bar actuated by the operation of any one of said keys, and connecting mechanism between said vibrating bar and arm, substantially as and for the purpose described.

45. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a vibrating dog-carrier and dog for actuating said wheel, a series of pivoted operating-keys, and a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys and connecting the keys with the vibrating dog-carrier, of a rock-shaft, a brake-dog secured to said rock-shaft and arranged to engage with the teeth of the registering-wheel, an arm secured to said shaft, a vibrating bar actuated by the operation of any one of said keys, and connecting mechanism between said vibrating bar and arm, substantially as and for the purpose described.

46. In a cash register and indicator, the combination, with a series of registering-wheels provided with teeth, a vibrating dog-carrier and dog for each wheel, a series of groups of operating-keys, one group for each wheel, and a series of arms connecting the keys of each group with the vibrating dog-carrier of its registering-wheel, of a rock-shaft journaled in the frame of the machine and extending across all of the registering-wheels, a series of brake-dogs, one for each wheel, supported on said rock-shaft and each arranged to engage with the teeth of its registering-wheel, an arm secured to said rock-shaft, a vibrating bar actuated by the depression of any key, and connecting mechanism between said bar and the arm secured to the rock-shaft, substantially as and for the purpose described.

47. In a cash register and indicator, the combination, with a registering-wheel provided with teeth, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, and a series of arms connecting said keys and the vibrating dog-carrier, of a shaft, a sleeve loose upon said shaft, a brake-dog secured to said sleeve and arranged to engage with the teeth of the registering-wheel, an arm secured to said sleeve, a vibrating bar actuated by the operation of any of said keys, and connecting mechanism between the vibrating bar and the arm secured to the sleeve, substantially as and for the purpose described.

48. In a cash register and indicator, the combination, with a series of registering-wheels provided with teeth, a vibrating dog-carrier and dog for each wheel, a series of groups of operating-keys, one group for each wheel, and a series of arms connecting the keys of each group with the vibrating dog-carrier of its registering-wheel, of a shaft extending across said registering-wheels, a series of sleeves loose upon said shaft, one sleeve for each registering-wheel, a brake-dog secured to each sleeve and arranged to engage with the teeth of its registering-wheel, an arm secured to each sleeve, a vibrating bar for each group of keys and actuated by the operation of any key of its group, and connecting mechanism between the vibrating bar and the arm secured to its corresponding sleeve, substantially as and for the purpose described.

49. In a cash register and indicator, the combination of a registering-wheel bearing one or more series of numbers on its periphery, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, a series of arms connecting said keys and vibrating dog-carrier, a supplemental registering-disk arranged in a plane tangential to the periphery of the registering-wheel and adjacent thereto and bearing a series of numbers in multiples of the amount registered by each series of numbers on the registering-wheel, and a projection on said registering-wheel for each series of numbers, arranged to engage with said disk and turn it one number for each complete series of numbers on said wheel, substantially as described.

50. In a cash register and indicator, the combination of a registering-wheel bearing one or more series of numbers on its periphery and a reading-opening through which said numbers are exposed one at a time, a vibrating dog-carrier and dog for actuating said wheel, a series of pivoted operating-keys, a series of arms pivoted at their lower ends to said keys at points unequally distant from the fulcrum of said keys and connecting said keys with the vibrating dog-carrier, a supplemental registering-disk arranged in a plane tangential to the periphery of the registering-wheel and adjacent thereto and bearing a series of numbers in multiples of the amount registered by each series of numbers on the registering-wheel, said numbers being exposed through the reading-opening one at a time, and a projection on each registering-wheel for each series of numbers, arranged to engage with said disk and turn it one number for each complete series of numbers on said wheel, substantially as described.

51. In a cash register and indicator, the combination of a registering-wheel bearing one or more series of numbers on its periphery and a reading-opening through which said numbers are exposed one at a time, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, connecting mechanism between said keys and vibrating dog-carrier, a supplemental registering-disk arranged in a plane tangential to the periphery of the registering-wheel and adjacent thereto and bearing a series of numbers in multiples of the amount registered by each series of numbers on the registering-wheel, said numbers being exposed through the reading-opening one at a time, and a projection on the registering-wheel for each series of numbers, arranged to turn said disk one number for each series of numbers on said wheel, the numbers on the registering-wheel and disk being so arranged that the two numbers exposed through the reading-opening coincide to indicate at all times, without addition, the total amount registered on said wheel and disk, substantially as described.

52. In a cash register and indicator, the combination of a series of registering-wheels, each provided with one or more series of numbers on its periphery, a series of vibrating dog-carriers and dogs, one for each wheel, a series of operating-keys and connecting mechanism between said keys and vibrating dog-carriers, a plate extending across all of said registering-wheels and provided with a series of reading-openings, one for each wheel, through which opening the numbers on its corresponding wheel are exposed one at a time, a series of supplemental registering-disks on the under side of said plate, one for each registering-wheel and arranged adjacent thereto, each provided with a series of numbers in multiples of the amount registered by each series of numbers on its corresponding registering-wheel, said numbers being exposed through its reading-opening one at a time, and a projection on each registering-wheel for each series of numbers, arranged to engage with said disk and turn its corresponding disk one number for each complete series of numbers on said wheel, substantially as described.

53. In a cash register and indicator, the combination of a series of registering-wheels, each provided with one or more series of numbers on its periphery, a series of vibrating dog-carriers and dogs, one for each wheel, a series of operating-keys, a series of arms pivoted to said keys and connecting them with the vibrating dog-carriers, a plate extending across all of said registering-wheels and provided with a series of reading-openings, one for each wheel, through which opening the numbers on its corresponding wheel are exposed one at a time, a series of supplemental registering-disks on the under side of said plate, one for each registering-wheel and arranged adjacent thereto, each provided with a series of numbers in multiples of the amount registered by each series of numbers on its corresponding registering-wheel, said numbers being exposed through its reading-opening one at a time, and a projection on each registering-wheel for each series of numbers on said wheel, arranged to engage with and turn its corresponding disk one number for each complete series of numbers on said wheel, substantially as described.

54. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, vibrating dog-carriers and dogs for actuating the ten-cent and dollar wheels, a series of operating-keys indicating cents in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, connecting mechanism between the cent-keys and the vibrating dog-carrier of the ten-cent wheel, and connecting mechanism between the dollar-keys and the vibrating dog-carrier of the dollar-wheel, a five-cent bar actuated by the cent-keys, which indicate odd multiples of five and arranged to actuate the five-cent-registering wheel, a plate extending across all of said wheels and provided with a series of reading-openings, one for each wheel, through which openings the numbers on its corresponding wheel are exposed one at a time, a series of supplemental registering-disks on the under side of said plate, one for each registering-wheel and arranged adjacent thereto, each provided with a series of numbers in multiples of the amount registered by each series of numbers on its corresponding registering-wheel, said numbers being exposed through its reading-opening one at a time, and a projection on each registering-wheel for each series of numbers on said wheel, arranged to engage with and turn its corresponding registering-disk one number for each complete series of numbers on said wheel, substantially as described.

55. In a cash register and indicator, the combination, with a series of operating-keys, of a series of stops arranged to permit the operation of one key at a time and to prevent the operation of two or more keys simultaneously, substantially as described.

56. In a cash register and indicator, the combination, with a series of operating-keys, of a series of movable stops arranged to permit the operation of one key at a time and to engage with said keys to prevent the operation of two or more of them simultaneously, substantially as described.

57. In a cash register and indicator, the combination, with a series of operating-keys, of a series of pendent stops pivoted above said keys and arranged to engage therewith to prevent the operation of two or more of them simultaneously, substantially as described.

58. In a cash register and indicator, the combination, with a series of operating-keys, of a series of pendent wedge-shaped stops arranged to engage with said keys to prevent the operation of two or more of them simultaneously, substantially as described.

59. In a cash register and indicator, the combination, with a series of operating-keys, of a series of pendent wedge-shaped stops pivoted above said keys and arranged to engage therewith to prevent the operation of two or more of them simultaneously, substantially as described.

60. In a cash register and indicator, the combination, with a series of operating-keys, of a series of movable stops arranged to be displaced upon the operation of a single key to permit such operation, but locking two or more keys when the latter are attempted to be operated simultaneously, substantially as described.

61. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of stops arranged to permit the operation of one key at a time, but to at all times prevent the simultaneous operation of two or more keys substantially as described.

62. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of stops arranged to permit the operation of one key at a time, but by engaging them to at all times prevent the simultaneous operation of two or more keys, substantially as described.

63. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of movable stops arranged to permit the operation of one key at a time, but to at all times prevent the simultaneous operation of two or more keys, substantially as described.

64. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of pendent wedge-shaped stops arranged to engage with said keys to prevent the operation of two or more of them simultaneously, substantially as described.

65. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of pendent stops pivoted above said keys and arranged to engage therewith to prevent the operation of two or more of them simultaneously, substantially as described.

66. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of pendent wedge-shaped stops pivoted above said keys and arranged to engage therewith to prevent the operation of two or more of them simultaneously, substantially as described.

67. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for operating said wheel, of a series of movable stops arranged to be displaced upon the operation of a single key to permit such operation, but locking two or more keys when the latter are attempted to be operated simultaneously, substantially as described.

68. In a cash register and indicator, the combination, with a registering-wheel, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, and connecting mechanism between said keys and vibrating dog-carrier, of a series of stops arranged to prevent the operation of two or more of said keys simultaneously, substantially as described.

69. In a cash register and indicator, the combination, with a registering-wheel, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, and a series of arms connecting said keys to the vibrating dog-carrier, of a series of stops arranged to engage with said keys to prevent the operation of two or more of them simultaneously, substantially as described.

70. In a cash register and indicator, the combination, with a series of registering-wheels and a series of groups of keys for operating said wheels, one group of keys for each wheel, of a series of sets of stops arranged to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

71. In a cash register and indicator, the combination, with a series of registering-wheels and a series of groups of keys for operating said wheels, one group of keys for each wheel, of a series of sets of

steps arranged to engage with said keys to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

72. In a cash register and indicator, the combination, with a series of registering-wheels and a series of groups of keys for operating said wheels, one group of keys for each wheel, of a series of sets of pendent wedge-shaped stops arranged to engage with said keys to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

73. In a cash register and indicator, the combination, with a series of registering-wheels and a series of groups of keys for operating said wheels, one group of keys for each wheel, of a series of sets of pendent stops pivoted above said keys and arranged to engage therewith to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

74. In a cash register and indicator, the combination, with a registering-wheel, a series of operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a vibrating dog-carrier and dog for actuating said registering-wheel, and a series of arms pivoted at their lower ends directly to said keys and provided at their upper ends with slots embracing said vibrating dog-carrier, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

75. In a cash register and indicator, the combination of a registering-wheel, a dog for actuating said wheel, a series of pivoted keys, a series of tablet-rods and indicating-tablets actuated by said keys, a series of arms connected to said keys at points unequally distant from the fulcrum of said keys, and connecting mechanism between said arms and actuating-dog, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its value is registered on said registering-wheel, substantially as described.

76. In a cash register and indicator, the combination of a registering-wheel, a series of pivoted operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a vibrating dog-carrier and dog for actuating said registering-wheel, and a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys and connecting them to the vibrating dog-carrier, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

77. In a cash register and indicator, the combination of a registering-wheel, a series of pivoted operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a vibrating dog-carrier and dog for actuating said registering-wheel, and a series of arms connected at their lower ends to said keys at points unequally distant from the fulcrum of said keys and provided at their upper ends with slots embracing said vibrating dog-carrier, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

78. In a cash register and indicator, the combination of a registering-wheel, a series of operating-keys, a series of tablet-rods, and indicating-tablets actuated thereby, a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms pivoted at their lower ends to said keys and engaging at their upper ends directly with said vibrating dog-carrier for communicating different degrees of motion thereto, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

79. In a cash register and indicator, the combination of a registering-wheel, a series of operating-keys, a series of tablet-rods and indicating-tablets actuated thereby, a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms pivoted at their lower ends directly to said keys and provided at their upper ends with slots which embrace said vibrating dog-carrier, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

80. In a cash register and indicator, the combination of a registering-wheel, a series of pivoted operating-keys, a series of tablet-rods and indicating-tablets actuated thereby, a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms connected at their lower ends to said keys at points unequally distant from the fulcrum of said keys and connected at their upper ends to said vibrating dog-carrier, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

81. In a cash register and indicator, the combination of a registering-wheel, a series of pivoted operating-keys, a series of tablet-rods and indicating-tablets actuated thereby, a vibrating dog-carrier hung concentric with said registering-wheel and provided with a dog for actuating said wheel, and a series of arms connected at their lower ends to said keys at points unequally distant from the fulcrum of said keys and provided at their upper ends with slots embracing said vibrating dog-carrier, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its arm vibrates the dog-carrier to cause its dog to actuate the registering-wheel to register the value of such key, substantially as described.

82. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a ten-cent-registering wheel common to all the keys of said series and connecting mechanism between said keys and registering-wheel, a five-cent-registering wheel, and connecting mechanism between said wheel and all of the keys of said series, whereby upon operating any one of the keys of said series its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

83. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a ten-cent-registering wheel common to all the keys of said series and connecting mechanism between said keys and registering-wheel, a five-cent-registering wheel, and a five-cent bar actuated by each of the keys of said series and arranged to actuate the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

84. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a vibrating dog-carrier and dog for actuating the ten-cent wheel, a series of operating-keys indicating odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, connecting mechanism between said keys and vibrating dog-carrier, and a five-cent bar arranged to be operated by said keys to actuate the five-cent-registering wheel, whereby upon operating any one of said keys its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

85. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a vibrating dog-carrier and dog for actuating the ten-cent wheel, a series of operating-keys indicating odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting said keys to the vibrating dog-carrier, and a five-cent bar arranged to be operated by said keys to actuate the five-cent-registering wheel, whereby upon operating any one of said keys its indicating-tablet is exposed to view, and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

86. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a vibrating dog-carrier and dog for actuating the ten-cent wheel, a series of pivoted operating-keys indicating odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connected at their lower ends to said keys at points unequally distant from the fulcrum of said keys and engaging at their upper ends with the vibrating dog-carrier, and a five-cent bar arranged to be operated by said keys to actuate the five-cent-registering wheel, whereby upon operating any one of said keys its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

87. In a cash register and indicator, the combination of a series of operating-keys indicating even multiples of five, another series of keys indicating odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a ten-cent-registering wheel and connecting mechanism between said wheel and all the keys of both series, a five-cent-registering wheel, and connecting mechanism between said wheel and all the keys of the odd-numbered series, whereby upon operating an even-numbered key its indicating-tablet is exposed to view and its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

88. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a dog for actuating the ten-cent wheel, a series of operating-keys indicating both even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, connecting mechanism between all of said keys and actuating-dog, and a five-cent bar arranged to be operated by each of said odd-numbered keys to actuate the five-cent-registering wheel, whereby upon operating an even-numbered key its indicating-tablet is exposed to view and its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

89. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a vibrating dog-carrier and dog for actuating the ten-cent wheel, a series of operating-keys indicating both even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting said keys to the vibrating dog-carrier, and a five-cent bar arranged to be operated by the keys indicating odd multiples of five to actuate the five-cent-registering wheel, whereby upon operating an even-numbered key its indicating-tablet is exposed to view and its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

90. In a cash register and indicator, the combination of a five-cent-registering wheel, a ten-cent-registering wheel, a vibrating dog-carrier and dog for actuating the ten-cent wheel, a series of pivoted operating-keys indicating both even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets, one for each key, a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys and connecting said keys to the vibrating dog-carrier, and a five-cent bar arranged to be operated by the keys indicating odd multiples of five to actuate the five-cent-registering wheel, whereby upon operating an even-numbered key its indicating-tablet is exposed to view and its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key its indicating-tablet is exposed to view and the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

91. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, and vibrating dog-carriers and dogs for actuating the ten-cent and dollar registering wheels, of a series of operating-keys indicating coats in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, a series of tablet-rods and indicating-tablets actuated by said keys, connecting mechanism between the cent-keys and the vibrating dog-carrier of the ten-cent-wheel, and connecting mechanism between the dollar-keys and the vibrating dog-carrier of the dollar-wheel, and a five-cent bar actuated by the cent-keys indicating odd multiples of five and arranged to actuate the five-cent-registering wheel, substantially as and for the purpose described.

92. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, and vibrating dog-carriers and dogs for actuating the ten-cent and dollar wheels, of a series of operating-keys indicating coats in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, a series of tablet-rods and indicating-tablets actuated by said keys, a series of arms connecting the cent-keys to the vibrating dog-carrier of the ten-cent wheel, a series of arms connecting the dollar-keys to the vibrating dog-carrier of the dollar-wheel, a five-cent bar actuated by the cent-keys indicating odd multiples of five, and provided with a dog engaging with the five-cent-registering wheel, substantially as and for the purpose described.

93. In a cash register and indicator, the combination, with a five-cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, and vibrating dog-carriers and dogs for actuating the ten-cent and dollar wheels, of a series of pivoted operating-keys indicating coats in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, a series of tablet-rods and indicating-tablets actuated by said keys, a series of arms pivoted to said keys at points unequally distant from the fulcrum of said keys, the arms of the cent-keys being connected to the vibrating dog-carrier of the ten-cent wheel and the arms of the dollar-keys to the vibrating dog-carrier of the dollar-wheel, and a five-cent bar actuated by the cent-keys indicating odd multiples of five, and provided with a dog engaging with the five-cent-registering wheel, substantially as and for the purpose described.

94. In a cash register and indicator, the combination of a registering-wheel provided with a ratchet, a series of keys for actuating said wheel, a series of tablet-rods and indicating-tablets actuated by said keys, a brake-dog arranged to engage with the ratchet of said wheel, but normally out of contact therewith, and mechanism connecting the brake-dog with the keys, whereby upon operating any one of the keys its indicating-tablet is exposed to view and the brake-dog is positively actuated to engage with the teeth of the registering-wheel and form a positive stop therefor, substantially as described.

95. In a cash register and indicator, the combination of a registering-wheel provided with a ratchet, a series of keys for actuating said wheel, a series of tablet-rods and indicating-tablets actuated by said keys, a vibrating bar actuated by the operation of any one of said keys, a brake-dog arranged to engage with the ratchet of said wheel, and connecting mechanism between said brake-dog and vibrating bar, whereby upon the operation of any one of said keys its indicating-tablet is exposed to view and the brake-dog is actuated to engage with the ratchet of the registering-wheel and form a positive stop therefor, substantially as described.

96. In a cash register and indicator, the combination of a registering-wheel provided with a ratchet, a series of keys for actuating said wheel, a series of tablet-rods and indicating-tablets actuated by said keys, a vibrating bar actuated by the operation of any one of said keys, a rock-shaft, a brake-dog secured thereto and arranged to engage with the ratchet of said wheel, and connecting mechanism between said rock-shaft and vibrating bar, whereby upon operating any one of said keys its indicating-tablet is exposed to view and the rock-shaft is oscillated to cause its brake-dog to engage with the teeth of said wheel, substantially as described.

97. In a cash register and indicator, the combination of a registering-wheel provided with teeth, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting said keys with the vibrating dog-carrier, a brake-dog arranged to engage with the teeth of the registering-wheel, a vibrating bar actuated by the operation of any of said keys, and connecting mechanism between said vibrating bar and brake-dog, substantially as and for the purpose described.

98. In a cash register and indicator, the combination of a registering-wheel, a series of keys for operating said wheel, a series of tablet-rods and indicating-tablets actuated by said keys, and a series of stops arranged to permit the operation of any one key, but to at all times prevent the simultaneous operation of two or more keys, substantially as described.

99. In a cash register and indicator, the combination of a registering-wheel, a series of keys for operating said wheel, a series of tablet-rods and indicating-tablets actuated by said keys, and a series of pendent stops pivoted above said keys and arranged to engage therewith to prevent the operation of two or more of them simultaneously, substantially as described.

100. In a cash register and indicator, the combination of a registering-wheel, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, a series of tablet-rods and indicating-tablets actuated by said keys, connecting mechanism between said keys and vibrating dog-carrier, and a series of stops arranged to prevent the operation of two or more keys simultaneously, substantially as described.

101. In a cash register and indicator, the combination of a registering-wheel, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting said keys with the vibrating dog-carrier, and a series of stops arranged to engage with said keys to prevent the operation of two or more of them simultaneously, substantially as described.

102. In a cash register and indicator, the combination of a registering-wheel, a vibrating dog-carrier and dog for actuating said wheel, a series of pivoted operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a series of arms pivoted to said keys at points unequally distant from said keys and connecting said keys with the vibrating dog-carrier, and a series of pendent stops arranged to engage with the rear ends of said keys to prevent the operation of two or more of them simultaneously, substantially as described.

103. In a cash register and indicator, the combination of a series of registering-wheels, a series of groups of keys for operating said wheels, one group of keys for each wheel, a series of tablet-rods and indicating-tablets actuated by said keys, and a series of sets of stops arranged to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

104. In a cash register and indicator, the combination of a series of registering-wheels, a series of vibrating dog-carriers and dogs for actuating said wheels, a series of groups of operating-keys, one group of keys for each wheel, a series of tablet-rods and indicating-tablets actuated by said keys, connecting mechanism between each group of keys and its corresponding dog-carrier, and a series of sets of stops arranged to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

105. In a cash register and indicator, the combination of a series of registering-wheels, a series of vibrating dog-carriers and dogs for actuating said wheels, a series of groups of pivoted operating-keys, one group of keys for each wheel, a series of tablet-rods and indicating-tablets actuated by said keys, a series of arms connecting the keys of each group with its corresponding dog-carrier, and a series of sets of pendent stops arranged to engage with the rear ends of the keys of each group to prevent the operation of two or more keys of a group simultaneously, but permitting the simultaneous operation of two or more keys of different groups, substantially as described.

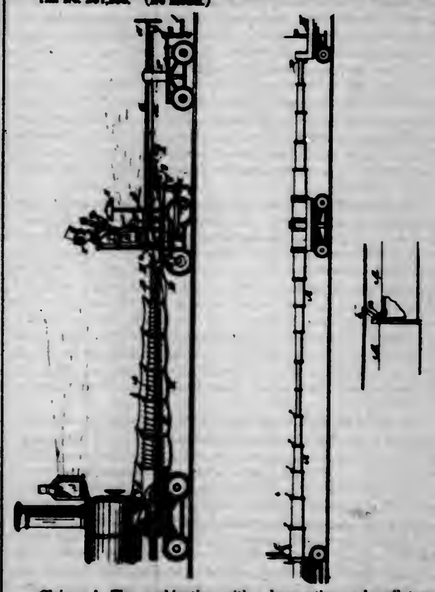
106. In a cash register and indicator, the combination of a registering-wheel, a vibrating dog-carrier and dog for actuating said wheel, a series of operating-keys, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting said keys with the vibrating dog-carrier, a brake-dog arranged to engage with the teeth of the registering-wheel, a vibrating bar actuated by the operation of any one of said keys, connecting mechanism between said vibrating bar and brake-dog, and a series of stops arranged to engage with said keys to prevent the operation of two or more of them simultaneously, substantially as described.

107. In a cash register and indicator, the combination of a five cent-registering wheel, a ten-cent-registering wheel, a dollar-registering wheel, vibrating dog-carriers and dogs for actuating the ten-cent and dollar wheels, a series of operating-keys indicating cents in even and odd multiples of five above the first power, a series of keys indicating dollars in multiples of one, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting the cent-keys with the vibrating dog-carrier of the ten-cent wheel, and a series of arms connecting the dollar-keys with the vibrating dog-carrier of the dollar-wheel, a five-cent bar engaging with the cent-keys which indicate odd multiples of five and provided with a dog engaging with the five-cent wheel, a series of brake-dogs, one for each registering-wheel and arranged to engage with the teeth thereof, a vibrating bar actuated by the operation of the keys, connecting mechanism between said vibrating bar and brake-dogs, and two sets of stops, those of one set being arranged to engage with the dollar-keys and those of the other set with the cent-keys, substantially as and for the purpose described.

108. In a cash register and indicator, the combination of a series of registering-wheels provided with teeth, a series of vibrating dog-carriers and dogs for actuating said registering-wheels, a series of groups of operating-keys, one group for each registering-wheel, a series of tablet-rods and indicating-tablets, one for each key, a series of arms connecting the keys of each group with the vibrating dog-carrier of that group, a series of brake-dogs, one for each registering-wheel and arranged to engage with the teeth thereof, a series of vibrating bars, one for each group of keys, arranged to be actuated by the operation of any key of its group, connecting mechanism between each vibrating bar and the brake-dog of the corresponding registering-wheel, two sets of stops, those of one set arranged to engage with the dollar-keys and those of the other set with the cent-keys, a plate extending across the peripheries of all the registering-wheels and provided with a series of reading-openings, one for each wheel, and a series of supplemental registering-disks pivoted to the under side of said plate adjacent to the reading-openings, one for each registering-wheel and arranged to be turned one notch at each revolution of the registering-wheel, substantially as and for the purpose described.

109. The combination, with the gong-hammer *v*, provided with a laterally-projecting pin, *u*, of the trip-bar *s*, normally engaging with said pin and pivoted to the vibrating frame J, and the block *w*, engaging with the incline upon the trip-bar to disengage the same from the pin *u*, substantially as and for the purpose described.

110. The combination, with the vibrating frame J and the drawer *p*, provided with a pin, *q*, of the pivoted locking-bars, arranged to engage with the vibrating frame when the drawer is open, to prevent the operation of the machine and to be thrown out of the way of the vibrating frame by the pin *q* when the drawer is closed, substantially as described.



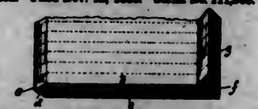
386,402. SEPARATING GREASE FROM WATER. JAMES HOGHES, New York, N. Y., assignor of one-half to Cornelius H. De Lamater, same place. Filed June 8, 1888. Serial No. 276,695. (No model.)

Claim.—1. An apparatus for extracting grease from water, consisting of a tank having inlet and outlet openings near its bottom and a grease-discharge pipe proceeding from its upper part, a valve applied to said outlet-opening, a float attached to said valve for controlling the opening of the same, and a hand-rod connected with said float and valve and projecting through an opening in the upper part of the tank for closing the said valve, substantially as herein described and set forth.

2. An apparatus for extracting grease from water, consisting of a tank having inlet and outlet openings near its bottom and a grease-discharge pipe proceeding from its upper part, and a partition across it, opposite the inlet-opening, for disturbing the entering stream of liquid and directing it upward, a regulating-valve applied to said outlet-opening, and a float attached to said valve for controlling the opening of the same, and a hand-rod connected with said float and valve and projecting through an opening in the upper part of the tank for closing the said valve, substantially as herein described and set forth.

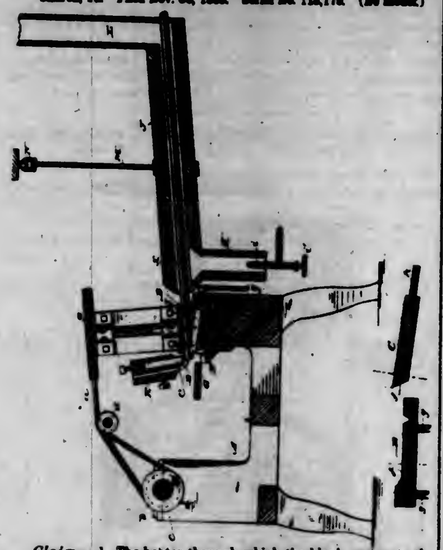
3. An apparatus for extracting grease from water, consisting of a tank having inlet and outlet openings near its bottom and a grease-discharge pipe proceeding from its upper part, and a partition across it for distributing the entering stream of liquid and directing it upward, and a perforated or reticulated diaphragm on the inlet side of said partition for causing a steady and uniform flow of said stream, a regulating-valve applied to said outlet-opening, a float attached to said valve for controlling the opening of the same, and a hand-rod connected with said float and valve and projecting through an opening in the upper part of the tank for closing the said valve, substantially as herein described.

386,403. APPARATUS FOR PREVENTING COLLISIONS OF RAILWAY-TRAINS. JACK W. JAMES, Cuba, Tenn. Filed Mar. 15, 1888. Serial No. 267,263. (No model.)



Claim.—1. The combination, with a locomotive and a pilot-car, of a series of telescopic tubes forming a connection between said locomotive and pilot-car, and an electrical circuit between the pilot-car and locomotive to apply the brakes and reverse the engine when the pilot-car is in collision or thrown from the track, substantially as described.

2. The combination of a locomotive, a pilot-car, a telescopic connection extensible by compressed air and connecting said locomotive and pilot-car, a longitudinally-movable pole projecting in front of the pilot-car, a trunk connected with the forward end of said pole, and an electrical connection or circuit between the locomotive and pilot device, substantially as described.

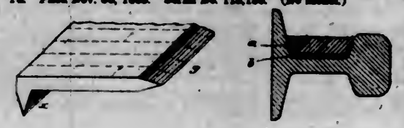


3. The combination, with a locomotive, of the telescopic tubes A, extensible by compressed air and projecting from the forward end of the locomotive, the flat car E, connected to the forward telescopic tube, the longitudinally-movable pole G, carried by the flat car E, the trunk F, connected to the forward end of said pole, the spring H on the pole, the electric wires J K *g*, the spring O, and cord M, substantially as described.

386,404. BLANK FOR RAILWAY-SPIKES. JOHN T. JONES, Iron Mountain, Mich. Filed Nov. 12, 1888. Serial No. 111,569. (No model.)

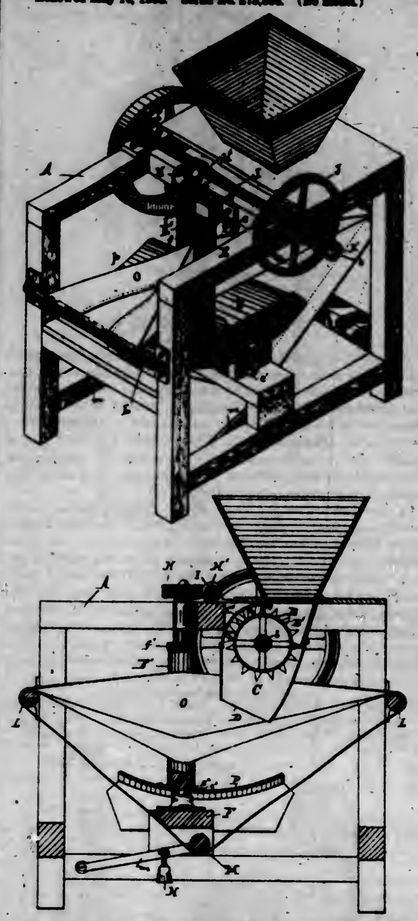
Claim.—A blank for railway-spikes having parallel sides, said sides being beveled off at one edge of the blank and having a ridge formed on one side of the opposite edge of the blank, said ridge being beveled off on both sides, substantially as shown and described.

386,405. MACHINE FOR MAKING NAILS AND SPIKES. JOHN T. JONES, Iron Mountain, Mich., assignor of one-half to Peter L. Kimberly, Sharon, Pa. Filed Nov. 30, 1888. Serial No. 113,178. (No model.)



Claim.—1. The heater through which the blank passes to the knives, and in which it is heated to the extent needed to maintain it at the required heat at the cutting-point, in combination with the knives and the feed-rolls arranged and operating to grip between them the longitudinal edges of the heated blank, the combination being and acting substantially as hereinbefore set forth.

2. In nail or spike making apparatus, the combination, with the cutting-knives, of a heater movable to and from said knives and provided with a passage along through which the blank is fed to the knives, substantially as and for the purposes hereinbefore set forth.

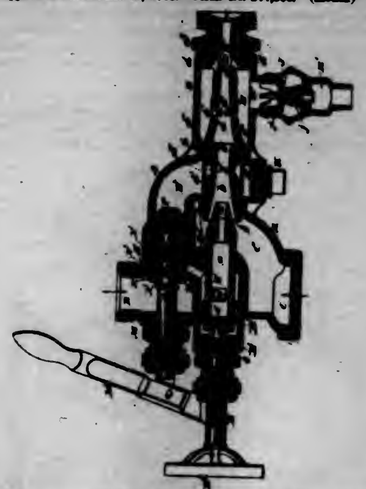


3. The combination, with the cutting-knives, of the swinging heater provided with a passage for the blank and adapted to be turned into and out of line with the knives, substantially as and for the purposes hereinbefore set forth.

386,406. MANUFACTURE OF RAILWAY-SPIKES. JOHN T. JONES, Iron Mountain, Mich., assignor of one-half to Peter L. Kimberly, Sharon, Pa. Filed Nov. 30, 1888. Serial No. 113,180. (No model.)

Claim.—The improvement in the art of making railway-spikes, consisting in incorporating or uniting with the web of a steel rail a steel filling-strip of the requisite cross-section, then bringing this prepared rail, by successive passes between rolls, to the form of a plate or blank having a cross-section corresponding in shape and dimensions to the outline of the spike, and finally cutting up said blank into spikes and forming side ears or flanges upon the heads of said spikes, substantially as hereinbefore set forth.

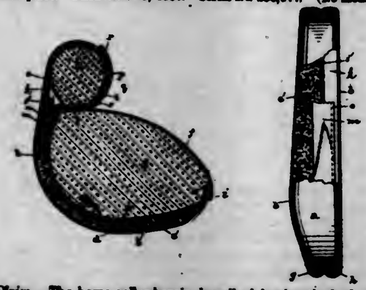
386,407. GRIST-MILL. MARK B. KAYLOR, Philadelphia, Pa., assignor of one-half to John J. Clyde, Jr., same place. Filed June 6, 1887. Renewed May 14, 1888. Serial No. 273,866. (No model.)



Claim.—1. In combination with the grinding-cylinder B, the apron O, the carrying-rolls L L, the vertical press-rolls E E', having concave depressions e^3 at the lower ends, the guard-plate e^4, and the receptacle P, substantially as described.

2. In combination with the grinding-cylinder B, the apron O, the carrying-rolls L L, the vertical press-rolls E E', adjustable with reference to each other at their upper ends and having concave depressions e^3 at their lower ends, the guard-plate e^4, and the receptacle P, substantially as described and shown.

3. The combination of the horizontal grinding-cylinder B, carrying the pinion K on its shaft *b*, the shaft I, carrying at one end the cog-wheel J, meshing with the pinion K and a worm, H', the vertical press-roll E', carrying at the upper end the worm-wheel H, gearing with the worm H', the adjustable press-roll E, mounted in movable bearings, the gear-wheels *f f*, carried by the press-rolls and meshing together, the endless apron O, and the carrying-rolls L L, all constructed and arranged substantially as shown and described.



386,408. INJECTOR. JOHN B. LETHER, Haddonfield, N. J. Original application filed Sept. 3, 1886, Serial No. 212,689. Divided and this application filed June 16, 1888. Serial No. 277,266. (Model.)

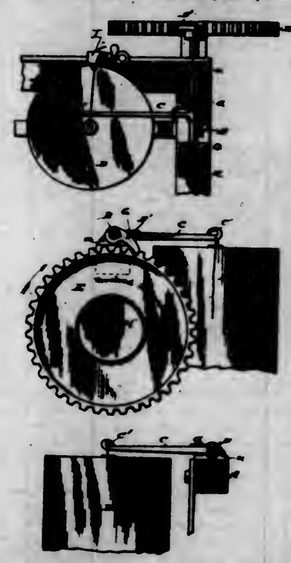
Claim.—1. An injector having a lifter and a forcer arranged in axial line with each other, in which the discharge end of the lifter combining-tube penetrates into a prolongation of the mouth of the forcer combining-tube, thereby forming an annular forcer steam-jet passage, and in which the forcer combining-tube is provided with a waste-opening between its mouth and its throat, where the area in cross-section of its bore is equal to or greater than the area in cross-section of the smallest portion of the forcer steam-jet passage, substantially as and for the purpose specified.

2. An injector having a lifter and a forcer arranged in an axial line with each other, in which the discharge end of the lifter combining-tube penetrates into a prolongation of the mouth of the forcer combining-tube, thereby forming an annular forcer steam-jet passage, and in which the forcer combining-tube is provided with a waste-opening between its mouth and its throat at a point where the area in cross-section of its bore is about equal to or greater than the area in cross-section of the smallest portion of the annular steam-jet passage, and also provided with a valve, whereby the efflux of fluid to the atmosphere from the waste-opening is permitted and the influx of air prevented, substantially as and for the purpose shown.

386,409. HORSE-COLLAR. HENRY B. HALDEN, Baltimore, Md., assignor to Isaac Bergman, Mayer Bergman, and Michael Bergman, all of same place. Filed Nov. 26, 1887. Serial No. 256,077. (No model.)

Claim.—The horse-collar herein described, having the body *g* and roll *h*, with the interposed filling-strip *m*, beveled toward its ends, substantially as and for the purpose specified.

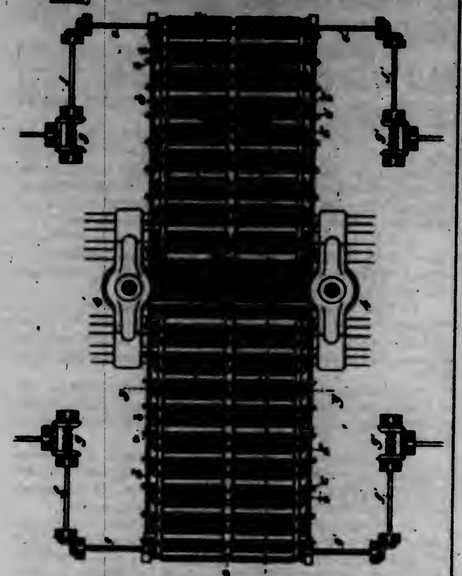
386,410. GAS-HOLDER GUIDE-WHEEL CARRIAGE. J. FREDERICK MAYER, Baltimore, Md., assignor of one-half to Bartlett, Hayward & Co., same place. Filed Jan. 13, 1888. Serial No. 261,257. (No model.)



Claim.—1. A telescopic gas-holder having, in combination with the annular cups comprising the hydraulic seal, consisting of the top plate, *l*, and tank-section N', two plates, I, placed with their broad sides in an upright position, and having one edge in contact with the

top plate, *l*, a plate, J, connecting the said two plates, a vertically-reinforcing plate secured to the side of the gas-holder section, and having its end secured to the said connecting-plate J, and two angle-plates, O, having a horizontal portion, *p*, in contact with the top plate, *l*, of the cup, and one end, *p'*, extended at a right angle with said top plate, to fit *d* of the cup, to which said top plate is secured, and the other end, *p''*, also extended at a right angle, but in an opposite direction, and secured to the said connecting-plate, as set forth.

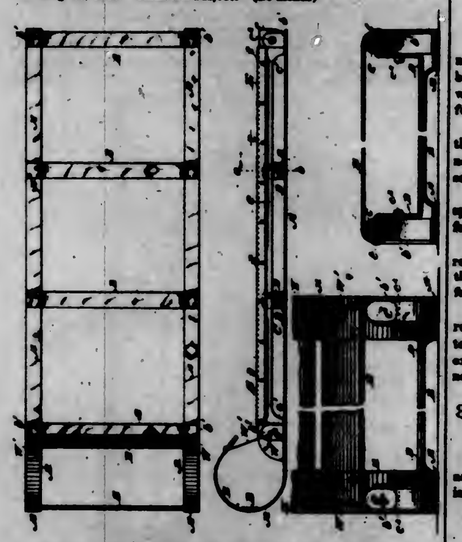
2. A telescopic gas-holder having, in combination with the annular cups comprising the hydraulic seal, two plates, I, placed with their broad sides in an upright position and secured to the said cup, and each having a horizontal slot, *t*, and provided on the outer side with a laterally-projecting arm, *u*, a roller, G, mounted on a shaft, *t'*, which rests in the said horizontal slots, two screw-threaded rods, *v'*, each having an eye attached to an end of the roller-shaft, and each rod provided with nuts and resting in the slotted arm, as set forth.



386,411. TWINE-LOOSENER. HARRY L. HUBBELL, New York, N. Y. Filed Feb. 1, 1888. Serial No. 262,893. (No model.)

Claim.—1. The combination, with the rock-shaft, of the twine-loosening arm mounted thereon and having an eye formed therein, through which the twine passes from the twine-box to the tension and take-up devices, and an intermittently-operated wheel, whereby a shaking or vibrating motion is imparted to the arm during the binding action to loosen the twine in the box, as set forth.

2. The combination, with the rock-shaft, of the twine-loosening arm mounted thereon, and having an eye formed therein, through which the twine passes from the twine-box to the tension and take-up devices, and an intermittently-operated wheel located in the binder mechanism train of gears, substantially as described, whereby a shaking or vibrating motion is imparted to the arm during the binding action to loosen the twine in the box, as set forth.

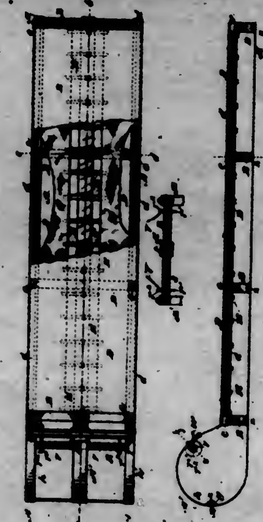


386,412. FEED-GAGE FOR ROLLING-MILLS. HAYES B. SAYER, Allegheny City, Pa. Filed May 17, 1888. Serial No. 274,253. (No model.)

Claim.—1. A rolling-mill feed-table composed of two independently-driven sets of feed-rollers, substantially as and for the purposes described.

2. A rolling-mill feed-table composed of two independently-driven reversible sets of feed-rollers, substantially as and for the purposes described.

386,413. TOBOGGAN. JOSHUA PERRY, Philadelphia, Pa. Filed Aug. 11, 1887. Serial No. 246,622. (No model.)



Claim.—1. The herein-described skeleton toboggan, consisting of a frame-work composed of elastic runners formed of strips of steel or other suitable metal, and the flexible elastic cross bars or strips secured thereto.

2. The combination, with a skeleton toboggan constructed of elastic runners and flexible elastic cross bars or strips secured thereto, of a yielding seat having a frame provided with elastic side rails which rest directly on the runners, substantially as described.

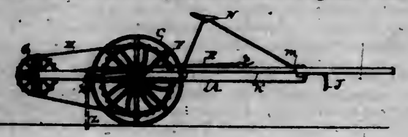
3. The combination of the skeleton toboggan consisting of the steel or iron runners and cross-bars secured thereto, the side rails, the angle-bars resting upon said cross-bars, and the flexible fabric secured to said side rails and suspended between the same, substantially as and for the purpose described.

4. As a new article of manufacture, a seat for toboggans composed of the flexible side rails, transverse connecting-bars provided with angular ends, the said angular ends being attached to the side bars, and the sheet of flexible fibrous materials secured to the tops of said side rails, substantially as described.

386,414. TOBOGGAN. JOSHUA PERRY, Philadelphia, Pa. Filed Oct. 4, 1887. Serial No. 251,207. (No model.)

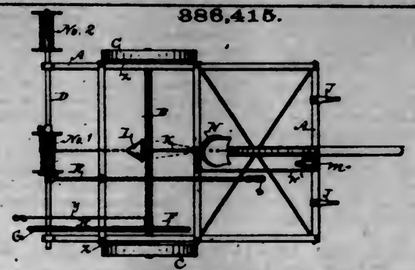
Claim.—1. In a toboggan, the combination, with the elastic runners, of the arched elastic cross-strips having their ends upturned and bent around to form eyes for the reception of the side rails together with the flexible seat suspended from said rails, substantially as and for the purpose set forth.

2. In a toboggan, the combination of the two lateral runners and the middle runner, the arched elastic cross-strips secured to said runners, the side rails connected to said cross-strips, and the flexible seat secured to said side rails, substantially as and for the purpose set forth.



3. The combination, with a toboggan or coasting-vehicle, of the spring-controlled roller and cord attached thereto, substantially as and for the purpose set forth.

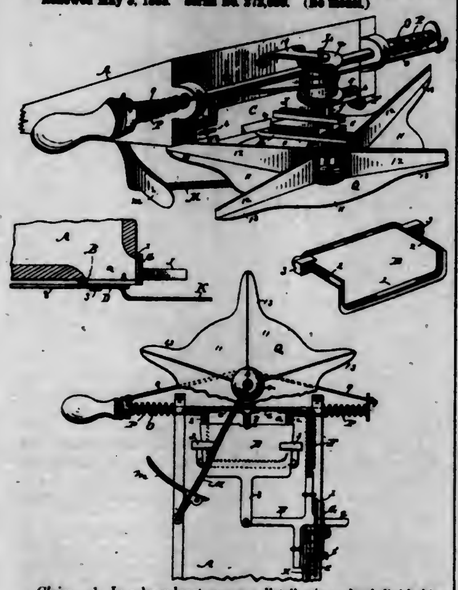
4. In combination with a toboggan, the wide spring-controlled roller and the cord having its ends secured to the said roller at or near the ends thereof respectively, substantially as and for the purpose set forth.



5. The combination, with a toboggan consisting of three or more runners connected by elastic cross-bars, of hand-rails rigidly connected to the cross-bars, and a seat composed of a fibrous flexible material extending over and around said rails, and having its free ends connected by a non-elastic connection, substantially as described.

386,415. MACHINE FOR WINDING AND UNWINDING WIRE. JOHN W. BROWN and ROBERT J. HAYDEN, Dubuque, Iowa. Filed Jan. 3, 1888. Serial No. 259,602. (No model.)

Claim.—A two-wheeled truck or carriage having a rotating shaft and spool-carrier in rear of and parallel with the carriage-axis, driving mechanism for transmitting motion from the carriage-axle to said



386,415.

rotating shaft, and the guide *l*, treadle *m*, lever *k*, and rod *k'*, arranged and combined substantially as shown and described, to operate in the manner set forth, for the purposes stated.

386,416. BROADCAST SOWER. ISAAC H. SWAIN, Dayton, Ohio, assignor to Silas B. Ritzenhouse, Liberty Mills, Ind. Filed Mar. 18, 1886. Renewed May 3, 1888. Serial No. 272,689. (No model.)

Claim.—1. In a broadcast sower, a distributing-wheel divided by ribs into a series of receiving-chambers and having channels connecting said chambers, substantially as set forth.

2. A distributing-wheel having a cast-metal hub and a sheet-metal body, the latter being provided with ribs dividing it into chambers, and the hub being formed hollow and having openings communicating with the chambers of the body, whereby to form channels between said chambers, substantially as set forth.

3. In a broadcast sower, a distributing-wheel having a sheet-metal body formed with ribs bent up from said body and formed of double thickness and approximately at right angles to the body, whereby the wheel may be operatively revolved in both directions, substantially as set forth.

4. In a broadcast sower, a distributing-wheel having its body formed of sheet metal and in sections, the adjoining edges of said sections being bent to form flanges constituting halves of the rib, the free edge of one flange being bent over that of the other to form a crown for the rib, substantially as set forth.

5. In a broadcast sower, the combination of the framing, the riddles, supports connecting the riddles to the framing, whereby they may be independently oscillated, and devices whereby to operate said riddles, substantially as set forth.

6. In a broadcast sower, the combination, with the framing and the riddle-plate, of a carrier pivoted thereto, and guides for directing the movement of said carrier longitudinally along the framing, whereby to preserve the location of the pivotal connection of the riddle therewith in line longitudinal to the framing, substantially as set forth.

7. In combination with the riddle and the carrier connected therewith, a ball-shaped guide, I, a detent constructed to engage the carrier, and having a hook or hooks engaged with ball I and movable along the same, and a clamp whereby to secure said detent in any desired adjustment.

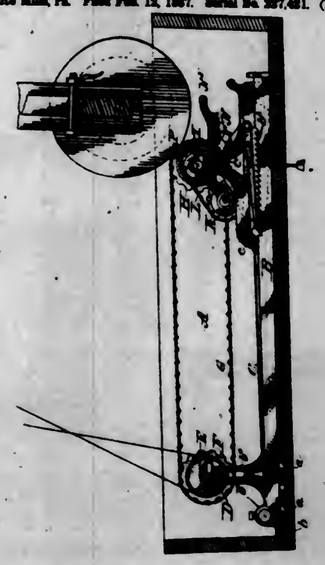
8. The combination, in a broadcast sower, with a case or frame having a discharge-opening at the juncture of its front side and bottom, of a riddle-plate movable laterally on the front side of the case and a riddle-plate movable laterally and longitudinally along the rear side of the case, substantially as set forth.

9. In a broadcast sower, the combination of the frame or case provided with a discharge-opening at the juncture of its front side and bottom, the distributing-wheel, and a riddle-plate connected with the front side of the case and movable laterally, said plate being arranged and movable in a plane approximately parallel with the axis of the distributing-wheel, substantially as shown and described.

10. The combination, with the drive-shaft and the distributer-wheel, of the arm forming a brace and pivotal support for the drive-shaft, and having a guard-plate formed integrally with it, all arranged and operating substantially as set forth.

11. The combination of the lower riddle-plate, guides securing the same so it may be moved longitudinally and laterally, the carrier pivotally connected with said riddle-plate, and a detent constructed to secure said carrier in any desired adjustment, substantially as set forth.

12. The combination of the lower riddle-plate, a detent constructed to secure said carrier in any desired adjustment, and a spring for closing the riddle-plate when the detent is released, substantially as set forth.



13. The combination, with the lower riddle-plate, of the detent constructed to secure said carrier in any desired adjustment, and adjustable, whereby it may be set at different points, and connections between said detent and riddle-plate, substantially as set forth.

14. The combination, with the metallic edge plate having right-angled sections and provided with guides for the base riddle-plate, of the riddle-plates, the drive-shaft having cranks connected with the riddle-plates, and the distributer, substantially as set forth.

15. The combination of the drive-shaft having cranks, the scatterer secured to said shaft, the edge plate having one wing forming a bearing for one riddle-plate and its other wing provided with guides for the other riddle-plate, and the riddle-plates provided with slotted arms engaging the cranks of the drive-shaft, substantially as set forth.

16. In a broadcast sower, substantially as herein described, the drive-shaft having cranks arranged on different radii, combined with the riddle-plates suitably supported, whereby to discharge the material being sown between them, and connections between said plates and the cranks of the drive-shaft, substantially as set forth.

386,417. FEED APPARATUS FOR GLASS-POLISHING MACHINES. RICHARD THIEME, Hoxendale, assignor to Louis J. Darlington, White Mills, Pa. Filed Feb. 13, 1887. Serial No. 227,481. (No model.)

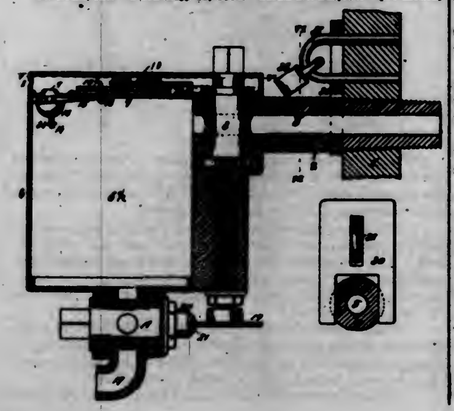
Claim.—1. In a finishing apparatus for glass-polishing machines, the combination of a longitudinally-adjustable frame, as B, a pivoted vertically-adjustable inner frame, as C, and a traveling brush-carrier, substantially as described.

2. The combination, with the internal frame vertically adjustable at its forward end, of the weighted putty-box suspended thereto, so as to retain a horizontal position in any adjustment of the frame, and the brush arranged to dip therein and carry the material to the polishing-wheels, substantially as described.

3. The combination, with the swinging frame and the brush-carrier, of the putty-box, the lever for adjusting the frame, and a locking device, substantially as described.

386,418. MEASURING BOTTLE OR FLASK. JOHN R. WHITNEY and HERMAN H. ROTTAKER, Little Rock, Ark., assignors, by direct and mesne assignments, of one-half to Dean Adams, same place, and Henry Schumann, St. Louis, Mo. Filed Aug. 11, 1887. Serial No. 246,701. (No model.)

Claim.—1. A bottle or flask having a partition forming a measuring-chamber at the bottom, an inlet to said chamber at one side, and a discharge-pipe connected to the chamber at the opposite side, substantially as described.



2. A bottle or flask having a partition forming a measuring-chamber, an inlet to said chamber at one side, an outlet to said chamber at the opposite side, a plug having a port, and a pipe connecting the outlet with the port, substantially as described.

3. A bottle or flask having a partition forming a measuring-chamber at the bottom, an inlet to said chamber at one side, an outlet to said chamber at the opposite side, a plug having a port, and a pipe connecting the outlet with the port, said pipe having bends, substantially as described.

4. A bottle or flask having a partition forming a measuring-chamber at the bottom, an inlet to said chamber at one side, an outlet to said chamber at the opposite side, a plug having a liquid-port and an air-port, and a pipe connecting the liquid-port with the outlet, substantially as described.

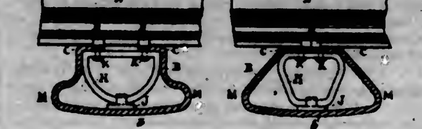
5. A bottle or flask having a partition forming a measuring-chamber at the bottom, an inlet to said chamber, and an extension at one side of the partition, and an outlet and a discharge pipe at the opposite side of the chamber, substantially as described.

386,419. REGISTERING-FAUCET. JOHN R. WHITNEY and HERMAN H. ROTTAKER, Little Rock, Ark., assignors, by direct and mesne assignments, of one-half to Dean Adams, same place, and Henry Schumann, St. Louis, Mo. Filed Aug. 11, 1887. Serial No. 246,707. (No model.)

Claim.—1. The combination, with the plugs 3 and 18 and a shell having a chamber located between the plugs, of a register with which one of the plugs is connected to indicate the number of times said plug is opened, and a locking device connecting the plugs, substantially as and for the purpose set forth.

2. The combination of the stem or spigot 2, plug 3, having stem 20, register connected with said plug, locking-disk on the lower end of said stem, having a notch, 23, plug 18, having a slot, 21, with which said disk engages, the shell 6, having a chamber, 6½, and valve 12, substantially as and for the purpose set forth.

3. The combination of the stem or spigot 2, having notches 31, loop 30, staple 32, lock 33, plug 3, register 10, to which said plug is connected, stem 20 on the plug, notched disk 19, plug 18, with which the disk engages, and the shell 6, having a chamber, 6½, substantially as and for the purpose set forth.



4. The combination of the stem or spigot 2, plug 3, plug 18, having a slot, 21, the locking-disk 19, having a notch, 23, by which the plugs are connected, the shell 6, having a chamber, 6½, and valve for allowing admission of air into the chamber, substantially as and for the purpose set forth.

5. The combination of the stem or spigot 2, plug 3, plug 18, to which the plug 3 is connected, the shell 6, having a chamber, 6½, valve 12, having elongated stem, and float 13, substantially as and for the purpose set forth.

6. The combination of the stem or spigot 2, plug 3, plug 18, locked to the plug 3, the shell 6, having a chamber, 6½, register 10, pawl 24 26, and a cam, 27, on the plug 3, substantially as and for the purpose set forth.

7. The combination of a plug having a disk, 19, formed with a notch, 23, a plug having a slot, 21, in which the disk rotates, and a shell having a chamber between the plugs, substantially as described.

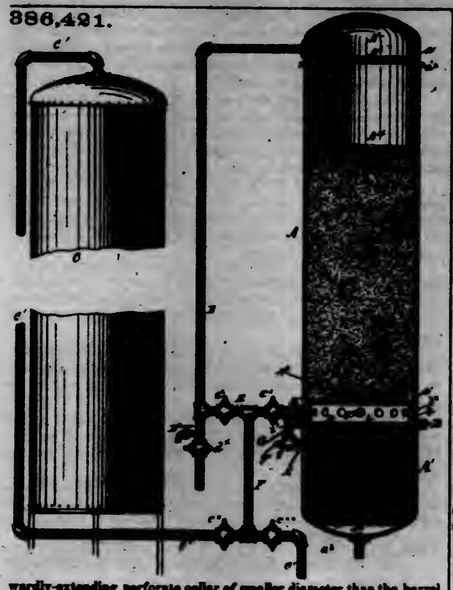
386,420. METALLIC TIE OR SLEEPER FOR RAILROADS. REYNOLDS T. WHITE, Boston, Mass. Filed Nov. 21, 1887. Serial No. 255,702. (No model.)

Claim.—1. A metallic tie or sleeper made of sheet-steel formed with a slightly-rounded bottom, then turned on each bottom corner on a suitable radius inwardly, then straight or curved toward the center of the top of the tie, then over inwardly, as shown, to form flanges, as and for the purposes set forth.

2. A tie or sleeper made of sheet-steel formed as shown, with its upper surface narrower than its lower surface, thereby making it elastic its entire length, and having a spring-band secured to its flanges on its inside under the rails, as and for the purposes set forth.

3. In a metallic tie, B, made as shown, the combination of the stops D, G, and E, and key-bolt F and key *f*, to secure rails A to flanges C on tie B, substantially as shown and described.

4. A metallic tie, B, being slightly rounded at bottom *b*, and then turned inwardly on a suitable radius at the bottom corners, M, and then straight or curved on an inward incline to its top flanges, C, to make a bearing for rails A, substantially as shown and described.



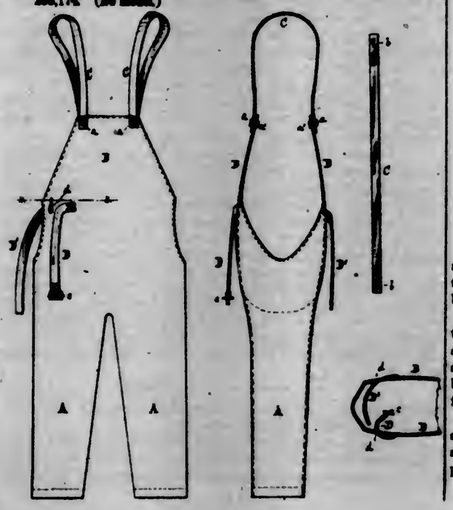
5. A metallic spring tie, B, having springs H, wearing-plates J, rivets or bolts K, stops D, G, and E, and keyed key-bolt F, in combination with rails A, as and for the purposes set forth.

6. A sheet of steel formed, as shown, to make a flexible railroad tie or sleeper its entire length, and having semicircular flexible bands secured to its flanges on its inside, and having a part of its flanges turned upward to form stops to prevent the rails from spreading, and suitable inside clips, stops, and bolts to hold the rails in position, all arranged substantially as shown and described, and for the purposes set forth.

386,421. FILTER. RAWSON ARMER, Oakland, Cal. Filed Sept. 12, 1887. Serial No. 249,895. (No model.)

Claim.—1. The combination, with a filter having a barrel and an auxiliary chamber, and provided with the imperforate head B and screen A^2, separating said parts, said head being provided with an up-

386,421.



wardly-extending perforate collar of smaller diameter than the barrel of pipe-connection between the space outside the collar and the auxiliary chamber, and pipes connecting to a cold and a hot water supply.

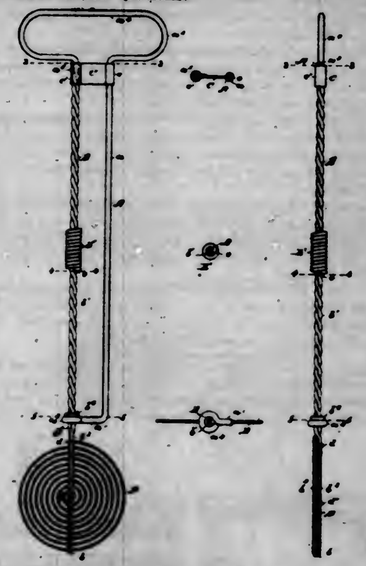
2. The combination of a filter having the barrel A, screens A^{x} and A^{3}, and an auxiliary chamber, A', and an imperforate head between them, and a supply-pipe with the space between the head B and disk A^{3}, with the auxiliary chamber, and a warm-water pipe connected to the pipe E between the supply-pipe D and the filter, as set forth.

3. A filter having a screen or perforate disk near one end, an imperforate head secured upon the end of the filter, a collar of smaller size than the barrel of the filter extending up against said disk, a series of openings in said collar, a space around said collar, and a discharge-passage connected with said space.

4. A filter consisting of the two chambers A and A', having flanged meeting ends, a solid head between them, a perforate plate or screen held in chamber A' to produce or form a space above said head beneath the filtering material, and a space beneath the filtering or purifying material in said chamber A', as set forth.

386,422. REVERSIBLE OVERALLS. EDWARD W. BUSHEE, Jr., and JAMES G. GLADDEN, Bristol, R. I. Filed Nov. 14, 1887. Serial No. 255,174. (No model.)

Claim.—The reversible garment herein described, having legs A, flaps B, slits in front and rear, shoulder-straps C, buttoned to said flaps, straps D D' above the slit upon one side, and openings *d* in the flaps, substantially as specified.



386,423. SHUTTER-FASTENER. JOHN M. GORSLINE, New York, N. Y. Filed Feb. 14, 1888. Serial No. 264,162. (No model.)

Claim.—1. The combination, with the hinged shutters S S', of the tube A and rod B, hinged to the respective shutters near their hinge-edges and movable in the same horizontal plane, and the gravitating fastening-hooks F, having step-toes *t* and hinged to the shutters near their free edges and movable vertically, said hooks embracing said tube when the shutters are closed, substantially as hereinbefore specified.

2. In combination with the shutters S S', tube A, and rod B, the hinges H H', said hinge H being composed of a nut, *n*, transfixed in a housing, H', with one end of the tube A screwed into the nut, substantially as hereinbefore specified.

386,424. EGG-BEATER. GEORGE D. DUDLEY, Lowell, Mass., assignor to Woods, Sherwood & Co., same place. Filed Feb. 20, 1888. Serial No. 264,993. (No model.)

Claim.—1. The combination of the frame, the spindle supported and rotating freely in said frame and extending below said frame, and the agitator consisting of a flat spiral of wire secured to said spindle below said frame, as and for the purpose specified.

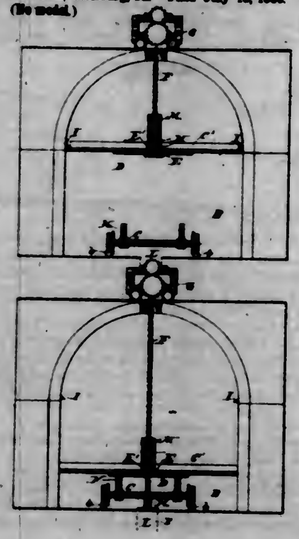
2. The combination of the frame, the spindle supported and rotating in said frame and extending below said frame, said spindle consisting of a wire doubled throughout its length and twisted within said frame, and an agitator consisting of a flat spiral of wire secured between the untwisted strands of said spindle below said frame, as and for the purpose specified.

3. The combination of the frame provided with a step, the socket secured to said frame, the spindle turning in said socket and step, and a ring or projection on said spindle to prevent said spindle from dropping out of said frame, as and for the purpose specified.

4. The combination of the wire frame, provided with a handle and

with a step at its lower end and with an intermediate vertical portion, a crank-piece attached to said vertical portion and provided with a cylindrical socket, the upper end of which receives the upper end of the frame-wire, a spindle turning in said socket and step, and above said step being formed of twisted wires or strands of wire and having a uniform diameter, as and for the purpose specified.

386,425. METHOD OF INSERTING SLEEVES IN SHIRTS. CHARLES S. BRAIN, Troy, N. Y., assignor to George B. Grant, Rec. & Co., same place. Filed Feb. 9, 1888. Serial No. 263,602. (No model.)



Claim.—The improved method of inserting shirt-sleeves in shirt-body fronts, consisting in, first, cutting out an opening in the shirt-body front to receive the shirt-bosom; second, folding the shirt-body front as cut out, and also the re-enforce pieces, in such a manner that the edge of the material surrounding the opening shall be capable of conforming to or of becoming substantially coincident with the several edges of the plies constituting the bosom when laid out flat and fully extended; third, plaiting the shirt-body front as folded between the back lining and the front lines of the bosom with its fine against the back of the back lining and its back against the face of the front ply or lines; fourth, applying a narrow strip of material to the outer raw edges of the plies consisting of the back lining, the shirt-body front, and the front lines, and securing all these parts together by stitches, so as to form a pocket, and, fifth, turning the pocket inside out, so that the binding-strip will cover the raw edges between the plies of the bosom, substantially as shown and described.

386,426. CUFF-HOLDER. ROBERT G. DUTTON, Penacook, N. H. Filed May 3, 1888. Serial No. 272,927. (No model.)

Claim.—In a cuff-holder, the combination of a pin-support having the ears B B and C C, the latter terminating in the hooks *c c*, a double-pointed pin, D, bent in the form of a staple, a spring-wire loop for attaching to a cuff-button, and an elastic band connecting said wire loop with the said pin between the ears B B, substantially for the purpose set forth.

386,427. PORTABLE-BOTTOM COKE-OVEN. DAVID EVANS and ALBERT W. ADAMS, Pittsburg, Pa. Filed July 16, 1888. Serial No. 280,130. (No model.)

Claim.—1. In a coke-oven having a pit below the level of its base or floor, the combination, with a movable bottom having a central opening, of a chain passing through said opening and through the eye of the oven, a portable crab above the oven mounted on rails, a spider or frame below the floor, and a car or truck mounted on tracks within said pit, substantially as described.

2. In a coke-oven, the combination, with a movable floor or bottom and a frame or spider to support the same while being raised and lowered, of a crab mounted on tracks above the oven, and a chain connecting said crab and spider through the eye of the oven, substantially as set forth.

3. The combination, with a coke-oven, of a vertically-movable floor, a portable crab or hoisting apparatus mounted upon tracks above the oven, and a chain passing from said crab through the eye of the oven and connected to said bottom, substantially as set forth.

386,428. HINGE-GAGE. HOLMES G. PERRY, Washington, D. C. Filed Feb. 24, 1888. Serial No. 265,311. (No model.)

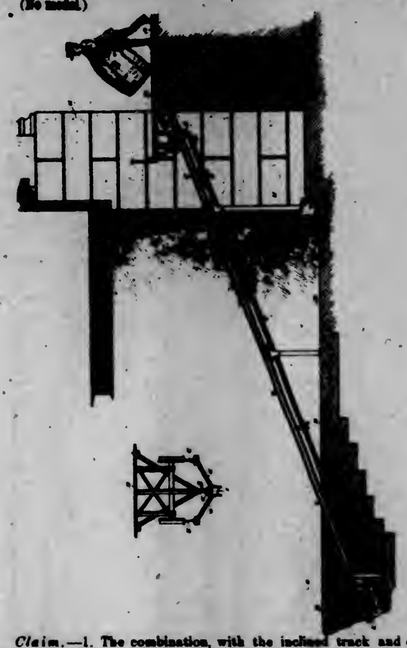
Claim.—1. A hinge-gage consisting of an upper block, A, having slot *a*, and the lower block, B, having pins G, held adjustably together by a screw, C, and provided with the cutters D E F, arranged for operation as shown, and for the purpose set forth.

2. The combination of the upper and lower blocks, A and B, adjustably secured together by a screw, C, movable in a slot, *a*, the block A provided with recesses *b*, and the block B having the pins G, fitting into said recesses *b b*, and the cutters, all arranged as shown and specified.

3. The hinge-gage herein described, consisting of the block A, provided with cutters D F, slot *a*, and recesses *b*, and the block B, provided with cutter E, pins G, and slot *c*, in combination with the clamping-screw C, all constructed and arranged as shown, and for the purpose set forth.

4. In a hinge-gage, the combination of the upper and lower blocks sliding upon each other, the former provided with knives D and F and the latter with knife E, with the adjustable clamping-screw C, movable in slot *a* and arranged to set all knives at one operation, as and for the purpose specified.

386,429. RAILWAY-CROSSING. ALBERT M. GORDON, Montezuma, Ind. Filed Jan. 7, 1888. Serial No. 259,979. (No model.)



Claim.—1. In a railway-crossing, the combination of the main-

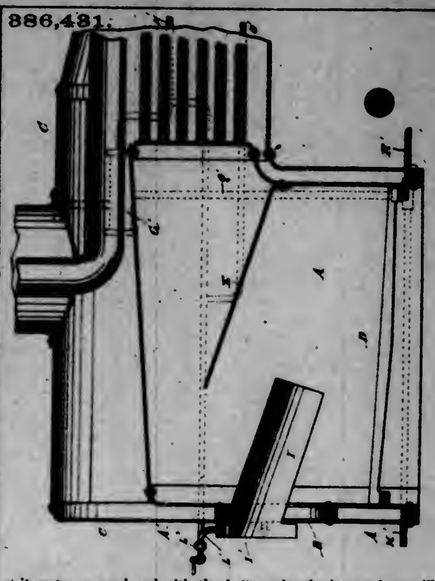
track rails, the side-track rails, the fixed frog at the junction of the main and side track rails, said having the flange D raised above the level of the main track, the frog-rail G, adapted to ride over the adjacent main-track rail, and the toggle-jointed frog-levers arranged on the inner side of the side track, pivoted near their outer ends, and connected directly to the frog-rail, said frog-rail and levers having the arms or extensions adapted to be operated by the flanges of the wheels of passing trains, substantially as described.

2. The combination, in a railway-crossing, of the main track, one of the rails of which is provided with a fixed frog, C, having the raised flange D, the side-track rail in line with the frog, the pivoted frog-rail G, having the arm K at its free end, said frog-rail being adapted to move over the top of the adjacent main rail and connect with flange D, the guard-rail on the inner side of the outer side-track rail, the toggle-jointed pivoted levers M N, having the extensions or arms at their outer ends, and connections between the jointed inner ends of said levers and the frog-rail, substantially as described.

3. The combination of the main and side tracks, the pivoted frog-rail G, having the arm K, the pivoted toggle-jointed levers M N, having the extensions or arms at their outer ends, for the purpose set forth, the bracket O, connected to the joint of said levers and having the ears P, the rod R, connected to frog-rail G, and having its outer end extended through ears P, the extensible spring bearing against one of the ears P, and the pin extending through rod R, bearing against the free end of the spring and adapted to strike the other ear P, substantially as described.

886,430. HOISTING AND CONVEYING APPARATUS. GEORGE F. HARRISON, Cleveland, Ohio. Filed Nov. 4, 1887. Serial No. 254,317. (No model.)

Claim.—1. The combination, with the inclined track and car adapted for traveling thereon, of a water-cylinder, the piston-rod of the latter being connected with the car, substantially as set forth.



2. The combination, with inclined track, car, water-cylinder and piston-rod, substantially as indicated, of hangers supported from the track, said hangers carrying rollers for supporting the piston-rod, substantially as set forth.

3. The combination, with inclined track extending from the sidewalk to below the basement-floor and a car for operating on the track, of a water-cylinder having its axial line parallel with the line of the track, the piston of such water-cylinder connected with the car for actuating the latter, substantially as set forth.

886,431. LOCOMOTIVE FIRE-BOX. CHARLES W. HELLMER, Port Reading, N. J. Filed Feb. 15, 1888. Serial No. 264,107. (No model.)

Claim.—1. The combination, with the locomotive-boiler and fire-box provided with a fuel-opening, of the hollow baffler extending through the upper part of the fuel-opening and detachably connected

886,431.

at its outer exposed end with the boiler, whereby it may be readily removed without drawing the fire or emptying the boiler, substantially as set forth.

2. In a locomotive-engine, the combination, with the fire-box having a fuel-opening, B, and the boiler, of the arched hollow baffler extending through the upper end of the fuel-opening into the fire-box and detachably connected at its outer exposed end to the boiler by valved connections, and valved connections between the water-supply pipes and the outer exposed end of said baffler, whereby the valves in said connections may be closed and the baffler removed without interfering with or drawing the fire or emptying the boiler, substantially as set forth.

3. The combination, with the boiler, the fire-box having a fuel-opening, B, the water-supply; injector, and feed-water pipes H H', N N', and P, and the valved pipes Q Q', of the hollow baffler I, extending through the fuel-opening B, valved exterior attaching-connections J J' between the baffler and the boiler, valved pipes M M', leading from pipes N N' to the baffler, and valved pipes O O', leading from pipes M M' to feed-pipe P, substantially as set forth.

886,432. BOAT CONSTRUCTION. JOSEPH H. HIRT, West Troy, N. Y. Filed Feb. 3, 1888. Serial No. 262,879. (No model.)

Claim.—1. The herein-described hull of a boat or vessel, consisting of a keelson, stem and stern posts, bottom B, and sides C C, extending forward to the bridge, in combination with the vertical and chamfered timbers E, fitted between the stem-post and the ends of the side C, substantially as described.

2. The herein-described hull of a boat or vessel, consisting of keelson, stem and stern posts, bottom B, and sides C C, extending forward to the bow and stern bilge, in combination with the bow and stern formed of vertical timbers having chamfered edges fitted between the bow and stern-posts and the opposite ends of the sides C C, substantially as described.

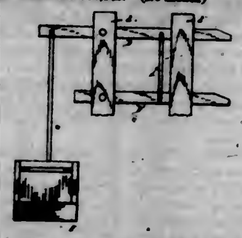
886,433. WAGON-STANDARD. JAMES HUNT, Osceola, Mo. Filed Dec. 3, 1887. Serial No. 256,576. (No model.)

Claim.—The combination, with the recessed bolster A, of the cap-pieces B, seated within said bolster and secured near their inner ends by screws to the bolster, and standards C, pivotally and centrally or nearly centrally secured to the cap-pieces near their outer ends, and

886,433.

provided with one or more rings, E, said standards being adapted to turn upon the cap-pieces B, substantially as described.

886,434. MAT. ROBERT KERR, Philadelphia, Pa. Filed Nov. 22, 1887. Serial No. 255,570. (No model.)



Claim.—A mat or similar article consisting of a textile cord wound with wire, said cord being folded on itself and having its lengths closely connected by the interlocking of the wire, substantially as set forth.

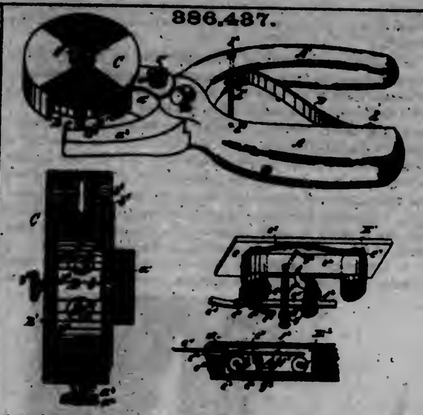
886,435. SHOE-NAIL. JOSEPH B. KENDALL, Milford, assignor to Henry S. Jenkins, trustee, Boston, Mass. Filed Apr. 3, 1886. Serial No. 161,160. (No model.)

Claim.—A metallic sole-fastener having two of its sides beveled, as at *c c*, to form the point of the nail, and having its sides opposite or at right angles to the beveled sides of substantially the same diameter as the body of the fastener, and chamfered off at the extremity of the point, as at *d d*, to enable the point of the nail to clinch without weakening the same, substantially as described.

886,436. FLOOD-GATE. JOSEPH HERVEY, Albany, Mo. Filed Mar. 14, 1888. Serial No. 267,148. (No model.)

Claim.—1. As an improvement in flood-gates, the latch-levers and the pocket or water-receptacle connected to said latch-levers, substantially as shown and described.

2. As an improvement in flood-gates, the latch-levers connected together, the pocket or water-receptacle, and the wire or rope connected to one of said latch-levers and to said pocket or receptacle, substantially as shown and described.



3. The combination, with the two posts or uprights and the gate pivotally secured between the same, of the two latching-posts disposed equal distances from said posts or uprights, the latch-levers designed to engage said latching-posts, and the pocket or receptacle connected to said latch-levers, substantially as shown and described.

4. The combination, with the gate and the latch-levers, of the pocket or receptacle open on one side and having a perforated bottom, substantially as shown and described.

886,437. TREMIE-FUNNEL. HENRY HYDE, Philadelphia, Pa. Filed Mar. 3, 1888. Serial No. 266,062. (No model.)

Claim.—1. In combination, a punch provided with two handles

886,437.

pivoted to each other, a hollow cylinder pivotally connected with the outer portion of one of said handles and provided with a series of dies, a recessed cap-plate mounted on said cylinder, and means, substantially as described, connected with said cap-plate and engaging with said cylinder to cause the same to be held in a fixed position, and an anvil-bar mounted in the outer portion of the opposite handle, substantially as and for the purposes set forth.

2. In combination, a punch provided with two handles pivoted to each other, a hollow cylinder pivotally connected with the outer portion of one of said handles and provided with a series of dies and a removable cover, means, substantially as described, in said cylinder whereby tampering with the device may be detected, a recessed cap-plate surrounding said cylinder with a portion of its surface cut away, and a spring secured to said plate and engaging in notches formed in the surface of said cylinder, substantially as and for the purposes set forth.

3. In combination, a punch provided with two handles pivoted to each other, a hollow cylinder pivotally connected with the outer portion of one of said handles and provided with a series of dies, and a removable cover with characters arranged around the surface thereof, means, substantially as described, in said cylinder whereby tampering with the device may be detected, a cap-plate with a portion of its surface cut away inclosing said cylinder, a spring for holding said cylinder in a fixed position, and an anvil-bar mounted in the outer portion of the opposite handle, substantially as and for the purposes set forth.

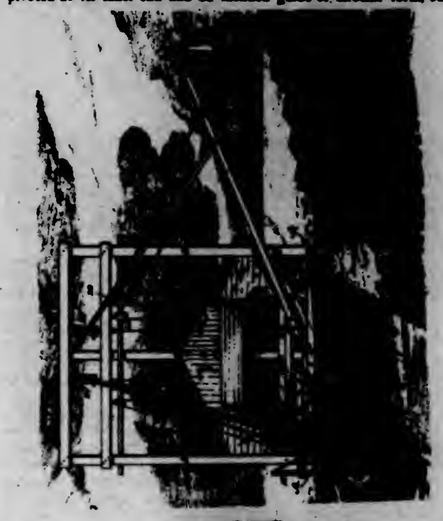
4. In combination, a punch provided with two handles pivoted to each other a hollow cylinder pivotally connected with the outer portion of one of said handles and provided with a series of dies and a removable cover, means in said cylinder whereby tampering with the same may be detected, a cap-plate with a portion of its surface cut away surrounding said cylinder, a spring attached to said plate and engaging in notches formed in the surface of said cylinder for holding the same in a fixed position, and means in said handles operating automatically to register the use and to indicate tampering with the device, substantially as and for the purposes set forth.

5. In combination, a punch provided with two handles pivoted to each other, a rod secured into one of the handles and extending through the body of the opposite handle and a collar mounted thereon, a spring secured to one of said handles and engaging with the opposite handle, a hollow cylinder secured to the outer portion of one of said handles and provided with a series of dies and a removable cover, means in said cylinder whereby tampering with the cylinder may be detected, an anvil-bar mounted in the outer portion of the opposite handle, and means, as described, in the handles, and actuated thereby, to register the use and to indicate tampering with the device, substantially as and for the purposes set forth.

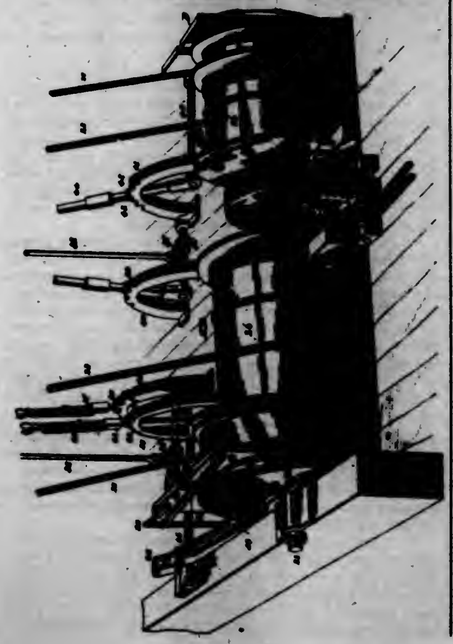
886,438. DITCHING, DREDGING, OR EXCAVATING MACHINE. BRUCE G. BEAN, Chicago, Ill., assignor of one-half to Oliver B. Green, same place. Filed Jan. 19, 1888. Serial No. 260,893. (No model.)

Claim.—1. A ditching, dredging, or excavating machine having two shovel-carrying booms adapted to be alternately operated, substantially as described.

2. A ditching, dredging, or excavating machine having two booms with connected shovels, two guides extending in opposite directions, chains or ropes connected with the shovels for raising and overturning the same, and winding mechanism, whereby the booms are alternately operated in order to advance and return the shovels to and from the ditch or excavation, load the same, and discharge the ex-

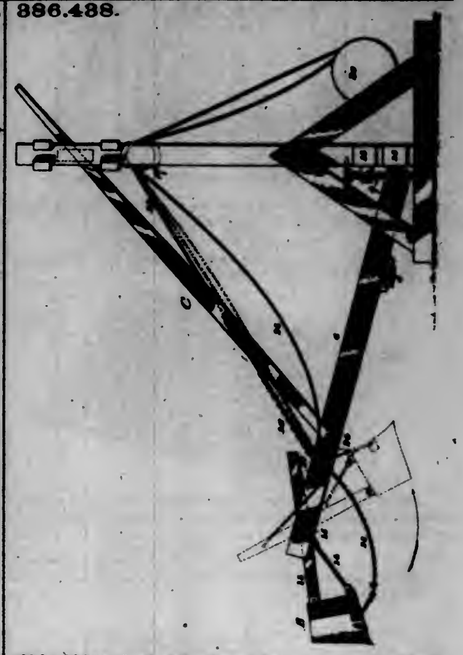


cavated material on opposite sides of the excavation, substantially as described.



3. A ditching, dredging, or excavating machine having a boom, a pivotal connection for said boom, consisting of a box with gudgeons and a screw passing through said box, and an inclined guide, said parts being combined substantially as described.

4. A ditching, dredging, or excavating machine having a boom, a spar pivoted to said boom, a box through which the upper end of said spar passes, a gripping device attached to said box, and mechanism, substantially as described, for operating said gripping device, said parts being combined substantially as and for the purpose set forth.



5. A ditching, dredging, or excavating machine having a pivotal boom whose axis is vertically adjustable for forming ditches or excavations of different depths, substantially as described.

6. A ditching, dredging, or excavating machine having a boom pivoted at its inner end and an inclined guide of circular form, on

386,438.

which said boom is adapted to bear, said parts being combined substantially as and for the purpose set forth.

7. A swinging boom pivoted to a box which is vertically adjusted by means of a screw, substantially as described.

8. In a ditching, dredging, or excavating machine, a swinging boom, in combination with the box 8, the screw 9, collars 10, and the nut 11, said box being freely fitted on said screw and connected therewith by said collars, substantially as described.

9. A ditching, dredging, or excavating machine having a boom pivoted at its inner end and having a roller on its under face and an inclined guide of segmental form, said parts being combined substantially as and for the purpose set forth.

10. In a ditching, dredging, and excavating machine, a boom pivoted to the frame of the machine and having a pulley thereon, a beam pivoted to the boom and having a shovel connected therewith, a pulley secured to the frame of the machine above and out of the vertical line of the pivoted lower end of the boom, a winding-drum, and a chain connected to said shovel and winding-drum and passing around said pulleys of the boom and frame, said parts being combined as described, whereby both a lateral and elevating movement is imparted to said boom.

11. In a ditching, dredging, and excavating machine, a winding-drum having a brake formed of linked sections and an operating device consisting of a lever pivoted at one end to one of the said sections and having a bar pivoted to the other section, the said bar being pivotally connected to said lever, said parts being combined substantially as and for the purpose set forth.

12. A fixed drum and a loose drum, in combination with a friction cone or clutch adapted to engage with said loose drum, in combination with chains or ropes connected with said drums and with opposite portions of the overturning shovel, substantially as described.

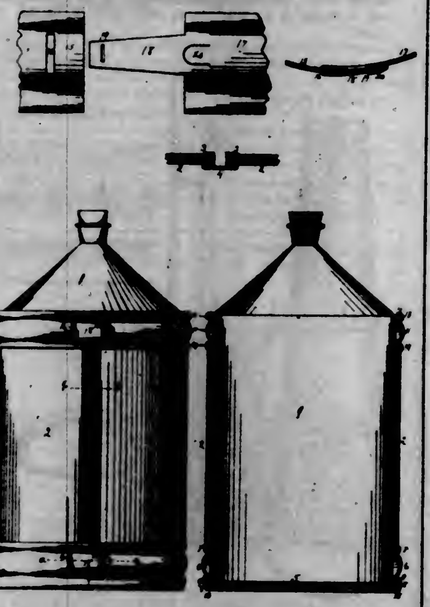
13. In a ditching, dredging, and excavating machine, a rising-and-falling boom pivoted at its lower end, a spar pivoted to said boom, and a guide in which the upper end of said spar has free play, said parts being combined substantially as and for the purpose set forth.

14. In a ditching, dredging, or excavating machine, a clamping or gripping device for the spar, consisting of a frame, a movable plate, a movable rod, and arms and links connected with said rod and plate, whereby the clamp or grip is operated, substantially as described.

15. In a ditching, dredging, and excavating machine, a rising-and-falling boom pivoted at its lower end and having rollers or pulleys thereon, a shovel having its beam pivoted to said boom, operating-chains connected, respectively, to said beam of shovel, a hoisting-drum, and a loose drum on the same shaft, said parts being combined substantially as and for the purpose set forth.

16. The rod 32 and the clamping or gripping device of the spar, in combination with the rock-shaft 36, mounted on the frame of the machine, a lever, 37, connected with said shaft, a toothed quadrant, and a pawl on said lever engaging with said quadrant, substantially as described.

17. In a ditching, dredging, or excavating machine, a rock-shaft and an operating-lever therefor, in combination with a crank connected with said shaft, and a rod connected with said crank and with a brake, the latter embracing a winding-drum, which is loosely mounted on the shaft and rotated by the same through the medium of a friction cone or clutch fixed to said shaft, substantially as described.



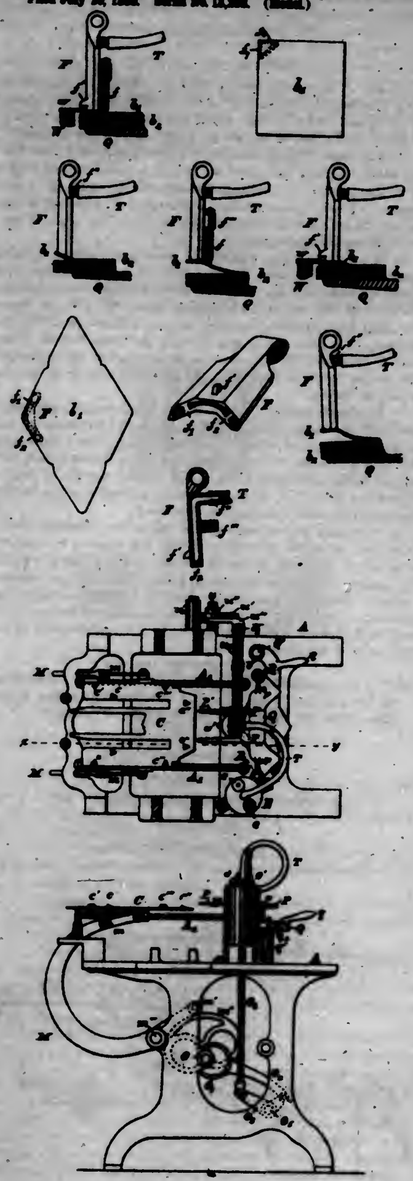
18. In a ditching, dredging, or excavating machine, a winding-drum loose on its shaft, and a clutch rigidly connected therewith, in combination with means for causing the engagement of said drum and clutch, consisting of a wedge, a bar carrying said wedge, a crank connected with said bar, and a rock-shaft carrying said crank, substantially as described.

19. In a ditching, dredging, or excavating machine, a rock-shaft, 45, carrying two cranks, 46 47, projecting in opposite directions, in combination with a brake and clutch mechanism, said brake and mechanism being alternately operated by said cranks, substantially as described.

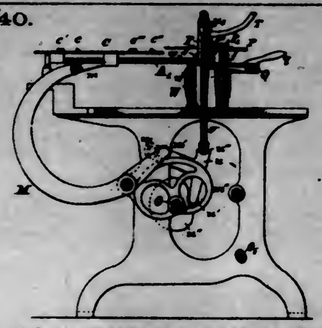
20. A ditching, dredging, or excavating machine having a boom, an adjustable pivotal connection for inner end of said boom, and a guide of segmental form having an inclined upper face, said parts being combined substantially as and for the purpose set forth.

21. A ditching, dredging, or excavating machine having a boom with pivotal connection for inner end, consisting of a box, a vertical screw, collars adjustable on said screw, and beams secured to the frame of the machine and having eyes attached thereto and in which said screw is guided, said parts being combined substantially as and for the purpose set forth.

386,439. JACKETED CAN. FREDERICK J. SOTHMANN, Rockford, Ill., assignor to the Rockford Can Company, same place. Filed Feb. 2, 1888. Serial No. 262,894. (No model.)



Claim.—1. A can having a body and bottom jacket held in place on the can by metallic feet and upper bands, the feet-band being turned under the outer edge of the bottom jacket and provided with a seat along its upper edge to receive the lower end of the body-jacket, and the upper band being bent over the seam edge of the can and having a seat along its lower edge for the upper end of the body-jacket, one of said bands having a detachable connection, substantially as set forth.



2. The herein-described band for holding jackets on a can, consisting, essentially, of a metallic strip provided along its opposite edges with seats for the edges of the jackets, one of the ends being provided with two tongues, one of the tongues being provided with a slot adapted to receive the other tongue and its opposite end provided with a slot adapted to receive the slotted tongue of the opposite end, substantially as set forth.

3. The herein-described band, consisting, essentially, of a strip of metal provided at one end with a projecting tongue and a second tongue at the base of the projecting tongue, the projecting tongue being provided with a slot adapted to receive the second tongue, and the opposite end of the strip being provided with a slot adapted to receive the said projecting tongue, substantially as set forth.

386,440. MACHINERY FOR FINISHING SEAMS OF PAPER. HENRY B. SWEET and B. WINSLOW SWEET, Worcester, Mass., assignors by mesne assignments, to the Whitcomb Envelope Company, same place. Filed July 10, 1888. Serial No. 12,382. (Model.)

386,440.

Claim.—1. In a paper-feeding machine, a lifter-tube from which the air is exhausted and which is moved to and from a pile of sheets, in combination with a presser which bears upon the upper sheet as it is raised off the pile, as and for the purpose shown and described.

2. In a paper-feeding machine, the combination of a lifter-tube from which the air is exhausted and which is moved to and from a pile of sheets, with an automatically-adjusted separator, W, and a presser, *f*, whereby the upper sheet as it is raised from the pile is bent concavely to the sheet beneath it in the vicinity of the place of contact of the separating devices.

3. In a paper-feeding machine, in combination with a suitable support for a pile of blanks, the pneumatic lifter moved to and from the pile of blanks over one corner thereof and adapted to engage and lift or turn up only one corner of the top sheet of the pile, and the reciprocating blank-receiving carriage moving transversely to the line of motion of the lifter and passing between the sheet or blank whose corner is lifted and the next sheet, so as to complete the separation of the former sheet or blank from the pile, substantially as and for the purpose shown.

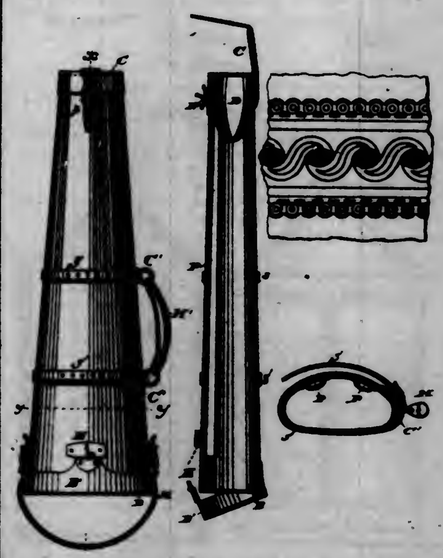
4. In a paper-feeding machine, in combination with a pneumatic lifter to lift one corner of a blank from a pile, the reciprocating carrier for completing the separation of the partially-raised blank, provided with the hooks c^{7} c^{7}, made inclined on their forward sides with reference to the movement of the carrier toward the pile of blanks, and with the stops c^{8} c^{8}, for engaging the blank when on the carrier, substantially as and for the purpose described.

5. In a paper-feeding machine, the pneumatic lifter-tube moved to and from the corner of a pile of blanks and adapted to raise only one corner of the blank on top of the pile, in combination with the reciprocating carriage for conveying a blank from the pile, adapted to move in under the raised corner of the top blank and complete the separation of such blank from the pile, and having the hooks c^{7} c^{7} inclined on their forward sides, and the stops c^{8} c^{8}, substantially as and for the purpose specified.

386,441. APPARATUS FOR ELECTRIC WELDING. ELIHU THOMSON, Lynn, assignor to the Thomson Electric Welding Company, Boston, Mass. Filed July 30, 1887. Serial No. 245,502. (No model.)

Claim.—1. In an electric welding apparatus, a plurality of pairs of clamps arranged for holding a number of pieces to be welded in juxtaposition, substantially as specified.

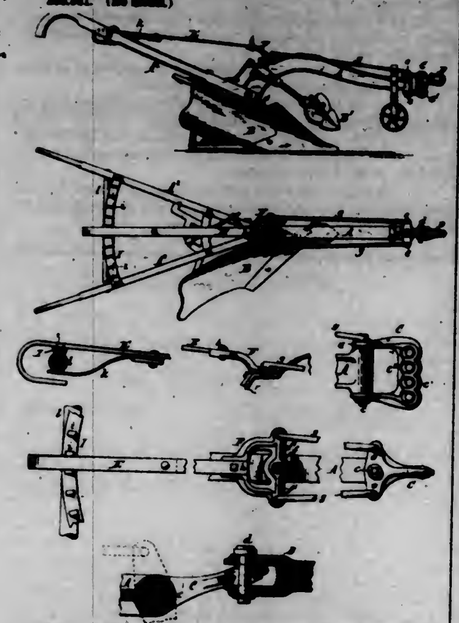
2. In an electric welding apparatus, the combination, with a plurality of pairs of clamps for holding the pieces to be welded in juxtaposition, of means for applying the welding current in succession to each pair of clamps, as desired, substantially as specified.



3. In electric welding apparatus, the combination, with a plurality of pairs of clamps, of a switching arm and lever, whereby the current may be distributed to any pair of clamps, substantially as specified.

4. In electric welding apparatus, the combination, with a pair of clamps, of a plurality of pairs of separate contact-pieces held in electrical contact with the sheets or plates to be welded, and means for passing the welding current between any pair of contact-pieces, as may be desired, substantially as specified.

5. In electric welding apparatus, the combination, with a pair of clamps, of a plurality of separate contact-pieces arranged in pairs and inserted between the pieces to be welded and said clamps, and means for passing an electric current between any pair of contact-pieces and through the pieces to be welded, substantially as specified.



6. In an electric welding apparatus, the combination of a clamp, a plurality of pairs of separate contact-pieces held in electrical contact with the sheets or plates to be welded, means for passing a constant welding current through the sheets or plates to be welded, and means for passing a welding current of slightly higher potential between any pair of said contact-pieces, as may be desired, substantially as specified.

386,442. VIOLIN-CASE. ASA T. VAN WINKLE, Brooklyn, N. Y., assignor of two-thirds to John Mandlebaum and George D. Whittemore, both of Newark, N. J. Filed Apr. 14, 1887. Serial No. 234,883. (No model.)

Claim.—As an improved article of manufacture, a leather violin or viola case, combining therein a body flat at both ends and larger at one end than the other and of a uniform taper from end to end, provided with a receptacle for a violin or viola, two pockets arranged within said receptacle for the bows, a receptacle at the smaller end for resin, strings, &c., a lid at each end to admit of access to said receptacles and pockets, straps S, secured to the outside of said case, handles, as described, arranged at the larger end and at the side, respectively, said parts being arranged with relation to each other and adapted to operate substantially as and for the purpose set forth.

386,443. FLOW. GEORGE WILSON, Dalzell, N. Y., assignor to the Wheel Plow Company, same place. Filed Nov. 22, 1887. Serial No. 255,851. (No model.)

Claim.—1. The combination, with the beam, of the clevis pivoted thereto and provided with lateral arms *c c*, a shifting-lever, E, pivoted to the beam and provided with lateral arms *f' f'*, rods *g*, connecting the arms *c* and *f'*, and a locking device whereby the shifting-lever is held in position, substantially as set forth.

2. The combination, with the beam and the clevis pivoted thereto, and the rods *g*, of the locking-bar I, the shifting-lever E, provided with cross-head F, and having its rear portion bent around the locking-bar, and a spring secured to the shifting-lever and having its free end between the bent end of the shifting-lever and the locking-bar, whereby the deflection of the spring is limited, substantially as set forth.

386,444. LAWN-MOWER FOR TERRACES. WILLIAM L. WOOD, Towanda, Pa. Filed Sept. 30, 1887. Serial No. 251,093. (No model.)

Claim.—1. As an improvement in lawn-mowers, the combination, with the wheel-covering plates, of the arms attached to said plates, the draft-ropes attached to the arms, and the ring or rings slipped upon one of the draft-ropes and retained in position on the other rope by passing the latter through and around the ring, so as to form a loop, as set forth.

2. As an improvement in lawn-mowers, the combination, with the wheel-covering plates, of the arms pivoted to the plates eccentrically to the axis of the wheels, and securing-bolts upon which the arms may be turned to bring the outer ends wholly within the peripheries of the wheels, each of said arms having a greater length than the shortest distance from its pivoting-bolt to the wheel's periphery, but not longer than the greatest distance, the draft-ropes attached to the arms by snap-hooks, and the ring or rings slipped upon one of the draft-ropes and retained in position on the other rope by passing the latter through and around the ring, so as to form a loop, as set forth.

3. As an improvement in lawn-mowers for mowing terraces, the combination, with the wheel-covering plates, of the arms pivoted thereto, the draft-ropes, the snap-hooks attaching said ropes to the arms, and the ring or rings slipped upon one of the ropes and retained in position on the other rope by passing the latter through and around the ring, so as to form a loop, said rings acting as a support for the shank rope when the machine is in use, substantially as shown and described.

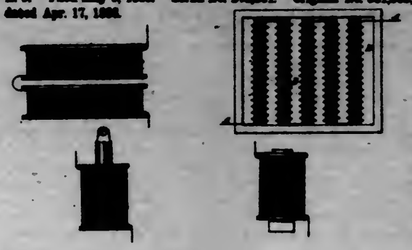
REISSUES.

10,944. ELECTRICAL CONDUCTOR. EDWARD WESTON, Newark, N. J. Filed May 9, 1883. Serial No. 273,362. Original No. 281,204, dated Apr. 17, 1883.

Claim.—1. A metallic electrical conductor the electrical resistance of which diminishes with increase of temperature.

2. An electrical conductor consisting of an alloy of copper or its equivalent, manganese, and nickel.

3. An electrical conductor composed of an alloy of sixty-five to seventy parts copper, twenty-five to thirty parts ferro-manganese, and two and a half to ten parts nickel.



4. An electrical conductor consisting of two metallic portions, the joint electrical resistance of which remains substantially constant under all variations of temperature.

5. A conductor consisting of two metallic portions, one composed of a material the electrical resistance of which increases with an increase in its temperature, and the other composed of a material the electrical resistance of which decreases under similar conditions, as and for the purpose specified.

6. A conductor consisting of two metallic portions, one of which is composed of a material the electrical resistance of which increases with an increase in its temperature, and the other is composed of an alloy of copper or its equivalent, manganese, and nickel, as set forth.

7. A rheostat, resistance, or other electrical instrument of the kind described, the conductors of which consist of two portions, one composed of a metal or an alloy the electrical resistance of which increases with an increase in its temperature, the other of an alloy the resistance of which decreases under similar conditions, as set forth.

10,945. ELECTRICAL CONDUCTOR. EDWARD WESTON, Newark, N. J. Filed May 9, 1888. Serial No. 273,201. Original No. 361,269, dated Apr. 17, 1888.

Claim.—1. An electrical conductor consisting of a material the electrical resistance of which is substantially constant under varying temperatures.

2. An electrical conductor composed of an alloy containing manganese, the electrical resistance of which conductor is substantially constant under varying temperatures.

3. In an electrical apparatus, a conductor composed of an alloy containing manganese and copper or its equivalent.

4. A coil or conductor wound in convolutions composed of an alloy of manganese and copper or its equivalent.

5. A coil or conductor wound in convolutions composed of copper and ferro-manganese, in the proportions of seventy parts of copper and thirty parts of ferro-manganese.

6. A rheostat, resistance, or other electrical instrument of the kind herein described, the coils or conductors of which are composed of an alloy of manganese and copper or its equivalent.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE ATWOOD.

Decided July 12, 1888.

SUSPENSION OF ALLOWED APPLICATIONS—PROCESS AND APPARATUS.

There is no authority for the Office to withhold from issue an application which is allowable and against which neither reference, publication, public use, nor interference can be presented.

PROCESS AND APPARATUS.

The relation between process and apparatus is not that of genus and species, but of independent inventions. If the inventor of an apparatus is subject or tributary to a patent for process, it is due to the patent law, which forbids all persons to use the invention of another for which a valid patent has been issued. The fact that such relation exists is no reason for withholding from issue an allowable application for process till an interference between a companion application for apparatus and other applications for apparatus which show but not claim the process is disposed of.

ON petition.

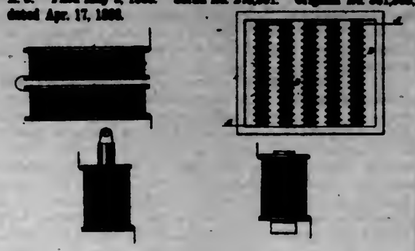
PROCESS FOR RECOVERING SODA FROM THE SPENT SODA LIQUOR OF PAPER-PULP MILLS.

Application of Edward N. Atwood filed December 87, No. 256,853.

Mr. A. L. Hayes and *Mr. F. C. Somes* for the applicant.

L, Commissioner:

Applicant petitions the Commissioner to vacate the on of the examiner in suspending the issue of patupon this application until an interference in h another case of applicant's is involved shall be mined; also, that such interference be suspended the present petition shall be disposed of.



e facts are as follows: Applicant has pending the nt application for a process and a companion cation for the apparatus by which that process be carried out. This application for the process dy for allowance; but the application for the atus must be placed in interference with an apion of another party, and the examiner feels it his duty to hold this process application from until such interference is disposed of. The reason this is stated by the examiner as follows:

opposing party in the interference for the apparatus prove to be the prior inventor, and this application should meantime have been issued, the anomaly would be created prior inventor of the apparatus for carrying out and per-

the process claim in this application would not have any according to the patents issued by the Office, to use his us, the allowance of this application being *prima facie* e that the applicant was the first inventor of the process, refore entitled to dominate all apparatus invented subse-

The examiner also calls attention to the Rules of Practice as they have heretofore existed, citing Rule 51, edition of August, 1878, and Rule 94, edition of April 15, 1883. But the relation between process and apparatus is not that which exists between generic and specific claims for obvious reasons. Every species contains the genus, both being present. A new species may be invented without there being any invention of the genus, which was old and known to the inventor. Hence a patent for the genus must cover and include and therefore dominate the new species, for in so far as the characteristics of the species are those of the genus there is no new invention. The inventor of the new species has borrowed the generic features of the genus to build upon, and as to these the new invention and the old are identical. The patent for the specific is dominated and controlled by the patent for the generic, because the subject of the latter belongs to the latter patentee. In these particulars the inventions are the same. But this is not the case in the matter of process and apparatus. There is no such relationship. They are wholly separate and distinct inventions. If A is the first inventor of a given process, his patent will necessarily dominate and control every apparatus that may be invented to carry it out. But this is a domination which arises from the patent system, and is the same domination and exclusive right which exists inherently in every patent. It is simply the prohibition of the law which forbids all persons from using the subject of an invention for which a valid patent has issued to the original inventor thereof. The inventor of the apparatus may patent the same whether he invents the apparatus pending the application of another person for the process or years after the patent for the process has issued; but in neither case can he use his apparatus except by consent of the patentee of the process. Why? Simply because his invention is of such a character that it is incapable of operation independently of execution of the other person's process, and such process is patented. Bell has a patent for a method of transmitting articulate speech. Hundreds of patents have issued for the mechanical apparatus which may be employed in executing Bell's method; but no one of these patentees can put his patented mechanisms into use except by consent of Bell. In this particular they occupy the same relation as the general public, which is simply that they cannot use Bell's method with or without patents for the apparatus except subject to the domination of a patent previously issued. Why therefore should this application be held up and not go to issue?

10,945. ELECTRICAL CONDUCTOR. EDWARD WEBER, Newark, N. J. Filed May 9, 1888. Serial No. 273,201. Original No. 261,269, dated Apr. 17, 1883.

Claim.—1. An electrical conductor consisting of a material the electrical resistance of which is substantially constant under varying temperatures.

2. An electrical conductor composed of an alloy containing manganese, the electrical resistance of which conductor is substantially constant under varying temperatures.

3. In an electrical apparatus, a conductor composed of an alloy containing manganese and copper or its equivalent.

4. A coil or conductor wound in convolutions composed of an alloy of manganese and copper or its equivalent.

5. A coil or conductor wound in convolutions composed of copper and ferro-manganese, in the proportions of seventy parts of copper and thirty parts of ferro-manganese.

6. A rheostat, resistance, or other electrical instrument of the kind herein described, the coils or conductors of which are composed of an alloy of manganese and copper or its equivalent.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE ATWOOD.

Decided July 12, 1883.

SUSPENSION OF ALLOWED APPLICATIONS—PROCESS AND APPARATUS.

There is no authority for the Office to withhold from issue an application which is allowable and against which neither reference, publication, public use, nor interference can be presented.

PROCESS AND APPARATUS.

The relation between process and apparatus is not that of genus and species, but of independent inventions. If the inventor of an apparatus is subject or tributary to a patent for a process, it is due to the patent law, which forbids all persons to use the invention of another for which a valid patent has been issued. The fact that such relation exists is no reason for withholding from issue an allowable application for process until an interference between a companion application for apparatus and other applications for apparatus which show but not claim the process is disposed of.

ON petition.

PROCESS FOR RECOVERING SODA FROM THE SPENT SODA LIQUOR OF PAPER-PULP MILLS.

Application of Edward N. Atwood filed December 1887, No. 256,853.

Mr. A. L. Hayes and *Mr. F. C. Somes* for the applicant.

MILL, *Commissioner;*

Applicant petitions the Commissioner to vacate the action of the examiner in suspending the issue of patent upon this application until an interference in which another case of applicant's is involved shall be determined; also, that such interference be suspended until the present petition shall be disposed of.

The facts are as follows: Applicant has pending the present application for a process and a companion application for the apparatus by which that process may be carried out. This application for the process is ready for allowance; but the application for the apparatus must be placed in interference with an application of another party, and the examiner feels it to be his duty to hold this process application from issue until such interference is disposed of. The reason for this is stated by the examiner as follows:

> The opposing party in the interference for the apparatus may prove to be the prior inventor, and this application should in the meantime have been issued, the anomaly would be created that the prior inventor of the apparatus for carrying out and performing the process claim in this application would not have any right, according to the patents issued by the Office, to use his own apparatus, the allowance of this application being *prima facie* evidence that the applicant was the first inventor of the process, and therefore entitled to dominate all apparatus invented subse-

The examiner also calls attention to the Rules of Practice as they have heretofore existed, citing Rule 51, edition of August, 1878, and Rule 94, edition of April 15, 1883. But the relation between process and apparatus is not that which exists between generic and specific claims for obvious reasons. Every species contains the genus, both being present. A new species may be invented without there being any invention of the genus, which was old and known to the inventor. Hence a patent for the genus must cover and include and therefore dominate the new species, for in so far as the characteristics of the species are those of the genus there is no new invention. The inventor of the new species has borrowed the generic features of the genus to build upon, and as to these the new invention and the old are identical. The patent for the specific is dominated and controlled by the patent for the generic, because the subject of the latter belongs to the latter patentee. In these particulars the inventions are the same. But this is not the case in the matter of process and apparatus. There is no such relationship. They are wholly separate and distinct inventions. If A is the first inventor of a given process, his patent will necessarily dominate and control every apparatus that may be invented to carry it out. But this is a domination which arises from the patent system, and is the same domination and exclusive right which exists inherently in every patent. It is simply the prohibition of the law which forbids all persons from using the subject of an invention for which a valid patent has issued to the original inventor thereof. The inventor of the apparatus may patent the same whether he invents the apparatus pending the application of another person for the process or years after the patent for the process has issued; but in neither case can he use his apparatus except by consent of the patentee of the process. Why? Simply because his invention is of such a character that it is incapable of operation independently of execution of the other person's process, and such process is patented. Bell has a patent for a method of transmitting articulate speech. Hundreds of patents have issued for the mechanical apparatus which may be employed in executing Bell's method; but no one of these patentees can put his patented mechanisms into use except by consent of Bell. In this particular they occupy the same relation as the general public, which is simply that they cannot use Bell's method with or without patents for the apparatus except subject to the domination of a patent previously issued. Why therefore should this application be held up and not go to issue?

The apparatus application of the other party shows but does not claim the process. The rules forbid an interference between the present process application and that. The applicant in that case does not see proper to file an application for the process, and the presumption is that he is not the inventor of it. It does not follow at all because he shows and claims the same apparatus that he is the inventor of the process. It is of the very essence of a patentable process that it shall exist and be capable of conception and operation independently of the apparatus by which it may be carried out. Not only this, but in the present application I understand there is a cross-reference to the apparatus application, and I infer that there is a similar cross-reference in the latter. If there is not there should be, and it should still be introduced. This gives the other party to the interference notice of the existence of the present application for the process, and if he does not choose to promptly file his application for such process, (if he claims to be the inventor of it,) and thus bring himself into interference with it, he ought not to be allowed by indirection to do what he refuses to do directly—tie up the present application and delay its issuance upon an imaginary or suppositious interference not contemplated and not provided for in the rules.

There is no provision of law or rule of the Office for suspending the issue of a patent on an application which is declared to be allowable. It can be rejected, in which case the applicant must be notified and given the reasons, together with such information and references as may be useful, &c. An interference may be declared, or a public-use inquiry instituted, and the investigation conducted to an end; but where an applicant has properly filed his application and the examiner can neither reject nor find public use nor declare an interference, but acknowledges the application to be allowable, his right to suspend the issue does not exist. In such case the Commissioner himself has no discretion to withhold a patent. I conclude, therefore, that the examiner erred in suspending the allowance of this application, and his action in this respect is reversed.

This decision, as I am advised, obviates the necessity for a further order suspending the interference; but if such shall be held necessary it will be made.

EX PARTE TREAT.

Decided July 12, 1888.

CLAIMS VAGUE AND INDEFINITE.

When several old elements are brought into close propinquity, and joint operation is effected by means but for which there would be only aggregation and not a combination, such means are the essential invention, and on a claim for a combination with the old elements and such means the terms "power-actuated transfer mechanism" and "power-actuating mechanism" are indefinite and vague. Such means are not mere adjunctive devices, but become new elements in the alleged combination, and must be properly and clearly described.

ON petition.

ROLLING-MILLS.

Application of Francis H. Treat filed June 21, 1887, No. 242,081.

Messrs. Whitaker & Prevost for the applicant.

HALL, *Commissioner:*

The examiner has objected to seven claims in this application as being vague and indefinite. It is only necessary to quote one of them, which is as follows:

The combination, with a blooming-mill, a roughing-mill, a three-high finishing-mill, and power-actuated feeding devices for each mill, of a bloom-shear interposed between the blooming-mill and shear, a like mechanism between the shear and roughing-mill, and a power-actuated transfer mechanism between the roughing-mill and the finishing-mill, substantially as described.

Applicant claims a combination between the several "mills"—as the blooming-mill, the roughing-mill, the three-high finishing-mill, &c., which are old and in common use, as he concedes—and connects the mills into a so-called combination by "power-actuated feeding devices" for each mill, or "power-actuated transfer mechanism" between the blooming-mill and shear and a "like mechanism" between the shear and the roughing-mill, &c.

Applicant cites what was said by the Commissioner in *ex parte Herr* (41 O. G., 463) by way of illustration of a similar subject in reference to the four elements of a reaper, where the blade or cutter, the table, the reel, and the binder were mentioned, and insists that in the present combination the "power-actuated transfer mechanism" and the "power-actuating feeding devices" are mere adjunctive devices, and need not therefore be more particularly described. The examiner, however, holding with the concession statement of the applicant that the plants or "mills" are old and in common use, insists that there is a mere aggregation of old elements, and that if there is any invention or possible combination by which these old elements coact or co-operate so as to bring about a new and different result, the invention resides wholly in the "power-actuated feeding devices," the "power-actuated transfer mechanism," &c., and that these features are not mere adjunctive devices, but constitute the essentials of the invention. In this opinion I entirely concur. It will be seen that these power-actuated mechanisms are not mere devices which unite the various mills and by means of which the motion or power of one is communicated to the other, as is done by cranks, pulleys, gearing, &c. They are independent organisms which have their own separate and appropriate functions independently of the mill-plants which they unite or bring into close proximity. They must be described with the particularity required of every new invention. To refer again to the reaper with its four elements: If some one were to introduce a fifth element by means of which he claimed a new combination and a new result, the fifth element could not, in the nature of things, be a mere adjunctive device. If it were, it could not be a new element and would therefore require to be described.

In the present case the power-actuated mechanisms must be more particularly and distinctly described and set forth. When this has been done, the examiner will be able to determine whether there is presented a case of aggregation or combination, and act upon the merits of the application.

The action of the examiner is affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

THE RUBBER AND CELLULOID HARNESS TRIMMING COMPANY *v.* THE INDIA RUBBER COMB COMPANY.

Decided May 22, 1888:

1. ALLEGIGHT—HARNESS-TRIMMINGS.

Reissued Patents Nos. 5,155 and 5,156, each granted to Andrew Albright for improvements in the manufacture of rubber-coated harness-trimmings, declared invalid for want of patentable novelty.

2. COMITY OF COURTS.

Where a patent has been found to be valid by a circuit court at an earlier date upon the same evidence as now exhibited, and since that date the Supreme Court has defined more strictly the line between mere mechanical skill and the exercise of invention, it is no longer the duty of the last circuit court to follow and adopt the adjudication of the former court.

3. PATENTABLE INVENTION—WHAT IS NOT.

The state of the art showing that dies could be used to compress and finish articles of vulcanizable gum, and to compress plastic material surrounding a metal core or skeleton in making articles of harness-trimmings, it required no exercise of invention to use dies to compress and finish similar articles in which a vulcanizable gum was used to envelop a metal core.

Mr. J. C. Clayton for the complainant.

Messrs. Gifford & Brown for the defendant.

WALLACE, *J.:*

The two suits pending between the parties which have been heard together are brought to restrain infringement of reissued Letters Patent granted to Andrew Albright, No. 5,155, dated November 26, 1872, and No. 5,156, dated the same day, for improvement in the manufacture of rubber-coated harness-trimmings. These patents are a reissue in two divisions of the original Letters Patent to Albright, No. 123,603, dated February 13, 1872.

The original patent describes the invention to consist—

in making a pair of dies for pressing, polishing, and trimming the edges of rubber coating of harness-trimmings, so as to imitate stitching, and finish each article without hand-labor.

The dies are described as follows:

The dies are beveled off at *a* and *c*, so as to form sharp edges. These edges cut off the waste on the other side. *c* shows the indentations which produce an imitation of stitches. The dies touch each other at *x y z*, so that they cannot crush the article placed in them.

The method of using the dies is stated to consist in placing the article to be coated in one of the dies and pressing the die down upon it after the dies or the article itself has been moderately heated, so that the pressure will finish the article. The drawings show dies with recesses adapted to form a rib and the indentations *c* located in such recesses.

The claim was as follows:

The construction and operation of the dies A and B with cutting-edges *a* and *c*, substantially as described, for finishing rubber-coated harness-mountings.

Reissue No. 5,155 describes the invention to consist—

in making and using a pair of dies for pressing, finishing, polishing, and trimming the edges of the vulcanized coating of harness-trimmings, such as rings, buckles, terrets, hooks, and like articles.

The dies are described as provided with cutting-edges, for trimming off the superfluous coating, and the drawing is referred to as showing, in the dies, the indentations which produce an imitation of "stitching or other ornamentation." The specification contains this statement of new matter:

The form of the dies will vary with the form of the article to be pressed on them.

The claim is as follows:

The dies A and B, substantially as described.

Reissue No. 5,156 describes the invention to consist of—

an improved process for manufacturing rubber-coated harness-trimmings.

The process as described in this patent includes applying the gum coating to the metal, the vulcanization of the coating, and the compressing and finishing of the coating by the use of the dies described in Reissue No. 5,155.

The claim is as follows:

The herein-described combined process of manufacturing metallic harness-trimmings covered with rubber, gutta-percha, or other known vulcanizable gums.

The defendants insist that the patents are void for want of novelty of the invention claimed, and because the reissues are not for the same invention described in the original patent. These defenses, so far as they relate to Reissue No. 5,155, were considered in a suit determined by the Circuit Court for the District of New Jersey in 1877, in which the proofs respecting the prior state of the art were substantially the same as in the present record, and the patent was sustained.

Ordinarily it would be the duty of this court to follow and adopt the adjudication of another court of co-ordinate jurisdiction in a suit upon the same patent depending on the same evidence; but since the time when the former suit was decided the line of demarkation in patentable novelty between mere mechanical skill and the exercise of invention in the adaptation of old instrumentalities to a new use has been more strictly defined, and stricter rules of interpretation and construction are now applied to the claims of patents by the court of last resort. In the light of more recent decisions of the Supreme Court it seems that the patents must be held to be void for want of novelty.

The evidence respecting the prior state of the art demonstrates that the compressing and finishing of the metal-coated articles by the use of the dies instead of by hand was the new thing, and the only new thing originated by the patentee in the manufacture of harness-trimmings. It was old to cover metal articles with a coating of vulcanized rubber by applying heat and pressure, and old to cover metal articles of harness-trimmings with vulcanized rubber. This appears by the English patent to Poole of 1852, and by the United States patent to Dunham of 1866. Dies formed with recesses of every conceivable shape and having walls to cut off the surplus material were a well-known instrumentality for compressing, densifying, giving form to, and polishing plastic material. Dies having recesses to receive the overflow or waste material and cut to ornament the article pressed had been shown by the English patent of 1841 to Harris, and cut to stamp the article pressed in imitation of leather stitching had been shown in the English patent of 1857 to Green. It was old to use dies in making articles of harness-trimmings, such as rings, when made of vulcanized rubber, by molding the article to

nearly the desired form and compressing it under heat to give it excellent finish. This is shown by another English patent of 1852 to Poole. It was old to use dies to compress and finish other plastic material—such as horn suitably softened—into loops, hooks, and other articles of harness-trimmings, as is shown by the English patent to Deakin of 1842, and to use them in making articles of harness-trimmings in order to compress plastic material upon metal cores, as is shown in the United States patent of 1863 to Welling for a material made of a metal ring enveloped with factitious ivory.

From this exhibit it is obvious that no inventive faculty was involved in the conception that dies could be efficiently employed to mold, compress, and finish vulcanized gums into articles of harness-trimming, or that dies could be constructed with recesses adapted to give such articles any desired form and successfully used. But this patent was the first to use dies for pressing and finishing such articles in which the vulcanized coating was compacted upon metal cores. The novelty consisted in applying the old instrumentality to this new use.

It is to be observed that the original patent described dies having special characteristics. They were not only to have cutting-edges, but they were to be adapted to form a rib upon the article to be coated and impress imitation stitching upon the rib. The drawings show recesses and indentations cut to form such a rib and stitching, and the reference to the letters of the drawing in the claim incorporate this characteristic of the dies into the claim. But in the reissues the form of the dies is no longer essential. They are to be of any varying form desired. As of necessity the form must vary with the form of the article to be made, the interpolation has no significance unless it is intended to enlarge the claim of the reissue, so that dies formed to create a rib, or a rib with imitation stitching, are no longer necessarily the dies of the patent.

It is in evidence that before the introduction of the treatment of dies the articles of rubber-coated harness-trimmings were made by covering the metal core or skeleton with soft rubber by hand, vulcanizing the rubber, and then turning, polishing, and finishing the article by hand; and it is not open to doubt that by using the dies such articles can be finished more quickly and economically, and can possibly be given more perfect finish, than by hand. Nevertheless, after it was known, or should have been known, that such dies could be used to compress and finish articles made of vulcanizable gum, as shown in the patent to Poole; could be used to compress plastic material surrounding a metal core or skeleton in making articles of harness-trimmings, as shown in the patent to Welling, it would seem that nothing more was necessary to suggest the use of them to compress and finish similar articles in which the vulcanizable gum was to envelop a metal core. The dies do the same work whether they are used upon an object wholly composed of vulcanized rubber or upon the vulcanized coating of an iron core. In both instances their pressure is exerted upon a plastic material to give solidity and final shape and finish to the article. It is absurd to suggest that there was anything peculiar in the properties of the material to start a doubt whether it could be compressed by dies about a metal core.

The bill is dismissed.

U. S. Circuit Court—Southern District of New York.

HALSTEAD *v.* MANNING, BOWMAN & COMPANY.

Bill filed December 13, 1887. *Demurrer filed February* 3, 1888.

1. ACT OF MARCH 3, 1887, CONSTRUED.
Under the act of March 3, 1887, a defendant can no longer be sued outside of the district of which he is an inhabitant, unless he consents or waives his right to object, except where the jurisdiction of the circuit court is founded only on the fact that the action is between citizens of different States.

2. PRACTICE—PLEADING.
The facts showing want of jurisdiction appearing upon the face of the bill, and the defendant not appearing generally, but specially to demur, the demurrer must be sustained.

ON demurrer.

Mr. Frederick W. Crocker for the plaintiff.
Messrs. Hanley, Clarke & Smith for the defendant.

WALLACE, *J.*:

The defendant raises, by demurrer to the bill of complaint, the objection that this court has not jurisdiction over the person of the defendant. The bill alleges the infringement by the defendant of Letters Patent of the United States granted to the complainant for a new and useful improvement in stewing kettles or boilers, and also alleges that the defendant is a corporation organized under the laws of the State of Connecticut and doing business in the southern district of New York. Prior to the act of Congress of March 3, 1887, the defendant could have been sued here if "found" within the district; but that act has made a radical change in the former provisions of law respecting the jurisdiction of this court, and a defendant can no longer be sued outside the district of which he is an inhabitant unless he consents or waives his right to object, except where the jurisdiction of the circuit court is founded only on the fact that the action is between citizens of different States. The present action does not fall within that category, and as facts showing want of jurisdiction appear upon the face of the bill, and as the defendant has not appeared generally in the action, but specially in order to raise the objection by demurrer, the demurrer must be sustained.

Proposals for Photolithographing.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 21, 1888.

Sealed proposals will be received at the Office of the Commissioner of Patents until 12 M. of August 8, 1888, for the reproduction by photolithography, or otherwise, of the drawings of the weekly issues of patents, and for the illustrated portion of the OFFICIAL GAZETTE.

Specifications and specimens will be furnished upon application to the Commissioner.

BENTON J. HALL,
Commissioner of Patents.

Order No. 485.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 14, 1888.

The establishment of the following sub-class in Division II, Class 31, Dairy, is hereby directed:

Churns—
Drink-mixers.

BENTON J. HALL,
Commissioner.

Order No. 486.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 16, 1888.

Class 100, Presses, is hereby transferred from Division XII, Aughinbaugh, Examiner, to Division III, Blodgett, Examiner.

BENTON J. HALL,
Commissioner.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and substantiated in the Scientific Library for convenient and ready reference.

Issue of July 24, 1888.

Patents	349	No. 386,445 to No. 386,793, inclusive.

DESIGNS.

18,475.—PHOTOGRAPHIC VIGNETTE.—*James C. Atkins*, Milton, Iowa. Application filed May 2, 1888. Serial No. 272,604. Term of patent 7 years.

18,476.—CHAIR-BACK.—*Lemuel A. Chichester*, Phœnicia, assignor to *Heywood Bros. & Co.*, New York, N. Y. Application filed April 21, 1888. Serial No. 271,469. Term of patent 3½ years.

18,477.—PURSE OR BAG FRAME.—*Henry S. Crane*, Mount Vernon, assignor to *John Menahan & Co.*, New York, N. Y. Application filed May 25, 1888. Serial No. 275,083. Term of patent 7 years.

18,478.—SLEEVE—*Etta L. Jenkins*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed June 15, 1888. Serial No. 277,269. Term of patent 3½ years.

18,479.—SURFACE ORNAMENTATION OF WALLS.—*Frederick Koskul*, Williamsport, Pa. Application filed March 17, 1888. Serial No. 267,573. Term of patent 14 years.

18,480.—BRIDLE-FRONT.—*Francis M. Livingston*, Newark, N. J. Application filed February 10, 1887. Serial No. 227,217. Term of patent 3½ years.

18,481.—PATTERN-CARD.—*Benjamin C. Lockett*, New York, N. Y., assignor to *The York Manufacturing Company*, Saco, Me. Application filed May 25, 1888. Serial No. 275,082. Term of patent 7 years.

18,482.—PEN-HOLDER BARREL.—*George H. Shattuck*, New York, N. Y. Application filed May 3, 1888. Serial No. 272,719. Term of patent 14 years.

18,483.—GIRL'S DRESS.—*Catherine Sheils*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed June 15, 1888. Serial No. 277,272. Term of patent 3½ years.

18,484.—LADY'S WALKING-SKIRT.—*Catherine Swain*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed June 15, 1888. Serial No. 277,270. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,705.—HARVESTING-MACHINES AND PARTS THEREOF.—*Aultman, Miller & Company*, Akron, Ohio. Application filed June 5, 1888. Used since July 1, 1885.

"The representation of an eye and the letter 'B' thereon."

15,706.—INKS.—*Thaddeus Davids Company*, New York, N. Y. Application filed June 5, 1888. Used since June 1, 1888.

"The representation of a lightning-flash and the words 'ELECTRO CHEMICAL.'"

15,707.—CERTAIN NAMED TOILET PREPARATIONS.—*Hall & Ruckel*, New York, N. Y. Application filed June 2, 1888. Used since 1886.

"The words 'BUCKWHEAT BLOSSOM.'"

15,708.—MEDICATED FOODS FOR MEN AND ANIMALS, AND SIRUPS, BALSAMS, AND OINTMENTS.—*Alexander Horlick*, Racine, Wis. Application filed June 8, 1888. Used since April, 1888.

"The word 'FOODT.'"

15,709.—LAUNDRY AND TOILET SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed August 14, 1886. Used since January 15, 1885.

"The words 'WHITE CAP.'"

15,710.—TOILET AND HOUSEHOLD SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed August 16, 1886. Used since September 15, 1883.

"The word 'CRYSTOLA.'"

15,711.—ANNATTO-SEED.—*A. S. Lascelles & Co.*, New York, N. Y. Application filed May 18, 1888. Used since January, 1888.

"The word 'CHURN' and the representation of a vertical-dasher churn."

15,712.—CERTAIN NAMED TOILET PREPARATIONS AND ARTICLES.—*George F. Lewis*, Chicago, Ill. Application filed April 19, 1888. Used since March, 1887.

"The word 'PRIMROSE.'"

15,713.—REMEDY FOR GOUT AND RHEUMATISM.—*Percy Litchfield*, Wandsworth Common, county of Surrey, England. Application filed April 9, 1888. Used since August, 1882.

"The words 'REYNOLDS' GOUT STRENGTH' and the representation of a bottle having a human face, legs, and arms, and carrying in one hand a spear, and trampling on a scaly monster."

15,714.—PREPARATION USED AS AN EMMENAGOGUE.—*Nelson A. Lloyd* and *Curtis G. Lloyd*, Cincinnati, Ohio. Application filed May 19, 1888. Used since November, 1887.

"The word 'LEONTIN.'"

15,715.—GENUINE OR IMITATION DIAMONDS.—*Henry E. Oppenheimer & Co.*, New York, N. Y. Application filed June 9, 1888. Used since January 1, 1888.

"The representation of a diamond in the center of a diamond-shaped figure."

15,716.—BLACK TEAS.—*Ridgway & Co.*, London, England. Application filed April 6, 1888. Used since 1886.

"The autograph signature of 'RIDGWAY & Co.' associated with the words 'HER MAJESTY'S SPECIAL BLEND.'"

15,717.—HOT-AIR FURNACES.—*Russel Wheeler, Son & Co.*, Utica, N. Y. Application filed March 16, 1888. Used since 1884.

"The words 'PALACE QUEEN.'"

15,718.—TONIC MEDICINE COMPOSED OF IRON AND SARSAPARILLA.—*Clara H. Schmidt* and *Walter B. Starbird*, Stockton, Cal. Application filed February 13, 1888. Used since January 1, 1887.

"The word 'UNIVERSAL,' associated with a monogram of letters and character 'S & Co,' with the words 'IRON AND SARSAPARILLA' upon the 'S.'"

15,719.—OYSTER-CRACKERS.—*David F. Stauffer*, York, Pa. Application filed December 19, 1887. Used since June 6, 1888.

"The words 'SADDLE ROCK.'"

15,720.—TABLE, POCKET, AND TOILET CUTLERY, AND SHEARS AND SCISSORS.—*Union Cutlery Company*, Chicago, Ill. Application filed May 19, 1888. Used since January, 1887.

"The word 'UNION.'"

15,721.—RAZOR-STROPS.—*Union Cutlery Company*, Chicago, Ill. Application filed May 26, 1888. Used since April 15, 1888.

"The word 'DIAMOND.'"

15,722.—EDGE, AGRICULTURAL, AND MINING TOOLS AND HAMMERS.—*A. W. Wills & Son*, Birmingham, county of Warwick, England. Application filed May 22, 1888. Used since November 28, 1883.

"The representation of a rectangular cross combined with a circular band, so arranged that the center of the circle coincides with the point of junction of the arms of the cross, associated with the words 'LA CRUX COLORADA.'"

15,723.—EDGE, AGRICULTURAL, AND MINING TOOLS AND HAMMERS.—*A. W. Wills & Son*, Birmingham, county of Warwick, England. Application filed May 22, 1888. Used since March 15, 1853.

"The representation of a human hand, shown as far as the wrist, with the fingers and thumb fully extended and separated from one another."

15,724.—SALVE OR OINTMENT.—*Mirum Sulz-Bacher*, New York, N. Y. Application filed May 31, 1888. Used since May 24, 1888.

"The words 'LITTLE ANGEL.'"

15,725.—METAL-POLISHING PREPARATION.—*Savage Bros.*, Washington, D. C. Application filed June 12, 1888. Used since May 1, 1888.

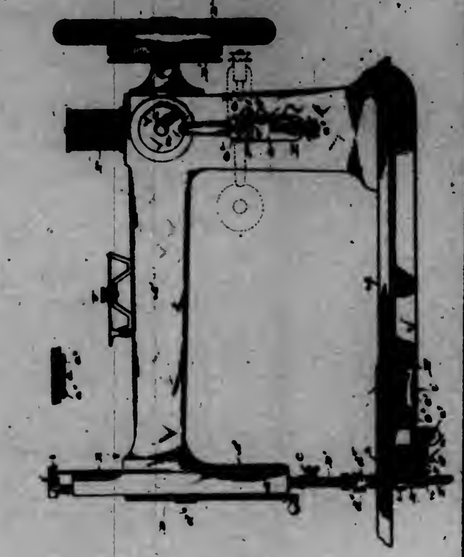
"The letters 'S B' and the Greek word ''Αλφα.'"

LABELS.

5,659.—Title: "LINCOLN'S KING BALM," (FOR A MEDICINE.)—*William H. Haigh*, Woonsocket, R. I. Application filed June 21, 1888.

5,660.—Title: "CRYSTOLA," (FOR SOAP.)—*James S. Kirk & Co.*, Chicago, Ill. Application filed February 15, 1888. (Trade-Mark Registered.)

5,661.—Title: "THE U. S. CHECKER-DIAMOND PROBLEM." (FOR A GAME OR PUZZLE.)—*Lee Nance*, New York, N. Y. Application filed May 11, 1888.



5,662.—Title: "ROGERS' INHALANT AN INHALING PREPARATION."—*M. J. Rogers & Co.*, Lewiston, Me. Application filed June 28, 1888.

5,663.—Title: "DR. R. W. WHITTINGTON'S BLOOD AND LIVER PILLS."—*R. W. Whittington*, Louisville, Ky. Application filed June 26, 1888.

PATENTS

GRANTED JULY 24, 1888.

386,445. SEWING-MACHINE. GEORGE A. ARMEY, Sabrevois's Corners, Ontario, Canada. Filed Apr. 9, 1887. Serial No. 234,233. (No model.)

Claim.—1. The combination, with a stitch-forming mechanism comprising a needle and a rotary shuttle and operating mechanism therefor, of a rotary take-up in the head of the sewing-machine and having a transversely elongated or slotted thread-eye to offset the proper timing of the take-up operation, and suitable thread guides or supports to co-operate with the said take-up.

2. The combination, with the needle-bar and its operating-link *b*, having the take-up extension B, provided with the elongated or slotted eye *r*, extending transversely of the machine, of the thread-guides *s* and *t*, the needle, and the rotary shuttle.

3. In a sewing-machine, the combination, with the bracket-arm of a sewing-machine having one or more openings for access to the interior mechanism, of a pivoted dust-cap to cover the said opening or openings, said dust-cap being provided with a bobbin-winder.

4. The combination, with a rotary sewing-machine shuttle, of main and auxiliary drivers for the said shuttle and means for rotating the said auxiliary driver at a speed different from that of the main driver.

5. The combination, with the shuttle-driving shaft B, the shuttle, and the main driver for the latter carried by the said shaft, of the auxiliary driver *a*, the sleeve by which the latter driver is carried, the inclined cylinder on which the said sleeve is mounted, and connections between the said main driver and the said sleeve.

6. In a sewing-machine, the combination, with the upper and lower shafts thereof, of the pitman-lever split at its upper end, and thus adapted to be sprung over the crank of the upper shaft, and provided with clamping-screws above and below said crank, and a washer between the split below the crank, the said pitman-lever having also a central opening to receive the fulcrum pin or block, adjusting-screws on opposite sides of said pin or block, and lugs in which the said screws are tapped.

7. The combination, with the lower rotary shaft, B, having the tapering cam *f* and the feed-lifting cam f^2, of the feed-bar consisting of the three rigidly-connected parts *f* f^2 f^3, the pivoted feed-rocker H, having arms to which the said feed-bar is hinged, the bar I, engaging the feed-bar, and having a device, as roller *i*, impinging against said tapering cam, the feed-regulating lever pivotally attached to the said bar I, and a retracting-spring for the said feed-bar.

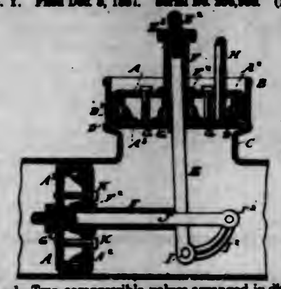
8. The combination, with the shaft B and the feed-lifting cam thereon, of the feed-bar having the arm f^2, provided with the horizontally-adjustable shoe or plate impinging against said cam, whereby the position of the said plate relative to the said cam may be varied as the plate becomes worn, as set forth.

9. The combination, with a rotary sewing-machine shuttle having a central bobbin-supporting pin provided with a friction device, as a split ring, of a sleeve fitting over said pin and having a recess into which said friction device or ring can spring, and a tension device which is hinged to said sleeve and the body of which is outside of the said shuttle, so as to retain the bobbin in the shuttle when the parts are in operative position.

10. A skeleton sewing-machine shuttle consisting of a central bobbin-holding portion or body and a segmental rim separate from, but attached to, said body at two points only and adjustable at one of its points of attachment, with an open space between the said body and the rim.

11. A skeleton sewing-machine shuttle consisting of a bobbin-holding portion or body and a segmental rim separate from, but adjustably attached to, said body.

12. The combination, with the shuttle-body portion M, having the lugs m^3, of the segmental rim *m'* and the adjusting-screws m^5 m^5, having conical portions for expanding or contracting said rim.



13. The combination, with the shuttle-body M, having the tapering lugs m^3, of the rim *m'*, attached to the said body and having the loop-seizing point m^4 and the inclined projections m^6 rearward of said point.

14. The combination, with the rotary shuttle having the central pin, of the hollow bobbin within said shuttle, an eccentric sleeve fitting over said pin and within said bobbin, and a tension device outside the shuttle, hinged to said sleeve and having a thread-slot slightly below the upper edge of the outer flange of the said bobbin.

15. The combination, with the shuttle, of the tension device consisting of the body portion *d'*, having the slot d^3, the thread-groove d^4, and the pin d^5, and the rib or projection 4, and the tension-spring d^7 and its regulating-screw d^8.

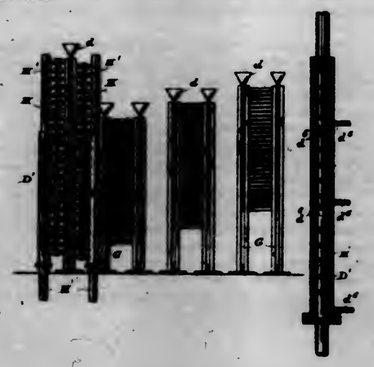
16. The combination, with the bracket-arm A', having at its forward end the depending portion A^2, provided with the groove a^3, of the shaft B, having at its forward end a crank-disk and crank-pin, the needle-bar C, having the collar c^7, provided with a pin, c^8, extending into said groove, and the link *b*, connecting the said pin with the said crank-pin, whereby as the needle-bar is reciprocated vertically the walls of the said groove will take the side-thrust on the said pin c^8, and thus steady the said needle-bar.

386,446. APPARATUS FOR DETECTING LEAKS IN SOIL AND OTHER PIPES. DANIEL A. B. BARLEY and NORMAN MCKELLIVANT, Potsdam, N. Y. Filed Dec. 5, 1887. Serial No. 256,902. (No model.)

Claim.—1. Two compressible valves arranged in different places, an independent stem for each of said valves, and a connection between said stems, combined with a valve-controlled filling-tube passing through one of said valves, a sleeve on the valve-stem above one of the valves, and an adjusting-nut on said stem above and bearing on said sleeve, substantially as described.

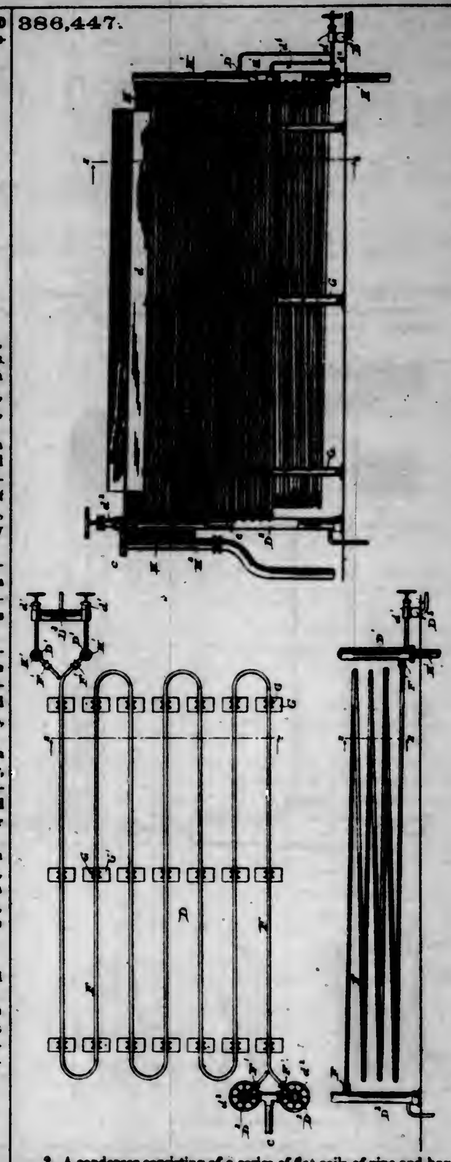
2. In a device for the purpose described, the combination, with two independent valve-stems arranged at an angle to each other and pivotally connected together at their adjacent ends, and two independent compressible valves, one on each stem, of a filling-tube in one of said valves, a sleeve on one of said stems bearing on one of said valves, and an adjusting-nut on said stem bearing on the sleeve, substantially as and for the purpose specified.

3. In a device for detecting leaks in mains, two separate compressible valves and a separate stem for each valve, combined with a pivoted connection between said stems, and a sleeve on said stem between the nut and valve, and a compression-nut on one of said stems and resting on said sleeve, as set forth.



4. In a device for detecting leaks in mains, two valve-stems arranged substantially at right angles to each other, a compressible valve carried by each of said stems, and a filling-tube, combined with an adjusting-nut on one of said stems, a projection between the valve and nut, and a pivoted connection between the free ends of said stems, substantially as and for the purpose specified

5. In a device for detecting leaks in mains, the combination, with two valve-stems arranged at substantially right angles with each other, and two valves, one carried by each of said stems, of a pivotal connection between the adjacent ends of said stems, a sleeve on one of said stems, and an adjusting-nut on said stem above said sleeve, as and for the purpose set forth.



6. In a device for detecting leaks in mains, the combination, with two valve-stems arranged at substantially right angles with each other, and two valves, one carried by each of said stems, of a filling-tube, a pivoted connection between the adjacent ends of each of said stems, a sleeve on one of said stems, and an adjusting-nut on said stem above said sleeve, as and for the purpose set forth.

386,447. CONDENSER. VICTOR H. BECKER, Chicago, Ill. Filed Jan. 20, 1887. Serial No. 225,040. (No model.)

Claim.—1. A condenser tube or pipe forming a flat coil, the ends of which are bent at angles to the adjacent portion of the tube, but lie substantially in the plane of the coil, and provided at such diverging ends with unions or couplings, substantially as shown, and hereinbefore set forth.

386,447.

2. A condenser consisting of a series of flat coils of pipe and having duplicate headers or manifolds at each end, the ends of the pipe being bent at angles to the adjacent portions of the tube, but lying in the plane of the coils, and provided with couplings or unions, by which they are connected to the headers, each alternate pipe or coil being connected to the opposite header, substantially as and for the purpose hereinbefore set forth.

3. The combination of duplicate inlet-headers connected to a common supply-pipe and provided with independent valves and duplicate outlet-headers connected to a common exit-pipe, and also provided with independent valves, with a series of parallel coils of pipe having diverging ends, which connect alternately to one of each pair of headers, thus forming two distinct systems in a condenser, either of which may be shut off without disturbing the other, substantially as set forth.

4. The combination of a series of parallel and substantially flat coils of pipe lying in close proximity and having alternately-diverging ends to provide space for the unions, by which they are connected to the duplicate headers, as shown, with supports or standards at suitable intervals, consisting of bars which embrace the sides of the series of pipes and are united by bolts which pass between the pipes, substantially as hereinbefore set forth.

5. A condenser constructed of coils of pipe alternately united to duplicate headers at each end, as described and shown, and drip-troughs suspended above the several straight portions of the coils, in combination with a series of pipes for cold gas, arranged above the latter portions of the coils and below the last water-trough, said pipes for cold gas being alternately connected at one end to duplicate induction-pipes leading through the outlet-headers of the condensers and at the other end to a single eduction-pipe, substantially as and for the purpose hereinbefore set forth.

6. The combination of the liquid-refrigerant reservoir B, the expansion-coils *a*, the pump C, the condenser D, constructed as shown, the induction-pipe H' from the expansion-coils passing through the eduction-header of the condenser and connected to a series of cooling-pipes, H, above the latter end of the condenser-coils, and then connected to the pipe H², leading to the pump, the ejection-pipe *c* from the pump leading through the condenser to the liquid-refrigerant reservoir, and the drip-trough *d* above the cooling-pipes H, all substantially as and for the purpose set forth.

7. The combination of a series of coils connected at their ends to common inlet and outlet headers, the drip-water troughs suspended above the coils, the partitions which divide the outlet-headers into several compartments, and the fluid-pipes which connect the several compartments with the fluid receiver or trap, substantially as and for the purpose set forth.

386,448. FOUNTAIN-PEN. JOHN BLAIR, New York, N. Y. Filed Jan. 16, 1888. Serial No. 260,897. (No model.)

Claim.—1. The combination of ink-retainer *c* with nozzle *b*, and with the feed-bar *f* and key *g*, substantially as specified.

2. The combination of hollow handle *a*, nozzle *b*, and ink-retainer *c* with the feed-tongue *f* and curved key *g*, substantially as specified.

3. The combination of fountain-pen *a*, having cap A, with the angular collar *i*, substantially as specified.

386,449. CAMERA-SHUTTER. EDWARD H. BLISS and JAMES P. MIDDLETON, Newark, N. J. Filed June 28, 1887. Serial No. 242,787. (No model.)

Claim.—1. A photographic-camera shutter consisting of two rotary disks having a common axis and provided with corresponding openings, one disk being fixed to the axis and the other being adjustable thereon.

2. A photographic-camera shutter consisting of two disks having a common axis and provided with openings or slots of the same dimensions and shape, one disk being fixed to the axis and the other being adjustable thereon.

3. A photographic-camera shutter consisting of two disks, one of which is rigidly mounted on the shaft and the other loosely mounted thereon, the said disks being provided with openings which may be adjusted to register with each other, in combination with mechanism, substantially as described, for adjusting the said disks and devices for locking them together as one piece.

4. A photographic-camera shutter consisting of two disks, one of which is rigidly mounted on a shaft and the other loosely mounted thereon, the said disks being provided with openings which may be adjusted to register with each other, in combination with mechanism, substantially as described, for adjusting the said disks to make the length of exposure required.

5. A camera-shutter consisting of a pair of disks having a common axis, one of the said disks being rigidly secured to the shaft and the other disk loosely mounted thereon, the rigid disk having a series of perforations and the loose disk a single perforation, in combination with a loose sleeve mounted on the shaft, provided with a pin or stud which is adapted to pass the perforation in the disks and lock them together as one piece, as set forth.

6. The combination of a pair of disks provided with holes with a shaft, loose sleeve, spring, and a set-nut, all arranged as described.

386,450. FOLDING TABLE. JOHN T. BIX, Syracuse, N. Y. Filed Mar. 27, 1888. Serial No. 268,651. (No model.)

Claim.—1. In a folding table, the combination, with the top provided with the apertured bracket upon its under side, and with the two sets of hinged legs formed near their upper ends with transverse recesses or sockets, and rotating rods journaled in said recesses or sockets, of braces rigidly secured at their outer ends to the said rods and formed at their opposite ends with longitudinal closed slots which register with the aperture of the bracket, a threaded bolt inserted through the slots of the braces and the aperture of the bracket, and a tightening-nut, all arranged to operate in the manner set forth.

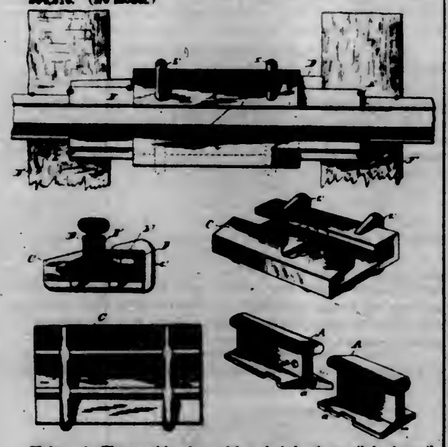
2. In a folding table, the combination, with the top having the cross-pieces secured to its under side near its ends, legs hinged to the inner sides of these cross-pieces and provided near their upper ends with boards, the upper portions of which project above the ends of said legs and contact with the under side of the top of the table and with the outer sides of the cross-pieces, of rotating rods journaled in said legs, and braces rigidly secured to said rods at their outer ends and adjustably secured at their inner ends to the under side of the table-top, substantially as set forth.

386,451. FILING-RECEPTACLE. AARON L. BROWN, Chicago, Ill. Filed Nov. 12, 1888. Serial No. 219,269. (No model.)

Claim.—1. The combination, with a filing-receptacle, a series of index-sheets, and a rod or post engaged with the index-sheets, of means for securing the rod in the receptacle, consisting of a single metal plate forming both a bearing or support for the lower end of the rod and a spring-catch to engage the upper end of the said rod, substantially as described.

2. The combination, with a filing-receptacle, a series of index-sheets, and a rod or post engaged with the index-sheets, of means of securing the rod in the receptacle, consisting of a metal plate provided at its lower end with projecting parts c^2 c^3 c^4, constructed to form a support for the lower end of the rod, and having its upper end bent to form a spring-catch, c', substantially as described.

3. The combination, with a filing-receptacle, a series of index-sheets, and a rod or post engaged with the index-sheets, of holding devices for the post, consisting of a metal plate having projections at its lower end, forming a support for the lower end of the rod, and having at its upper end a rearwardly-bent part, C^3, provided with a slot, c^4, and a spring-catch, c', forming a continuation of the part C^3, substantially as described.



4. The combination, with a filing-receptacle provided with a groove or recess, A^5, in its back wall, a series of index-sheets, and a holding rod or post adapted for insertion in the said groove or recess, of holding devices for the rod, consisting of a plate provided with a vertical slot, C^3, and the projections c^2 c^3 c^4 at its lower end, forming a support for the lower end of the rod, and having at its upper end a spring-catch, c', formed of metal composing the plate, substantially as described.

5. The combination, with a filing-receptacle and a series of index-sheets and a post or rod provided with a projection, c, at its upper end, of a holding device for the said post or rod, consisting of a plate, C, having projections at its lower end, forming a support for the lower end of the rod, and having a spring-catch, c', formed of the metal composing the plate at the upper end of the latter, said spring-catch being provided with an aperture, c^4, adapted to receive the projection c, substantially as described.

6. The combination, with a filing-receptacle, a series of index-sheets, and a link-shaped rod split at one point for engagement with the sheets, of a holding device for the rod, consisting of a plate, C, secured to the receptacle and having projections at its lower end, forming a support for the lower end of the rod, and provided at its upper end with a spring-catch formed of the metal composing the said plate, substantially as described.

7. The combination, with a filing-receptacle, a series of index-sheets, and a rod or post, of a holding device for the post, consisting of means for engaging the lower end of the rod and a spring-catch constructed to engage the upper end of the rod, and a ledge, D, extending continuously along the rear upper edge of the receptacle over the said spring-catch, substantially as described.

886,452. RAIL-JOINT. PERRY BROWN, Louisville, Ky., assignor to Daniel R. Doherty, same place. Filed Feb. 16, 1888. Serial No. 264,316. (No model.)

Claim.—1. The combination, with a chair having a rib in the rail-seat extending across the seat, of a rail provided with a recess in its foot to receive said rib, substantially as described.

2. In a rail-joint, the combination, with the diagonally-cut rails A A, having recesses in their bottoms, of a chair, C, having a central ridge entering the recesses in both rails, substantially as described.

3. In a rail-joint, the combination, with a chair, C, and a fish-plate, B, having a recess embracing the chair at each end, of two rails fitting in the chair, a second fish-plate set on the opposite side of the rails, and a wedge for securely locking the rails and fish-plates together, substantially as described.

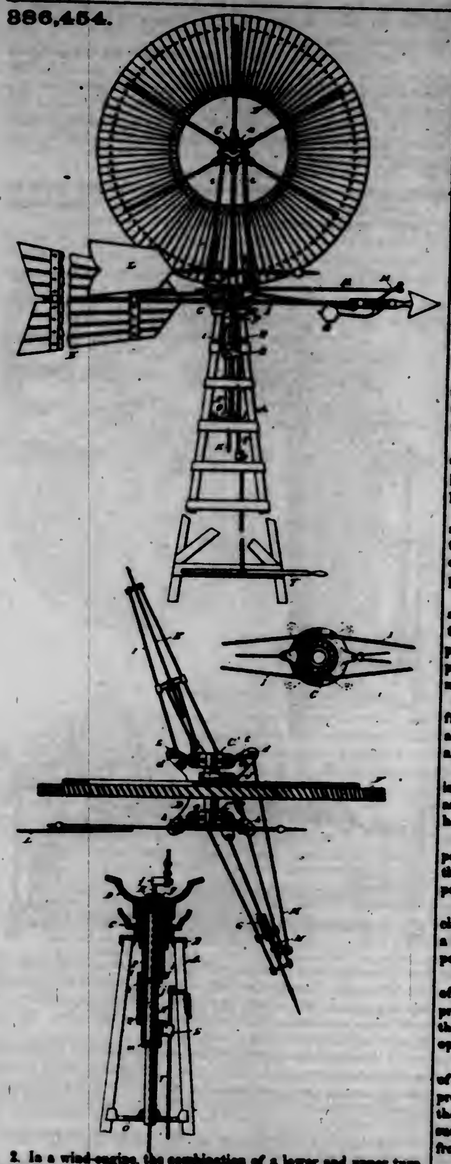
4. In a rail-joint, the combination, with a chair, C, and a fish-plate, B, one having a recess receiving a portion of the other and the fish-plate projections on its rail-side, of two rails having recesses, one part of which receives the projections on the fish-plate B and a second fish-plate, B', having projections to fit into other recesses on the rails, and a wedge for securely locking the whole together, substantially as described.

5. In a rail-joint, the combination of a chair having the inner top and bottom surfaces of one side parallel, with a fish-plate fitting the opposite side of the chair, rails fitting against said fish-plate, and a second fish-plate fitting against the rails, having a portion of its top and bottom parallel, and a wedge for locking the whole together, substantially as described.

6. In a rail-joint, and in combination with the ties and rails, fish-plates fastened to said rails and provided with notches in the parts at right angles to the length of the rails to receive the spikes for fastening them to the ties, substantially as described.

886,453. COIN ASSORTER AND DELIVERER. THOMAS CARNEY, Chicago, Ill., assignor to himself and Hiram Benninger, same place. Filed May 4, 1887. Serial No. 237,145. (No model.)

Claim.—1. In a coin-sorter, a number of coin-receptacles with openings g', for the delivery of the coins from the bottoms of the receptacles, in combination with a number of slides, as K i j' k l m', one for each receptacle, and hinged arms P, one for each slide, substantially as and for the purposes specified.



2. In a coin-sorter, a number of coin-receptacles, a slide for each receptacle, each slide being provided with a projection, p', at its rear end, and pivoted operating-arms P, one for each slide, and having handles n', in combination with a sliding bar, R, provided with hooks o', adapted to engage with a projection, p', in the slide, substantially as and for the purposes specified.

3. A coin-sorter having a number of coin-receptacles and channels leading thereto, and a rearwardly-inclined way curved around at its lower end for conveying the coins to said channels, all arranged and operating to sort the coins in the order of their values, substantially as described.

886,454. WIND-ENGINE. ARTHUR S. CLARK, Saline, Mich. Filed June 7, 1887. Serial No. 240,548. (No model.)

Claim.—1. In a wind-engine, the combination of a main wheel mounted on a revolving support forming an upper turn-table, a main vane secured to a revolving support forming a lower turn-table, an inner tube attached to the upper turn-table and forming its pivot of rotation, an outer tube of shorter length than the inner tube attached to the lower turn-table and forming its pivot of rotation, a sliding cam-sleeve on the inner tube, and two lugs or rollers secured to the outer and inner tubes, respectively, whereby the relative position of the tubes is changed by lifting the cam-sleeve, all substantially as described.

886,454.

2. In a wind-engine, the combination of a lower and upper turn-table forming independent supports for the main vane and wind-wheel and having different frictional resistance when rotated, an outer and inner tube respectively attached to said lower and upper turn-tables and forming the pivots of rotation thereof, two lugs or rollers secured to the outer and inner tubes, respectively, a cam-sleeve slidingly secured upon the inner tube and provided with a wedge-shaped cam having one face straight and the other spirally inclined, and a lifting device for the cam-sleeve, all arranged to operate substantially as described.

3. In a wind-engine, the combination, with the lower turn-table, C, carrying the main vane, of the upper turn-table, D, carrying the side vane and consisting of the bed-plate d, resting on anti-friction rollers or balls, arms d', formed integral with the upper turn-table, uprights e, boxes b, and shaft a, clamped therein and supporting the wind-wheel, said uprights connecting said boxes and arms and supporting the shaft a, all substantially as described.

886,455. PEN-HOLDER. WILLIAM G. GILLAM, Orange, N. J. Filed Sept. 7, 1886. Serial No. 212,933. (No model.)

Claim.—1. As a new article of manufacture, a paper-weight or equivalent structure provided with a pen-extracting device and an interior compartment beneath the same for the reception of discarded pens.

2. As a new article of manufacture, a paper-weight or equivalent structure provided with a pen-extracting device, an interior compartment for the reception of the discarded pens, and an interior compartment for holding the unused pens, as and for the purpose described.

3. As a new article of manufacture, a paper-weight or equivalent structure provided with a pen-extracting device and an interior compartment adapted to receive the discarded pens as they fall from the pen-extracting device, as and for the purpose described.

4. In a paper-weight or equivalent structure, the combination of a pen-extracting device, and an interior compartment located beneath the same and provided with an opening adapted to receive the discarded pens as they fall from the pen-extracting device, as and for the purpose described.

5. In a paper-weight or equivalent structure, the combination of a pen-extracting device, and an interior compartment located beneath the same and provided with an elongated opening in proximity to the pen-extracting device, whereby the pen and pen-holder may be readily presented to such device and the discarded pens fall into the compartment, as and for the purpose described.

6. A paper-weight provided with clamping-jaws to extract pens from their holders, and an interior compartment beneath the same, adapted to receive the pens as they fall from the clamping-jaws, as and for the purpose described.

7. A paper-weight or equivalent structure provided with clamping-jaws, an interior compartment beneath the same to receive the pens as they fall from the clamping-jaws, and an interior compartment to hold the unused pens, as and for the purpose described.

8. A paper-weight provided with clamping-jaws for extracting pens from their holders, one of the jaws being extended laterally over the bearings to furnish a hand-hold or finger-knob, as and for the purpose described.

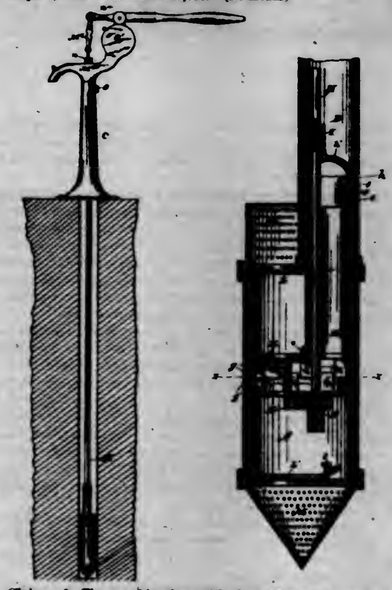
9. As a new article of manufacture, a paper-weight provided with clamping-jaws mounted thereon, the moving jaw being provided with a hand-hold or finger-lever with an upturned end, as and for the purpose described.

10. In a paper-weight or equivalent structure, the combination of a pen-extracting device, an interior compartment beneath the same, provided with an opening adapted to receive pens as they fall from the extractor, and a shelf located in said compartment and beneath the opening of the same, as and for the purpose described.

11. In a paper-weight or equivalent structure, the combination of a pen-extracting device, an interior compartment beneath the same, provided with an opening adapted to receive pens as they fall from the extractor, and a spring-supported shelf located within or below such opening and adapted to be pressed down by a cam projection from the extractor, as and for the purpose described.

12. A paper-weight or equivalent structure provided with a pen-extracting device, an interior compartment provided with an opening contiguous to such pen-extractor, and a second compartment provided with an opening on the opposite face of the structure, as and for the purpose described.

13. A pen-extractor mounted upon a paper-weight or equivalent structure, consisting of a fixed and a movable jaw, the latter being arranged to move out of the path of the falling pen, whereby the discarded pens may fall into the compartment below, as and for the purpose described.



14. The combination, with a pen-extractor, of a box provided with three compartments, B, C, and M, the compartments B and C having swinging or movable lids, the bearings or hold devices of which are located in the compartment C, as and for the purpose described.

15. The combination, with a pen-extractor, of a box provided with three compartments, one of said compartments having a swing-

ing lid, the bearing of which is located in an adjacent compartment, as and for the purpose described.

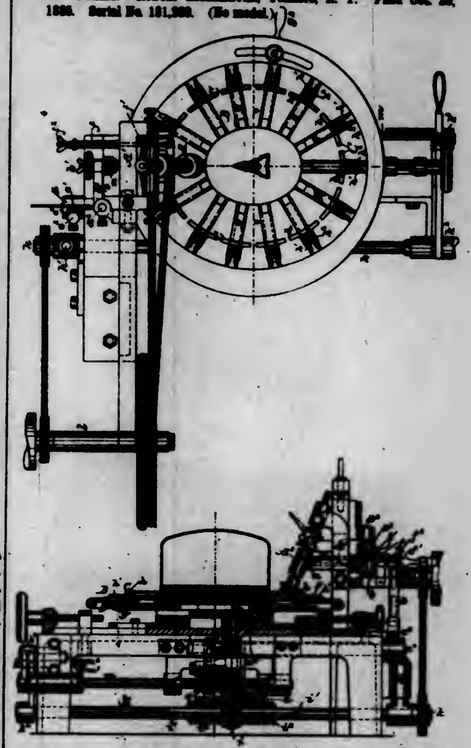
16. As a new article of manufacture, a paper-weight or equivalent structure provided with an interior compartment, and a pen-extracting device consisting of a fixed and movable jaw, substantially as specified.

386,456. WELL-PUMP. OTIS R. DAVISSON, Huntsville, Texas, assignor of two-thirds to C. A. Black and W. W. Martin, same place. Filed Sept. 7, 1887. Serial No. 249,096. (No model.)

Claim.—1. The combination, with the cylinder of a pump, of a piston working therein having suitable packing-rings thereon, with a piston-rod for tightening said packing-rings connected thereto at a point to one side of its center, whereby the piston will be prevented from turning while the packing is being tightened, substantially as described.

2. The combination, with a pump-cylinder and a piston working therein composed of top and bottom sections, with intermediate packing-rings, of a piston-rod screwing into the lower section at a point to one side of its center and provided with a stop abutting against the upper section for preventing its passage therethrough, whereby when the rod is turned the piston will be held stationary and the two sections be brought together and the intermediate packing tightened, substantially as described.

3. The combination, with the pump-cylinder and the hollow piston having the short section of pipe through which the water passes connected thereto and extending into the passage leading from the top of the cylinder, of packing-rings on said piston and at the top of said short section of pipe, and a rod passing through said pipe and piston for tightening both packings simultaneously, substantially as described.



4. The combination, with the pump-cylinder having the up-passage for the water connected to its top at a point to one side of the center and the hollow piston having the short section of pipe through which the water passes connected thereto at a point corresponding to said up-passage, of packing-rings on said piston and a rod passing through said pipe and into the piston for tightening the said packing, substantially as described.

5. The combination, with the pump-cylinder, the valved hollow piston having packing-rings thereon, and the short pipe through which the water passes on its upward passage, with packing-rings thereon and a cap for holding them in position, of a rod abutting against said cap and screwing into the piston, whereby the said packing may be adjusted to take up wear, substantially as described.

6. The combination, with the pump-cylinder, the valved hollow piston having packing-rings thereon and the short pipe through which the water passes on its upward passage connected thereto at a point to one side of its center, substantially crescent-shaped valve-openings partially surrounding said pipe, and packing-rings on said pipe held in place by a suitable cap, of a rod abutting against said cap and screwing into the piston, whereby the said packings may be adjusted to take up wear, substantially as described.

7. The combination, with the pump-cylinder, the hollow valved piston therein composed of two sections, the lower one having the downwardly-projecting lug thereon, with packing-rings between said sections, of a rod abutting against the upper section and screwing into the lug on the lower section for adjusting the said packings, and a valve in said piston, provided with the arm surrounding said lug, substantially as described.

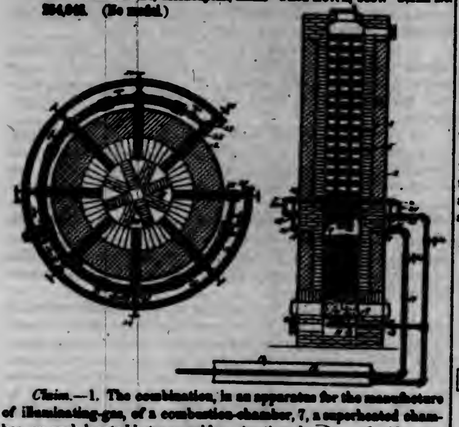
386,457. MACHINE FOR PLANING THE FOLDED EDGES OF HAT-BRIMS. RUDOLF ROSENSTAB, Yonkers, N. Y. Filed Oct. 29, 1888. Serial No. 151,269. (No model.)

Claim.—1. In a hat-brim-planing machine, the combination, substantially as hereinbefore described, of a rotary hat-bed, a brim-clamping ring thereon, and a rotary planing-tool mounted in a swinging pivoted frame and automatically vibrated in a vertical plane, and also toward and from the center of said bed.

2. In a hat-brim-planing machine, the combination, substantially as hereinbefore described, of the rotary hat-bed, the rotary planing-tool mounted in a movable frame, the rock-shaft, its cam and its spring, the sliding rod in contact with said planing-tool frame, and the series of levers and arms between said cam and sliding rod, whereby the latter is moved longitudinally, varying the position of the planing-tool toward and from the center of the hat-bed.

3. In a hat-brim-planing machine, the combination, with the planing-tool, its movable frame, and sliding rod, of a vibrating lever provided with an adjustable piece abutting against said rod, and a clamp-screw, substantially as described, whereby said frame may or may not be moved by said lever during its vibrations, as set forth.

4. In a hat-brim-planing machine, the combination of the planing-tool and its movable frame, a rock-shaft provided with an arm, and a complex lever and a sliding rod interposed between said arm and planing-tool frame for enabling said rock-shaft to move said frame, and the adjustable shoe interposed between said arm and lever, substantially as described, whereby, notwithstanding the uniform movements of the rock-shaft, the planing-tool and its frame may be variably moved to and fro.



5. In a hat-brim-planing machine, the combination of a hat-bed mounted upon an oval shaft, a planing-tool mounted in a movable frame, and a cam detachably coupled to said planing-tool frame for moving said tool toward and from the center of the hat-bed, substantially as described, whereby a hat-brim may be presented to the planing-tool in a true oval line or in various other lines merging with an oval line.

6. In a hat-brim-planing machine, the combination, with a hat-bed and a series of radially-movable sliding blocks, of a brim-clamping ring composed of sections, each of which has a slotted tail-piece, and is attached to a sliding block by means of a single screw which serves as a pivot and a clamping device, substantially as described.

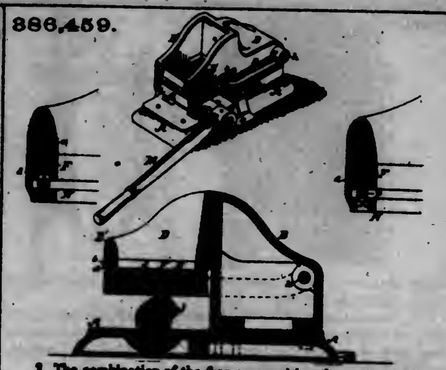
7. In a hat-brim-planing machine, the combination of the rotary planer, the rotating hat-bed, and the step-motion mechanism, substantially as described.

8. In a hat-brim-planing machine, the combination of the rapidly-driven rotary planing-tool, the slowly-rotating hat-bed, and a hat-bed step-motion containing a rotary controlling-cam which revolves but once during two revolutions of said bed, substantially as described.

386,458. APPARATUS FOR THE MANUFACTURE OF GAS. VINCENT L. RAGER, Minneapolis, Minn. Filed Nov. 2, 1887. Serial No. 254,063. (No model.)

Claim.—1. The combination, in an apparatus for the manufacture of illuminating-gas, of a combustion-chamber, 7, a superheated chamber, an arch located between said combustion-chamber and said superheater-chamber and provided with a series of legs forming separate passages leading from said combustion-chamber into said superheater-chamber, and a series of oil-pipes opening through the outer wall of the cupola into said separate passages between the combustion-chamber and the superheater, substantially as described.

2. The combination, in an apparatus for the manufacture of illuminating-gas, of a combustion-chamber, 7, a superheater-chamber, a series of passages connecting said combustion-chamber with said superheater-chamber, and a series of oil-pipes opening through the outer wall of the cupola into said passages, with a series of steam-pipes extending through said oil-pipes, substantially as described, whereby a vaporized crude oil or liquid hydrocarbon may be thrown into the passages and mingled with the gases after they leave the combustion-chamber and before they reach the superheater, for the purpose set forth.

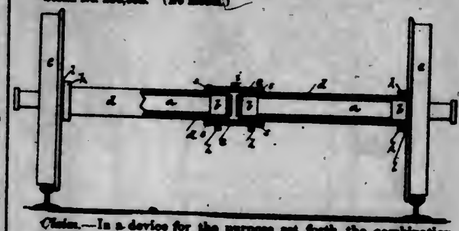


3. The combination, with the cupola 2, having the combustion-chamber 7, the superheater-chamber arranged above said combustion-chamber, and an arch located between said chambers, of an oil-pipe, 17, extending around said cupola and provided with a series of branch pipes, 25, opening through the wall of the cupola into the passages formed by the legs of said arch between said combustion-chamber and said superheater, substantially as described, and for the purpose set forth.

4. The combination, with the cupola 2, having the combustion-chamber 7, the superheater-chamber arranged above said combustion-chamber, and an arch located between said chambers, of an oil-pipe, 17, extending around said cupola and provided with a series of branch pipes, 25, opening through the wall of the cupola into the passages formed by the legs of said arch between said combustion-chamber and said superheater, and the series of steam-pipes 27, extending through said oil-pipes 25, all substantially as described.

386,459. CUTTING-FRAME. WILLIAM G. HUTCHISON, Philadelphia, Pa. Filed May 18, 1888. Serial No. 125,202. (No model.)

Claim.—1. The combination of the frame comprising the projecting base and rear standard having an overhanging portion with opening through the same, a knife secured to the under side of said overhanging portion around the opening in the same, a supporting-bed movable beneath said overhanging portion, and an operating device for said bed having its bearing on the base, all substantially as specified.



386,459.

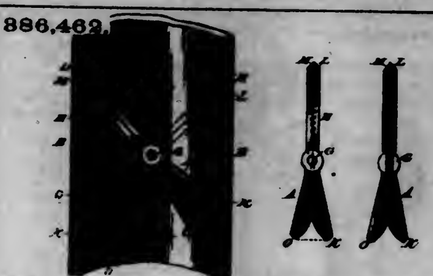
2. The combination of the frame comprising the projecting base, rear standard, and elevated and overhanging front portion with knife on the under side, the supporting-bed located beneath said overhanging front portion of the frame and carried by arms pivoted to said rear standard, and an operating device for the bed having its bearing on the base below said bed, all substantially as specified.

3. The combination of the frame comprising the projecting base, rear standard, and elevated and overhanging front frame, the knife, the supporting-bed having arms pivoted to the frame, and a shaft adapted to bearings on the base and having an operating-handle and a cam for acting on the supporting-bed, all substantially as specified.

386,460. CAR-AXLE. SAMUEL CRESSON, Pittsburg, Pa., assignor of one-half to Samuel Wainwright, same place. Filed Dec. 3, 1887. Serial No. 256,502. (No model.)

Claim.—In a device for the purpose set forth, the combination consisting of the divided axle *c*, having formed in each of its inner ends a groove, *f*, in which an open washer, *g*, may be placed for the purpose of locking the parts together, the sleeve or coupling *e*, for attaching the two sections of tubing *d* together, the set-screws *h*, entering the coupling *e*, and an opening in the said coupling for the purpose of introducing a proper lubricant to the bearings, substantially as and for the purpose described.

386,461. OVAL ANGULAR VALVE. HENRY A. GILL, Chicago, Ill. Filed Mar. 20, 1887. Serial No. 232,091. (No model.)

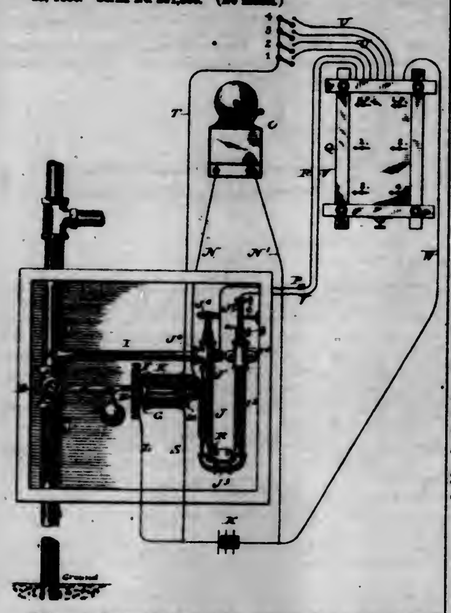


Claim.—For a circular cylinder pipe or passage, the swinging valve, the valve being oval angular, having an oval angular seat hung diametrical in said pipe on the bearing G, fitting said pipe or passage, and having the wings of unequal length, size, weight, and area, the passages controlled by the valve, substantially as described, and for the purpose as specified.

386,462. OVAL ANGULAR VALVE. HENRY A. GILL, Chicago, Ill. Filed July 21, 1887. Serial No. 244,987. (No model.)

Claim.—1. The swinging double oval angular-seated valve, being oval, double angular, antomatic, hung diametrical in a circular cylinder-pipe, fitting the pipe, and having the wings H and A, of unequal

886,462.



length, shape, size, weight, and arrangement, substantially as described, and for the purpose as specified.

2. The swinging double oval angular-seated valve having the bevel oval angular seats M G K and L G O, and the swinging and crossing bearings G of the two oval angular seats, substantially as described, and for the purpose as specified.

3. The combination of the swinging double oval angular-seated valve, constructed and arranged as herein described, with the circular cylinder part of pipe B, the set-screws R, and the passages controlled by the valve, substantially as described, and for the purpose set forth in the specification.

886,463. ELECTRIC VALVE-CONTROLLER. EDWARD GRAY, Toledo, Ohio, assignor of one-half to William Grah, Jr., same place. Filed Jan. 25, 1888. Serial No. 261,889. (No model.)

Claim.—1. In combination with a main or pipe, a valve located therein, an electro-magnet, an armature adapted to hold said valve open, a battery, a pressure-gage, and electric connections, arranged substantially as described, whereby, when the pressure exceeds or falls below a predetermined limit, the electro-magnet will be energized, its armature rocked, and the valve turned and the supply thereby cut off.

2. In combination with a main or pipe, a valve located therein, an armature adapted to hold said valve open, an electro-magnet controlling said armature, a pressure-gage communicating with the main or pipe and subject to the pressures therein, and an electric circuit, arranged substantially as shown, and including the magnet and pressure-gage.

3. In combination with a main or pipe, a valve located therein, an electric circuit, comprising a battery, an electro-magnet, and a pressure-gage, an armature for said magnet adapted to hold said valve normally open, an electric bell, and a second circuit, in which said bell is included, all arranged for operation substantially in the manner shown.

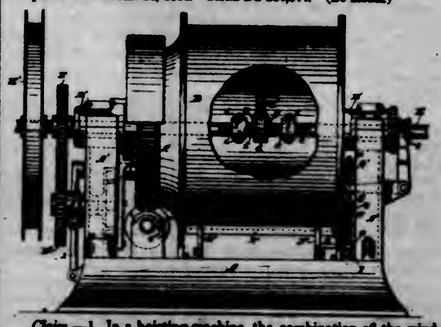
4. In combination with main or pipe A, having valve B, electro-magnet H, having an armature, F, to hold the valve open, a mercurial pressure-gage, J, provided with a metallic section, J^2, and with contact-points J^3 and J^4, a battery, K, wire S, extending from the battery to the magnet, wire R, connecting the metallic section J^2 of the gage with the magnet, and wires P and V, extending, respectively, from the points J^3 and J^4 to the battery.

5. In combination with a main or supply pipe, a valve located therein, an electro-magnet and armature adapted to control the valve, an annunciator, a pressure-gage, and an electric circuit, including the annunciator, gage, and electro-magnet, all substantially as shown.

6. In combination with a main or supply pipe, a valve located therein, an electro-magnet and armature adapted to control the valve, an annunciator, a pressure-gage, a bell, and an electric circuit, including the bell, magnet, annunciator, and gage, all substantially as shown.

7. In combination with a main or supply pipe, a valve located therein, an electro-magnet and armature adapted to control the valve and included in an electric circuit, a switch, and an annunciator, also included in the circuit, as and for the purpose set forth.

8. In combination with a main or supply pipe, a valve located therein, an electro-magnet and armature adapted to control the valve and included in an electric circuit, and a switch, annunciator, and a bell, also included in the circuit, substantially as and for the purpose set forth.



9. In combination with main or pipe A, having a valve, B, electro-magnet H, having an armature, F, adapted to hold the valve open, pressure-gage J, communicating with the main and provided with contact-points J^3 and J^4, battery K, wires S and R, connecting the magnet with the battery and gage, respectively, wires P and V, electrically connected with opposite ends of the gage or the contact-points J^3 and J^4, and in connection, also, with the battery, a wire, L, extending from the battery to the armature F, a bell, O, wire N, extending from the core of the magnet to the bell, and a wire, N', extending from the bell back to the battery.

10. In an apparatus for regulating or controlling the supply of natural gas or other fluids, the combination of the following elements, to wit: a supply-pipe, a valve located therein, an electro-magnet provided with an armature and adapted to hold the valve normally open, a pressure-gage communicating with the supply-pipe and included in the main circuit, an annunciator and a switch, one or more, also included in the circuit, a second circuit, and a bell included in said circuit.

11. In combination with a main or supply pipe, a valve located therein, a pressure-gage subject to the pressures within the main, conductors extending from opposite ends of the gage and forming a normally-open electric circuit, an electro-magnet having an armature to hold the valve open and included in the circuit, all substantially as shown, whereby, when the pressure exceeds or falls below a predetermined limit, the circuit will be completed and the valve caused to shut off the supply.

12. In combination with a main or supply pipe, a valve, B, located therein, and adapted to cut off the supply, an electro-magnet, H, included in a normally-open circuit, an armature adapted to hold the valve normally open, and a second circuit, including a bell and the armature of the electro-magnet.

886,464. SLACK-CABLE STOP-MOTION FOR ELEVATORS. LEMUEL S. GRAVES, Rochester, N. Y., assignor to L. S. Graves & Son, same place. Filed Mar. 21, 1888. Serial No. 267,977. (No model.)

Claim.—1. In a hoisting-machine, the combination of the winding-drum, the mechanism for rotating it, the shaft passing through the journals of the drum, to which the hand-rope wheel and the starting and stopping devices are connected, the clutch-section formed on the drum, the movable clutch-section mounted on the hand-rope shaft, the frame or bar arranged in close proximity to the surface of the drum, and connections between the movable clutch portion and the frame, whereby upon the movement of said frame away from the drum the clutch will be thrown into engagement, substantially as described.

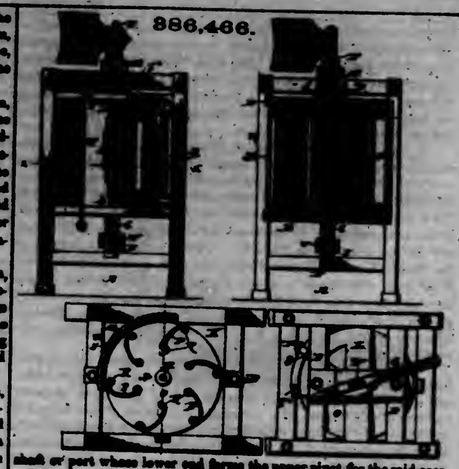
2. In a hoisting-machine, the combination, with the winding-drum, mechanism for rotating it, a starting and stopping mechanism, the hand-wheel shaft connected to said last-mentioned mechanism extending through said drum, the clutch-section on the drum, the clutch-section on the hand-wheel shaft, and a bell-crank lever for moving it into connection with the section on the drum, of a bar or frame arranged in proximity to the surface of the drum, and connections between said frame and the movable section of the clutch, whereby when the former is moved away from the drum the clutch will be thrown into operation, substantially as described.

3. In a hoisting-machine, the combination of the hoisting-drum, mechanism for rotating it, and a shaft to which the starting and stopping mechanism is connected, a clutch interposed between said drum and shaft, a bar arranged in close proximity to the surface of the drum, a lever connected to the clutch for operating it, and a spring interposed between and forming a connection between the bar and the clutch-operating lever, substantially as described.

4. In a hoisting-machine, the combination, with the hoisting-drum, mechanism for rotating it, and a shaft to which the starting and stopping mechanism is connected, of a clutch interposed between said drum and shaft, a bar arranged in close proximity to the drum, a lever connected to the clutch for operating it, and a spring-connection between the lever and bar, whereby motion will be transmitted therefrom only through the interposed spring, and a spring supporting said bar and holding the clutch normally disengaged, substantially as described.

5. In a hoisting-machine, the combination, with the hoisting-drum, mechanism for rotating it, and a shaft to which the starting and stopping mechanism is connected, of a clutch interposed between said drum and shaft, the bell-crank lever having one of its arms connected to the movable clutch-section, a bar arranged in close proximity to the drum having an extension, the rod connected to the extension, two stops on the rod, the loop or stop through which the rod passes, a spring interposed between one of the stops on the rod and the loop, and the spring interposed between the other stop on the rod and the end of the bell-crank lever operating the clutch, substantially as described.

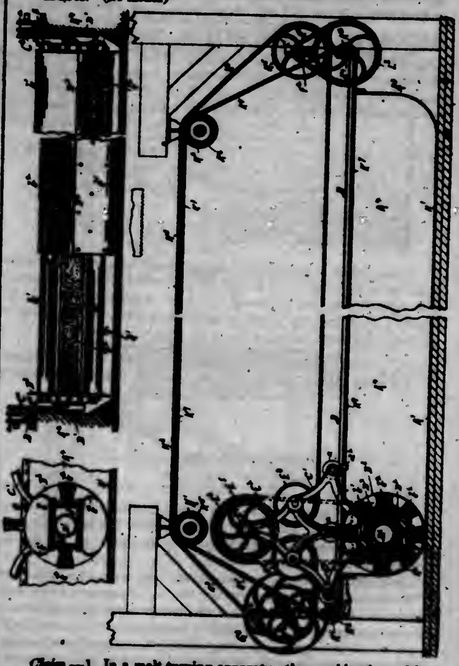
886,465. ROOF. JOHN HAMM, De Kalb, Ill. Filed Feb. 28, 1888. Serial No. 265,857. (No model.)



Claim.—1. The combination of the wall A, provided with the openings E therein, sheathing B, transverse strips C, and outer coating, D, and means, substantially as shown, for opening and closing said openings, for the purpose described.

2. The combination of the wall A, provided with the openings E therein, sheathing B, strips C, attached transversely at suitable intervals to the sheathing B, the shingles or outer coating, D, brace F, seated in openings E, screw-shaft G, seated in said brace, and plates H, adapted to be moved to and from each other in the rotation of the shaft G, substantially as shown, and for the purpose described.

886,466. WINDMILL. JORDAN HAMM, May, Tex. Filed Nov. 1, 1887. Serial No. 253,594. (No model.)



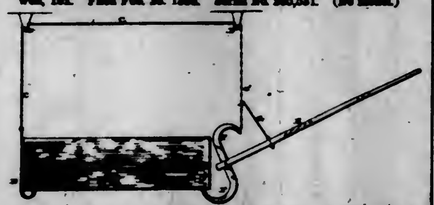
Claim.—The combination of the horizontal wind-wheel, the semi-cylindrical case partly inclosing the same and independently revolvable, the case having the notches T' in its upper side, the vane having the

886,466.

shaft or part whose lower end forms the upper pivot for the said cone, and the lever S, having its inner end fast to the vane shaft or part, and adapted to engage the said notches, and thereby cause the cone to expose any desired area of the wheel to the wind, substantially as described.

886,467. MALT-TURNING APPARATUS. FABIUS HAMMER, Sr., and HERMAN H. DOWNY, St. Paul, Minn. Filed Oct. 6, 1887. Serial No. 251,903. (No model.)

Claim.—1. In a malt-turning apparatus, the combination, with a malt-floor, of a transverse shaft provided with means for drawing it over the floor, from one end to the other, and with means for revolving it, rectangular box-sections secured upon said shaft, blades formed with flat central portions and with upturned and curved ends or edges and secured with said flat central portions to the wide sides of said box-sections, and brushes secured to the narrow sides of said box-sections, substantially as described.



2. In a malt-turning apparatus, the combination, with a malt-floor, of a transverse shaft provided with means for drawing it over the floor,

from one end to the other, and with means for receiving it, rectangular box-sections secured upon said shaft in progressive positions, or with their faces in spiral lines around said shaft, blades formed with flat central portions and with upturned and curved ends or edges and secured with said flat central portions to the wide sides of said box-sections, and brushes secured to the narrow sides of said box-sections, substantially as described.

3. In a malt-turning apparatus, the combination, with a floor having tracks upon its sides, upright frames traveling upon said tracks and provided with means for drawing them from one end of the tracks to the other, and a turning roller journaled with the ends of its shaft in the lower portions of said frames, of transverse shafts F' F² at the ends of the floor, pulleys H' H² upon said shafts, guide-pulleys H' H² above said pulleys, a transverse shaft, E², journaled in the upper portions of the frames C', pulleys F² and E² upon said shaft, guide-pulleys or idlers E' F' upon the frames C', chains E², passed around pulleys E² and around pulleys upon the roller-shaft, and chains H², passed around the pulleys H' H², around the guide-pulleys H' H², around the idler-pulleys, and around the pulleys F² upon the shaft of the carriage, substantially as described.

4. In a malt-turning apparatus, the combination, with a floor having tracks upon its sides, upright frames traveling upon said tracks, and a turning roller journaled with the ends of its shaft in the lower portions of said frames, of a transverse drive-shaft, F', at one end of the floor, pulleys H' upon said shaft, a corresponding transverse shaft, F², at the other end of the floor, pulleys H² upon said shaft, pulleys L' upon said shaft, transverse shafts K' K² at the ends of the floor, pulleys K² and K' upon said shaft, pulleys L² upon said shaft K², chains L², passed around pulleys L² and L', guide-pulleys H' K² and H² K² above the floor, chains K², secured to the frames C and passed around the pulleys K² K² at the ends of the floor and over the guide-pulleys K² K', and chains H², passed around the drive-pulleys H', over the guide-pulleys H' H², around the pulleys H² and around pulleys in the frames, which pulleys drive the turning roller, substantially as described.

386,468. WAGON-BED ELEVATOR. William A. Holliday, Bagwell, Tex. Filed Feb. 20, 1888. Serial No. 265,531. (No model.)

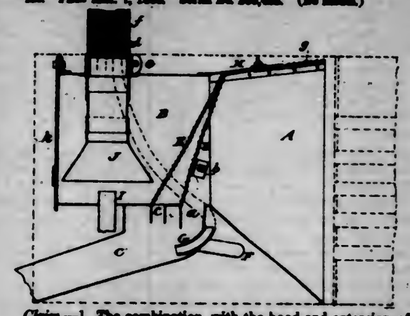
Claim.—The combination of a hook which is to catch under the front end of the wagon-bed, a supporting-wire and chain which passes over suitable supports overhead, the lever E, provided with the S-shaped hook F, and the rod G, provided with a hook for catching in the links of a chain, substantially as shown and described.

386,469. MACHINIST'S MEASURING-TOOL. Henry Howard, Fitchburg, Mass. Filed Apr. 9, 1888. Serial No. 269,739. (No model.)

Claim.—1. A machinist's measuring-tool consisting of two wedge-shaped sections with their small or thin ends in the same direction, one of the sections being adjustable upon the other, as and for the purpose set forth.

2. A measuring-tool consisting of two wedge-shaped sections, one of the sections having a tongue, and the other a groove fitting over the tongue and adjustable thereon, the two sections being adjustably secured together, with their thin ends in the same direction, as set forth.

3. A measuring-tool consisting of two wedge-shaped sections, one adjustably secured upon the other, with their thin ends in the same direction, the lower or base section having a bearing-ear for an adjusting-screw at the wide end extending above the section, as and for the purpose set forth.



4. The combination, with a measuring-tool consisting of two wedge-shaped sections adjustably secured upon each other, with their thin ends in the same direction, of a nut in the upper section, containing a lug having a screw in the lower section at right angles with its upper inclined surface, and an adjusting-screw ear on the lower section at right angles with and extending above its upper inclined face, as set forth.

5. A measuring-tool consisting of two wedge-shaped sections, one secured upon the other, with their thin ends in the same direction, one of said sections having a series of graduated steps parallel to the plane of the base of the other section and being adjustable thereon, as set forth.

6. The combination, with a tool consisting of two wedge-shaped sections adjustably secured together, with their thin ends in the same direction, of a series of steps on the upper section, with an enlarged contracted groove on its under side containing a screw-threaded ring, and the lower or base section having at its wide end a bearing-ear at right angles to its upper face extending above the section for an adjusting-screw, as set forth.

7. The combination, with a measuring-tool consisting of two wedge-shaped sections, one section having a tongue and the other a groove, the two being adjustably secured together, with their thin ends in the same direction, of a series of graduated steps on one section parallel to the plane of the base of the other section, with an enlarged contracted groove on its under side, the other section having a clamping-screw and bearing-ear at right angles to its inclined surface, said ear having an adjusting-screw, as set forth.

386,470. SPARK-ARRESTER. Franklin H. Hemlin, Trenton, Mo. Filed Mar. 7, 1888. Serial No. 266,622. (No model.)

Claim.—1. The combination, with the hood and extension, of an outlet at the bottom of said extension, the discharge-tube communicating with said inlet, and the water-pipe connected with the boiler and emptying into the discharge-tube, substantially as described.

2. The combination, with the hood and the extension, the latter provided with an opening, *a*, at its bottom, of the discharge-tube and the water-pipe connected with the boiler and emptying into said tube, substantially as described.

3. The combination, with the hood and the extension, of the two screens in said extension, the latter provided in its bottom with the openings *a c*, and the discharge-tube communicating with said openings, substantially as described.

4. The combination, with the hood and the screens, arranged as described, of the nettings arranged at the inner end of the top of said hood, substantially as and for the purpose specified.

386,471. COMBINED WASH-BENCH, IRONING-TABLE, AND SETTEE. Oscar S. Jenkins, Danby, N. Y., assignor of one-half to John R. Boyd, same place. Filed Dec. 15, 1887. Serial No. 257,933. (No model.)

Claim.—In a household article or implement consisting of a wash-bench, ironing-table, and settee in one structure, the arms at each end of the settee provided with flanges along their tops and down their rear sides, in combination with an ironing-board having legs which engage with the flanges of the arms, whereby the said board is made interchangeable on the arms, and serves as a back to the settee and as an ironing-table, as set forth.

386,472. LAG FOR PATTERN-CHAINS OF LOOMS. Ernshaw Jowett, Bradford, England. Filed June 20, 1887. Serial No. 241,893. (No model.)

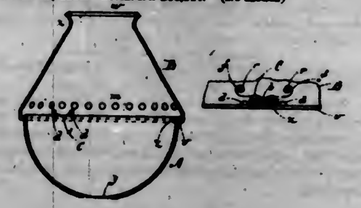
Claim.—In combination, the leg A, grooved and provided with countersunk holes, as described, headed pins D, adapted to fit these holes, and the metallic slide B, serving to cover the heads of the pins and to hold the pins in place, all substantially as and for the purpose shown and described.

386,473. GAS-STOVE. John Kellum, Brooklyn, N. Y. Filed June 16, 1884. Renewed Jan. 7, 1887. Serial No. 223,712. (No model.)

Claim.—1. In a gas-stove, the burner-plate A, having a series of perforations, N, surrounding the mouth of the mixing-chamber, flanges O, surrounding the series of perforations, whereby jets of air will be drawn into the burning gas and the perforations H become the burner proper when the stove is at work, the mixing-chamber C, and the cover J, having a series of slots, all as shown and described.

2. In a gas-stove, the burner-plate A, provided with a mixing-chamber open at both ends and formed with the interior shoulder, G, near its upper end, in combination with the wire-gauze H, resting on the shoulder G, and the cover J, having a series of curved slots, L, and a depending flange, K, supported by the shoulder G, and a gas-burner entering the lower end of the mixing-chamber, whereby the air and gas passing up through the chamber C and gauze H will be thoroughly mixed in the space between the gauze and the under side of plate J before issuing through the openings L, substantially as set forth.

3. In a gas-stove, the burner-plate A, provided with a circular depending mixing-chamber, C, open at both ends and provided with a circular shoulder, G, around its upper end, the raised flange O, the series of openings N in the plate A, between the flange and mouth of the chamber C, the cover-plate J, having a depending circular flange, K, resting on shoulder G, the wire-gauze H, resting on shoulder G below flange K, and a burner, D, held in the lower end of chamber C, as described, whereby the gas and air will be thoroughly mixed between the cover-plate and wire-gauze before ignition, and jets of air will mix through openings N with the flame to cause the complete combustion of the gas.



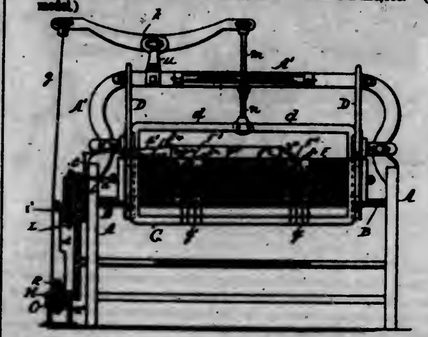
4. A gas-stove consisting, essentially, in a burner-plate, A, provided with circular flanges O I, the latter being in a lower plane than the former, a series of openings, N, between said flanges and independent of the chamber C, radial flanges M, a circular opening, in which is formed the downward-projecting mixing-chamber C, having a shoulder, G, around its upper portion, the cover-plate J, provided with a depending flange, K, and a circular series of slots, L, the top of the plate J being flush with the top of flange I, the wire-gauze H, resting on shoulder G below flange K, and the gas-burner, substantially as set forth.

386,474. GRATE OR ASH-PAN BAR. Christopher Knabe, Detroit, Mich. Filed Jan. 9, 1888. Serial No. 260,134. (No model.)

Claim.—As an improved article of manufacture, a bar provided with a depending lug having a recess, said recess having a horizontal portion extending to one side of said lug and a vertical portion extending above the horizontal portion and communicating with said horizontal portion, said vertical portion being made in the face of the lug adjoining the face to which the horizontal portion extends and corresponding with the end of the bar, substantially as described.

386,475. LAMP-SHADE. Sylvanus B. Kneeland, Boston, Mass. Filed Jan. 16, 1888. Serial No. 260,817. (No model.)

386,476. DENTAL ENGINE. William A. Knowles, Alameda, Cal. Filed Aug. 25, 1887. Serial No. 247,282. (No model.)



Claim.—1. The combination, in a dental engine, of the hinged bracket carrying a spring-actuated lever, a head-stock journaled thereon and having its journal-aperture grooved, the hinge-bolt having a spline to enter said groove, a shoulder on the said stock for the engagement of the spring-actuated lever, and a cam on the bolt to disengage the said lever from the head, substantially as specified.

2. The combination, in a dental engine, substantially as described, of the hinged bracket, the spring-pressed lever thereon, the head-stock journaled on the outer end of the bracket and having the groove in its journal-aperture, and a shoulder for the engagement of said lever, and the hinge-bolt having a spline to enter the said groove, substantially as specified.

3. The combination, with the main frame B, having the vertical aperture therein, as described, of the vertical plate having the conical enlargement, the hinged bracket and also the drive-pulley journaled on said spindle, the head-stock, the spring-actuated lever for engaging said stock and the hinge-bolt and cam thereon, and the cable-shaft having the vertical pulley, substantially as specified.

386,477. LOOM FOR CROSS-WEAVING. Charles A. Littlefield, Fall River, Mass., assignor to Miles A. Tuttle and James T. Miles, both of same place. Filed Feb. 10, 1887. Serial No. 226,169. (No model.)

Claim.—1. The combination, with the needles and needle-holding frame, of levers *b* and *c*, rods intermediate said levers and frame, cam K, ratchet-wheel K', lever T, pawl *r*, rod T, and the crank-shaft, substantially as described.

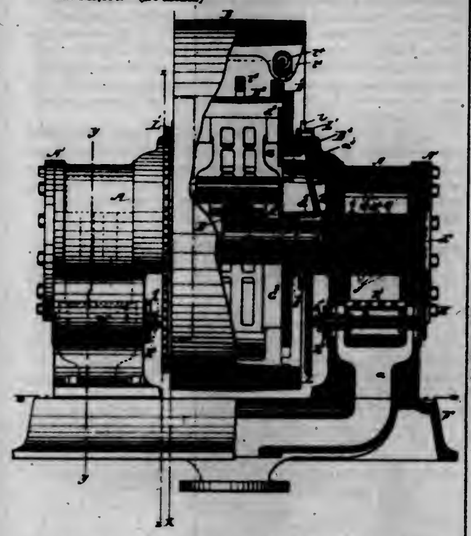
2. The combination, with the reed F and mechanism for imparting lateral movement thereto, of auxiliary reed-sections movable with said reed F, and mechanism for imparting an independent lateral movement to said reed-sections, substantially as described.

3. The combination, with the reed F, the pattern-chain, its actuating devices, and intermediate devices for imparting lateral movement to said reed F, of the auxiliary reed-sections F', movable with said reed F, said devices, substantially such as described, intermediate the pattern-chain and said auxiliary reed-sections for imparting an independent lateral movement to said reed-sections, substantially as described.

4. The combination, with reed F, the pattern-chain, its actuating devices, and intermediate devices for imparting lateral movement to said reed F, of an auxiliary reed-section, F', sleeve L', and devices,

substantially such as described, intermediate the pattern-chain and said sleeve and the latter and said reed-section for imparting independent lateral motion to said reed-section, substantially as and for the purpose set forth.

5. The needle *f*, having an open eye, x^5, and a tongue, f^5, forming an integral part of the needle-body, and having its tongue and the material adjacent to the said eye curved in opposite directions, substantially as described.



386,478. TUB-HOOP. KIMBERLY M. LOOMIS, Keokuk, Iowa. Filed Apr. 18, 1888. Serial No. 271,016. (No model.)

Claim.—1. The combination, in a tub-hoop, of a hoop-body provided with a head at one end, a screw and a nut thereafter at the other end, and the double lug described, comprising two end lugs joined by two side bars, all in one piece, one of the lugs being slotted in its back and provided with shelves at the sides of the slot, and the other lug having a longitudinal aperture in it, substantially as shown and described.

2. The double lug for hoops described, comprising the two end lugs, 6 and 7, joined by the side bars, 16, and the shelves 15, each of the end lugs having a longitudinal aperture, one of them having a slot at its back, substantially as shown and described.

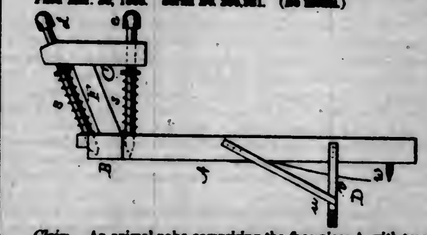
386,479. ROTARY STEAM-ENGINE. FRED R. LOW, Chelsea, Mass., and FRANK M. CLARK, Tilton, N. H. Filed July 1, 1887. Serial No. 243,056. (No model.)

Claim.—1. A rotary steam-engine, in which are combined a steam-cylinder, three differentially-moving pistons mounted upon concentric axes, a fly-wheel mounted upon a center of revolution different from the center of revolution of the three steam-pistons, and a series of cranks, d d' d^2, of equal lengths and each longer than the distance separating the two centers of revolution, and connecting-rods g g' g^2, attached to said concentric shafts and to the interior of said fly-wheel, and a train of gearing, L L', revolving with and revolved by the revolution of the fly-wheel B, and a spring and weight-governor and linkage connecting the same with the gear L', which governor is attached to and revolves with the fly-wheel B, and a cut-off valve, A, substantially as described.

2. The fly-wheel B, consisting of a hollow hexagonal box, as described, within the rim of the said fly-wheel, which hexagonal box is adapted to contain the cranks and connecting-rods of the engine, substantially as described.

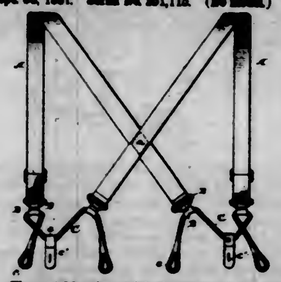
3. The fly-wheel formed, as described, with an oil-tight hollow web for containing the working parts and with a series of oil-chamber, d^3 d^3 d^3 d^3 d^3, leading from the interior of said hollow web to and along the axes of revolution of the pistons C C' C^2 and to the bearings of these axes, substantially as described.

4. The cylinder A, provided with the neck a^2, containing the internal hollow box, a^4, in combination with the fly-wheel B, provided with the web B' and its hub, substantially as and for the purposes described.



5. The combination of the continuously-revolved cylinder-valve A, with its gear-wheel L, the driving-gear L', mounted around the center of revolution of the fly-wheel B and revolved with said fly-wheel, the fly-wheel B, the governor mounted within said fly-wheel B and consisting of a weighted arm, P, actuated by the centrifugal force imparted to the weight by the revolution of the fly-wheel B, and a spring, P', which resists the outward throw of said weighted arm, a linkage between said governor and said gear L', whereby the outward or inward movement of the revolved weight is transmitted to said gear L' and moves it forward or back around its axis of revolution, substantially as described.

386,480. SIDE-CHECK-LOOP. HARRY LOWE, Montpelier, Vt. Filed Jan. 5, 1888. Serial No. 257,709. (No model.)

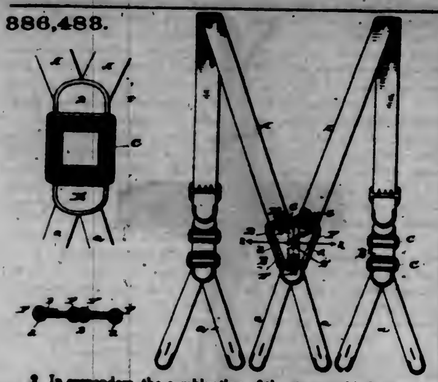


Claim.—A slide for a check-rein, consisting of a rectangular metallic band and flexible loop, the band having equal and parallel projections in the same direction from the edge at two points opposite each other and equally distant from similar corners as long as the band is wide, the ends of such projections connected together by a pin, a flexible loop encircling the pin, the sides of the loop of the width of the inside of the band, and the interior of the loop of sufficient size to receive the water-hook of a harness.

386,481. ANIMAL-POKE. WILLIAM MAST, Tippecanoe City, Ohio. Filed Mar. 30, 1888. Serial No. 268,981. (No model.)

Claim.—An animal-poke comprising the face-piece A, with transverse arms B, having slots for straps, the oblique part F, the supporting part C for the outer end of the lances, and said lances held in said face-piece and said supporting part, with spiral springs to hold the lances outwardly from the head of the animal, substantially as set forth.

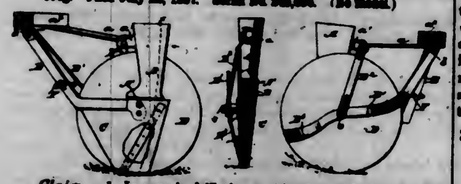
386,482. SUSPENDERS. ALBERT A. HASKELL, Ryde Port, Mass. Filed Sept. 30, 1887. Serial No. 251,115. (No model.)



Claim.—The combination, with the straps A A, connected at the back and terminating in bearings B B for a sliding cord, of button-holes or eyes c c c', the latter provided with a cord-bearing, c, and an elastic cord passing through said bearings B B'c, and connected to the button-eyes c c', substantially as described.

386,483. SUSPENDERS. ALBERT A. HASKELL, Ryde Port, Mass. Filed Oct. 20, 1887. Serial No. 252,773. (No model.)

Claim.—1. Suspenders having a round elastic cord interposed between non-elastic straps thereof, and non-elastic binders carried by said non-elastic straps, provided with elongated cylindrical pockets wherein said round elastic cord is laid and retained for a corresponding portion of its length and bound at or near both ends, substantially as described.



386,483.

2. In suspenders, the combination of the straps, a binder consisting of two thicknesses of more or less stiff material, having lines of stitching uniting them and forming elongated cylindrical pockets therein, and a rounded elastic cord secured to the straps and seated in the pockets in the binder, to which they are united by stitching passing through them, substantially as set forth.

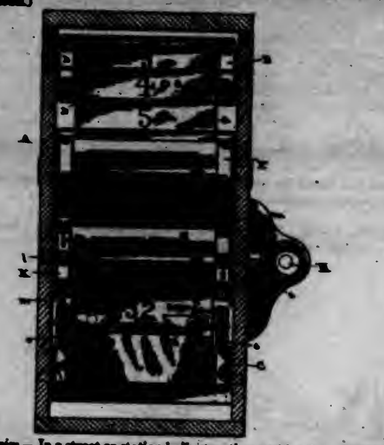
3. In suspenders, the combination of the straps, a binder consisting of two thicknesses of material stitched to form elongated cylindrical pockets F F', round elastic cords uniting the shoulder-straps with the binder and the pantaloons-straps to the binder, and stitchings d, substantially midway between the top and bottom edges of the binder, passing through the same and through the elastic cords, substantially as set forth.

386,484. GRAIN-DRILL. ALEXANDER C. MCCLELLAND, Island City, Oreg. Filed July 30, 1887. Serial No. 245,696. (No model.)

Claim.—1. In a grain-drill, the combination, with the wheel or disk and the furrow-opener, of the plate-like bars and the adjusting-screw adapted to bring the wheel or disk toward or against the opener, substantially as set forth.

2. In a grain-drill, the combination, with the boot or tube having at its lower end a wedge-shaped projection depending from its under side, of the furrow-opener secured to one side of said projection and the wheel or disk, substantially as set forth.

3. In a grain-drill, the combination, with the boot having at its lower end a wedge-shaped projection depending from its under side, of the furrow-opener secured to one side of said projection, the plate-like bars, one being secured to the opposite side of said projection and the other bar receiving an adjusting-screw bearing in the aforesaid bar, and the disk or wheel borne by an axle projecting from said furrow-opener, and which axle is connected to one of said bars, substantially as set forth.



386,485. GAS-BURNER. JOHN MCELHINNY, Cincinnati, Ohio. Filed June 6, 1887. Serial No. 240,455. (No model.)

Claim.—1. In a gas-burner, the combination, with a hollow perforated cylinder, of a band adjustable along said cylinder, and a series of gas-outlets surrounding the same, substantially as and for the purpose specified.

2. The combination of a perforated cylinder capped at the top, a band adjustable along said cylinder, a series of gas-outlets surrounding the base thereof, and a perforated plate admitting air to the outside of the gas-outlets, substantially as and for the purpose specified.

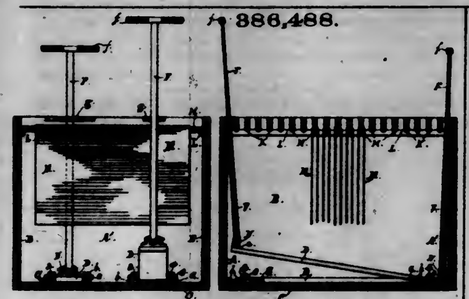
386,486. STREET OR STATION INDICATOR FOR CARS. ISRAEL H. ELKINS, Quincy, Ill. Filed July 30, 1887. Serial No. 245,603. (No model.)

Claim.—In a street or station indicator, the combination, with the box or casing having apertures c and d, and a number of rolls supported between the sides thereof, of a belt traversing the rolls, having thereon two sets of names or numbers of the streets arranged reversely to each other, the operating-roll G, having the notched disks and provided with pins m, and beveled gear e, the gauge n n, and the V-shaped springs having shoppers extending into the gauge, the hand-shaft having cog meshing with cog e, and having its handle provided with the ratchet, the pawls pivoted to the casing and engaging the ratchet, and the spring bearing between the outer ends of said pawls, substantially as described.

386,487. COMBINED SQUARE, MITER, AND TRY-SQUARE. JOHN MURRAY, Conshohocken, Pa. Filed Aug. 2, 1887. Serial No. 245,913. (No model.)

Claim.—1. A combined miter, square, and try-square consisting of a piece of material having an inclined edge, C, the right-lined side F, and the projection B, with upper edge at right angles to the line F, and screws D, set in openings in said piece at right angles to said side F, substantially as described.

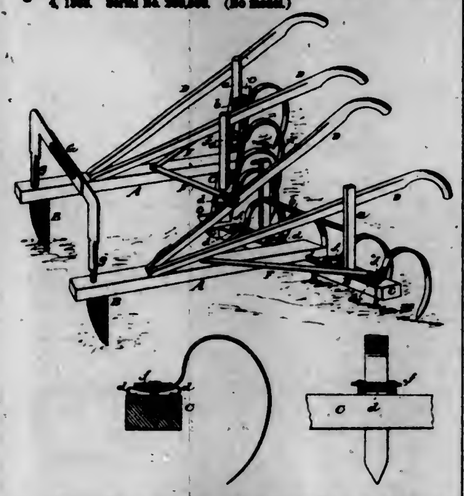
2. The implement A, with inclined side C, the side F, and screws D, the line of said screws and the side F being at a right angle to each other, substantially as and for the purpose set forth.



3. The implement A, with inclined side C, the right-lined side F, and having openings therein at right angles to the side F, with screws in said openings, substantially as and for the purpose set forth.

386,488. LIME-VAT AGITATOR. ABRAHAM A. MYERS, Lancaster, Pa. Filed Feb. 16, 1888. Serial No. 264,262. (No model.)

Claim.—1. The combination, with a vat, of the agitator herein described, hinged by one end to the bottom thereof, so that in operating the downward movement of said agitator may bring its entire under surface into contact with the bottom of the vat, and means for operating said agitator, substantially as and for the purpose specified.



2. The combination, with a vat, of the agitator herein described, having one end hinged thereto, so that in operating the same the entire under surface may be brought in contact with the bottom of the vat, and devices for operating said agitator, substantially as and for the purpose specified.

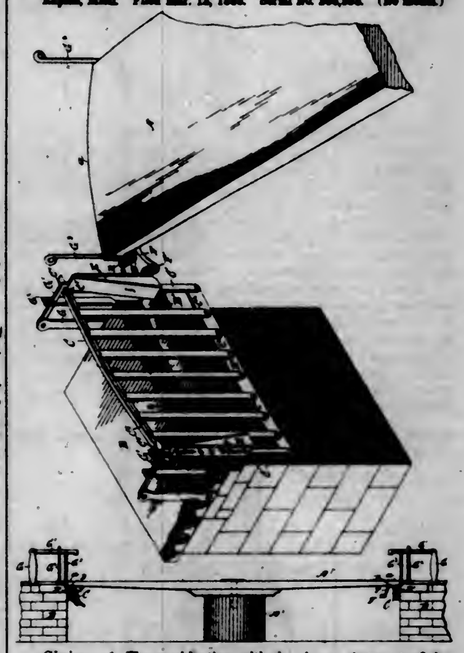
3. The combination, with a vat, of the agitator herein described, hinged by one end in said vat, and provided with a series of perfora-

tions, and means for operating said agitator, substantially as and for the purpose specified.

386,489. CULTIVATOR. ASA J. CLEVY, Dush, Mich. Filed Apr. 4, 1888. Serial No. 269,869. (No model.)

Claim.—The combination, with the cross-beam, of the bearing-plate formed of spring metal doubled upon itself with the bent ends resting on the cross-beam and concaved upon its upper side, the tooth formed with curved shank seated in said concaved portion, and a clamp for holding said tooth and plate in position, substantially as described.

386,490. FIRE-SHUTTER FOR ELEVATOR-SHAFTS. ALBERT G. PAGE, San Francisco, Cal. Filed Sept. 20, 1887. Serial No. 250,198. (No model.)

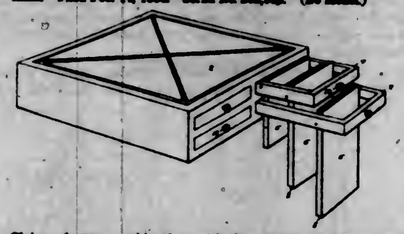


Claim.—In fire-shutters for elevators, in combination with an elevator-cage having the deflecting guide-pulley M', attached to the top of the cage, and the deflecting guide-wheel K', attached to the bottom or floor of the same, the double lever having the tripping-arm J and the short arm I, with slot M, the connecting-bar H, the lever G, the connecting-levers E and F, the lever K, the connecting-bar Q, and tripping-lever R, for the purpose of balancing and operating the shutters A and B, constructed, connected, and operated substantially as and for the purposes set forth.

386,490.

386,491. DRAW-BRIDGE GATE. ALBY LE GRAND PIERCE, Grand Rapids, Mich. Filed Mar. 12, 1888. Serial No. 266,982. (No model.)

Claim.—1. The combination, with the pier or abutment, of the latch-posts, the latches pivotally supported thereon, the slotted uprights, the folding gate pivotally secured to said pier or abutment, and a swinging draw span or bridge provided with posts at its corners for lifting said latches when the gate is to be opened, substantially as described.



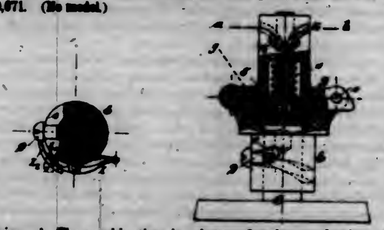
2. The combination of a pier or an abutment with a folding gate provided with vertical pivoted end bars, C, top rail, C', and friction-blocks E, secured to and projecting from said end bars, and a draw span or bridge, A, provided with arms and rollers, which are supported upon the corners thereof, for engaging with said friction-blocks and opening and closing said gate, substantially as described.

3. The combination of a pier or an abutment with a folding gate provided with vertical pivoted end bars, C, top rail, C', and friction-blocks E, secured to and projecting from said end bars, and provided on their inner faces with inclined friction-plates *f* and on their outer faces with adjustable friction-plates *e*, and a draw span or bridge, A, provided with arms and friction-rollers which are supported upon its corners and arranged to engage with said friction blocks and plates and to thus open and close said gate, substantially as described.

4. The combination of a pier or an abutment, a folding gate consisting of vertical bars and intermediate bars, which are pivoted at their upper and lower ends, a horizontal plate and a top rail having notches near its ends with pivoted latches, and a swinging draw span or bridge provided with vertical posts at its corners having rounded upper ends, substantially as and for the purpose described.

5. A folding gate for draw-bridges, comprising a horizontal stationary bottom plate, a movable top rail, and vertical bars pivoted at their ends to said bottom plate and top rail, in combination with latches for holding said gate in raised position and devices for raising and lowering the same, substantially as described.

386,492. DENTAL CABINET. JOSEPH W. FREDERICK, Minneapolis, Minn. Filed Feb. 14, 1888. Serial No. 263,963. (No model.)



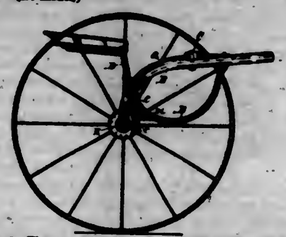
Claim.—1. The combination, with the cabinet, of a drawer consisting of a frame having sides and ends and an open bottom, and one or more receptacles pivoted in said drawer and adapted, as the drawer is drawn out of the cabinet, to drop into a substantially perpendicular position, substantially as described.

2. The combination, with the frame or cabinet 2, of a series of rectangular drawers, 4, arranged to slide in said cabinet, provided with open bottoms, plates or drops 5, pivoted to the said drawers and provided with the series of compartments 6, and the shoulders or stops 8 upon the lower plate or drop to limit its upward movement, substantially as described.

3. The combination, with the cabinet, of the drawer consisting of a frame having sides and ends and an open bottom, and a plate pivoted in said frame and having a series of compartments formed in it and adapted, as the drawer is drawn out of the cabinet, to drop into a substantially perpendicular position, substantially as described.

4. The combination, with the cabinet, of the slide arranged therein, and receptacles pivoted one above another in said slide, with the pivots of the lower receptacle nearer to the front of the slide than those of the upper receptacle, substantially as described.

386,493. BUTTON-MAKING MACHINE. CARL A. PFEIFFER, Barmen Rittershausen, Prussia, Germany. Filed Apr. 5, 1888. Serial No. 269,671. (No model.)

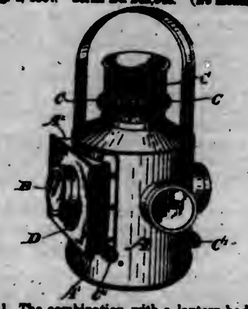


Claim.—1. The combination, in a button-forming mechanism, of a central suitably-mounted core surrounded by a sleeve capable of motion on said core, a cover mounted upon said sleeve and provided with central button-forming mechanism, the said mechanism being connected with an arm traversing a slot in the cover, which slot is provided at its upper end with a cavity, and then extends therefrom with a descending grade, and then with an ascending grade, substantially as described.

2. The combination, in a button-forming mechanism, of the core C, carrying pin D, the sleeve E, provided with slot *e*, and the adjustable limited stop *s s' s²*, substantially as described.

3. The combination, in a button-forming mechanism, of the sleeve E, provided with a slot, *e*, a pin, D, traveling in said slot, and a stop device for limiting the movement of the pin in the slot, substantially as described.

4. The combination, in a button-forming machine, of the cylindrical core, a sleeve containing a helical slot, a pin projecting through that slot, and a lever or stop for preventing the movement of the pin to the end of the slot, and capable of removal from the path of the pin to allow the pin to complete its movement in the slot, substantially as described.



386,494. TWO-WHEELED VEHICLE. JOHN W. PHILLIPS and FRANK C. SEALEY, Kalamazoo, Mich. Filed Feb. 20, 1888. Serial No. 264,962. (No model.)

Claim.—1. The combination of the axle, spring, spring-bar, and a fulcrumed body having the rearwardly-extended brace-arms between which the ends of the spring-bar are attached, substantially as set forth.

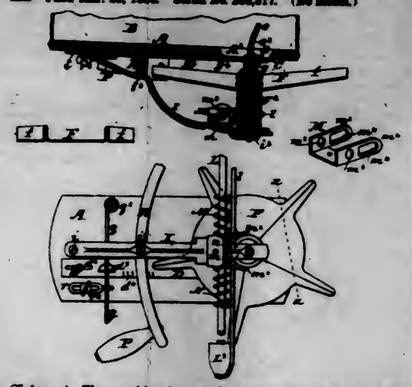
2. The combination of the wheeled axle, the thills having the elegie cross-bar, the hanger-supports, which also form braces to the thills, said supports being attached to the cross-bar extending across the angle of the cross-bar and thills, thence down the bend of the thills and attached thereto, the fulcrumed body, spring, and the hangers jointedly attached to the lower end of said supports, substantially as set forth.

386,495. SIGNAL-LAMP. ADOLPH F. PRAHL, Indianapolis, Ind. Filed Aug. 1, 1887. Serial No. 245,943. (No model.)

Claim.—1. The combination, with a lantern-body, of ventilator-tubes arranged horizontally within said body, said tubes being open at their ends to the outer air and having perforated walls, substantially as set forth.

2. The combination, in a lantern, with the casing thereof, of ventilator-tubes arranged horizontally within said casing, a part of which cross the others, the ends of said tubes being open to the outer air and their walls being perforated, substantially as described, and for the purpose specified.

386,496. LACING-CORD FASTENER. CHARLES A. PERRIN, Cambridgeport, Mass. Filed Apr. 20, 1888. Serial No. 272,266. (No model.)



Claim.—1. The herein-described fastening for lacing-cords, consisting of the plate *c*, having the loop or eye *c²*, the elastic strap to

which the said plate is attached, and a lacing-cord, the said loop or eye being adapted to engage a lacing-hook, as described, and to hold thereon the said lacing-cord passed around it, substantially as described.

2. The herein-described fastening for lacing-cords, it consisting of the plate *c*, having the opening c^2 for the lacing-cord, and the loop or eye c^3 for the lacing-hook, around which the lacing-cord passes, substantially as and for the purposes set forth.

386,497. HAND-SEEDER. SILAS B. RITTENHOUSE, Liberty Mills, Ind. Filed Mar. 30, 1888. Serial No. 269,317. (No model.)

Claim.—1. The combination of the bottom board of a seeding-machine, having the opening A^3 therein, the bottom plate, C, having a semicircular opening, and the slide D, having its front edge, *d*, concave, with the distributer-wheel, its shaft passing through the plate C, and the stirrer *k* thereon, substantially as and for the purpose described.

2. The combination of the bottom board, A, having an opening therein, the bottom plate, C, and the seed-controlling slide, with the distributer-wheel and its shaft, having the stirrer *k* thereon, and its upper end bent to one side at c^2, substantially as and for the purpose described.

3. The combination of the bottom board, A, the bottom plate, C, the oil-cup *g* under said plate, the distributer-wheel and its shaft, and the bracket I, having an oil-cup therein for said shaft, substantially as and for the purpose described.

4. The distributer-wheel F, of sheet metal, having the ribs or ledges *f*, of two thicknesses, bent up and folded together therefrom and integral therewith, the angles formed by said ribs with the body being the same on both sides of said ribs, whereby the soldering of ribs upon the body of the wheel is dispensed with, and said wheel can be revolved alternately in opposite directions and identical results obtained from said ribs, substantially as described.

5. The combination of the distributer-wheel, its shaft and supporting-bracket, with the operating cord-guide slotted for the passage of said cord and secured to said bracket, substantially as and for the purpose described.

6. The combination of the distributer-wheel, its shaft and supporting-bracket, and its operating-rod L and cord *l*, with the rod and cord-guide M, pivotally secured to said bracket, substantially as and for the purpose described.

7. The combination of the distributer-wheel, its shaft and under bracket, and the operating-rod L and rod-guide, with the double coil-spring N upon said rod on the sides of said guide-rod, and a connecting-link, *n*, integral with both coils of said spring and passing under the bracket and rod-guide to unite said springs, substantially as described.

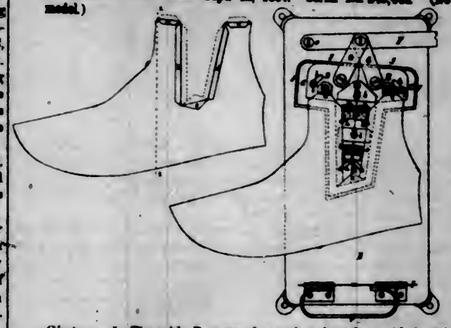
8. The combination of the distributer-wheel, the shield, and the bottom board of a hand-seeder, with a handle, P, secured to the shield of said seeder, substantially as and for the purpose described.

9. The combination of the bottom board, A, and handle P on one side thereof, the grain-controlling slide D, having lug d^3 integral therewith, and the rod *q*, pivoted to the board A, and passing through said lug and extending beyond the board A toward the handle P, with the adjustable stop-guide *r*, substantially as and for the purpose described.

386,498. SMOKE-CONSUMER. BENJAMIN ROSSMAN, Indianapolis, Ind. Filed Mar. 12, 1887. Serial No. 230,736. (No model.) Patented in England Feb. 14, 1887, No. 2,216.

Claim.—1. The combination, in a smoke-condenser, of a water-supply pipe, a chamber provided with numerous orifices and connected to said pipe, and a screw attached to said chamber and extending up into the portion of pipe which enters it, whereby said chamber will be given a rotary motion by the force of the water.

386,498.



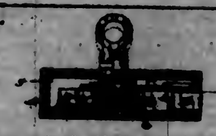
2. The combination, in a smoke-condenser, of a water-supply pipe leading to the interior of said condenser and a rotary hollow bulb or globe secured to its inner end and provided with orifices through which the water may discharge in the form of fine streams or spray.

386,499. FIRE-KINDLER. JAMES H. SIMPSON, Brooklyn, N. Y. Filed Nov. 4, 1887. Serial No. 254,203. (No model.)

Claim.—A fuel supply and firing package containing inconbustible absorbent material and having solid ends and a portion of the length of its casing formed with open-work and a portion thereof solid, said solid portion forming a reservoir for an additional supply of fuel, substantially as described.

386,500. MACHINE FOR CORING UPPERS. CHARLES W. SIMPSON, Milford, Mass. Filed Sept. 12, 1887. Serial No. 249,444. (No model.)

Claim.—1. The table B, secured to a bench and provided with an opening in its top to receive the chambered heater C, secured thereto and in said opening, and provided with pipes to convey steam from a steam boiler or generator into it to heat it, in combination with the folding and pressing plates D E, substantially as shown and described.

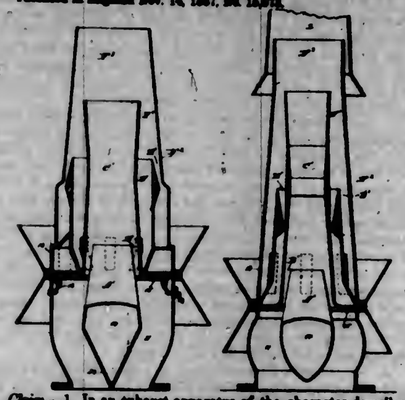


2. The table B, secured to a bench and provided with an opening in its top to receive a chambered heater, C, secured thereto and in said opening, and provided with pipes to convey steam from a steam boiler or generator into it to heat it, in combination with the folding and pressing plates D E, provided with inclined slots to receive studs projecting from the top of said heater to guide said plates in their movements, the folder and presser H, springs *k l*, screws *m*, gages *n*, connecting-rods G G, and lever F, pivoted to the table, all essentially as shown and set forth.

3. The table B, secured to a bench and provided with an opening in its top to receive the chambered heater C, secured thereto and in said opening, and provided with pipes to admit of its being heated, in combination with the folding and pressing plates D E, provided with inclined slots to receive studs or screws projecting from the top of said heater to guide said plates in their movements, the folder and presser H, the springs *k l*, and screws to vary the tension of said springs, gages *n*, connecting-rods G G, and lever F, pivoted to the table, the plate I, provided with the opening *v* and secured to the bars *q*, connected by a handle, *r*, said bars being pivoted to the table B, all as shown, and substantially as described.

386,501. LOCK. GEORGE G. SMITH, St. Albans, Vt. Filed Sept. 22, 1887. Renewed June 26, 1888. Serial No. 278,594. (No model.)

Claim.—1. The combination, in a lock, with a suitable external case, A, a key-barrel, D, fitted to rotate therein, and whose inner end is formed with a flat surface or surfaces parallel with its axis, a key



386,501.

adapted to be supported and guided by said barrel, and a bolt, B, to be actuated by said key, of a flat spring secured to the case, and whose free end, moving in a plane parallel with the axis of said barrel, springs into contact with the flat surface of the barrel to stop the retention thereof, and in position to be struck and depressed by the inner end of the key when in readiness to be turned to subdue the bolt, substantially in the manner and for the purpose herein set forth.

2. The combination, in a lock, of a bolt, a key for actuating the same, a rotating key-barrel to engage the key and turn with it and formed with an encircling groove or recess, a spring-plate whose free end engages the barrel to stop it, and is adapted to be carried by the key into register with the encircling groove of the barrel to permit its retention, and a lateral slotted guard-plate attached to the spring-plate and interposed between the barrel and the bolt, substantially in the manner and for the purpose herein set forth.

386,502. BLAST OR EXHAUST APPARATUS. JOHN Y. SMITH, Doylestown, Pa. Filed Jan. 11, 1888. Serial No. 260,484. (No model.) Patenied in England Nov. 14, 1887, No. 15,973.

Claim.—1. In an exhaust apparatus of the character described, the combination, with the inner ejector, of a second or outer ejector arranged with its steam-nozzle in advance of the steam-nozzle of the inner ejector, said ejectors receiving steam from a chamber or passage common to both and delivering into a common passage or flue through independent combing-flues, substantially as described.

2. In combination with the smoke-box and the chimney or smoke-stack, an exhaust apparatus, and an adjustable flue interposed between the delivery end of the exhaust apparatus and the passage or opening into the smoke-stack, and co-operating with the latter to close or open direct communication between the smoke-box and smoke-stack, substantially as described.

3. In combination with the smoke-stack and blast or exhaust apparatus, a movable flue interposed between the delivery end of the exhaust apparatus and the opening in the smoke-stack, said flue co-operating with the blast apparatus to form a supplemental ejector, and with the smoke-stack to act as a damper, substantially as described.

4. In combination with the smoke-box or uptake and the smoke-stack of a locomotive-boiler, a blast apparatus receiving steam from the cylinders and containing an inner and an outer ejector, and a vertically-movable flue surrounding the delivery end of the two ejectors and interposed between the latter and the opening into the smoke-stack, substantially as described.

5. In a locomotive-boiler, and in combination with the exhaust apparatus located within the smoke-box, a movable flue interposed between the delivery end of the exhaust apparatus and the opening into the smoke-stack, and co-operating with the latter to control the direct draft or passage from smoke-box into the smoke-stack, and adjusting devices convenient to the engineer for actuating said movable flue, substantially as described.

6. In an exhaust apparatus for locomotive and other similar boilers, located within the smoke-box and delivering into the smoke-stack, said exhaust apparatus comprising an inner ejector with an inlet opposite the lower series of flues, an outer ejector having its air-inlet above the inlet of the inner ejector, a supplemental combing-chamber into which both ejectors deliver, and an air-inlet to said chamber opening into the upper portion of the smoke-box, substantially as described.

7. In an apparatus such as described, the combination of an inner and an outer ejector, each provided with a separate combing-flue, said combing-flues opening into a flue or passage common to both ejectors, substantially as described.

8. In an apparatus such as described, the combination of an inner ejector provided with air and steam nozzles and a combing-flue, a second ejector surrounding the first-mentioned ejector and provided with an independent air-supply, steam-nozzle, and combing tube or passage, and a combing tube or flue common to both of said ejectors, substantially as described.

9. In an exhaust apparatus such as described, the combination, with an inner ejector communicating directly with the steam-supply passage, of a second or outer ejector detachably secured to said inner ejector and receiving steam therefrom, substantially as described.

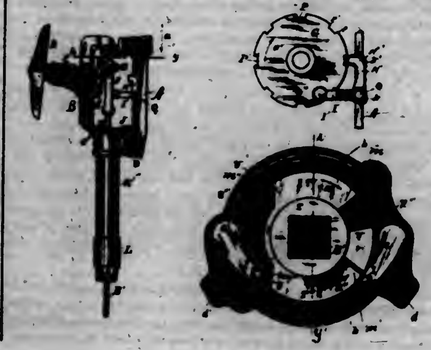
10. In an ejector or blast apparatus, and in combination with the steam-nozzle thereof, a compression-chamber communicating with the steam-passage below or in rear of the nozzle, substantially as described.

11. In an ejector or blast apparatus wherein exhaust-steam from a cylinder or steam in successive blasts is projected into a passage leading to a nozzle or escape-orifice, and in combination with the latter, a closed compression-chamber communicating with the steam-supply passage, substantially as and for the purpose set forth.

12. In an exhaust apparatus such as described, and in combination with the inner and outer ejectors, their steam passages and nozzles, the compression-chamber communicating with both of said nozzles, substantially as described.

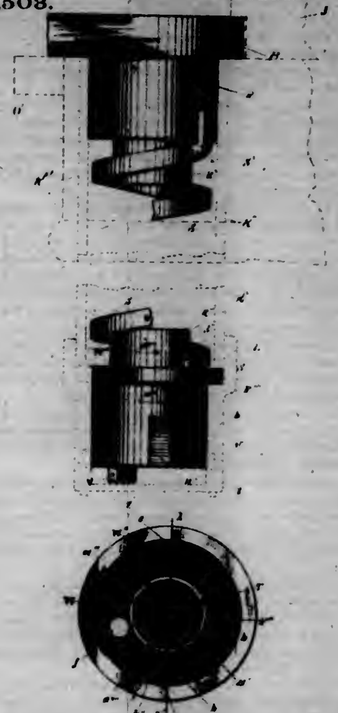
13. In an exhaust apparatus such as described, the combination, with an inner ejector communicating with the exhaust-steam passage, of an outer ejector receiving steam through ports in said inner ejector, a valve controlling said ports, and a compression-chamber connected to said outer ejector below or in rear of said steam-ports, substantially as described.

14. In combination with the cylinders of an engine, and the exhaust-steam passages leading therefrom, an exhaust or blast apparatus such as described, provided with two or more separate ejectors, a steam-passage common to all the ejectors, a hollow bridge or wall intermediate said steam-passage, and the exhaust-steam passages leading to the cylinders, substantially as described.



15. In combination with the two passages or chambers into which the exhaust-steam from the cylinders is delivered, an ejector whose lower or receiving end is divided by a hollow wall into two sections, each communicating with one of the steam-passages leading to the cylinders, and both opening into a common passage leading to the steam-nozzle, substantially as described.

16. In an exhaust apparatus such as described, the combination, with the annular steam-nozzle and central air-tube, of the cross-piece or bridge containing an air-passage communicating with the central air-tube, said cross-piece being provided with inclined upper edges and co-operating with the partition between the exhaust-chambers of the cylinders to convey the exhaust-steam from each cylinder directly to the nozzle, substantially as described.



17. In an exhaust apparatus such as described, and in combination with the inner and outer ejectors and a compression-chamber, separate passages for receiving the exhaust-steam and delivering it directly to the nozzle, substantially as described.

386,503. WINDMILL. DANIEL C. SNYDER, Prospect, Ill. Filed June 15, 1888. Serial No. 103,672. (No model.)

Claim.—1. In a windmill, the combination of a vane and a wind-wheel-supporting casting, each pivoted on a vertical axis, a wind-wheel shaft journaled in said casting and normally parallel or approximately

886,503.

parallel to the vane, a stop or stops adapted to prevent the rotation of said casting from its normal position in one direction, but to permit such rotation in the opposite direction, a coiled spring connected at one end with one of said pivoted parts and having its free end in position to be connected with the other of said parts, means whereby the free end of said spring may be rotated in either direction and said spring thus coiled closer or uncoiled at will, and means whereby said free end, after such rotation in either direction, may be connected with said last-mentioned pivoted part, and said spring be thus made to assist or resist the rotation of the wind-wheel casting from its normal position in the direction permitted by said stop or stops.

2. In a windmill, the combination of a vane and a wind-wheel casting, each pivoted on a vertical axis, a wind-wheel shaft journaled in said casting and normally parallel or approximately parallel to the vane, suitable coacting stops attached to said vane and said wind-wheel casting, respectively, and adapted to permit the rotation of said wind-wheel casting from its normal position in one direction, but to prevent such rotation in the opposite direction, a coiled spring connected at one end with said wind-wheel casting and having its free end in position to be connected with said vane, means for rotating the free end of the spring in either direction, and thereby coiling or uncoiling the spring, and means whereby said spring, when coiled or uncoiled by such rotation of its free end, may be connected with said vane, and thus exert a force to resist or assist, as desired, the rotation of the wind-wheel casting from its normal position in the direction permitted by said stop or stops.

3. In a windmill, the combination of a vane-casting and a wind-wheel-supporting casting, each pivoted on a vertical axis, a coiled spring connected at one end with one of said pivoted castings, a pawl-and-ratchet mechanism, one of whose coacting parts is attached to the free end of said spring and the other part to the other of said pivoted castings, means for rotating the free end of said spring with reference to said pivoted castings, and means whereby, after such rotation, the parts of said pawl-and-ratchet mechanism may be brought into engagement and said spring be made to exert upon each of said pivoted castings a force tending to rotate it with reference to the other.

4. In a windmill, the combination of the vane-casting and the wind-wheel-supporting casting, each pivoted on a vertical axis, a coiled spring connected at one end with the wind-wheel-supporting casting and having its free end in position to be connected with the vane-casting, two oppositely-placed pawl-and-ratchet mechanisms, each adapted to connect the free end of said spring with said vane-casting, and means whereby the free end of the spring may be rotated in either direction, its rotation in one direction bringing one of said pawl-and-ratchet mechanisms into engagement and its rotation in the opposite direction bringing the other pawl-and-ratchet mechanism into engagement.

5. In a windmill, the combination of a vane-casting and a wind-wheel-supporting casting, each pivoted on a vertical axis, a coiled spring connected at one end with one of said pivoted castings, a pump-rod lying within said coiled spring and connected with the free end thereof by means whereby the rotation of the pump-rod rotates the free end of said spring, and means whereby the free end of said spring, when rotated by the rotation of the pump-rod into a given position with relation to said castings, shall be connected with the other of said pivoted castings, and said spring be thereby made to exert on each of said castings a force tending to rotate it with reference to the other.

6. In a windmill, the combination of a vane-casting and a wind-wheel-supporting casting, one of said castings having a vertical tubular base pivoted in the tower of the mill and the other a tubular base pivoted within the base of the first, a coiled spring attached at one end to the inner of said bases and having its axis coincident with the axis of said bases, a pump-rod passing through said spring and said pivoted bases, and connected with the free end of the spring by means whereby the rotation of the pump-rod in either direction rotates the free end of the spring, two oppositely-placed pawl-and-ratchet mechanisms, each adapted to connect the free end of the spring with said outer tubular base, and means whereby the rotation of the free end of the spring in one direction through a given angular space shall bring one of said pawl-and-ratchet mechanisms into engagement and a like rotation of said free end in the opposite direction shall bring the other pawl-and-ratchet mechanism into engagement.

7. In a windmill, the combination of a vane-casting and a wind-wheel-supporting casting, the base of one of said castings being pivoted in the windmill-tower and the base of the other being pivoted in the base of the first, a pump-rod passing through both of said bases and susceptible of rotation independent of both of them, a coiled spring surrounding said pump-rod and connected at one end with the inner of said pivoted bases, two oppositely-placed pawls attached to the outer of said bases, a notched sleeve or block attached to the free end of said spring and adapted to engage with one of said pawls when the free end of the spring is rotated through a given angular space in one direction from its normal position, and to engage with the other of said pawls when said free end is similarly rotated in the opposite direction, and means connecting said pump-rod with said notched sleeve, whereby the rotation of the pump-rod in either direction rotates said sleeve and the free end of said spring.

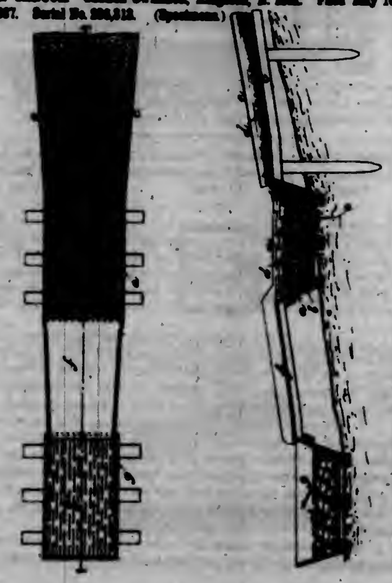
8. In a windmill, the combination of a vane-casting and a wind-wheel-supporting casting, the base of one of said castings being pivoted in a stationary vertical bearing and the base of the other being pivoted in the base of the first, a coiled spring connected at one end with the inner of said pivoted bases, and a notched sleeve attached to the free end of said spring, a pawl attached to the outer of said pivoted bases and adapted to engage with said notched sleeve when the free end of said spring is rotated through a given angular space from its normal position, a block journaled in said sleeve and having a limited rotation independent thereof, but adapted, when rotated beyond said limit, to rotate said sleeve, a pump-rod passing through said block, sleeve, spring, and pivoted bases, and adapted when rotated to rotate said block, and a wing or projection on said block adapted to disengage said pawl from the notch in said sleeve, whereby the rotation of said rod in one direction brings said pawl and notch into engagement and the reverse rotation thereof disengages said pawl and notch and disconnects the spring from said outer base.

9. The combination of the vane-casting having the vertical tubular base K L, pivoted in a suitable stationary bearing, the wind-wheel-supporting casting having the tubular base R, pivoted within the tubular base K, the spring S, lying within the tubular base K L and fastened at its upper end to the base R, the notched sleeve R", fastened to the lower end of the spring S and susceptible of rotation within the base K L, the pawl c', attached to the base K L and adapted to engage with the notch U' of the sleeve R" when the sleeve is rotated from its normal position through a given angular space in the direction requisite to coil the spring S closer, the pump-rod B', lying within said sleeve and spring, and means connecting said pump-rod with said sleeve and adapted to communicate rotary motion of the pump-rod to the sleeve.

10. The combination of the box L, the pawls c c', pivoted to the box, the sleeve R", journaled in the box and having notches U U', adapted to engage the pawls c c', respectively, the block T, journaled in the sleeve R" and having limited independent rotation therein, and the pump-rod B', passing through the block and adapted to rotate the same, substantially as shown and described, and for the purpose set forth.

11. The combination of the box L, provided with lug c, the sleeve R", journaled in the box and provided with the flange W, adapted to co-operate with the lug c and limit the rotation of the sleeve in the box, the block T, journaled in the sleeve and having wings T T', adapted to co-operate with a lug, V, on the sleeve, and thus limit the rotation of the block in the sleeve, and the oppositely-placed pawls c c', attached to the box L and adapted to engage, respectively, with corresponding notches, U U', in the sleeve R".

12. The combination, with the box L, having the lug c, of the sleeve R", journaled in said box and provided with the lug V, the notches U U', and the flange W, adapted to co-operate with the lug c and limit the rotation of the sleeve in the box, the pawls c c', pivoted to the box L and adapted to engage with the notches U U', respectively, the block T, journaled in the sleeve R" and provided with the wings T T', and the pump-rod B, passing through the block T and adapted to rotate the same, each of the wings T T' having one face adapted to strike the lug V and limit the rotation of the block in the sleeve, and having another face adapted to disengage one of the pawls c c' from the corresponding notch in the sleeve R".



13. The combination, in a windmill, of a vane-casting and a wind-wheel-supporting casting, each pivoted on a vertical axis, a wind-wheel shaft journaled in said wheel-supporting casting, a notched plate or its equivalent mounted on the wind-wheel shaft, and a latch attached to the vane-casting and adapted to engage the notches of the plate when the wind-wheel swings out of the wind and to lock said plate and the wind-wheel shaft against rotation when in such engagement.

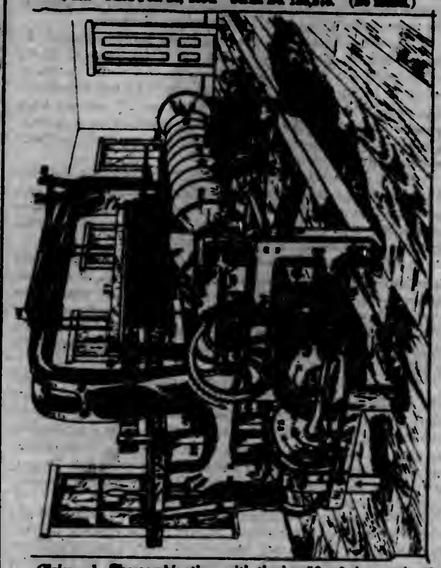
14. The combination, with the two main castings of a mill, each swinging about a vertical axis, of a wind-wheel shaft journaled in one of said castings and a vane attached to the other, a notched plate attached to and rotating with the wind-wheel shaft, and having a series of notches in its periphery, and a latch pivoted to the vane-casting and adapted to engage the notches in said plate when the wind-wheel swings out of the wind, the contact of each of said notches with said latch being approximately radial with reference to the axis of rotation of the plate, whereby the engagement of the latch and plate locks the shaft against rotation, substantially as and for the purpose set forth.

15. The combination of the wind-wheel shaft, the crank-plate G, mounted thereon and having in its periphery the notches P, formed substantially as set forth, and the latch H, pivoted to the vane-casting of the mill and adapted to engage the notches P as the wind-wheel swings out of the wind, substantially as shown and described, and for the purpose set forth.

16. The combination of the wind-wheel shaft, the crank-plate G, notched substantially as described, and the latch H, pivoted to the vane-casting of the mill and provided with the weighted arm I I', said latch being adapted to engage the notches of the plate G when the wind-wheel swings out of the wind and to lock the plate and the shaft against rotation when in engagement.

886,504. METHOD OF SEPARATING METALS FROM QUARTZ OR GANGUE. GEORGE SWEARER, Kingston, N. Mex. Filed May 16, 1887. Serial No. 238,312. (Specimens.)

Claim.—The herein-described method of separating metals from crushed quartz or gangue, which consists in discharging crushed quartz containing metal into a vessel containing water and a liquid insoluble in water and of greater density than water, but of less density than the quartz or gangue, whereby the crushed quartz will remain in and pass off with the water, whereas the metal will pass through the liquid (insoluble in water and of greater density than water) to the bottom of the vessel, substantially as described.



886,505. CAR-COUPLING. ANDREW DUNCAN, Gemmill, North-West Territory, Canada. Filed Mar. 19, 1888. Serial No. 268,017. (No model.)

Claim.—1. The combination, in a car-coupler, of the plate C, secured to the draw-head and having the lunk d', on which is formed the shoulder d, with the lever F, having the arm H, and engaging with the pin-lifter D, which is provided with the arm V, which carries the coupling-pin E, substantially as herein shown and described.

2. The combination of the plate C, having the inclined lunk d', and its shoulder d, with the inclined guide-plate I, secured to the car-crank, substantially as shown, and for the purpose herein set forth.

886,506. LOUIS ADRIEN J. THOMAS and WINFIELD S. THOMAS, Boston, Mass., assignors to the American Metallic Fabric Company, Portland, Me. Filed Feb. 28, 1888. Serial No. 265,572. (No model.)

Claim.—1. The combination, with the lay 50, of the toggle, the rest 57, the cam 46, its operating mechanism, and connections between the said cam and toggle, whereby the lay will be brought against said rest and there held during the flight of the shuttle, as set forth.

2. The combination, with the lay and the shuttle and their actuating mechanisms, of the rock-shaft 70, provided with an arm, 69, having a yielding connection with said shaft, and thus adapted to move independently thereof, and mechanism for rocking said shaft, whereby the weft will be prevented from kinking when it is slackened as the shuttle starts forward to pass through the shed, substantially as set forth.

3. The combination, with the loom-frame and the lay, of the rock-shaft 70, provided with yielding arm 69, torsional spring 72, pin 73, lever 74, pivoted to said frame and arranged to act on said pin, shaft 43, cam 76, and spring 77, for holding said lever in contact with said cam, substantially as set forth.

4. The combination, with the lay, of the vertically-movable raddle 79 80, means for operating the same, the pivoted raddle 83 84, having arm 85, the vertically-movable pin 86, connected to said arm, the lever

89, provided with an incline adapted to be engaged by said pin when the latter is depressed at the commencement of the forward movement of the lay, a shipper-lever for stopping and starting the loom, and connections between said shipper-lever and the lever 89, whereby when the weft is absent the loom will be stopped at the commencement of the forward movement of the lay, substantially as set forth.

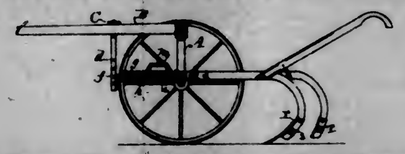
5. The combination, with the lay, of the pivoted raddle 83 84, the pin 86, upheld thereby, the vertically-movable raddle 79 80, its operating-rod 78, having a projection; an collar 108, a lever operated by said collar, and connections between said lever and said pivoted raddle, whereby the latter will be tilted to lift the pin 86 when the vertically-movable raddle is lifted, substantially as set forth.

6. The combination, with the lay, of the vertical shaft 78, raddle 79 80, collar 108, secured to said shaft, lever 109, arranged to be engaged at one end by said collar, raddle 83 84, connected with said lever, pin 86, lever 105, the loom-frame to which said lever is pivoted, cam 104, spring 107, and shaft 43, whereby when said shaft 78 and raddle 79 80 are moved upward the raddle 83 84 will be tilted, substantially as set forth.

7. The combination, with the lay and the vertically-movable pin 86, supported thereby, and means for operating the said pin, of the lever 89, provided with an adjustable plate having an incline, 95, rod 93, connected with said lever, lever 93, slide 97, having an inclined projection, shipper-lever 20, and bracket 95, adapted to operate substantially as set forth.

8. The combination, with the movable slide 97, means for operating the same, the shipper-lever 20, and bracket 95, having a retaining-notch for said lever, of the longitudinally-movable rod 98, provided with torsional and retracting spring 99, and collar 101, having a projection, an arm or lever, 103, attached to said rod and adapted to engage said shipper-lever, whereby when said slide is moved the said shipper-lever will be disengaged from its retaining-notch and moved to effect the stopping of the loom, substantially as set forth.

9. The combination, with the loom-frame and driving-shaft 21, supported thereby, of the friction-clutch and driving-pulley 23 24, the clutch-lever 25, the arm or lever 26, the shipper-lever 20, the brake-lever 31, its spring 33, a sliding bar connected with said clutch-lever and provided with an incline, and a vertical bar, 37, whereby when the said shipper-lever is moved in the proper direction the parts forming the driving-clutch will be disconnected and the brake be simultaneously applied, substantially as set forth.

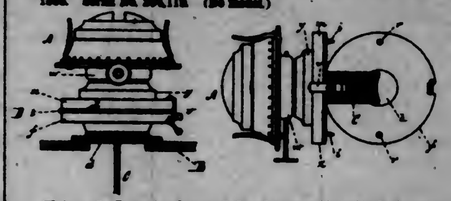


10. The combination, with a warp-roll provided with a longitudinal groove, of a grooved block or beam fitted in said groove, a clamping-bar adapted to be inserted in the groove of said block or beam, and attaching-devices, as screw-bolts 128, for securing said clamping-bar in place, substantially as set forth.

11. The combination, with the rolls 124 and 126, differentially geared, as described, and means for operating said rolls, of the intermediate pinion, 126, and the friction-rolls 127 and 128, whereby the woven fabric as it is taken up in the process of weaving is passed over and between said rolls and pressed and subjected to a uniform strain, thereby leveling and finishing the surface of the web, substantially as set forth.

12. The combination, with a pair of take-up rolls and their operating worm-gear wheel, of a shaft provided with a worm and a ratchet-wheel, a warp or let-off roll provided with worm-gear wheel, a second shaft carrying a worm, connections between said shafts, a pawl-carrier and pawl for operating said ratchet-wheel, the lay, and a device moving with the latter for imparting motion to said pawl-carrier, whereby said take-up and let-off rolls will be intermittingly and simultaneously operated from the lay, substantially as set forth.

13. The combination, with the take-up roll, of the shaft 132 and mechanism for rotating the same, connections for rotating said roll from said shaft, a gear-wheel, 140, on said shaft, a gear-wheel, 141, having a number of teeth different from the number of the wheel 140, a warp or let-off roll, and a train of gearing between the latter and the said gear-wheel 141, whereby the said take-up and let-off mechanisms may be simultaneously but differentially operated, substantially as set forth.

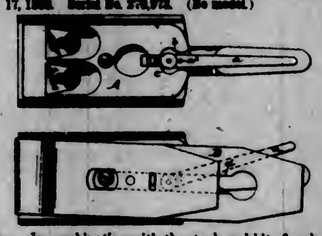


886,507. CULTIVATOR. HARVEY N. THEIS, Des Moines, Iowa. Filed Nov. 22, 1887. Serial No. 255,691. (No model.)

Claim.—1. The combination, with a cultivator-frame, of an evener, swinging hangers attached to the evener, frames having hooks for attachment to the axle or drag-bars, and buffer-springs working in said frames and adjustably attached to the swinging hangers, substantially as described.

2. The combination, with a cultivator-frame, of an evener, swinging hangers, and buffer-springs attached to the hangers and the drag-bars, frames for said springs, and a dynamometer or draft-registering device attached to the springs and frames, substantially as described.

886,508. LAMP. EDWARD TOBEY, Lowell, Mass. Filed Feb. 16, 1888. Serial No. 264,112. (No model.)



Claim.—1. In an incubator of the character described, the members *m* and *f*, composed of wood, mastic, rubber, or similar non-conducting material, the member *m* being provided with a screw-threaded socket-piece, as *y*, for connecting it with a burner, and the member *f* with a screw-threaded nipple, as *d*, for connecting it with the body of a lamp, said members being hinged together and provided with a catch for keeping them closed, substantially as described.

2. In an incubator of the character described, the members *m* and *f*, provided with the hinge *l*, catch *v*, and packing *z*, the member *m* having a screw-threaded socket-piece, as *y*, for connecting it with a burner, and the member *f* a screw-threaded nipple, as *d*, for connecting it with the body of the lamp, substantially as set forth.

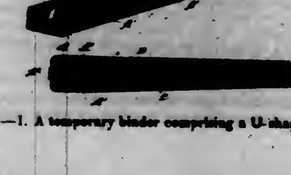
3. In an incubator of the character described, the member *f*, provided with the holes *r*, and the member *m*, provided with the dowels *i*, adapted to enter said holes, said members being hinged together at *l* and provided with a catch, *v*, and packing *z*, and also with means for respectively connecting them with the body and burner of a lamp, substantially as described.

886,509. BENCH-PLANE. JOSEPH A. TRAFT, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Apr. 17, 1888. Serial No. 270,972. (No model.)

Claim.—In combination with the stock and bit of a plane, a lever for laterally adjusting said bit, and the rotary disk pivoted on the shorter arm of said lever and engaging the longitudinal slot of said bit, substantially as described, and for the purpose specified.

886,510. PADLOCK. WILLIAM P. TEGART, Lancaster, Pa., assignor of one-third to Samuel B. Slaymaker, same place. Filed Mar. 3, 1888. Serial No. 266,098. (No model.)

Claim.—1. The combination, with the case having slots to receive the journals of the tumblers and filling-plates to keep said journals in place, of the tumblers having journals at one end and springs bearing upon the inner faces of said tumblers to force the vibrating ends of the same apart, substantially as and for the purpose specified.



2. The combination, with the case having slots to receive the journals of the tumblers and filling-plates to keep said journals in place, of the tumblers journaled at one end in said slots and curved springs passing around the journaled bearing-lips of said tumblers and having their ends resting against the inner faces thereof to force the vibrating ends of the same apart, substantially as and for the purpose specified.

3. The tumblers journaled in the case at their inner ends and having inwardly-projecting arms interlocked at the other, with a space between said arms to receive the key to draw these ends of said tumblers together, and springs connected with said tumblers to force the vibrating ends of the same apart, substantially as and for the purpose specified.

4. The combination, with the case and shackle, of tumblers extending lengthwise between the top and bottom of the shell or case and each having projections on the outer sides or faces thereof to engage notches in the shackle, and means for throwing the tumblers into engagement with said shackle, the tumblers being constructed to be disengaged from the shackle by a key, for the purpose specified.

5. The combination, with the case and shackle, of tumblers C C, journaled in the top of the case, extending toward the bottom thereof and provided on their outer faces with projections *c*, adapted to engage notches *b'* in the arms of the shackle, a spring bent around arms D, projecting inwardly from the upper ends of the tumblers and bearing against the inner faces of said tumblers, and rectangular arms G, projecting inwardly from the lower ends of the tumblers and lapping each other, so as to form an opening to admit the key, all constructed and operating substantially as specified.

886,511. LOCK. CHARLES R. WILLIAMS, Peoria, Ill. Filed Dec. 21, 1887. Serial No. 258,027. (No model.)

Claim.—The combination, with the lock-case A A, of the sliding block C, similarly recessed upon two opposite faces, the stud E and spring I, adapted to be inserted in either of such recesses, and the slots F F' in each of the plates, all constructed, combined, and co-operating substantially as set forth.

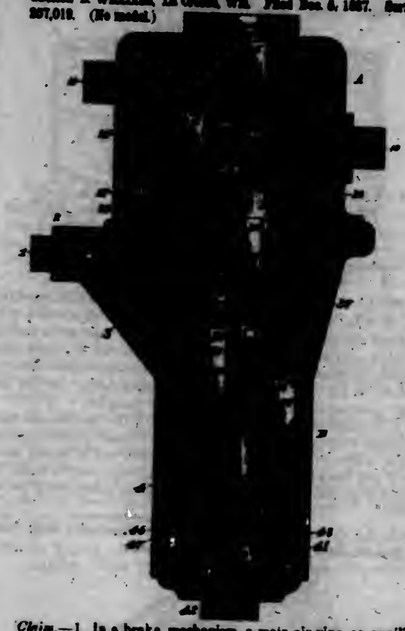
886,512. RAILWAY-CAR. EDMUND VERDEMANN, Chicago, Ill. Filed Mar. 1, 1888. Serial No. 265,827. (No model.)

Claim.—1. The combination, with a railway-car, of two extended housed-in platforms, one at either end thereof, each platform being closed at the end and being provided with sliding side doors, substantially as described.

2. The combination, with an electric-railway car, of a box or casing for covering the motor, the box being located at one side of the car and extending about half-way across the same, a free passage being left between the box and the side of the car.

3. The combination, with an electric-railway car, of a box or casing for the motor located at one side of the car, the car being provided with a door in its side through which access may be had to the motor.

886,513. TEMPORARY BINDER. WILLIAM H. WEBB, New York, N. Y. Filed Jan. 24, 1888. Serial No. 261,722. (No model.)



Claim.—1. A temporary binder comprising a U-shaped strip of metal having a spring-tongue formed therein near the edge thereof, substantially as specified.

2. A temporary binder consisting of a U-shaped strip of metal having opposite spring-tongues formed therein, substantially as specified.

3. The combination of a temporary binder, consisting of a U-shaped strip of metal having integral and oppositely-arranged spring-tongues with a cover for the same, and a tablet of paper inserted between said spring-tongues, substantially as specified.

4. The combination of the strip A, having the spring-tongues A' and clips A', with the cover B, secured to said binder by said clips, and the tablet C, mounted between said tongues, substantially as specified.

886,514. FLUID-PRESSURE AUTOMATIC-BRAKE MECHANISM. GEORGE B. WILLIAMS, La Crosse, Wis. Filed Dec. 6, 1887. Serial No. 257,012. (No model.)

Claim.—1. In a brake mechanism, a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple valve, in combination with an auxiliary-valve device actuated by the piston of triple valve for admitting compressed air from the main air-pipe into the auxiliary reservoir through a secondary feed channel, pipe, or groove for the purpose of recharging the auxiliary reservoir by means of a gradual increase of pressure in the main air-pipe and without releasing the brakes, substantially as set forth.

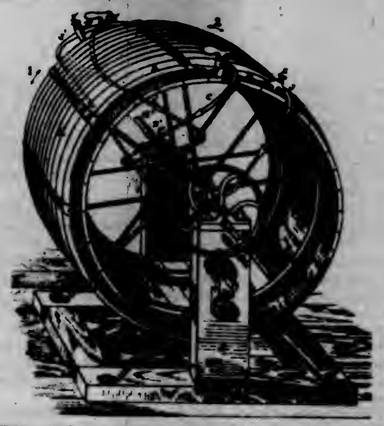
2. In a brake mechanism, a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple valve, in combination with an auxiliary-valve device actuated by the piston of triple valve in such manner that the preliminary upward traverse of said piston admits compressed air from the main air-pipe into the auxiliary reservoir through such auxiliary-valve device and a secondary feed channel, pipe, or groove for the purpose of recharging the auxiliary reservoir by means of a gradual increase of pressure in the main air-pipe and without releasing the brakes, and which piston, by a further upward traverse, admits air from the main air-pipe into the auxiliary reservoir through the ordinary feed-groove simultaneously with the release of the brakes, substantially as set forth.

3. In a brake mechanism, a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple-valve, in combination with an auxiliary-valve device actuated by the piston of triple valve for admitting compressed air from the main air-pipe into the auxiliary reservoir through a secondary channel, pipe, or groove governed and controlled by such valve device, as well as through the ordinary feed-groove in piston-chamber round edge of piston, in order that the auxiliary reservoir may be recharged, when the brakes are applied, with or without the release of the brakes, as may be desired, substantially as set forth.

4. In a triple-valve device, a case or chest, a piston fixed upon a stem and working in a chamber therein, a valve moving with the piston-stem and governing-ports, and passages in the case leading to connections with an auxiliary reservoir, a brake-cylinder, and to the atmosphere, respectively, an auxiliary valve actuated by the piston-stem

and controlling communication between passages leading to connections with a main air-pipe and a brake-cylinder, respectively, in combination with a second auxiliary valve actuated by the piston of triple valve and controlling a secondary communication between the main air-pipe and the auxiliary reservoir for the purpose of recharging the auxiliary reservoir, when the brakes are applied, by means of a gradual increase of pressure in the main air-pipe and without releasing the brakes, substantially as set forth.

5. The valve 32, actuated by piston 12, having graduating-valve 33 and port 34, in combination with port 35, cavity 36, and channels 37, 38, and 10, substantially as set forth.



386,515. CIDER-PURIFIER. JOHN W. WILLIAMS, Dexter, Mich. Filed May 7, 1888. Serial No. 273,013. (No model.)

Claim.—1. In a cider-purifier, the combination of the receiver or tank, the filter removably supported on the bottom thereof and provided with inclined sides formed of fabric and with imperforate bottom and top, a pulpous filtering material covering the fabric, a lateral discharge-opening, and transverse quilting-partitions provided with vent-apertures on top and bottom apertures communicating with the discharge, substantially as and for the purposes specified.

2. In a cider-purifier, the combination, with the receiver, of a filter of inverted-V-shape form with inclined sides formed of porous fabric and the bottom and sides imperforate, the partitions D, having apertures F and vents G, the vent-pipe H, the faucet L, and the board K, supported on the filter, all arranged to operate substantially as described.

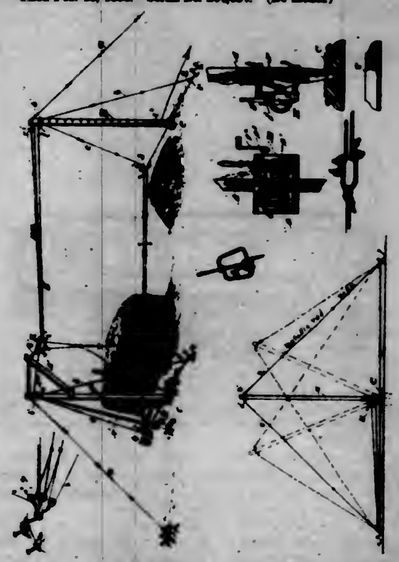
386,516. AIR-PUMP. FRANK J. WELLS, Winchester, Mass. Filed Mar. 12, 1887. Serial No. 230,594. (No model.)

Claim.—1. In a vacuum-pump, the combination of a curved pipe containing a body of mercury, and smaller tubes provided with suitable stop-cocks running from each end of the pipe to and through the ends of the axle of the machine, substantially as shown and described.

2. In a vacuum-pump, the combination of a pipe having a piston of mercury curved around a supporting-frame, tubes leading from each end of the pipe provided with suitable stop-cocks, and an axle made hollow at each end to allow the flow of air, one end of the axle being connected to a stationary pipe leading to the vessels to be exhausted, the other end similarly connected leading to the outer air or to auxiliary pumps, the whole system of pipes, tubes, and hollow axle being connected by air-tight joints, substantially as herein shown and described.

3. In a vacuum-pump, the combination of an axle made hollow at each end, either with or without an inclosed tube, a reservoir tube connected to one end of the axle and leading to the globes or other articles to be exhausted, (the connections to be all air-tight,) and the system of pipes, stop-cocks, and tubes, whereby the air is exhausted by the action of mercury flowing through a pipe, substantially as herein shown and described.

4. In a vacuum-pump, the combination of the curved pipe A', Fig. 6, containing a body of mercury, and the tubes K K' R R', provided with suitable stop-cocks, *x x' x x'*, with a supporting-frame, O, made to vibrate upon an axle, T, so that the mercury in the tube may by its own weight be made to pass by the motion of the frame from one end of the tube to the other and back again, substantially as described and shown.



5. In a vacuum-pump, the combination of the curved pipe A', Fig. 6, containing a body of mercury, the pipes provided with suitable stop-cocks, *x x' x x'*, the supporting-frame and the axle having a hollow end, the tube, pipes, and axle forming a continuous air-tight passage from the mercury to and through one end of the axle to the stationary pipe leading to the globes to be exhausted, substantially as shown and described.

386,517. HOSE-REEL. LEANDER W. WEED, Fontanelle, Iowa. Filed Apr. 16, 1888. Serial No. 270,894. (No model.)

Claim.—A hose-ring for hogs, composed of a single piece of wire bent into a triangular shape, and provided with a barb that projects from one corner outwardly, substantially as shown and described, for the purposes stated.

386,518. HAY-STACKER. MELVIN A. TRAILEY, Lakeside, Ohio. Filed Feb. 16, 1888. Serial No. 264,057. (No model.)

Claim.—1. In a hay-stacker, a set of poles, a cable for the hay-carrier between the poles, and guys by which the poles may be inclined to either side of a vertical position, whereby the hay may be unloaded at different points on a stack, substantially as set forth.

2. In a hay-stacker, a set of poles and a carrying-cable between the poles, in combination with flexible guys at the sides of the poles to incline the poles laterally, and a windlass to which the guys are connected, substantially as set forth.

3. In a hay-stacker, a set of poles and guys at the sides of the poles, with pulleys at the points where the guys are staked to the ground, and a windlass to take up and let out the guys when the poles are inclined laterally, substantially as set forth.

4. In a hay-stacker, a set of poles and flexible guys at the sides of the poles, with pulleys over which said guys travel, and a windlass tapering from its ends toward its center, to which said guys are attached and by which they are tightened and operated, substantially as set forth.

5. In a hay-stacker, two posts, one at each end of the stacker, and an elastic cable stretched between the poles, in combination with elastic guys to support the posts laterally, and a windlass over which the guys are run and by which they are operated to incline the poles laterally, substantially as set forth.

6. In a hay-stacker, a pair of posts and a cable stretched between the posts, in combination with guys on the posts to stretch said cable, elastic guys supporting the posts laterally, pulleys at the corners, over which said guys run, and a single windlass on which the lateral guys are wound, whereby both posts may be simultaneously inclined to either side, substantially as set forth.

7. In a hay-stacker, an elastic carrier-cable, a block having a pulley arranged within the cable passes, and a link to hook on the pole, in combination with a cross-pin at the opposite extremity of the cable for engaging the carrier, substantially as set forth.

8. In a hay-stacker, an elastic cable and supports for the cable at its ends and connections for the cable with its supports consisting at one end of a pulley-block and at the other end of a yoke with a cross-piece for engaging and holding the carrier, substantially as set forth.

9. In a hay-stacker, a carrier provided with a substantially A-shaped recess in its bottom and an open slot with flaring projections at the end of the carrier near its top, in combination with a hay-hook link that enters the A-shaped recess, a yoke that enters the open slot, a disk to engage the yoke, and a pivoted lever to support the hay-hook link, substantially as set forth.

10. In a hay-stacker, a carrier provided with locking and releasing mechanism for the hay-hook-supporting link, and the yoke to hold the carrier on the cable, consisting of a bell-crank lever having a catch on its lower extremity to engage the hay-hook link, and a push-bar for the lever, with a notched disk for engaging the yoke which is locked by the upper arm of the lever, substantially as set forth.

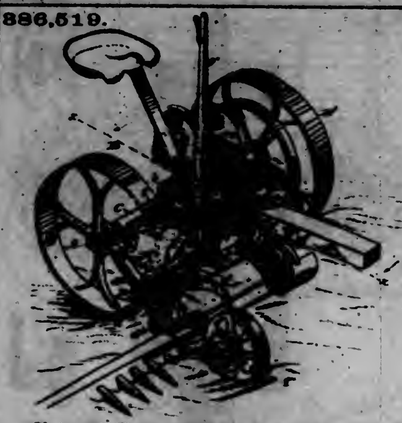
11. In a hay-stacker, a carrier provided with a recess in its bottom, a bell-crank lever having a catch on its lower extremity and pivoted to swing the catch into the said recess, a push-bar attached to the upper arm of the lever and extending down to said recess, and a hay-hook link, substantially as set forth.

12. In a hay-stacker, a carrier having a recess with a flaring mouth leading thereto at an upper corner in the carrier, in combination with a rotating locking-disk set in said recess, a yoke for holding the carrier, and a catch for the disk to prevent its rotation, substantially as set forth.

13. In a hay-stacker, a carrier having an open recess in its side near the top, a rotating disk set in said recess to engage the yoke which holds the carrier, said disk having recesses on its periphery to engage the yoke and the pivoted lever, and a stop to limit the rotation of the disk, substantially as set forth.

14. In a hay-stacker, a carrier having a recess in its bottom and a recess at one side near its top, in combination with a bell-crank lever having a catch on its lower arm, a push-bar extending from the lower recess to the upper arm of said lever, and a notched disk set in the upper recess adapted to be locked by the upper arm of the lever, substantially as set forth.

15. In a hay-stacker, an elastic cable having a cross-pin fixed thereto to hold the carrier, in combination with a carrier having a recess at one side near its top with flaring projections, a rotating locking device having a catch to engage said cross-bar in said recess, and a pivoted catch to hold the locking device, substantially as set forth.



16. In a hay-stacker, a carrier having a draft-rope attached at one side and passing over a pulley at the other side, with a hay-hook suspended between the point of attachment and the pulley, in combination with a bell-crank lever pivoted in the carrier and having a catch to engage a link on the hay-hook, a push-bar on said lever, and a locking device for the lever to hold the catch thereon in engagement with the hay-hook link, substantially as set forth.

17. In a hay-stacker, a pair of posts, and an elastic cable stretched between said posts and forming a double track, the ends of said cable being connected to a cross-piece in a yoke at one post, and passing around a horizontal pulley at the other, all in combination, substantially as set forth.

18. In a hay-stacker, a carrier having a bell-crank lever, a disk in the upper part of the carrier, and a yoke engaged by the disk, in combination with a counter-weight and cord by which the carrier is returned to be loaded, substantially as set forth.

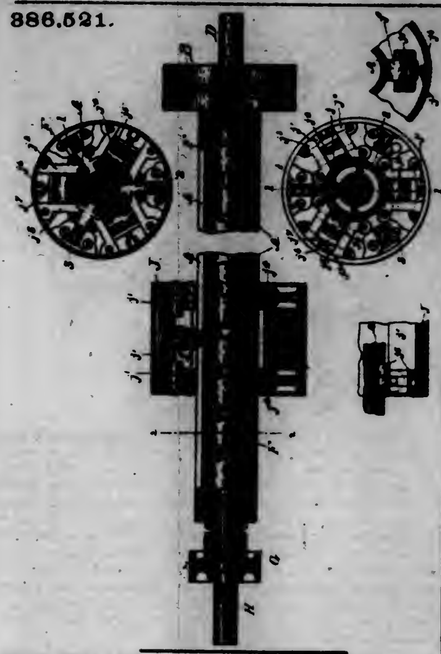
19. In a hay-stacker, a carrier having pulleys at each side, a double-track cable on which said pulleys run, and a pulley-block having shoulders adapted to rest against the end of the carrier and provided with links to attach the block to one of the posts of the stacker, substantially as set forth.

386,519. MOWING-MACHINE. HENRY BRADLEY, Havana, N. Y. Filed Feb. 13, 1888. Serial No. 263,886. (No model.)

Claim.—1. The combination, with the draft-frame and main frame, the latter having sleeves C and C', provided one with a pendent arm, c, and the other with the elastic coupling-arm C², of the thrust-bar and shoe D, having both a longitudinal and a transverse pivotal connection with said main frame, and provided with the stepped flange f, the gag-lever G, pivoted on said thrust-bar, the rack G', pivoted to said gag-lever and adapted to engage the draft-frame, as described, the arm or step H, pivoted on said draft-frame, said gag-lever and arm or step being both adapted to rest on the thrust-bar on the stable side of its longitudinal pivot, and the lifting-lever F, also pivoted on said draft-frame and connected with the thrust-bar and shoe at a point on the grain side of the longitudinal pivot of the latter, all substantially as and for the purpose specified.

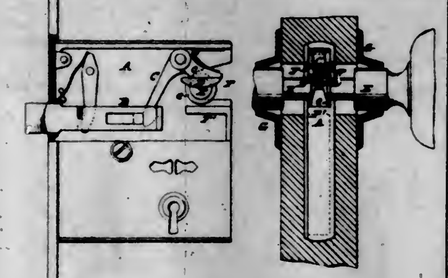
2. The combination, with the draft-frame and the longitudinally-pivoted thrust-bar and shoe, of the gag-lever G, pivoted on said thrust-bar, the rack-bar G', pivoted to said gag-lever and provided on its upper end with ratchet-teeth g, adapted to engage a tooth, c', on the draft-frame, and the sliding block or shoe F' and spring F' on said draft-frame for holding said rack-bar normally out of engagement with said frame, substantially as described.

386,520. AUTOMATIC GAS-VALVE. MELVILLE C. BRAGDON, Newton, Mass. Filed Apr. 19, 1887. Serial No. 235,258. (No model.)



Claim.—1. The combination of the burner-tube provided with brackets *f f'* at each side of the tip, with a gas-valve having a controlling-arm, *d*, working in one of said brackets, and an expansive rod or bar, *e*, located in position to be exposed to the flame and extending from one to the other of said brackets and constituting a locking device for said valve-controlling arm, substantially as described.

2. The combination of the burner-tube provided with brackets at opposite sides of the tip, with a gas-valve having a controlling-arm working in a notch in one of said brackets, a rod connected with the other bracket, extending over the burner, and terminating opposite one side of said arm, and a co-operating adjustable clamping member secured in the bracket at the other side of said arm, substantially as described.

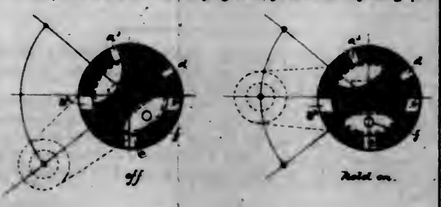


386,521. CARD-GRINDER. JAMES BUNN, Westbrook, Me., assignor to himself and Woodbury Kidder Bunn, same place. Filed June 9, 1887. Serial No. 240,603. (No model.)

Claim.—In a card-grinder, hollow shaft A, having a longitudinal slot, screw F, and drum J, provided with a dog, *j*, which engages screw F through the longitudinal slot in shaft A, in combination with rollers *f*, which are intermediate drum J and shaft A, and keep the drum out of contact with the shaft, substantially as and for the purpose set forth.

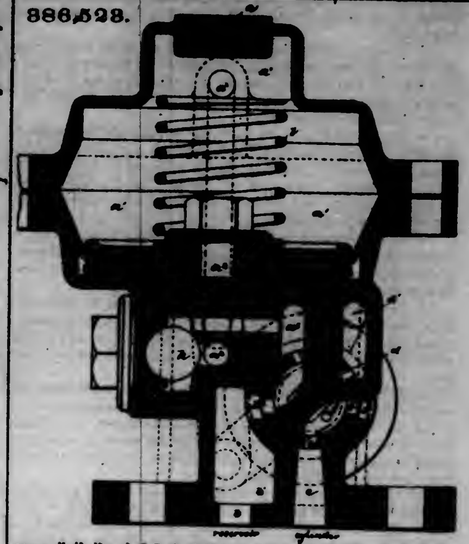
886,521.

886,522. LATCH-CASE. CHARLES W. BULLARD, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,263. (No model.)



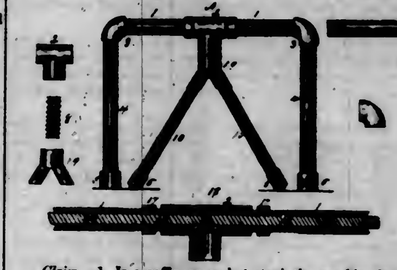
Claim.—In a door-latch, the combination of the latch-case A, having an opening, F, extending through its edge, the knob shank or spindle E, engaging the side of the latch-case through said opening and provided with lug or cam D, and the rose or escutcheon G, essentially as set forth.

886,523. AUTOMATIC COCK-VALVE. J. FAIRFIELD CARPENTER, Berlin, Germany. Filed Feb. 7, 1888. Serial No. 263,204. (No model.)



Claim.—1. An automatic cock apparatus comprising a plug-cock, *y*, having various passages a^5, b^5, *c*, *d*, *i*, and *f*, substantially as and for the purposes described, in combination with a diaphragm, *x*, used to turn said plug-cock *y* through different degrees of a circle by means of variations of pressure induced on opposite sides of said diaphragm.

2. In combination with a plug-cock, *y*, and the adjoining pas-



Off. *Acted on.*

886,528.

sages d' d^3 d^4 and *f f*, the balance-valve *s*, for the purpose of automatically regulating the exhaust of the main conduit *a* by means of the pressure then in the cylinder.

886,524. COFFIN OR CASKET STOOL. BENJAMIN G. CARLER, Cleveland, Ohio. Filed Jan. 19, 1888. Serial No. 261,511. (No model.)

Claim.—1. In a coffin or casket stool, the combination, with a bearer having standards, of an intermediate movable T provided with a standard or standards, and stops on the bearer to limit the movement of the T and straddle of the standards, substantially as and for the purpose specified.

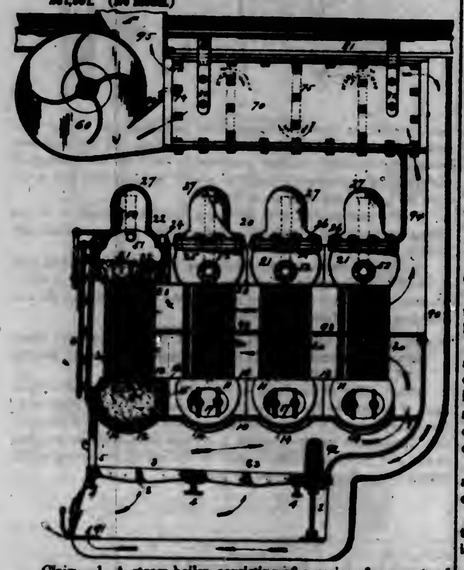
2. In a coffin or casket stool, the combination, with a bearer having standards, of an intermediate movable T provided with a standard or standards, and adjustable stops on the bearer, substantially as and for the purpose specified.

3. In a coffin or casket stool, the combination, with a bearer, of an intermediate movable T adapted to turn on the threaded ends of the bearer-sections, and provided with a standard or standards, and jam-nuts on the bearers for limiting the movement of the T, substantially as and for the purpose specified.

4. In a coffin or casket stool, the combination, with a bearer having standards, of an intermediate movable T provided with a standard or standards, and a friction-clamp which binds the T on the bearer to produce friction between the parts, substantially as and for the purpose specified.

5. In a coffin or casket stool, the combination, with a bearer having standards, of a central pipe or rod, a movable T provided with a standard, and a set-screw which passes through the central rod of the bearer and binds on the T, substantially as and for the purpose specified.

6. In a coffin or casket stool, the combination, with a bearer provided with standards, of a movable T and a Y-fitting provided with standards, substantially as and for the purpose specified.



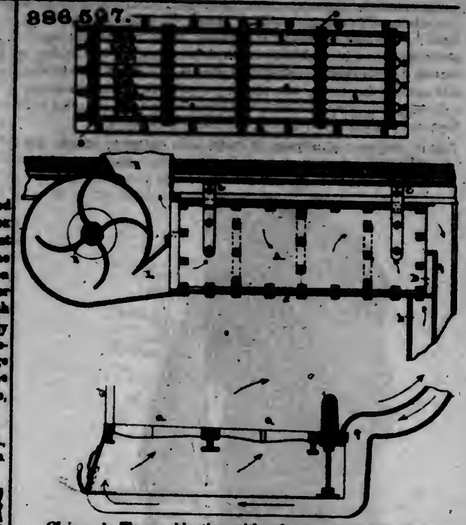
886,525. AXLE-BOX. LEMUEL B. CLARK, Stoughton, Wis. Filed Nov. 26, 1887. Serial No. 256,572. (No model.)

Claim.—An axle-box having at its inner end an outwardly-projecting flange integral therewith, which axle-box is inserted and secured in a hub provided with a recess at its inner end about the box, the box being so inserted in the hub as to form a channel or chamber about the axle-box between the flange and the bottom of the recess in the end of the hub, in combination with an axle having a shoulder thereon and integral therewith, which shoulder fits a chamber-flange of proper size to receive the flange of the box, and which flange integral with the axle projects around and beyond the flange on the axle-box nearly to the bottom of the recess in the inner end of the hub, which axle-flange is provided in its under side with a recess, K, beyond the flange on the box and only opposite to the chamber formed between the flange on the box and the bottom of the recess in the end of the hub, substantially as described.

886,525.

886,526. STEAM-BOILER. H. BRADY CLARK, Washington, D. C., and FRANK B. KING, Baltimore, Md. Filed Mar. 31, 1888. Serial No. 267,991. (No model.)

Claim.—1. A steam-boiler consisting of a series of segments of the character described placed side by side and secured together, abutting and having direct communication with each other, forming the lower member of a unit, a series of segments similarly placed and connected forming the upper member, and connecting-tubes between said members.



2. In a steam-boiler, the combination of a flat plate forming the tube-plate of a boiler member and a series of arched sections attached to said plate, forming therewith a series of segments arranged side by side and connected together, substantially as described.

3. The combination, in a steam-boiler, of a bottom member and a top member connected thereto by tubes, a bonnet on the top member, said bonnet provided with a steam-dome, and a steam-pipe leading from the dome through the top member to the outside of the boiler, as set forth.

4. In a steam-boiler, the combination, with a steam-section having a number of steam-domes, of separate pipes leading down from the top of the domes inside the steam-section to the outside of said section and thence to a drum common to all the domes, as set forth.

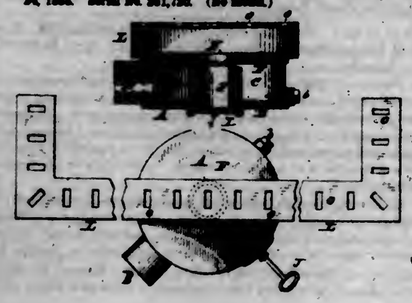
886,527. HOT-AIR FURNACE. NATHAN B. CLARK, Washington, D. C., and FRANK B. KING, Baltimore, Md. Original application filed Mar. 21, 1888, Serial No. 267,991. Divided and this application filed May 10 1888. Serial No. 272,469. (No model.)

886,527.

Claim.—1. The combination, with a furnace, of an interchanger consisting of a casing divided into narrow passages by thin plates, alternate passages communicating with and receiving air from the outer atmosphere and conveying it toward the furnace, and alternate passages receiving the products of combustion from the furnace and conveying them in reverse direction from that of the moving air-currents and in proximity thereto, all substantially as set forth.

2. The combination, with a furnace, of an interchanger consisting of a number of passages separated by thin plates, alternate passages communicating with an air-forcer, and alternate passages leading to the smoke-pipe, the inflow-passages leading toward and the outflow-passages away from said furnace, substantially as described.

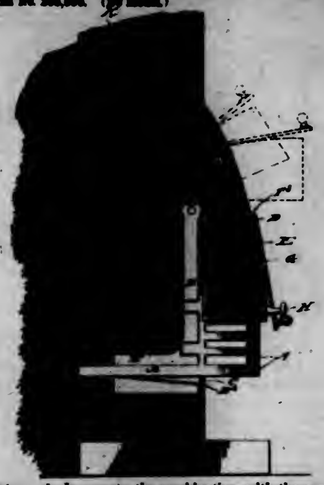
3. The interchanger, substantially as described, consisting of a casing, and a number of thin metallic plates within the casing separated by suitable spacing-pieces, adjacent plates at the ends being turned toward each other and riveted, substantially as described, all in combination.



4. The interchanger described, consisting, essentially, of a casing, a number of thin plates dividing said casing into narrow passages from end to end, a number of spacing-pieces between the plates extending inward from the casing between the plates, arranged as described, so as to partially close the passages alternately at one side and at the other, and tie-rods for holding all in place, the combination being and operating substantially as described.

5. The interchanger described, consisting, essentially, of a casing and a number of thin vertical plates dividing the same into narrow channels, and a movable bottom piece to said casing, as set forth.

6. The combination, with the casing of the interchanger, of asbestus sheets inside the same, and thin partition-plates resting in grooves in said sheets, as set forth.



7. The combination, with a boiler-furnace, of an air-forcer, an air-interchanger of substantially the character described, and a double boiler-casing having an air-passage between the walls open to the air at one end and leading to said air-forcer at the other end, all substantially as described.

886,528. TUYERE. JAMES GUNNING, Dublin, N. Y. Filed Jan. 24, 1888. Serial No. 261,720. (No model.)

Claim.—The annular casing A, having the nozzle B and the upright tube D cast therewith, and having also a central opening, H, above said tube, in combination with an auxiliary conduit having a central opening, and a downwardly-extending flange, N, surrounding said opening and fitting into the said opening H, this auxiliary conduit being shaped to conform to the work required and provided with discharge-openings *o* in its top, substantially as set forth.

386,529. CONSUMED SMOKE AND CHIMNEY-DRAFT CONTROLLER. CHARLES H. CUMMER, Chicago, Ill. Filed Feb. 11, 1888. Serial No. 263,668. (No model.)

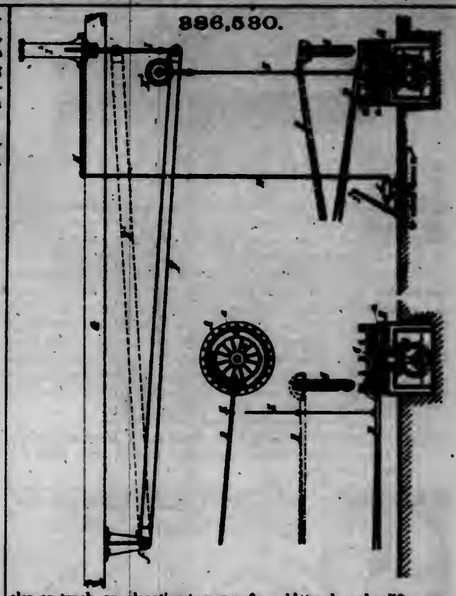
Claim.—1. In a grate, the combination, with the grate-bars, of standards removably secured thereto, and a blower pivoted to said standards, substantially as described.

2. In a grate having a flue leading out from its top, the combination of the sides of the grate and a blower pivoted thereto, said blower having a damper in its upper portion adapted to be swung below the said flue to regulate the draft, substantially as described.

3. In a grate, the combination, with the outer grate-bars, of a pair of standards having grooves in the sides of their lower ends, in which said bars are adapted to be fitted, a blower pivoted to said standards, and a damper formed in the upper part of said blower, substantially as described.

4. The combination, with a grate having a flue leading out from its top and vertical standards secured thereto, of a blower pivoted to said standards having a damper in its upper portion, said blower arranged to be swung on said standards, its upper end coming beneath said flue and its lower end projecting out from the top of the grate to act as a deflector, substantially as described.

5. In a grate, the combination, with the grate-bars, of a pair of standards having grooved feet, a key for securing the same in place, a blower pivoted to said standards, and a flexible catch secured to one of said standards, substantially as described.



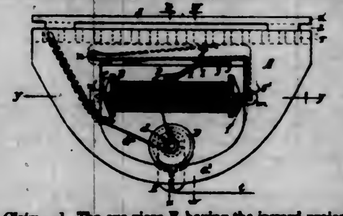
6. In a grate, the combination, with the grate-bars, of a pair of standards having inclined grooves in their outer lower portions and journal-bearings on their upper ends, a beveled key for securing the standards to the grate-bars, a blower having a damper in its upper portion and a pivoted lever for operating the same, and a spring-catch secured to one of the standards having ratchet-teeth on its side adjacent to the blower, substantially as described.

386,530. WIRE-ROD-REEL DISCHARGING MECHANISM. FRED H. DANIELS, Worcester, Mass. Filed Apr. 16, 1887. Serial No. 235,008. (No model.)

Claim.—1. The combination, with a reel having flanges to support the coiled rod above the bottom thereof, of a discharging implement fulcrumed in connection with a traveling supporter, and having at its forward end a hook or jaw adapted to be inserted between said flanges and passed under the side of the coil to remove it from the reel and transfer it to a place of deposit, substantially in the manner set forth.

2. The combination, with a reel having flanges that support the coiled rod above the bottom thereof, of a coil-discharging implement having at one end a hook adapted to be inserted between said flanges under the side of the coil, at its other end a handle or handles for manipulation thereof, and intermediate thereto a fulcrum on which said implement swings as a lever supported in connection with a traveling carrier or truck, an elevating-tramway for said truck, and a lifter connected with one end thereof, whereby said tramway can be raised and lowered to oppositely-inclined positions, to facilitate the running of said discharging-implement truck by gravity in either direction to or from the reel, substantially as set forth.

386,530.



3. The combination, with elevating discharging-tongs, of a reel having flanges which support the coiled rod clear of the reel-plate and walls in the coiling mechanism.

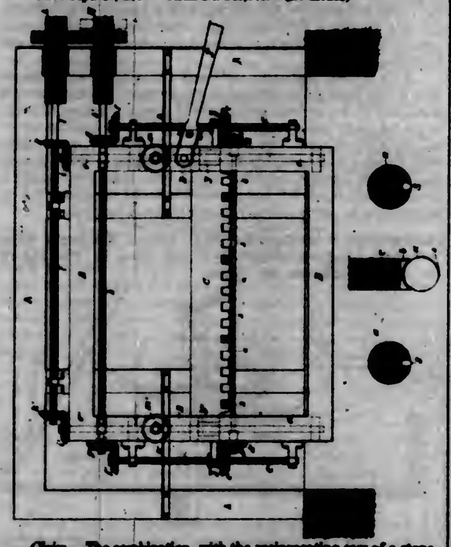
4. The reel having its coil-supporting plate provided with flanges or ribs for containing the coil of wire rod, and an open center or space wherein said ribs are omitted to facilitate the introduction of the discharging-tongs, substantially as set forth.

386,531. LOOM-SHUTTLE. LEVI W. FISHER, Worcester, Mass., assignor of one-half to Albert H. Steele, same place. Filed Nov. 26, 1887. Serial No. 256,003. (No model.)

Brief.—The shuttle-body is provided with a detachable back piece of vulcanized fiber, forming a deep recess in rear of the rack. The rotary take-up is carried by the eye-piece in the bow of the shuttle. The spindle has provided for it rawhide seats, and has an offset at one end which is locked in place by the end of the spring which presses the tender-bar against the cop.

Claim.—1. The eye-piece E, having the inward projection *e*, and the rotating take-up D, mounted thereon, as described, in combination with the shuttle-frame having the bow portion *a'* and the spring G and spring-connection G', arranged as shown, for the purpose set forth.

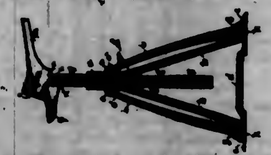
2. The combination, with the shuttle-frame and spindle, of a spring provided with a movable end or bar that engages the end of the spindle and locks it in position within the shuttle-frame, for the purpose set forth.



3. The combination of the shuttle-frame A, the spindle C, the spring F, provided with an extension or locking-arm, *f*, that normally extends over the spindle-rest *n*, and the friction-pad arm I, pivoted to said frame and adapted for forcing back said spring and retracting said locking-arm when the pad is pressed backward to the limit of action, substantially as and for the purpose set forth.

4. The shuttle-frame having the cylindrical rawhide spindle-bearings cast or set therein, and provided with a rest at the rear side thereof, as shown, and the auxiliary back plate, K, with the shoulder *l* and depending flange K', said back plate being attached to the upper rear part of the frame and presenting the deep upward groove L to rear of the rest-tooth, as shown and described.

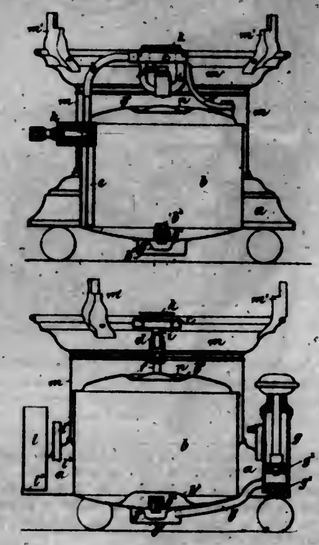
6. The combination, with the shuttle-body A, having its back A' provided with a right-angular rabbet constituting the finished gear-rack T, of the detachable back plate, K, having the flanges S and K' and shoulders *l* and A, as shown, said back plate being detachably secured to the upper part of the shuttle-back in rear of the gear-rack, with the shoulder *l* above the median plane of the shuttle-body.



7. A loom-shuttle having a wood body furnished on its rear part with the notched rack, as shown, and provided with an auxiliary back plate of vulcanized fiber made wider than the thickness of the body, rabbeted on its front side to form a bearing-shoulder, and rigidly and detachably connected to the back of said body, with its top and bottom edges projecting above and below the same, in the manner shown and described.

386,532. STONE-SAWING MACHINE. WILLIAM PLYER, New York, N. Y., assignor of one-half to Thaddeus A. Jackson, same place. Filed Sept. 17, 1887. Serial No. 249,972. (No model.)

Claim.—The combination, with the reciprocating saw of a stone-sawing machine and bearing-plates, substantially as specified, fastened at convenient distances along the edge of said saw, of a cylindrical rod extending through the whole length of the edge of said saw, mounted in bearings on the back of said saw, running in bearings in said bearing-plates upon the edge of said saw, armed with diamond-bort and similarly hard material, revolving continuously in one direction around its own axis, moving lengthwise with said saw in its reciprocating motion, and, being guided by the said saw and the said bearing-plates in the edge thereof, forming the cutting-edge of said saw, substantially as and for the purpose set forth.



386,533. LIFTING-JACK. ELI FRANZ, Columbus, Ohio. Filed Apr. 30, 1888. Serial No. 272,329. (No model.)

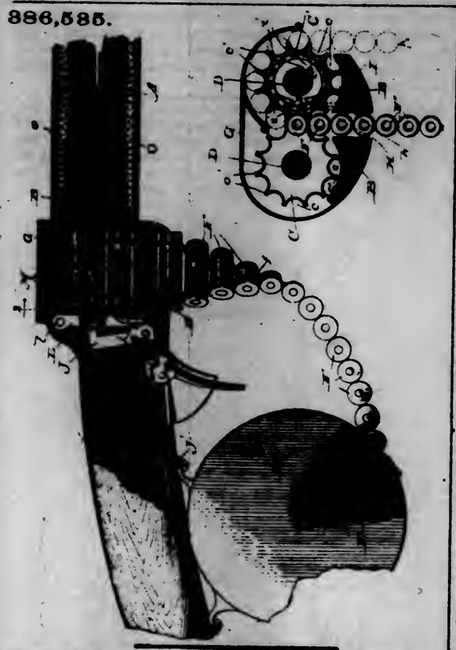
Claim.—In a lifting-jack, the combination, with the frame, consisting of sleeve *a*, standards *b*, and base *d*, of the vertical elevating

toothed or notched bar F, adapted to be supported at different heights within said sleeve, pawls *i*, pivotally supported, as described, in said frame, said elevating-bar having step-lugs *f*, and the pivoted lever *m*, having head *l*, provided with shoulder *p*, substantially as and for the purpose specified.

386,534. VAPOR-BURNER. JAMES P. GOODMAN, Vining, Durand, engineer to Earl Cadogan, London, England. Filed Jan. 28, 1887. Serial No. 225,854. (No model.) Patented in Germany Nov. 14, 1886, No. 39,976; in Norway Jan. 25, 1884; in England Apr. 28, 1884, No. 6,288; in France May 6, 1884, No. 161,941; in Belgium May 31, 1884, No. 66,324, and in Austria-Hungary Oct. 2, 1884.

Claim.—1. The combination of a closed chamber, a reservoir for containing liquid hydrocarbon, a pump for forcing said liquid hydrocarbon from said reservoir into said closed chamber and thus compressing the air therein, a vaporizing-chamber and discharge-nozzle located above said closed chamber, and a pipe for conducting said liquid hydrocarbon from said closed chamber to said vaporizing-chamber, said chamber having a depression in its top beneath said vaporizing-chamber adapted to receive inflammable liquid for effecting the preliminary heating of said vaporizing-chamber, substantially as described.

2. In a vapor-burner, the combination, with the annular vaporizing-chamber *c*, the discharge-nozzle *d*, concentric therewith, and a pipe, *i*, connecting said chamber and nozzle, of a deflector, *k*, provided on its under side with a casing, *F*, fitting into said vaporizing-chamber, and having holes F^1 F^2, all substantially as and for the purpose set forth.



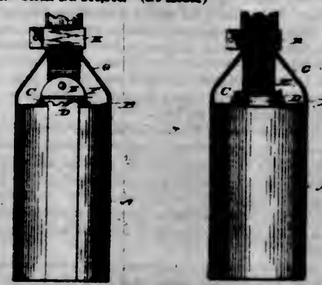
386,535. MAGAZINE FIRE-ARM. HENRY H. GRAHAM, Chicago, Ill. Filed June 9, 1887. Serial No. 240,703. (No model.)

Claim.—1. In a hand fire-arm, in combination with a barrel and suitable firing mechanism, two rotatable cylinders having grooved exteriors adapted to form, when the cylinders are rotated, a firing-chamber in line with the bore of the barrel, one of said cylinders provided on its rear end with a ratchet, and a pawl actuated by the hammer and adapted to engage the ratchet, whereby to rotate the cylinders, substantially as set forth.

2. In a hand fire-arm, in combination with a barrel and suitable firing mechanism, two exteriorly-grooved rotatable cylinders, one of which is provided on its rear end with a ratchet and one with holes to receive the end of a locking-pin, a pawl actuated by the hammer and adapted to engage the ratchet, whereby to rotate the cylinder, and a spring locking-pin actuated by the pawl and adapted to enter the holes of the cylinder, whereby to lock the latter, substantially as described.

3. In a hand fire-arm, in combination with the cartridge-cylinder and hammer, a recoil-lever pivoted at one end and depending between the cartridge and hammer, and its free end adapted to engage the latter, and carrying a firing-pin, substantially as described, whereby the shock of the explosion will be received by said pivoted recoil-lever and transmitted to the hammer, so as to cock the latter.

386,535.



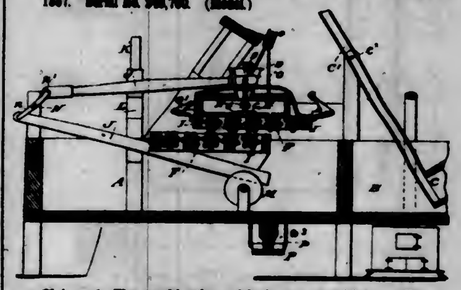
386,536. RUNNING-STITCH SEWING-MACHINE. SAMUEL HAHN, Berlin, Germany. Filed Apr. 30, 1887. Serial No. 236,514. (No model.) Patented in Belgium Apr. 30, 1887, No. 77,126; in England May 17, 1887, No. 5,880; in Germany June 24, 1887, No. 40,730; in Sweden Aug. 19, 1887, No. 1,001; in France Oct. 12, 1887, No. 183,616, and in Austria-Hungary Oct. 16, 1887, No. 18,008.

Claim.—In the running-stitch sewing-machine, a horizontal stationary needle having a straight part next to its point, another straight part at the other end of said needle in a higher plane than the first straight part, and an intervening undulating part, in combination with the grooved toothed wheels *a*, *c*, *d*, *b*, and *e*, the first three of which fit the curvatures of said undulating part, while the wheels *b e* are respectively above and below the point of the needle and the straight part next to said point, substantially as set forth.

386,537. MUD-BUCKET. JOHN R. HALL, Rover, Tenn. Filed Mar. 8, 1888. Serial No. 266,802. (No model.)

Claim.—As a new article of manufacture, the mud-bucket herein described, consisting of a cylinder, A, of equal radius throughout, suspended by the straps G, conically formed toward their junction with the binding-straps H, the said cylinder containing near its top a diaphragm, B, to which an upwardly-projecting flange, C, is secured, forming a valve-seat, D, for the flap-valve E, whereby the mud is drawn up and maintained in the cylinder by reason of an artificial vacuum above the column and atmospheric pressure beneath the same.

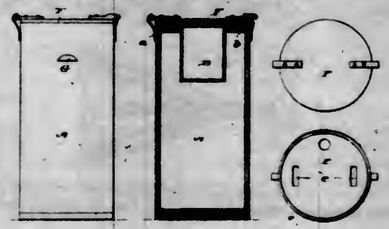
386,538. ROTARY CUTTER. H. TRAUGOTT HAEBERLE, Waltham, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Apr. 16, 1888. Serial No. 270,702. (No model.)



Claim.—1. In a rotary cutter, the combination of a central hub provided with a series of radial openings, a series of cutter-blades each provided with a transversely-grooved shank which is adapted to fit and project into the openings in said hub, and a plate revolvable about the axis of said cutter and provided with ribs which project into the grooves in said shanks to lock and secure said cutter-blades in position.

2. In a rotary cutter, the combination of a central hub provided with a series of radial openings, a series of cutter-blades each provided with a transversely-grooved shank which is adapted to fit and project into the openings in said hub, and a plate revolvable about the axis of said cutter and provided with ribs eccentric to said axis which project into said grooves in the shanks of the cutter-blades to hold them in position and at the same time move them toward or from the axis when desired.

3. In a rotary cutter, the combination of a block having flanged ends in which are radial openings, a hub mounted in a bearing in said block, and having as many radial pairs of arms as there are openings in the flanges of said block, with the walls of which openings the inner sides of said arms form a continuation, a series of cutter-blades each having a transversely-grooved shank adapted to fit and project through said openings and between said arms, and a plate revolvable about the axis of said hub and provided with ribs which project into said grooves in said shanks to hold said blades in position.



386,539. WASHING-MACHINE. EPHRAIM HERRINGTON, Mount Vernon, assignor of one-half to H. H. Bush, Texas, Ga. Filed Sept. 14, 1887. Serial No. 249,702. (Model.)

Claim.—1. The combination, with the upper and lower rollers on a washing-machine and the roller-frames, of the two clamps Q Q', one arranged upon each end of the upper roller-frame, whereby the clothes may be held between the rubbers, as described.

2. In a washing-machine, the combination, with the rollers, roller-frames, and superposed water-reservoir E, of the water-supply tank B and the lever carrying at one end the bucket C, as and for the purpose described.

386,540. MILK-CAN. CHARLES M. HOLMES, New Orleans, La. Filed Oct. 17, 1887. Serial No. 252,696. (No model.)

Claim.—1. The combination, with the can having the annular recess, as described, of the ice-chamber having the supporting-flange, the vent-tubes arranged in the said flange and the cover having grooves in its under side to receive the said tubes, substantially as specified.

2. The combination, with the can recessed as described, of the ice-chamber having the supporting-flange provided with the threaded aperture, the screw-plug for closing the same, the vent-tubes in the said flange, and the cover having the recesses to receive the said tubes, substantially as specified.

386,541. RAILWAY-SIGNAL-CIRCUIT BREAKER. EDWARD B. IVES, New York, N. Y. Filed Nov. 12, 1885. Renewed Oct. 24, 1887. Serial No. 253,264. (No model.)

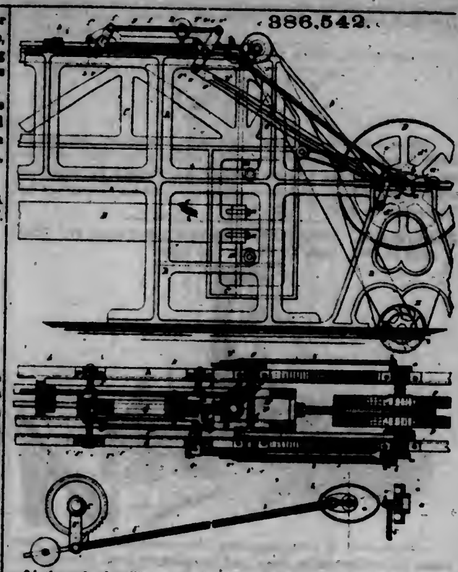
Claim.—1. A key-block composed of a horseshoe-magnet, a piece of soft iron so pivoted as to swing one of its ends between the poles of said magnet, and to make contact with one or the other thereof as it may be swung in one or the other direction, and adapted to have its position changed by the passage near its end of the pole of a powerful magnet of similar polarity to that of the pole of the horseshoe-magnet with which the free end of said pole-piece is at that time in contact, a circuit-wire attached to said pole-piece, a contact-post, the other circuit-wire attached to said contact-post, which is so located that when said pole-piece is swung in one direction it makes contact therewith, and when swung in the other direction it breaks contact therewith, all constructed, arranged, and combined substantially as and for the purpose set forth.

2. The combination of magnet C, pole-piece A, pivoted as described, contact-posts c^2 c^3 c^4 c^5, arranged as described, whereby said pole-piece will make contact with one pair of them and the magnet, in whichever direction it is swung, and wires d d' e e', all as and for the purpose described.

3. A circuit-breaker composed of three magnets, C' C^2 C^3, two pole-pieces, A A', insulated from each other and pivoted to swing between the opposite poles of said magnets, as described, wires D D', connected to said pole-pieces, respectively, the block d', connected to C' and arranged to pass between and make contact with said pole-pieces when they are swung in one direction, and the blocks d^2 d^3, insulated from each other and connected, respectively, to magnets C^2 and C^3 in such position that they will pass between and make contact with A and A' when swung away from C', and of such a width that such contact will be made before contact with d' is broken and the wires E E' connected with C^2 and C^3, respectively, all combined as and for the purpose specified.

4. The combination, with a telegraph circuit-wire, of the described key-block connected therewith, a partial circuit-wire upon a telegraph-car, and magnets also upon said car, and arranged to pass opposite poles in close proximity to said key-block, whereby the telegraph-circuit will be broken and shunted through said car, as and for the purpose specified.

5. In a railway-telegraph system, two or more circuit-wires running along the railway-track and provided with key-blocks, as described, a partial telegraph-circuit upon a car upon said road, and a magnet upon said car provided with means for causing said magnet to operate the key-blocks of any one of said circuits, as and for the purpose specified.



6. The combination, with a telegraph-circuit, of the described key-block in proximity to the rails of a railway, and magnets, arranged, as described, upon a car upon said rails, whereby the passage of said car over said rails will bring the magnets of opposite polarity upon said car in position to break or close the circuit with which said key-blocks are connected, as specified.

7. The combination, with a telegraph circuit-wire, of a key-block adapted to be operated to make and break said circuit by the passage near it of magnets of opposite polarity and located in close proximity to the rails of a railway, together with magnets of opposite polarity upon a car upon said rails, arranged as described, whereby the passage of said car over said rails will bring said magnets of opposite polarity in position to successively break and close the circuit with which said key-blocks are connected, for the purpose specified.

386,542. STONE-SAWING MACHINE. THADDEUS A. JARMAN, New York, N. Y. Filed Aug. 17, 1887. Serial No. 247,231. (No model.)

Claim.—1. The combination, with a wheel revolving upon a shaft and having an eccentric periphery, of an oscillating lever attached pivotally by one end to a proper support and having at the other end

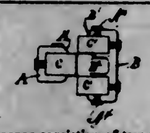
386,542.

a friction-wheel rolling upon the face of the eccentric wheel, a connecting-rod communicating motion to a bell-crank, the said bell-crank, and means connected therewith, substantially as hereinbefore described, to lift the saw of a stone-sawing machine for its clearance, substantially as and for the purpose set forth.

2. The combination of the radial slot and the eccentric periphery hereinbefore described in one wheel, whereby the one wheel, by means of the mechanism hereinbefore described, is enabled to feed the saw, and also to lift the saw for its clearance, substantially as and for the purpose set forth.

3. In a stone-sawing machine, the wheel *a*, mounted upon a revolving shaft and having the radial slot *a'*, in combination with the wrist-bolt *b*, the connecting-rod *b'*, the ratchet-wheel *c*, the pawl *c'*, the lever b^3, the shaft *l* and its bearings, the bevel-wheels l' b^4, the shaft *k* and its bearings, the spur-wheel *h*, the spur-wheel *i* and its bearings, the shaft *i'* and its bearings, the bevel-wheels i^2 i^3, the screws *m* and their bearings, the nuts *n*, the saw B, and the reciprocating frame or sash C and its supports, substantially as and for the purpose set forth.

4. In a stone-sawing machine, the combination of the wheel *a*, mounted upon a revolving shaft and constructed with an eccentric periphery, with the lever *d* and its pivotal support, the friction-wheel d^2, the connecting-rod *e*, the lever *o*, the arm o', the shaft o^2 and its bearings, the connecting-rod *f*, the bell-crank f^2 *s*, the shaft *r* and its bearings, the bar *g*, the roller *h*, the rod *g'*, and the reciprocating frame or sash C, with its supports, substantially as and for the purpose set forth.



386,543. COMPOUND ELECTROMOTOR FOR ELECTRIC RAILWAYS. ALFRED J. JARMAN, London, England. Filed Nov. 24, 1886. Serial No. 219,264. (No model.) Patented in England Feb. 20, 1886, No. 2,703.

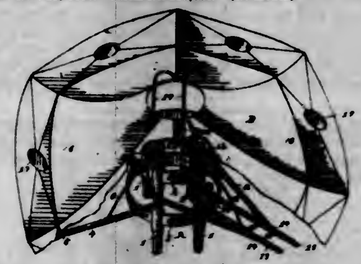
Claim.—The combination of levers K K', rods L L, rocking shafts N N', the tilting plates O O', and the brushes G G', with the electromotor and gearing for giving motion electrically to the car in a forward or backward direction by alternately lifting the said brushes or for electrically creating a braking action, substantially as set forth.

386,544. KNIFE-SHARPENER. HARRY L. JOHNSON and WALTER G. STEWART, Reading, Pa.; said Stewart assignor to said Johnson. Filed Jan. 30, 1888. Serial No. 262,302. (No model.)

386,544.

Claim.—A knife-sharpener consisting of two pivoted jaws, one of which is provided with two sharpening mediums, the other with one adapted to be moved between the first two, whereby the angle and crossing-point of said mediums may be varied, substantially as and for the purpose set forth.

386,545. FLOOR-CLAMP. GEORGE H. LEE, Panama, Fla. Filed July 21, 1887. Serial No. 244,912. (No model.)

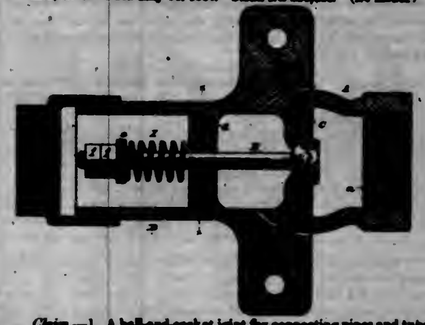


Claim.—1. In a flooring-clamp, the combination, with a fixed frame, the reciprocating head, and its operating-lever, of a rotatory clamping-hook, 20, pivoted in a vertically-arranged bearing in the frame and having its impaling end beyond the axial line of the pivot, and operative connections between said hook and lever to partially rotate the hook, substantially as set forth.

2. In a flooring-clamp, the combination of the frame, an operating-lever, a reciprocating plunger moved thereby, cranks mounted on the frame and rocked by said lever, and pivoted hooks connected with the cranks, substantially as described.

3. In a flooring-clamp, the combination of a pivoted operating-lever having a toothed segment at its end, a reciprocating plunger having a rack engaged by said segment, cranks carried by the lever, and pivoted clamping-hooks connected with the crank, whereby the hooks are rocked by the crank, substantially as described.

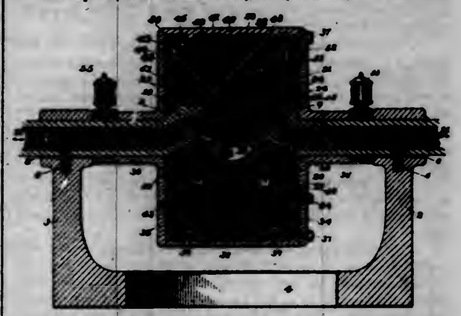
4. The combination of the frame, the operating-lever provided with a crank, 16, a pivoted hook mounted on the frame, a lever connected to said hook, and a rod connecting the lever and crank, whereby the movement of the crank is imparted to the hook, substantially as described.



386,546. CURCULIO-CATCHER. HENRY LOTH, Youngstown, N. Y. Filed Nov. 26, 1887. Serial No. 256,116. (No model.)

Claim.—1. The combination of the central supporting-frame, composed of the upright standards and upper and lower connecting-hooks, the arms hinged to the standards, brace-rods having their outer ends hinged to the hinged arms and their inner ends arranged to slide through eyes in the standards, and a catching-cloth secured to the hinged arms and adapted to be arranged on the person at its center, substantially as described.

2. The combination of the central supporting-frame, composed of upright standards united by upper and lower hoops, 2 3, arms hinged to three of said standards and provided with brace-rods having their outer ends hinged to the arms and their inner ends arranged to slide in eyes in the standards, double arms hinged to a cross-piece on one of the upright standards and provided with hinged brace-rods arranged with their inner ends to slide in eyes in the supporting-standard, rods hinged to opposite standards and having their outer ends detachably connected to the double arms, and a catching-cloth secured to the outer ends of all the hinged arms and its central part adapted to be arranged about the person, substantially as described.



386,547. PIPE OR TUBE COUPLING. WILLIAM MATHER, Dunkirk, N. Y. Filed May 31, 1887. Serial No. 239,888. (No model.)

Claim.—1. A ball-and-socket joint for connecting pipes and tubes, the internal portions of which are provided with lugs or cross-bars, and the bolt connected with the internal lugs or cross-bars to permit the parts to have a universal and free movement relative to each other, substantially as set forth.

2. A ball-and-socket joint for connecting pipes and tubes, the internal portions of which are provided with lugs or cross-bars, and the bolt and spring mounted thereon connected with the internal lugs or cross-bars, all arranged and operating substantially as and for the purpose set forth.

386,548. STEAM-ENGINE. RICHARD H. MATHER, Windsor, Conn. Filed Apr. 19, 1886. Serial No. 199,203. (No model.)

Claim.—1. A tubular shaft having the form of a double crank and provided with an oblique internal diaphragm dividing the eccentric portion of said shaft into two overlapping compartments, which are respectively provided with a steam-port and with an exhaust-port which open through opposite sides of said shaft, in combination with a number of steam-cylinders which are radially disposed about the eccentric portion of said shaft and are mounted at a variable inclination toward each other upon a rotary sleeve which is immovably attached to one of said cylinders and is provided with a single steam and exhaust port for each of them, substantially as and for the purpose specified.

2. A tubular shaft consisting of a single piece of metal having the form of a double crank and provided with an oblique internal diaphragm dividing the eccentric portion of said shaft into two overlapping compartments, one of said compartments being provided with a steam-port which opens from the overlapping portion of such compartment through the side wall of said shaft, and the other of said compartments being provided with an exhaust-port which opens through the opposite wall of said shaft into the overlapping portion of such other compartment, in combination with a number of steam-cylinders which are radially disposed about said shaft at a variable distance from each other, and an intermediate rotary sleeve which is provided with one steam and exhaust port for each of said cylinders and is rigidly attached to one of said cylinders, substantially as and for the purpose specified.

3. In an engine of the kind described, a metallic pipe, bent as shown, mounted as a stationary crank upon suitable standards and

partly insulated therefrom by means of air-spaces formed by intermediate ribs, substantially as and for the purposes specified.

4. A steam-cylinder which is provided with two laterally-projecting curved feet and terminates, continuously with such feet, in a cylindrically-concave bottom surface which is perforated by a steam and exhaust port, substantially as and for the purpose specified.

5. A steam-cylinder whose base, being cylindrically concave, is perforated by a steam and exhaust port and is provided with two laterally-projecting curved feet, substantially as and for the purpose specified.

6. A tubular shaft having the form of a double crank, a rotary cylindrical drum which is mounted upon the concentric portion of said shaft, and a number of steam-cylinders which are provided with lateral curved feet and with pistons hinged immediately to said drum and are disposed radially about said shaft, in combination with two metallic rings passing over said feet, and a sleeve which is provided with steam and exhaust ports and is attached to one of said cylinders and surrounds said shaft, substantially as and for the purpose specified.

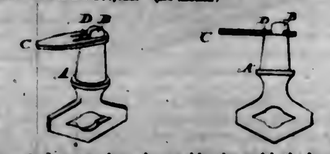
7. In combination with a rotating drum and inclosed therein, a stationary open oil-pipe whose ends are unequally distant from the axis of such drum, and whose mouth is turned in a direction opposed to the direction of rotation of such drum, substantially as and for the purpose specified.

8. A hollow crank, a sleeve surrounding the same, and one or more revolvable cylinders mounted upon said sleeve, in combination with a surrounding belt-wheel to which the piston of each such cylinder is hinged, substantially as and for the purpose specified.

9. In a steam-engine whose working parts are located in a rotary cylinder adapted to contain oil, a stationary oil-pipe having a mouth opening backward in the outer portion of said cylinder and a discharging-orifice directed toward the crank-shaft bearings, substantially as and for the purpose specified.

10. A tubular shaft having the form of a double crank, a sleeve surrounding the eccentric portion of said shaft, and one or more cylinders mounted upon said sleeve, in combination with a surrounding drum to which the piston of each such cylinder is hinged, substantially as and for the purpose specified.

11. As a means of holding upon a cylindrical crank one or more steam-cylinders and an intermediate sleeve, two feet projecting from each such cylinder in opposite directions, and two flanges upon such sleeve, in combination with two metallic rings fitted closely over such feet and flanges, substantially as and for the purpose specified.



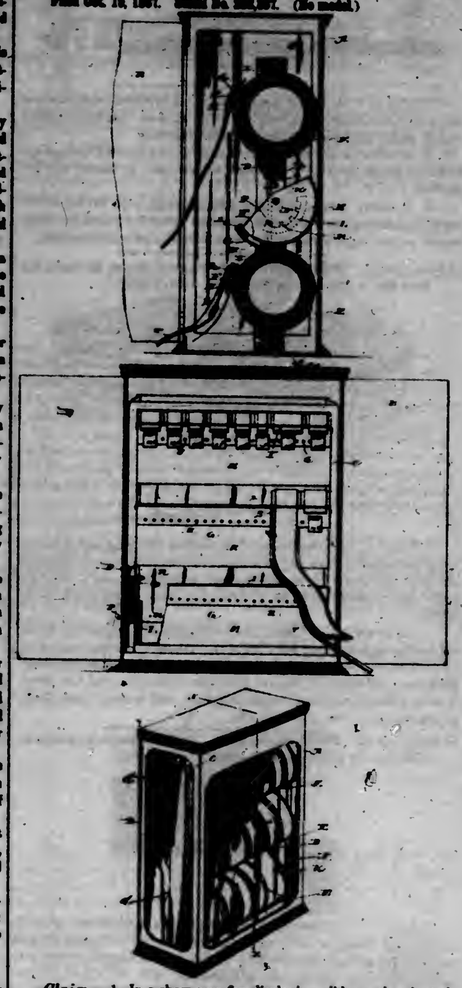
12. A metallic rod provided with a terminal nut and head or their equivalents, and having a neck adjacent to such head, a sleeve or steel tube surrounding the middle part of such rod, and a piston whose head is attached to such sleeve, in combination with an inclosing belt-wheel to which said rod and sleeve are attached by means of lugs or other suitable projections, substantially as and for the purpose specified.

13. A number of steam-cylinders provided with pistons which are hinged to a wheel or drum and are radially mounted by a sleeve upon the eccentric portion of a stationary tubular shaft having the form of a double crank, substantially as and for the purpose specified.

14. In combination, a number of steam-cylinders distributed about a common axis of rotation in radial positions relatively to that axis, and mounted upon a sleeve which is rigidly attached to one of said cylinders, substantially as and for the purpose specified.

15. In combination, a number of steam-cylinders which are distributed radially about a common axis of rotation and are mounted at a variable distance apart upon a sleeve which is rigidly attached to one of said cylinders, substantially as and for the purpose specified.

386,549. TURN-KEY. ANDREW T. MATTHEWS, Worcester, Mass., assignor to the Worcester Ferrule Company, same place. Filed Mar. 19, 1888. Serial No. 267,722. (No model.)



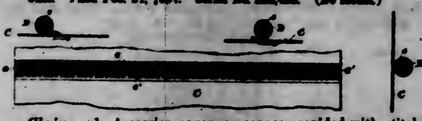
Claim.—1. In a turn-key, the combination, with the handle provided with a shank, of a button provided with a recess to receive and with a tongue to bear against the shank.

2. In a turn-key, the combination, with the handle provided with an undercut shank, of a button provided with a recess to receive and with a tongue to bear upon the shank.

3. In a turn-key, the combination, with the handle provided with an undercut shank, of a button adapted to fit upon the reduced neck of the shank, and provided with a tongue to bear against that face of the shank opposite its undercut face.

4. As an improved article of manufacture, the button herein shown, having a recess to receive and a tongue to bear against a handle-shank.

386,550. SHOW-CASE. ALEXANDER HOLLIS, Valley Mills, Tex. Filed Oct. 10, 1887. Serial No. 252,257. (No model.)



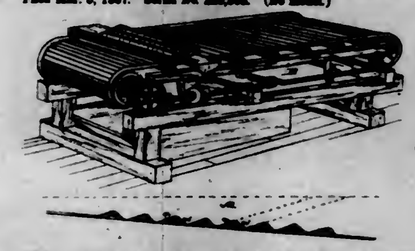
Claim.—1. In a show-case for displaying ribbons, the pivoted trays to contain the spools of ribbon, and provided near their rear edges with the longitudinal openings F, and the depending flange-plates G, covering said openings and dividing the ribbons from the paper strips, the paper strips of the spools passing through said openings and the ribbons passing over in the upper edges of the plates G, as set forth.

2. In a show-case for displaying ribbons, the pivoted trays adapted to be inclined in either direction, having the openings F on one side, the depending flanges G, arranged over the said openings, and the elastic straps I on the upper sides of the said flanges, substantially as described.

3. The combination of the pivoted trays having the openings F, the depending flange-plates G, covering said openings and having the longitudinal series of openings H, and the measure provided with a hook to engage the trays, as specified.

4. The combination, with a case having a glass front, of the series of semicircular pivoted trays within the case, and adapted when swung backward to receive the spools of ribbons and when swung forward to display the same through the glass front of the case, and the measuring-tape having a hook or catch to engage the rear side of the tray when the latter is swung backward, as set forth.

386,551. ENDLESS CARRIER-APRON. LEWIS MILLER, Akron, Ohio. Filed Feb. 21, 1887. Serial No. 228,626. (No model.)



Claim.—1. A carrier apron or canvas provided with stitched loops, in combination with rods or strips incased throughout their length within said loops, substantially as described.

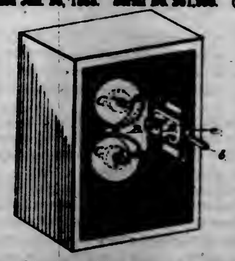
2. In a belt or canvas carrier, a strip or rod incased throughout its entire length directly by the cloth of said belt, as shown and described.

3. A canvas carrier provided with stitched loops having closed ends, in combination with rods or strips incased throughout their length in said loops, substantially as and for the purpose described.

386,552. ORE-CONCENTRATOR. FRANK H. MORSE, Murphy's, Cal. Filed Mar. 8, 1887. Serial No. 230,203. (No model.)

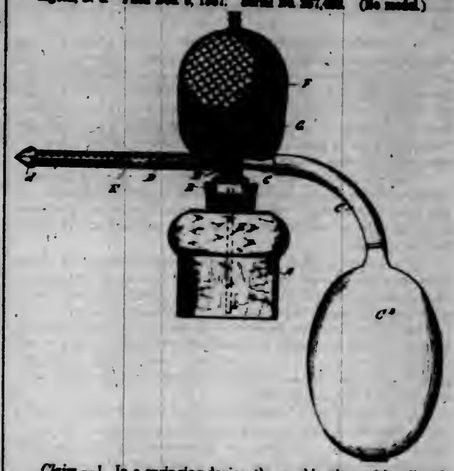
Claim.—1. In a concentrator, an endless traveling belt mounted at an inclination and having its working-surface composed of the series of short transverse upwardly-inclined vanning-surfaces *c*, and the downwardly-inclined surfaces *c'* connecting them, substantially as described.

2. In an ore-concentrator, the combination of a supporting-frame, an endless traveling belt mounted at an inclination therein and having its working-surface composed of the series of short transverse vanning-surfaces *c*, elevated or inclined from the horizontal, and the downwardly-inclined surfaces *c'* connecting them, and means, substantially as described, for vibrating said belt.



386,553. FLOOR-BOARD GAGE. FRANK H. MORSE, Savannah, Ga. Filed Jan. 18, 1888. Serial No. 261,004. (No model.)

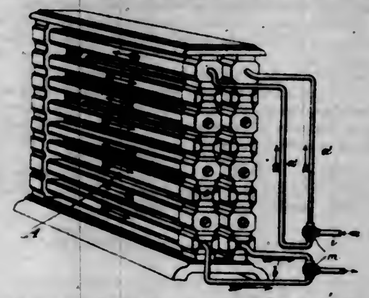
Claim.—1. A floor-gage consisting of the strip A, the gage B, formed with recess *b* and projecting portion *c*, and the gage C upon the opposite side of said strip and formed with a tongue, *f*, and projecting portion *g*, substantially as described.



2. The floor-gage described, comprising the strip A and the interchangeable gages secured thereto upon opposite sides and opposite ends thereof and formed with projecting portions, as set forth.

386,554. LATCH. JOHN H. MORRIS and THOMAS D. MORRIS, Seward, Nebr. Filed Jan. 26, 1888. Serial No. 261,955. (No model.)

Claim.—The combination, with a door and a lock mechanism comprising a sliding bolt having a centrally-disposed leg, *c*, of a housing or plate contiguous to said bolt, a pivoted locking-lever within said housing, and a spring acting upon the lever, said lever being provided with a hook-shaped front end adapted to engage the centrally-disposed leg, and a rear extension or handle adapted to be operated from the rear to effect the releasing of the lever, substantially as described.

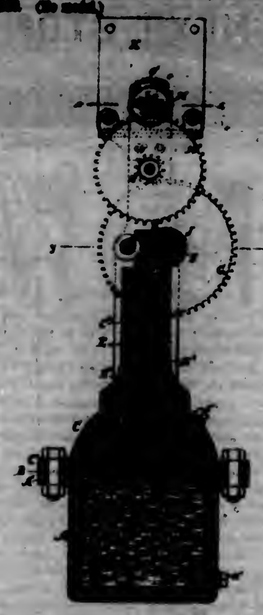


386,555. SYRINGING APPARATUS. THOMAS R. OSBAN, Washington, D. C. Filed Dec. 9, 1887. Serial No. 257,402. (No model.)

Claim.—1. In a syringing device, the combination, with a liquid-holding vessel, of an expansible air-storage bulb secured to and communicating directly with the interior of the vessel, and an air-supply tube connected to the vessel at a point adjacent to and independent of said bulb and communicating directly with the interior of the vessel and bulb, substantially as described.

2. In a syringing device, the combination, with a liquid-holding vessel, of a removable hollow cap situated thereon, an expansible air-storage bulb secured to said cap, and an air-supplying bulb secured to said cap at a point adjacent to said storage-bulb, said cap forming a direct communication for the storage-bulb with the air-supply and the interior of the vessel, substantially as described.

386,556. RADIATOR. WILLIAM R. PEALL, Washington, D. C., assignor, by mesne assignments, to the National Heating Company, New York, N. Y. Filed Oct. 7, 1887. Serial No. 251,779. (No model.)



Claim.—1. The combination, with a radiator consisting of a number of hollow bars, the passages therein communicating at the alternate ends of the bars, as shown and described, of the air-pipe *x*, connected with the outer or top and bottom bars of the radiator, and provided with the air valve or vent *x'*, substantially as shown and described.

2. The combination, with a radiator cast in a single piece consisting of separate hollow bars, the passage therein communicating at the alternate ends of the bars, as shown and described, of the air-pipe *x*, connected with the outer or top and bottom bars of the radiator, and provided with the air valve or vent *x'*, substantially as shown and described.

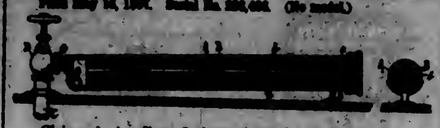
3. The combination of a series of radiators and a supply and return pipe, each of said pipes being provided with a cock or valve having a series of passage-ways and a series of branch pipes, whereby the heating medium may be supplied to either or all of the radiators and excepted therefrom, substantially as shown and described.

386,557. REVERSIBLE WINDOW GLASS IN THE VARIATIONS OF TEMPERATURE. ISAAC L. ROBBINS, Brooklyn, N. Y., assignor of one-half to Richard Trenchy, Roxbury, Conn. Filed Mar. 30, 1886. Serial No. 197,033. (No model.)

Claim.—1. The combination of a hermetically-sealed vessel having a portion of its body formed of a yielding material and inclosing a liquid that completely fills such vessel, and a power-transmitter adapted to transmit the movement of said yielding material, whereby the variations of temperature to which the inclosed liquid is subjected will act thereon through said yielding material, substantially as described.

2. The combination of a hermetically-sealed vessel having a portion of its body formed of a yielding material and inclosing a liquid that completely fills such vessel, a power-transmitter adapted to transmit the movement of said yielding material, and an auxiliary receptacle filled with a liquid interposed between said yielding material and the power-transmitter, substantially as described.

3. The combination of a hermetically-sealed receptacle, a piston and cylinder connected therewith, a liquid completely filling said receptacle and adapted to act upon said piston, and two power-storing devices, both arranged to receive power from the piston, and serving the one to return the piston when the liquid contracts and the other to receive and transmit a portion of the power exerted by the piston, substantially as herein specified.



4. The combination of a hermetically-sealed receptacle, a piston and cylinder connected therewith, a liquid filling said receptacle and adapted to act upon said piston, a power-storing device serving to return the piston after it has been acted upon, a second power-storing device, suitable power-transmitting connections between the latter and the piston, and a mechanism or apparatus adapted to receive motion from said second power-storing device, substantially as described.

5. The combination of a receptacle, a cylinder, a piston, a liquid completely filling said receptacle, and an elastic impermeable thimble separating the space of the receptacle from the space of the cylinder, substantially as specified.

6. The combination of a main receptacle, a liquid filling said receptacle, a diaphragm, an auxiliary receptacle, a yielding but non-compressible substance filling said auxiliary receptacle, a cylinder connected with the auxiliary receptacle, and a piston moving in said cylinder, substantially as described.

7. The combination of a main receptacle, a diaphragm, an auxiliary receptacle, liquids filling both receptacles, a cylinder, a piston, and an elastic impermeable thimble separating the space of the auxiliary receptacle from the space of the cylinder, substantially as specified.

386,558. RADIATOR. CHARLES H. BENNETT, St. Paul, Minn. Filed May 16, 1887. Serial No. 238,026. (No model.)

Claim.—1. A radiator for imparting and retaining heat, consisting of an outer casing, in combination with an interior core or filling of wood within said casing, substantially as and for the purpose set forth.

2. A radiator for imparting and retaining heat, consisting of an outer casing and a trapping device therefor, in combination with an interior core or filling of wood within said casing, substantially as and for the purpose set forth.

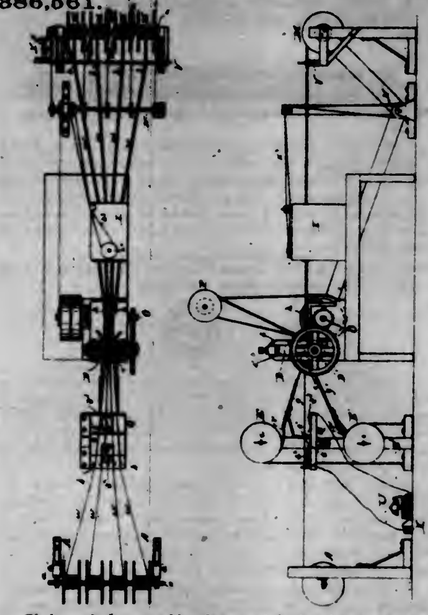
386,559. BUTTON. BERARD B. BENNETT, Waterbury, Conn. Filed Sept. 1, 1887. Serial No. 248,899. (No model.)

Claim.—1. In a button such as described, the combination of a back provided with a longitudinal slot, C, a circular depression, E, depression F, and inclined planes G, and a shank provided with a shield adapted to rest against the said back, and having turned ends protruding through the said shield and adapted to rest in the said depressions E and F, substantially as described.

2. In a button such as described, the combination of a back provided with a longitudinal slot, C, the circular depression E, the depressions F, and the inclined planes G, and a shank, H, provided with a shield adapted to rest against the said back, and having turned ends protruding through the said shield and adapted to rest in the said depressions E and F, substantially as described.

3. In a button such as described, the combination of a back provided with a longitudinal slot, C, depressions D, circular depressions E, depressions F, and inclined planes G, and a shank, H, provided with a shield adapted to rest against the said back, and having turned ends protruding through the said shield and adapted to rest in the said depressions E and F, substantially as described.

386,560. FRUIT-JAR. GEORGE C. SAWYER, Groton, N. Y. Filed Feb. 21, 1882. Serial No. 204,732. (No model.)



Claim.—1. The jar having a rounded peripheral bead, D, at its mouth and the interior overhanging lip or shoulder below the bead and provided with slots F, in combination with the cover arranged in the mouth of the jar and provided on its upper side with the swiveled locking-arm adapted to engage at its extremities under the said overhanging lip or shoulder, and the ball Z, mounted at its ends in suitable apertured ears on the upper side of the locking-arm and adapted to normally fold within and be protected by the bead D, substantially as and for the purpose specified.

2. The combination, with the jar having the lip or shoulder E, of the cover having the grooves K L and the recess M in its upper side, the fastener having the ring or flange O, fitting in the groove K, the transverse bar R, fitting in the groove L, and the socket S, fitting in the recess M, and having the webs or wings T T, and the locking-arm having a central spindle mounted in the socket S and adapted to engage at its ends under the lip or shoulder E, substantially as and for the purpose specified.

3. The jar having an interior overhanging lip or shoulder at its upper edge provided with slots F, in combination with the cover arranged in the mouth of the jar and provided with a double inclined ring or flange, O, the socket S, arranged in an aperture, M, at the center of the cover within the ring or flange O, and provided with wings or webs T, and the locking-arm bearing on the ring or flange and engaging under the overhanging lip or shoulder, and provided at its center with a depending spindle, V, mounted in the socket S and capable of a vertical motion, whereby the locking-arm moves vertically as it slides on the inclined ring or flange, substantially as specified.

386,561. MACHINE FOR COVERING WIRE. WILLIAM H. SAWYER, Providence, R. I. Filed Nov. 28, 1884. Serial No. 149,152. (No model.)

386,561.

Claim.—1. In a machine for covering wire, the combination, with the standards, of a pair of rolls mounted one above the other in said standards, the upper roll having a series of peripheral grooves therein, which are separated by conical ridges having sharpened edges, and the lower roll having a series of grooves therein which register with said other grooves, and which are separated by ridges having flattened edges, substantially as described.

2. In a machine for covering wire, the combination, with a traveling covered wire, of a powder-box having a series of apertures in its sides and a compartment for containing the powder, a compartment arranged by the side of said powder-compartment for the reception of wiping material and having a slatted bottom, and a receptacle arranged beneath said bottom, substantially as described.

3. In a machine for covering wire, the combination of a powder-box having a series of perforations in its sides, a powder-compartment arranged at one side in said box, and a wiping-compartment at the opposite side, said latter compartment having a slatted bottom, and a receptacle located beneath said compartments, having an inclined plate arranged directly beneath the said slatted bottom, substantially as described.

4. In a machine for covering wire, a powder-box having a powder and a wiping compartment arranged side by side, said powder-compartment being provided with a revolving stirrer, for preventing the caking of the powder, substantially as described.

5. In a machine for covering wire, the combination of a stationary platform, a movable plate mounted thereon, having slits through which the wire passes, a metal strip situated on said platform in the rear of said plate, and a bell having electrical connections with said plate and strip, substantially as described.

6. In a machine for covering wire, the combination of a non-conducting platform having a metallic clip secured thereto, a movable metallic plate on said platform and held in place by said clip, said plate having a vertical flange thereon with slits formed therein, through which the wire passes, a metallic strip secured to the platform in the rear of the plate, and an electric bell having a circuit-connection with said clip and strip, whereby the bell is caused to ring by the closing of said circuit caused by the occurrence of snarls in the wire forcing said plate in contact with said strip, substantially as described.

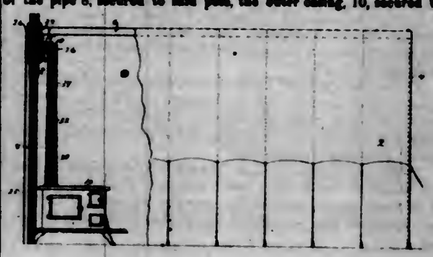
7. In a machine for covering wire, the combination, with the wire reels and covering-reels, of separate guides for the covering, standards having grooved rollers mounted thereon, one above the other, a horizontally-arranged plate having guide-openings therein, secured to said standards, a series of vertically-arranged knife-blade separators in the rear of said rolls, a powder-box having powder and wiping compartments located beyond the said blades, and the winding-reels, substantially as described.

8. In a machine for covering wire, the combination, with the covering-reels and the rollers, arranged, respectively, one above the other, of the reels F, for collecting the surplus covering, said reels located one above and the other below the said rolls, substantially as described.

386,562. STATION-INDICATOR. FRANK A. STARR, Manitowoc, N. Y. Filed Feb. 6, 1888. Serial No. 263,177. (No model.)

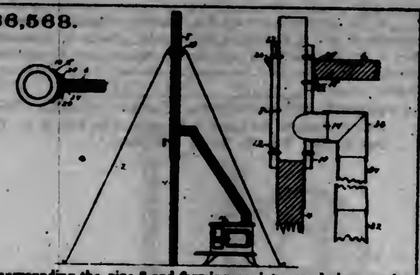
Claim.—1. In an indicator, the combination, with a case or frame provided with suitable rollers and with an inscribed band or web mounted on said rollers and adapted to be rolled or wound from one to the other, said case having an opening through which the inscriptions on the band are visible, of a movable board or strip adapted to hide or disclose words or inscriptions separate from the web or band, and which, in connection with the names or inscriptions on the band, as the same are successively brought opposite the opening in the case, convey definite information, substantially as set forth.

2. In a station-indicator, the combination with the case or frame provided with suitable rollers and with a suitably-inscribed web or band mounted on said rollers and adapted to be rolled or wound from one to the other, the case or frame having an opening through which the inscriptions are visible, of a strip or board hinged or journaled to the case and adapted to be turned to hide or expose words or inscriptions separate from the web or band, which words or inscriptions coact with the successive inscriptions on the web or band to indicate the present or the next succeeding station, substantially as shown and described.



3. In a station-indicator having the usual rolls provided with a suitably-inscribed web or band mounted thereon, and an opening in the case through which the web or band is visible, a strip hinged or journaled to the case and having inscriptions on both of its sides, whereby the present or the next succeeding station may be indicated by turning the said strip, substantially as set forth.

4. In a station-indicator, the combination, with the case A, of the drums *a a'*, upon which the strip that carries the names of the streets or stations is wound, a board or strip, B, hinged or journaled to the case A and adapted to be turned up or down to cover and uncover words or signs used to convey information to the passengers, and a friction-spring, d^3, arranged, as shown and described, to bear upon the journals of the drums *a a'*, and of the board or strip B, to prevent the same from turning.

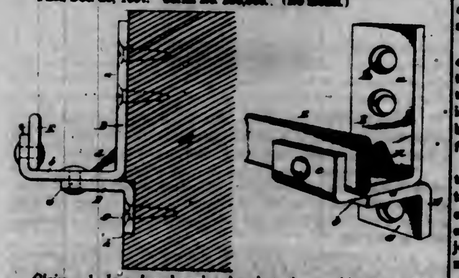


5. In a station-indicator, the combination, with the case A, of a board or strip, B, hinged or journaled to the case and adapted to be turned up or down to cover and uncover words or signs used to convey information to the passengers, a cam-lever, *c*, on the journal of said board or strip, and a spring bell-hammer arranged in the path of said cam-lever to be tripped by the same when the board is turned in one direction and to be pushed back when it is turned in the opposite direction.

386,563. TENT. JOHN A. STEELE, Minneapolis, Minn. Filed Dec. 7, 1887. Serial No. 257,262. (No model.)

Claim.—1. In a tent, the combination, with the upright pole 4, of the pipe 8, secured to said pole, the outer casing, 10, secured to

386,568.



and surrounding the pipe 8 and forming an interposed air-space between said pipe and the canvas covering of the tent, substantially as described.

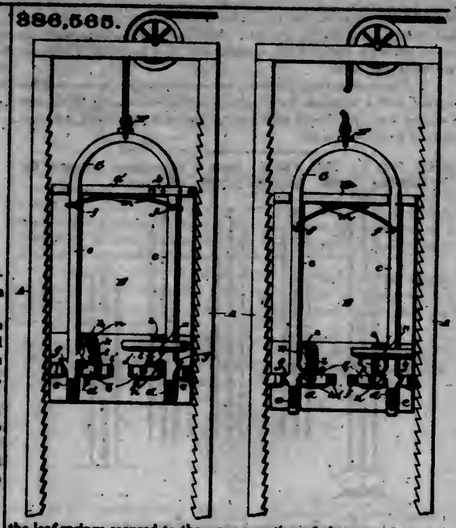
2. In a tent, the combination, with the upright pole 4, of the pipe 8, secured to the said pole, the outer casing, 10, secured to and surrounding the pipe 8 and forming an interposed air-space between said pipe and the canvas covering of the tent, and the ridge-pole 6, secured to said casing 10, substantially as described.

3. In a tent, the combination, with the pole 4 and the pipe 8, secured thereto, the outer casing, 10, surrounding said pipe, and the ridge-pole 6, secured to said casing 10, of the branch pipe 14, connected to the pipe 8, the elbow 35, and the sections of pipe secured thereto or arranged to be placed one inside the other, substantially as described.

386,564. TRACK-HANGER. LE GRAND TERRY, Havershands, N. Y. Filed Dec. 20, 1887. Serial No. 258,203. (No model.)

Claim.—1. In a door-hanging bracket, the combination, with a main L-shaped bracket consisting of vertical and horizontal pieces stiffened at their junction by a web, of an L-shaped re-enforcing bracket that has its depending leg projected beyond the line of the vertical limb of the main bracket, substantially as set forth.

2. In a door-hanging device, the combination, with an L-shaped main bracket having vertical and horizontal pieces which are integral with each other, and a stiffening diagonal corner-web formed at the junction of these two pieces of the main bracket, of an L-shaped re-enforcing bracket, one leg of which is secured to the under side of the horizontal piece of the main bracket and the other projected beyond the rear surface of the vertical limb of the main bracket, substantially as set forth.



3. In a door-hanging bracket, the combination, with a main bracket consisting of vertical and horizontal sections and a re-enforcing bracket having its depending leg projected beyond the line of the vertical limb of the main bracket, of a rail attached to the outer free end of the horizontal section of the main bracket, substantially as set forth.

4. In a door-hanger, the combination, with a main L-shaped bracket, of a re-enforcing L-shaped bracket secured to the under side of the main bracket, the depending leg of the re-enforcing bracket projecting beyond the vertical limb of the main bracket.

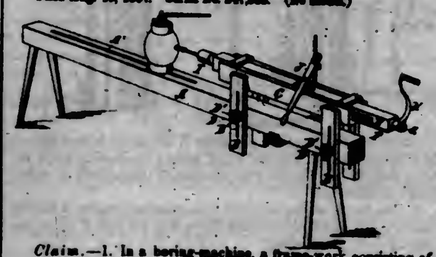
386,565. SAFETY DEVICE FOR ELEVATORS. FREELAN TRAVER, Kinsley, Kans. Filed Oct. 3, 1887. Serial No. 251,945. (No model.)

Claim.—1. The combination, with the racks and the elevator-car, of the bolts located on the sides of the car and adapted to engage the racks, the vertically-movable frames mounted on the sides of the car and having offsets on their lower portions resting on the bolts to project the same, and levers acted upon by the frames to withdraw the bolts, substantially as set forth.

2. The combination, with the car and the racks, of the bolts located in the sides of the car to engage the racks, the vertically-movable frames having oppositely-inclined offsets on their lower portions to actuate the bolts and having the studs *f* on their upper portions, and

the leaf-springs secured to the upper portion of the car and bearing on the studs *f* to depress the frames on the release of the rope-tension, as set forth.

3. The combination, with the racks and the car, of the bolts located in the sides of the car to engage the racks, the projections *d* on the lower portion of the car, the guides *b* at the upper portion thereof, the inverted-U-shaped frames moving through the guides *b* and having slots *e* engaging the projections *d*, the said frames engaging the bolts, and springs at the upper portion of the car to depress the said frames upon the release of the tension of the rope, as set forth.



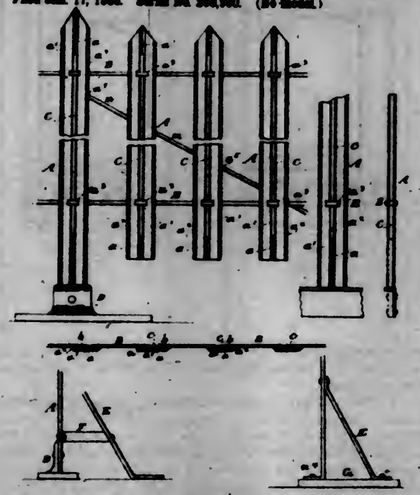
4. The combination, with the racks and the car having horizontal recesses in its sides, of the vertically-movable frames mounted on the sides of the car and connected to the suspending-rope and having oppositely-inclined offsets on their lower portions, and the bolts located in the recesses in the sides of the car, the said bolts being projected and withdrawn by the action of the offsets on the vertically-movable frames, substantially as set forth.

5. The combination, with the car and racks, of the inverted-U-shaped frames movable vertically on the sides of the car, the bolts located on the sides of the car and actuated by said frames to engage said racks and having recesses *p* in their inner portions, and the spring-levers having their upper ends secured to the sides of the car and their lower ends engaging the recesses *p*, substantially as set forth.

6. The combination, with the car and the racks, of the bolts located on the sides of the car to engage the racks, the vertically-movable frames mounted on the sides of the car and having inclined offsets *g* to actuate the bolts, and spring-levers having their upper ends secured to the sides of the car above the bolts and having their lower ends engaging the bolts, as set forth.

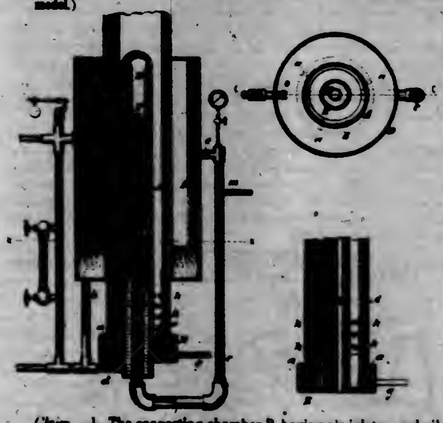
7. The combination, with the car and the racks, of the bolts located in the sides of the car and adapted to engage said racks, the vertically-movable frames mounted on the sides of the car and engaging the bolts, the spring-levers mounted on the sides of the car and engaging the bolts, and the levers *n*, mounted on the car between the spring-levers and the vertically-movable frames, substantially as and for the purposes specified.

386,566. BORING-MACHINE. WILLIAM B. TRIPP, Augusta, Kans. Filed Aug. 19, 1887. Serial No. 247,303. (No model.)



Claim.—1. In a boring-machine, a frame-work consisting of a

bench having retaining-bolts and a horizontal box carrying a bit-stock and having side cleats provided with wide slots, substantially as herein set forth, whereby the operator can bore holes at an angle to the line of the bench.

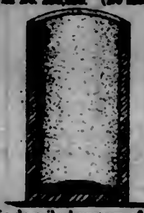


2. The combination of a bench having retaining-bolts on the sides thereof, with a bit-stock frame having vertical slotted side cleats, and a sliding bar with a lever attached for operating the same, substantially as herein set forth.

386,567. IRON FENCE. CHRIS G. VANDEMARK, Lexington, Ky. Filed Jan. 17, 1888. Serial No. 260,980. (No model.)

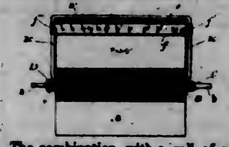
Claim.—In a fence, the metallic pales A, each of which is provided with a central groove, *a*, holes *a*², and the wings *a'*, which extend laterally in opposite directions ob the same plane from the said groove and have their outer edges bent to bear against the wire rails, as shown, in combination with the horizontal wires B, passed through the holes in pales A and in position bearing against the bent edges of the pales, and vertical rods C, which are inserted in the grooves *a* and within the wires B, all being constructed substantially as set forth and described.

386,568. BURNER FOR STEAM-BOILER HEATING APPARATUS. WILLIAM WALKER, Brooklyn, N. Y., assignor of one-half to Abraham G. Jennings, same place. Filed Apr. 14, 1887. Serial No. 234,772. (No model.)



Claim.—1. The converting-chamber B, having air-inlets *a* and oil-inlet *g*, in combination with the flue A, having air-openings A, the air-inlets *a* being of less area than the air-inlets A, substantially as herein shown and described.

2. The flue A, having air-inlets *a*, and flashing-chamber B, having air-inlets *a* and oil-inlets *g*, in combination with the pipe E within flue A, substantially as described.



3. The combination of the flue A, having air-inlets A, converting-chamber B, having air-inlets *a* and oil-inlet *g*, boiler D, surrounding flue A, pipe E within flue A, and pipe F within the pipe E, and means, substantially as described, for supplying the boilers with water, as set forth.

386,569. PERIOD CUP FOR ELECTRIC BATTERIES. RANSFIELD J. WHEELOCK and JAMES W. WHEELOCK, New York, N. Y. Filed Sept. 19, 1887. Serial No. 249,889. (No model.)

Claim.—The herein-described process of treating porous cups so as to reduce to any desired extent their excess of porosity, which consists in first heating the cups to a degree sufficient to melt wax, then applying to the surfaces of the cups sufficient wax to reduce their porosity to a limited extent, and repeating these operations as many times as may be necessary to bring the cups to the desired degree of porosity.

386,570. TOILET-PAPER CUTTER. CHARLES R. WILLIAMSON, Topeka, Kans. Filed Feb. 27, 1888. Serial No. 265,627. (No model.)

Claim.—1. The combination, with a roll of paper, of an axis, a cutter-frame the ends of which are adjustable upon the said axis, and a cutter adjustable upon said frame, substantially as described.

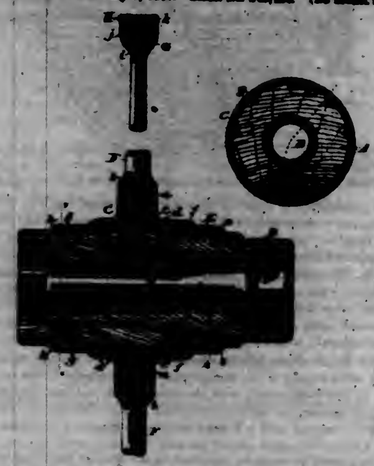
2. The combination, with a spindle, a roll of paper loosely mounted on the spindle, and a cutter supported on arms loosely mounted on the spindle at the ends of the roll, of a clamping device to lock the arms, and hence the cutter, to the roll or to release it therefrom, substantially as set forth.

3. The combination, with a roll of paper, of a spindle-support to the roll, the spindle being provided with a shoulder and a threaded portion, a nut adapted to work on the threaded portion, and a cutter supported on arms embracing the spindle at the ends of the roll and between the shoulder and nut, substantially as set forth.

4. The combination, with the roll of paper, the spindle-support, the cutter-frame suspended therefrom, and means for clamping the cutter-frame to the roll, of the cutter secured to the cutter-frame in sliding adjustment toward and away from the surface of the roll, said cutter being held normally in position on the frame by a friction-grip, substantially as set forth.

5. As an article of manufacture, a roll of paper having a cutter secured thereto, one portion of the cutter-frame forming a carrier for the roll and another portion supporting the cutter, substantially as set forth.

386,571. PHOTOGRAPHIC BATH. ALEXANDER ANDERSON, Elgin, assignor of one-half to George Whyte, Northview, Scotland. Filed Aug. 11, 1887. Serial No. 246,674. (No model.) Patented in England Sept. 17, 1886, No. 11,692.

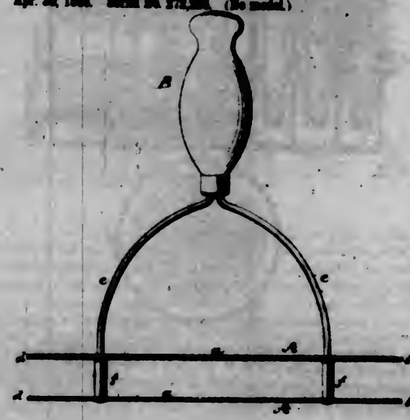


Claim.—1. The combination, with a photographic bath-dish, of a finger pivoted to the bath-dish and adapted to lift the plate out of the solution contained by the dish, substantially as specified.

2. As an improved article of manufacture, a rocking bath-dish consisting of the dish A, provided with the pivotal projections B, and the finger C, hinged to the side of the dish and adapted to lift one end of the plate out of the solution contained by the dish, substantially as specified.

3. The combination of a photographic bath-dish provided with a depression or recess at one end and an angular finger pivoted to the end of the dish, substantially as herein shown and described.

386,572. METALLIC WHEEL. WILLIAM P. BRUNNEMER, Davenport, Iowa. Filed July 5, 1887. Serial No. 243,402. (No model.)



Claim.—1. In a metal wheel, the metallic hub-section C, provided with mortises extending therethrough, and with an internal shoulder, A, in combination with the metal spokes seated in said mortises and enlarged, as described, so that they are carried and sustained wholly by said section C, the wooden core seated in the section C, and removable therefrom without disturbance of the spokes, and the metal hub-section D, removably united to section C and resting solely to confine the wooden core in place.

2. In a metal wheel, the combination of the two metallic hub-sections C and D, one of which is provided with a spoke-receiving socket, and the nut E, lying between and connecting said sections, as described, whereby they may be contracted forcibly upon an internal core without affecting the sockets or the spokes.

3. A metallic hub consisting of two separable parts, C and D, the former provided with sockets or mortises extending through from the exterior to the interior, the metallic spokes seated in said mortises and secured by enlargements *b c*, and the removable wooden core having the axle-box seated therein, said members constructed and combined substantially as described.

4. The wooden core having the annular shoulders at the two ends, in combination with the metal hub-sections C and D, provided with corresponding internal shoulders, and the nut E, encircling the section D and engaging a shoulder thereon and threaded into the end of section C, as shown.

386,573. CURRY-COMB. GEORGE W. BATES, Ashland, Me. Filed Apr. 30, 1888. Serial No. 272,203. (No model.)

Claim.—1. As an improved article of manufacture, a curry-comb consisting of the handle B, wires *c c*, the two plates A at the outer ends of said wires, and the thimbles *f*, spacing the plates apart, each plate being serrated except at one end, *d*, convex on its upper edge, as at *e*, concave on its lower edge, as at *e*, and rounding at its serrated end, as shown at *h*, substantially as set forth.

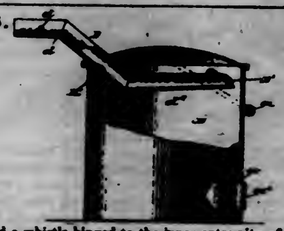
3. As a new article of manufacture, the plates A, having a plain edge, *d*, at one end, a serrated rounding edge, *h*, at its opposite end, a serrated convex top edge, *e*, and a serrated concave lower edge, substantially as set forth.

386,574. SLATE-CLEANER. ALBERT G. BRADEN, Goshen, Ill., assignor of one-half to John S. Hatfield, same place. Filed Dec. 27, 1887. Serial No. 259,012. (No model.)

Claim.—A slate-cleaner consisting of the flexible hollow ellipsoidal case A, which is compressible laterally and provided with eye D, for attaching it to a slate, in combination with the sponge B, filling the case, and the prongs H H, projecting inwardly from the ends of the case to hold the sponge therein, as specified.

386,575. CHURN. WILLIS F. CHAMBERS, Indianapolis, Ind., assignor to David L. Whistler, same place. Filed Aug. 27, 1887. Serial No. 248,033. (No model.)

Claim.—1. The combination, in a churn, of a dasher consisting of two curved pieces secured together at the bottom by a clip, C^3, which they enter alongside of each other and at the top to a plate, d^3, formed on the end of a shaft, and the means, substantially as described, for driving said shaft, whereby said churn is operated, substantially as set forth.

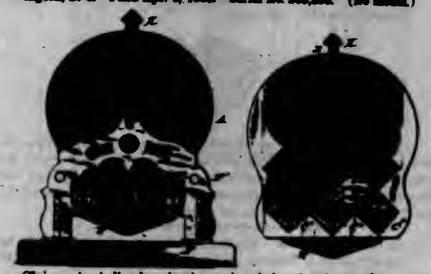


2. The combination, in a churn, of a dasher composed of two curved sides, and the clip C^3, for securing their lower ends together, formed to receive said lower ends when their tops are open and to clamp said lower ends when their tops are closed, substantially as set forth.

386,576. OIL-CAN. GEORGE H. COUSENS, Baltimore, Md. Filed May 31, 1888. Serial No. 275,800. (No model.)

Claim.—1. In an oil-can or similar vessel, the combination, with the body of the vessel, of an outlet-tube attached thereto extending within the vessel and provided with an inlet-aperture, and an alarm secured to the inner end of said tube, substantially as shown and described.

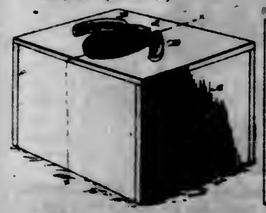
2. In an oil-can or similar vessel, the combination, with the body, of an outlet-tube attached thereto extending within the said vessel, provided with an aperture in one side smaller than the cross-section



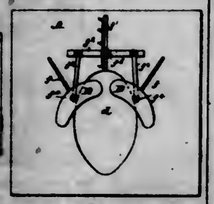
886,576.

of the tube, and a whistle hinged to the inner extremity of the tube, substantially as shown and described.

3. A spout for oil-cans or similar vessels, bent essentially as shown and described, provided with an aperture in one side smaller than the cross-section of the tube, and a whistle attached to its inner extremity, substantially as shown and described.



886,577. DIE AND DIE-BOX. REINHOLD F. DE GRAHL, Washington, D. C. Filed Apr. 6, 1888. Serial No. 269,886. (No model.)

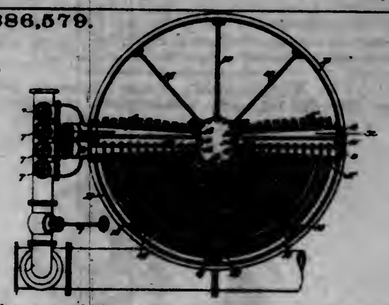


Claim.—1. A dice-box having a closed chamber just wide enough to receive the dice, with recesses or seats at one end for the dice, and openings in its side opposite these recesses or seats, and dice made to correspond in shape with said seats, and having numbers on their sides and constructed to tumble in said box or case without changing their places, substantially as and for the purpose described.

2. A revolving dice-box containing dice, and having openings in its sides to show the numbers, in combination with a supporting-frame, and a set of horizontal journals and bearings connecting the box to the frame for revolution in a vertical plane, substantially as and for the purpose described.

886,578. COMMODE, EARTH-CLOSET, OR SIMILAR APPLIANCE. CHARLES L. DULL, St. Joseph, Mo. Filed May 18, 1887. Serial No. 238,508. (No model.)

Claim.—1. In a commode, earth-closet, or similar appliance, the combination, with the body thereof, divided into two compartments, one for the urine and one for the feces, of a detachable metal shield inclined rearward and extending from side to side of the body beneath the seat-aperture, uniting the partitions of the two compartments, and guides formed each side of the seat-aperture, substantially as shown and described, and for the purpose herein set forth.



2. The combination, with the closet-seat having an opening, as specified, of the guides D D, which are arranged in rear of said opening and adjustable toward or from it, as shown and described.

3. The combination of the adjustable guides D D, rods f^3, and bar f^5 with the seat having opening d and slots $f\ f\ f'$, as shown and described.

886,579. VACUUM-PAN. GOTTFRIED BEGAS, Brooklyn, N. Y., assignor to Henry F. Bagel, same place. Filed Nov. 10, 1887. Serial No. 254,773. (No model.)

Claim.—1. The combination, with a vacuum-pan, of two or more independent segmental radiators mounted in the same horizontal plane, each connected separately with steam supply and discharge pipes and

886,579.

each constructed of a pair of separate radial steam-heads or extended boxes, and a series of curved connecting-tubes concentrically disposed and fitted to one side only of each steam-head, substantially in the manner and for the purpose herein set forth.

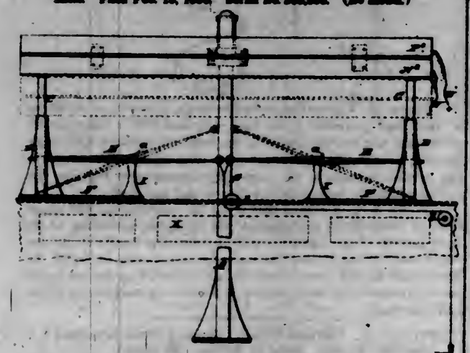
2. The combination, with a vacuum-pan, of a series of segmental radiators, each constructed of a series of concentrically-arranged segmental tubes fitted to a pair of radial steam-heads, to communicate therewith upon one side thereof only, vertical standards fitted and secured centrally within the pan, and sectional segmental brackets bolted to said standards, to furnish bearings for the inner end of each radial head, substantially in the manner and for the purpose herein set forth.

3. The combination, with the steam-heads A A' and the tubes 3 3, coupled thereto, of offsets 4 4, formed within the end of each tube, a bolt, 5, formed with a T-head adapted to engage said offsets, and a nut, 6, upon the outer end of the bolt, whereby, when the end of the bolt is passed through an aperture in the tubular head opposite the opening to which the end of the tube 3 is to be fitted, the end of this tube may be drawn up by the bolt against its seat encircling said opening to form a joint therewith, substantially in the manner and for the purpose herein set forth.

4. The combination of a tier, W, of curved concentric tubes 3 3 3, arranged in two horizontal sections and all connected at their opposite ends to single steam-heads A A', an interposed radial bar, 14, inserted between the two sections of tubes, opposite tie-plates 15 15, embracing two adjacent tubes in the sections on each side of the bar, and a transverse bolt, 16, coupling the two tie-plates, to draw and clamp the tubes upon the radial bar, substantially in the manner and for the purpose herein set forth.

5. The combination of a tier of curved pipes arranged in double sections, an interposed radial bar, 14, inserted between the two sections of tubes, opposite tie-plates 15 15, embracing two or more adjacent tubes, and a sleeve or separator, 18, interposed between the tie-plates, with a bolt, 16, by which the tie-plates are drawn together upon the separator, substantially in the manner and for the purpose herein set forth.

886,580. STORAGE-BATTERY. JOHN A. REES, Boston, assignor to William C. Cobb, Hobart B. Herbert Ingalls and Paul West, Brookline, and William B. Plummer, Newton, Mass. Filed Feb. 13, 1888. Serial No. 263,883. (No model.)

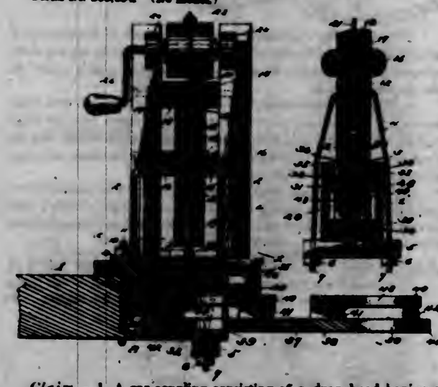


Claim.—1. The battery-case herein described, consisting of two semi-cylindrical sections, one of which is provided with longitudinal guide-flanges or supporting-ribs A^2 A^2, adapted to run upon ways, substantially as shown and described.

2. The combination, with the battery-case and a horizontal shaft arranged to rotate therein, of two spirally-wound metal ribbons forming the two elements, the said ribbons being insulated from each other and attached to the shaft, and radial arms for supporting the same, substantially as shown and described.

3. The combination, with the shaft B, having insulating-tube E, of the diagonally cut said insulated sleeves G D', the metal ribbons C D, attached thereto, and the radial arms F F', substantially as shown and described.

4. The combination of the battery-case, the shaft B, with insulating-tube E, the diagonally-cut sleeves G D', brushes J J', the ribbons C and D, the arms F F', and the insulating-blocks H, substantially as and for the purpose described.



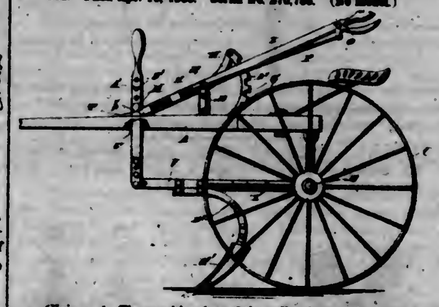
886,581. CURRENT-RECEIVER FOR ELECTRIC-RAILWAY CARS. JOHN A. REES, Boston, assignor to William C. Cobb, Hobart B. Herbert Ingalls and Paul West, Brookline, and William B. Plummer, Newton, Mass. Filed Feb. 13, 1888. Serial No. 263,882. (No model.)

Claim.—1. The combination, with a car, of two vertically-adjustable horizontal conductor-plates, P^2 P^2, extending along the roof of the car, and corresponding stationary brushes arranged along the line of travel, substantially as and for the purpose described.

2. The combination, with a car, of two horizontal conductor-plates P^2 P^2, the supporting-bar C C, slotted standards D D, levers E E, and a pull-cord connected thereto, and stationary posts provided with electrical brushes, substantially as and for the purpose described.

886,582. CAR-COUPLING. WILLIAM H. GRIFFITH, Bolivar, Tex., assignor to himself and C. C. Grundy, same place. Filed Apr. 6, 1888. Serial No. 269,654. (No model.)

Claim.—1. A car-coupling consisting of a draw-head having a spring-actuated sliding piece projecting into the draw-head, with a shouldered end therein, and a hole adapted to register with the coupling-holes in the draw-head, a coupling-link having yielding slotted pieces pivoted at its ends above slots in the ends of the link, and a coupling-pin with resting spring mounted in a frame having a winding-drum, and a rope connected with the coupling-pin, the latter projecting through and engaging the sliding piece and link, substantially as shown and described.



2. In a car-coupling, a draw-head having a sliding piece projecting into the draw-head with an inner shouldered end and a hole adapted to register with the coupling-pin holes in the draw-head, and normally held out of line therewith by retracting-springs, and a coupling-pin connected by a cord with a winding-drum mounted in a frame, and a spring pressing the coupling-pin against the sliding piece in the draw-head, substantially as shown and described.

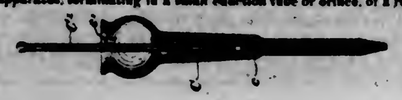
3. The car-coupling link 37, consisting of a flat strip, 38, having oblong slots 39, and pieces, 40, with slots 43, pivoted in brackets 41, and resting on coiled springs 42, and the bowed strips 44, extending about the ends of strip 38, and connected thereto by oblong slots 45, at their ends engaging pins 46, substantially as shown and described.

4. A car-coupling link consisting of a flat strip having oblong slots at its ends, and spring-actuated pivoted pieces with oblong slots extending over the slotted ends of the link, substantially as shown and described.

5. A car-coupling consisting of draw-head 1, having sliding piece 26 extending into recess 29 of the draw-head, and having a shouldered end, 30, perforation 31, and retracting springs 34, and a frame consisting of posts 2, with drum 23, crank 25, and rope 21, and central casket-piece, 12, having coupling-pin 16, secured to rope 21, and a resting-spring, 19, in combination with coupling-link 37, having oblong slots 39 at its ends, and bowed elastic strips 44, with slots 45 at their ends engaging pins 46, and pieces 40 with slots 43, pivoted in brackets 41 and resting on springs 42, substantially as shown and described.

886,588. SULKY-CULTIVATOR. JAMES A. HARLEWOOD, Clifton, Tex. Filed Apr. 16, 1888. Serial No. 270,780. (No model.)

Claim.—1. The combination of the sulky-frame, the beam having the cross-bar at its rear end, and the rearward-diverging brace-arms connecting the beam to the ends of the cross-bar, the links hinged to the rear ends of the brace-arms and pivoted to the sulky-frame, the hand-lever fulcrumed on the frame, and the rod A', connecting the hand-lever to the front end of the beam, substantially as described.



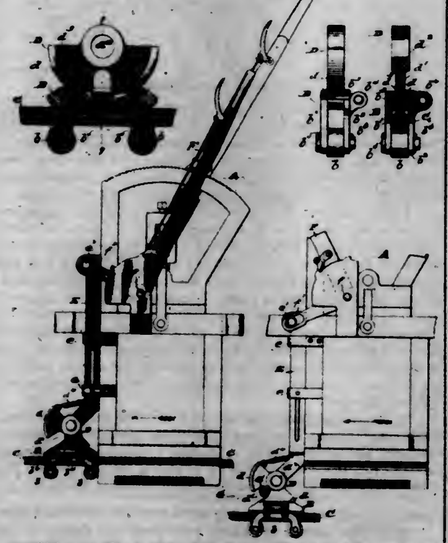
2. The combination of the sulky-frame having the tongue, the hand-lever fulcrumed on a suitable support on the tongue, the curved arm or segment plate F, having notches G, and riding from the tongue in rear of the fulcrum of the lever, the lug or ear S, rising from the tongue in advance of the fulcrum of the lever, the spring-actuated bolt on the lever adapted to engage both the notches of the segment-plate and the lug or ear S, the lever O, pivoted to the lever I, the link-rods connecting lever O to the spring-actuated bolt, whereby said bolt may be withdrawn simultaneously for the purpose set forth, the vertically-movable beam having the plow or shovel, and the rod connecting the front end of lever I and the front end of the beam, substantially as described.

3. The combination of the standard, the plow having the rearward-extending ears G', having openings I' and openings H' concentric therewith, and the pivotal bolt in openings I', connecting the plow to the standard, and the frangible pin extending through one of the openings H' and through the standard, substantially as described.

886,584. APPARATUS FOR SUPPLYING LIQUIDS IN GAS-GENERATORS. ARTHUR S. HOCKLEY, Indianapolis, Ind., assignor to the Jenney Electric Company, same place. Filed May 26, 1887. Serial No. 239,509. (No model.)

Claim.—1. The combination, with the receiver and generator of a gas-generating apparatus, of a supply-vessel for the acid, terminating in a minute orifice and provided with a rod terminating in a point, by which said orifice may be closed when desired, substantially as set forth.

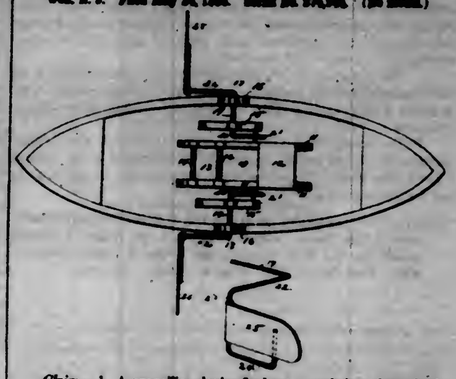
2. The combination, with the supply-vessel of a gas-generating apparatus, terminating in a small ejection-tube or orifice, of a rod for



386,584.

closing said orifice upon occasion, provided with a hook by which it can be held up away from said orifice without being removed from the supply-vessel altogether, substantially as set forth.

386,585. CABLE-GRIP DEVICE. JOHN T. HOGGINS, St. Louis, Mo., assignor of one-third to Samuel G. Hodgins, same place. Filed May 9, 1888. Serial No. 273,308. (No model.)



Claim.—1. The combination of the cable-holder B, the pivoted, notched, and flanged part D, the grip, and means for raising and lowering said holder B, substantially as described.

2. The combination of the holder B, having its sides hinged together and made to open, substantially as described, with the part D, said part D in turn, and by being journaled upon the bar E, being connected with a car, substantially as described.

3. The combination of the holder B, the part D, the bar E, and the spring d^3, substantially as described.

4. The combination of the grip A, the holder B, made to open as described, the part D, constructed and engaging with said holder as described, the spring d^3, and the means for raising and lowering said holder and part D, as described.

386,586. VIBRATING PROPELLER. ISRAEL G. HOWELL, Hopewell, N. J. Filed May 24, 1888. Serial No. 274,244. (No model.)

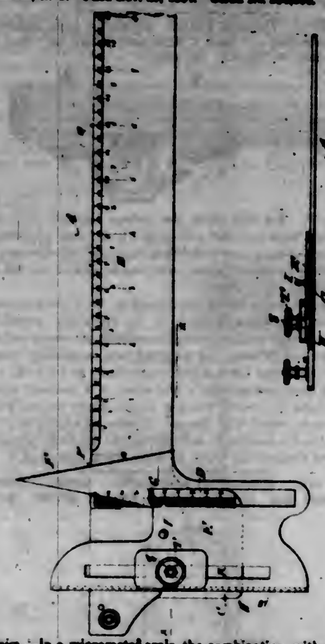
Claim.—1. A propelling device for boats, consisting of standards, a crank-shaft journaled in the same, provided with a body portion, an inboard arm at right angles to the body, an outboard right-angular arm, an upwardly-curved outer extremity, and a blade hinged to the pendent member of the outer right-angular arm engaging the curved extremity, substantially as shown and described.

2. In a device for propelling boats, the combination, with standards, of crank-shafts journaled in said standards, consisting of the body portion 19, the inboard arm 20 and attached handle 21, the outboard arms 22 and 23, and the upwardly-curved outer extremity, 24, and a blade hinged upon the arm 23 and supported at the rear by the curved extremity 24, all combined to operate substantially as shown and described.

386,587. VEHICLE-THILLS. GEORGE A. HYDE, Little Falls, N. Y. Filed Mar. 10, 1888. Serial No. 266,999. (No model.)

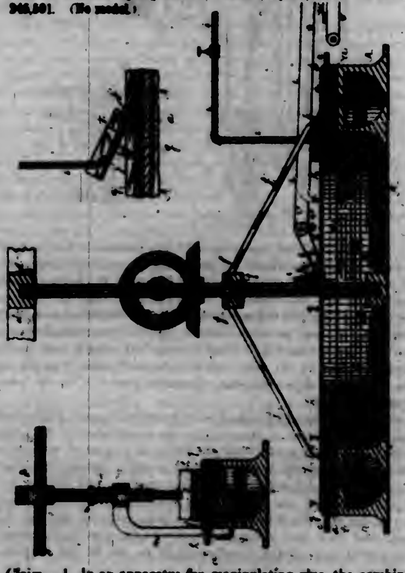
Claim.—1. The combination, with the runners, of the castings B, secured thereto and formed with arms *b*, and the shafts having shaft-irons detachably secured between said arms, substantially as and for the purpose specified.

2. The combination, with the runners, of the castings B, detachably secured to the forward portions thereof and formed with the longitudinal arms *b*, provided with a plurality of holes, as shown, and the shafts provided with shaft-irons detachably secured between said arms, substantially as and for the purpose specified.



3. The combination, with the metal portions of the shafts, curved and having offsets, as shown, and formed with tubular forward ends, of the wooden forward portions of the shafts fitted and secured in said tubular portions, substantially as shown and described.

386,588. GAS-BURNER TIP. WALTER H. JAMESON, New York, N. Y., assignor to the Gas Consumers' Benefit Company of the United States, same place. Filed Apr. 14, 1887. Serial No. 234,522. (No model.)



Claim.—As a new article of manufacture, a tip for gas-burners, consisting of a slightly-conical shank, having a perforated lower end and a flanged upper end, a ferrule having an outwardly-projecting flange adapted to rest in contact with the flange of the shank and an inwardly-projecting flange for deflecting the gas in its passage to the exit-slit in the head, and the rounded or curved head having a slot extending across the top and sides of the head, the end of the slot being in or approximately in a plane with the inwardly-projecting flange, substantially as set forth.

386,589. MICROMETER-SCALE. EDWARD JONES, Gold Spring Harbor, N. Y. Filed Nov. 28, 1887. Serial No. 256,698. (No model.)

Claim.—In a micrometer-scale, the combination, with a straight-edge having a longitudinal scale and a lateral extension having a transverse scale, of a gage mounted to work on the said extension on a transverse guide, and having an index adapted to register with the transverse scale, and an edge oblique to the said guide and adapted to register with the straight-edge, substantially as and for the purpose specified.

386,590. APPARATUS FOR SHEETING AND LAYING GLUE. CHARLES KELLER, Springdale, Pa. Filed July 23, 1887. Serial No. 245,501. (No model.)

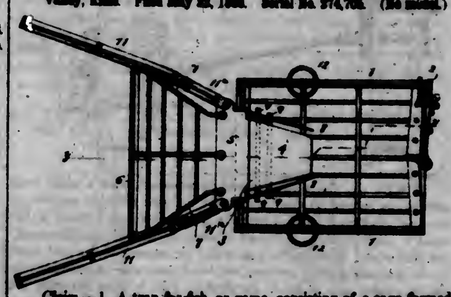
Claim.—1. In an apparatus for manipulating glue, the combination of a continuously-moving mold, a supply-pipe for delivering glue to the same, and a reciprocating knife mounted on the supporting-frame across the pan for cutting the glue into strips, substantially as and for the purpose set forth.

2. In an apparatus for manipulating glue, the combination of an annular trough, means for supplying the same with water, and an annular congealing-pan supported within said trough, substantially as and for the purpose set forth.

3. In apparatus for manipulating glue or like substances, the combination of a continuously-moving congealing-pan, a knife mounted on the supporting-frame for cutting the congealed glue into strips in the pan, and a stripper in the rear of said knife for stripping said strips from the pan, substantially as and for the purpose set forth.

4. In apparatus for manipulating glue and like substances, the combination of a continuously-moving congealing-pan, a cooling-trough in which the same travels, a stripper for stripping the congealed glue from the pan, and a conveyer back of said stripper for conveying the strips away from the pan, substantially as and for the purpose set forth.

5. In apparatus for manipulating glue, the combination of a continuously-moving congealing pan or mold, a stripper for stripping the glue from the pan, a conveyer back of said stripper, and a continuously-moving table under the end of the conveyer for the support of the drying-frame, substantially as and for the purpose set forth.



6. In apparatus for manipulating glue, the combination, with an annular trough, of means for supplying the same with a continuous current of water, with an annular rotating congealing-pan supported by a vertical shaft in said trough, substantially as and for the purpose set forth.

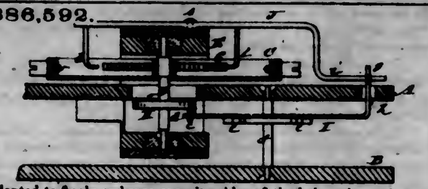
7. In apparatus for manipulating glue or like substances, the combination of a continuously-moving mold or pan, a cooling-trough in which the same travels, and a stripper for stripping the congealed glue from the pan and conveying it away, substantially as and for the purpose set forth.

8. In an apparatus for manipulating glue, the combination of the water-trough *a*, congealing-pan *g*, rotating in said trough, a stripper, *k*, held down against the surface of said pan, and a conveying-table, *l*, in the rear of said stripper for conveying the material away, substantially as and for the purpose set forth.

9. In the apparatus for manipulating glue, the combination of a water-trough, *a*, the congealing-pan *g*, rotating in said trough, a knife, *l*, supported by said trough, a stripper, *k*, held down against the surface of said pan in the rear of said knife, and a conveying-table, *l*, in the rear of said stripper for conveying away the material, substantially as and for the purpose set forth.

386,591. TRAP FOR FISH OR GAME. GEORGE H. KIRK, Round Valley, Kans. Filed May 23, 1888. Serial No. 274,703. (No model.)

Claim.—1. A trap for fish or game, consisting of a cage formed with an opening having an inwardly-tapering passage-way, a grating hinged to the lower side of the opening, and double folding guide-gratings hinged to the sides of the opening, substantially as described.



2. A trap for fish or game, consisting of a cage provided with an opening having an inwardly-tapering passage-way, the bottom of which is formed of a platform and its top and sides of pointed rods, and a grating hinged to the lower side of the opening, and double folding gratings hinged to the sides of the opening, substantially as described.

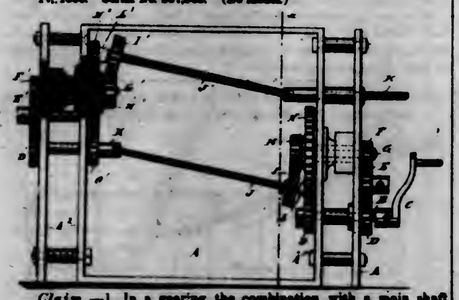
3. A trap for fish or game, consisting of cage 1, having opening 3, with an internal passage-way formed of platform 4 and converging pointed rods 6, and having the 'external shelf' 5, the grating 6, with outwardly-inclined sides 7, hinged to shelf 5, and the double folding guide-gratings 11, hinged at the sides of opening 3, substantially as described.

386,592. BALANCE-ESCAPEMENT FOR WATCHES. JAMES R. KNIGHTHORSE, Hollidaysburg, Pa. Filed Apr. 24, 1888. Serial No. 271,670. (No model.)

Claim.—1. In a watch-movement, the combination, with the hair-spring, balance-wheel, and roller-pin, of the forked pallet or escapement-lever and a vibrating governor actuated by said lever and

886,592.

adapted to freely embrace opposite sides of the hair-spring, substantially as specified.



2. The vibrating governor J, with its attached curbs *l l*, working upon or from an independent pivot, *c*, in combination with the hair-spring G, the balance-wheel C, balance-staff D, the roller H, with its attached pin *c*, and the pallet or escapement-lever I, having a fork, *d*, at its one end and extended and constructed at its opposite end to establish a vibrating engagement with the governor J, essentially as shown and described.

886,593. WHEEL HAY-RAKE. HENRY W. KRAMER, Bowensville, Ind. Filed May 14, 1887. Serial No. 238,269. (No model.)

Claim.—The rake-head D, provided with the rake-teeth D', rear rods, *g*, attached to the rake-head, and the arms H, hinged to the rear ends of the rods *g*, in combination with the side spring-rods, K, levers J' and *j*, and the rods *g*', connecting the lever *j* with one of the arms H, substantially as described.

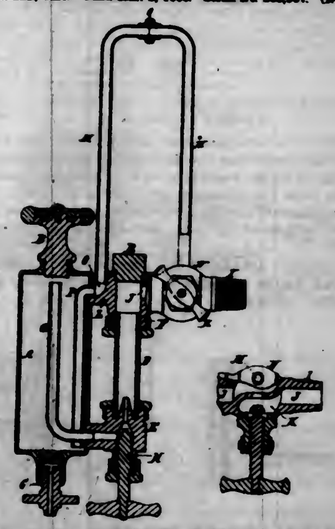
886,594. GEARING. OLE O. KRAVIK, St. Carl, Dak. Filed Mar. 17, 1888. Serial No. 267,923. (No model.)

Claim.—1. In a gearing, the combination, with a main shaft adapted to receive a rotary motion, of the gear-wheel D, secured on the said shaft and meshing into the intermediate gear-wheel, E, the shaft G, carrying the gear-wheel F, meshing into the said intermediate gear-wheel, E, the bevel gear-wheel H, secured on the said shaft G, the inclined shaft J, carrying the bevel gear-wheel I, meshing into the said bevel gear-wheel H, the shaft K, held in axial line with the said shaft G and on which one end of the said shaft J is pivotally connected, the gear-wheel N, mounted to rotate loosely on the said shaft G, and having a bearing on the other end of the said inclined shaft J, and the gear-wheel O, secured on the main shaft B and meshing into the said gear-wheel N, substantially as shown and described.

2. In a gearing, the combination, with two shafts, B and G, rotating in the same direction, of a bevel gear-wheel, H, secured to the said shaft G, an inclined shaft, J, carrying a bevel gear-wheel, I, meshing into the said bevel gear-wheel H, a large gear-wheel, N, mounted to rotate loosely on the said shaft G and forming the bearing for one end of the said shaft J, and the gear-wheel O, meshing into the said large gear-wheel N and being secured to the said shaft B, substantially as shown and described.

3. In a gearing, the combination, with two shafts, B and G, rotating in the same direction, of a bevel gear-wheel, H, secured to the said shaft G, an inclined shaft, J, carrying a bevel gear-wheel, I, meshing into the said bevel gear-wheel H, a large gear-wheel, N, mounted to rotate loosely on the said shaft G and forming the bearing for one end of the said shaft J, a gear-wheel, O, meshing into the said large gear-wheel N and being secured to the said shaft B, and the shaft K, mounted to rotate and placed in axial line with the said shaft G, said shaft K forming the bearing for the other end of the said shaft J, substantially as shown and described.

886,595. VEHICLE-BRAKE. ANDREW W. LAIR, Somerville, as signor to himself, and James L. McDermott, Milford, Ct. Filed Jan. 5, 1888. Serial No. 259,982. (No model.)

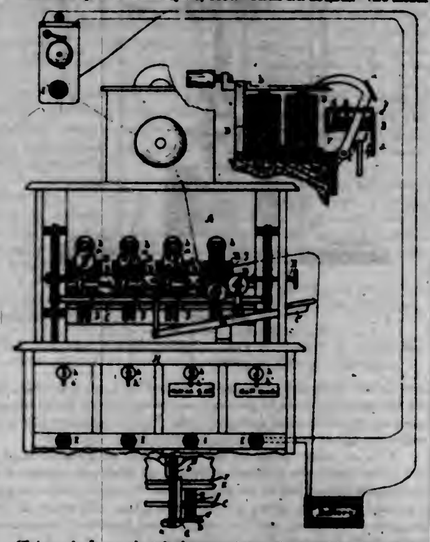


Claim.—1. In a brake-shoe, the ⅂-shape brackets 10 11, having their adjacent faces provided with spurs 17, and their oppositely-projecting attaching-arms provided with a transverse bolt-aperture and a slot, respectively, through which bolts may be passed into the brake-bar, substantially as set forth.

2. In a brake-shoe, the ⅂-shape brackets 10 11, the adjacent faces of which are provided with spurs 17, the oppositely-projecting attaching-arms of the brackets being transversely apertured and slotted, respectively, and formed with longitudinally-extending flanges 12 along their upper and lower edges, substantially as set forth.

3. The combination, with a brake-bar, of a recessed block, 20, brackets 10 and 11, one of which is longitudinally slotted, and both of which are provided with flanges 12, bolts by which the brackets are secured to the brake-bar, and a bolt arranged to pass through the brackets and through the block, substantially as described.

886,596. SIGHT-FEED LUBRICATOR. BERNARD LUBKEMEIER, Cincinnati, Ohio. Filed Mar. 2, 1888. Serial No. 265,997. (No model.)

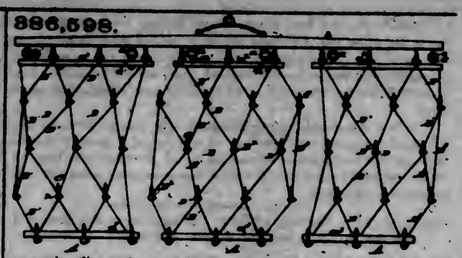


Claim.—1. In an ascending sight-feed lubricator having a single connection with the source of steam-supply, the combination of the oil-reservoir A, sight-feed glass D and its fitting E, oil-pipe G, connection I, provided with shank L, fitting F, and a single channel, J, for admitting steam and delivering oil, valve K, controlling said channel water-pipe P, and steam-condensing pipe M, communicating at one end with the channel J at a point between the valve K and the sight-feed glass, and at the other end with the water-pipe P on the opposite side of the sight-feed glass, substantially as and for the purpose described.

2. In an ascending sight-feed lubricator having a single connection with the source of steam-supply, the combination of the oil-reservoir A, sight-feed glass D and its fitting E, oil-pipe G, connection I, provided with shank L, fitting F, and a single channel, J, for admitting steam and delivering oil, valve K, controlling said channel, water-pipe P, secured to the shank L, and condensing-pipe M, communicating at one end with the channel J at a point between the valve K and sight-feed glass, and at the other end with the water-pipe P through the duct O in the shank L, substantially as and for the purpose described.

3. In an ascending sight-feed lubricator having a single connection with the source of steam-supply, the combination of the oil-reservoir A, sight-feed glass D and its fitting E, oil-pipe G, valve K, screw-plug R, connection I, provided with shank L, fitting F, and a single channel, J, for admitting steam and delivering oil, valve K, controlling said channel, water-pipe P, screwed into the shank L, and the condensing-pipe M, communicating at one end with the channel J at a point between the valve K and sight-feed glass, and at the other screwed into the shank L and communicating with the pipe P through the duct O, substantially as and for the purpose specified.

886,597. ELECTRICAL CALL SYSTEM. JAMES C. MCLAUGHLIN, Kansas City, Mo. Filed Apr. 9, 1887. Serial No. 234,262. (No model.)



Claim.—1. In an electrical annunciator, the combination of the call-drops, a movable actuating-bar to return said drops to their normal position, and registers disconnected from said drops and actuating-bar, but arranged in the path of said drops, so as to be thrown from their normal position as the drops fall, substantially as shown and described.

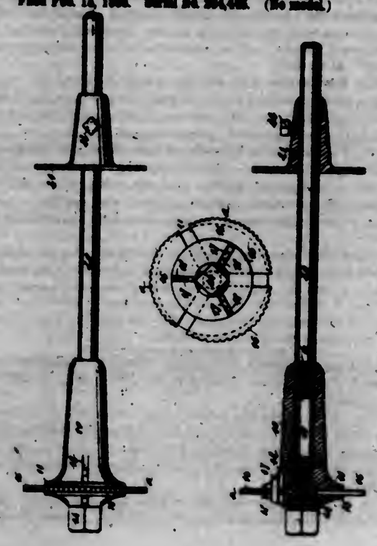
2. The combination, substantially as specified, of an electrical annunciator provided with call-drops, a bell and a push-button in each room electrically connected with said annunciator, a system of registers separate from the call-drops, but arranged to be thrown from their normal position by said drops, a pull-rod to return the registers to their normal position, and push-buttons located in the office or other central station and in electrical connection with the bells, for sounding an alarm in any room from the office, as set forth.

3. The combination, substantially as specified, of the annunciator A, provided with call-drops *a a'*, electrical connections and appliances for releasing the same from the different rooms, and means for returning the said drops to their normal position, with the pivoted registers D, having pendants *d* arranged in the path of the drops *a a'* when in their normal position, the spring-latches *g*, to retain the said registers in their normal position, and the spring-pull E, pins *e*, and studs *e'*, to return the registers D to their normal position.

4. The combination, substantially as specified, of the electrical annunciator A, provided with the call-drop *a*, the pivoted registers D, having pendants *d*, and studs *e'*, arranged to be actuated by the call-drops, and the spring-pull E, having pins *e* for the purpose of returning the registers to their normal position.

886,598.

successive diagonal or angular arms or portions of which varies in the direction of their lengths and extends in opposite directions, which beams are connected together, with the shorter portions or arms of one beam bracing the longer arms or portions of the adjoining beam, substantially as set forth.



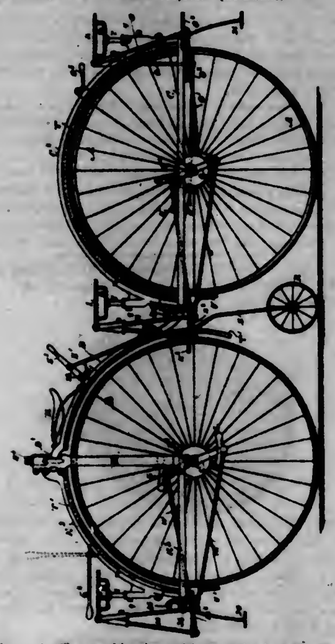
3. The harrow comprising the series of thin plate-like zigzag beams having apertured straight parallel portions intermediately of their angular or diagonal portions or arms, the angle of deflection of the successive diagonal or angular arms of which varies in the direction of their lengths and extends in opposite directions, which beams are connected together, with the shorter portions or arms of one beam bracing the longer arms or portions of the adjoining beam, and the teeth, the shanks of which are formed with an apertured web provided above and below the aperture with shoulders, substantially as set forth.

886,599. DEVICE FOR COOKING AND TURNING OMELETS. MARY D. REVELL, Wellsburg, Va. Filed June 15, 1887. Serial No. 241,362. (No model.)

Claim.—An omelet-pan made in two parts and constructed with a rim, *a*', said rim cut out or notched, as shown at *a*', to allow one side of the rim of the pan to enter within the other, the parts joined together by a hinge constructed approximately midway between the bottom of the pan and the top of the rim, in combination with the handles *a*', for turning one side of the pan over the other and for handling the pan, substantially as described.

886,600. FLUE-CLEANER. JAMES REVERE, New Ridge, Ala. Filed Feb. 13, 1888. Serial No. 264,462. (No model.)

886,598. HARROW. GEORGE HERZOG and REUBEN H. HARPER, Eugene City, Oreg. Filed Mar. 6, 1888. Serial No. 266,570. (No model.)



Claim.—1. The harrow comprising the series of zigzag beams, the angle of deflection of the successive diagonal or angular arms or portions of which varies in the direction of their lengths and extends in opposite directions, which beams are connected together, the shorter portions or arms of one beam bracing the longer arms or portions of the adjoining beam, substantially as set forth.

2. The harrow comprising the series of thin plate-like zigzag beams having apertured straight parallel portions intermediately of their angular or diagonal portions or arms, the angle of deflection of the

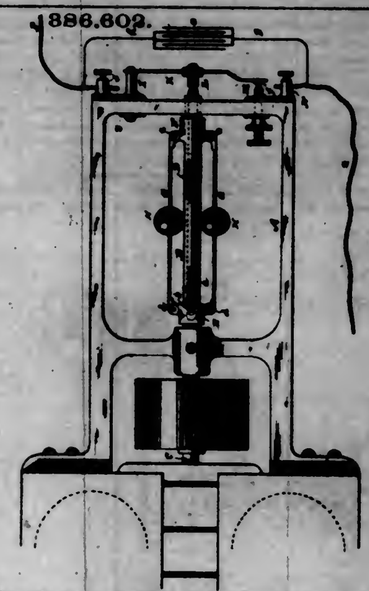
Claim.—1. In a flue-cleaner, a head having a transversely-apertured flat outer end, a circular series of flat scraping-plates having transverse bars projecting from their opposite faces, and an apertured clamping-plate between which the said plates are held with their bars projecting into the apertures in the head and plate, substantially as set forth.

2. In a flue-cleaner, the combination, with a head formed with a flat-faced flange and with apertures 12, of a clamping-plate, 15, formed with apertures 18, serrated-faced blades 16, provided with bars 17, which rest in the apertures 12 and 18, and a clamping-screw, 14, substantially as described.

386,601. TANDEM BICYCLE. THOMAS O'REILLY, New York, N. Y. Filed Oct. 24, 1887. Serial No. 253,173. (No model.)

Claim.—1. The combination, with the wheels A B, of a frame composed of the bow C and arch C^2 at the wheel A, the curved spine D, rising above the wheel B, the fork E, quadrant spine E^2, and half-yoke E^3, and the head D', pivoted to the top upper end of the fork E and the seats G, I, and K, and the standards for supporting the same substantially as set forth.

2. The combination, with the two wheels A B, and the frame connecting the same pivoted at D', of the seat H upon the spine D, the crank L', and treadles L, the seat G in front of the wheel B, the pendent links M, and connecting-rods M', substantially as set forth.

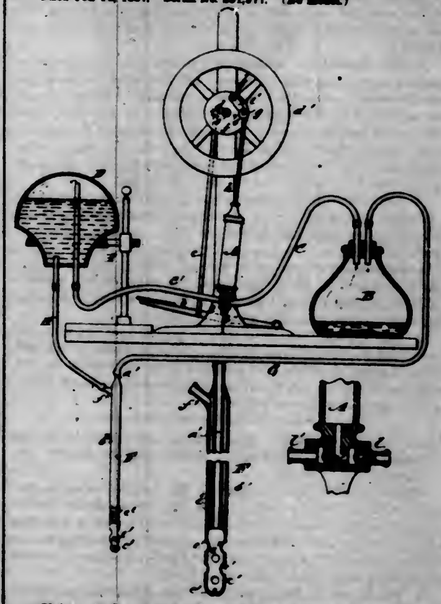


3. The combination, in a bicycle, of two wheels and the frame for connecting the same, the cranks, connecting-rods, pendent links, and treadles or foot-pieces, and three seats, one in front of the bicycle, one behind, and one between the two wheels, the pendent links being connected at their upper ends to the respective seats, substantially as set forth.

4. The combination, in a bicycle, of two wheels, the connecting-frames, the three seats, pendent links, treadles, and cranks, two steadying-wheels, a frame for supporting the same pivoted at its upper end to the spine D of the frame-work, links connected to the frame, and handles for swinging the steadying-wheels down into position and raising the same, substantially as set forth.

386,602. ELECTRIC GOVERNOR. HORACE W. PARSONS and JOHN HESSIT, Wamego, Kans. Filed Sept. 26, 1887. Serial No. 250,760. (No model.)

Claim.—1. In an electric governor, the combination of a tubular shaft, a rod in the shaft, a sleeve fitted to slide on the shaft and connected to the rod, springs pivoted to the shaft and sleeve, weights on the springs, and a circuit-interrupting spring operated by the said rod, substantially as described.



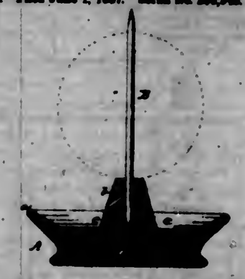
2. In an electric governor, the combination of a tubular shaft provided with a longitudinal slot, a rod in the shaft, a sleeve fitted to

slide on the shaft and connected to the rod by a pin projecting into the slot, springs pivoted to the shaft and sleeve, weights on the springs, and a circuit-interrupting spring provided with an insulated stop, with which the end of the rod engages, substantially as described.

3. In an electric governor, the combination of a tubular shaft, a rod in the shaft, a sleeve fitted to slide on the shaft and connected to the rod, springs pivoted to the shaft and sleeve, weights on the springs, a circuit-interrupting spring provided with a stop, with which the rod engages, a condenser, and the contacts and electrical connections, substantially as herein shown and described.

386,603. STORAGE-PUMP. HORACE W. PARSONS, Wamego, Kans. Filed Oct. 11, 1887. Serial No. 251,977. (No model.)

Claim.—1. In apparatus for washing out the stomach and other cavities or organs of the body, the combination of an air exhausting and forcing pump, a close receiver adapted to receive the washed-out contents of the cavity or organ and connected with the suction-inlet of the pump, a separate close receptacle or vessel adapted to contain the fluid used in washing out the said cavity or organ and connected with the forcing-outlet of the air-pump, ducts or tubes connected, respectively, the one with the upper portion of the close receiver and the other with the lower portion of the vessel containing the washing-out fluid and air under pressure, and a stomach or other like tube common to both of said last-named tubes, and adapted to both receive and pass the contents of the organ under treatment and to separately pass or eject the washing-out fluid, essentially as specified.



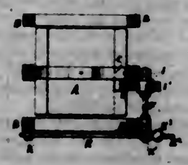
2. In apparatus for washing out the stomach and other cavities of the body, the double-current tube F, composed of an inner tube, *c'*, having an attached tube, perforated extension or nozzle, and an outer tube, *b'*, provided with discharge-perforations at or near its one end and an inlet at or near its other end, substantially as herein set forth.

3. The combination, with the double-current tube F, constructed for operation substantially as described, of the attached tubes G H and an exhaust vessel or receiver connected with the one tube, G, and a close fluid and air vessel connected with the other tube, H, essentially as specified.

4. The combination, with the pump of the driving face-plate *f*, having adjusting-apertures *s* in different positions relatively to the center of said plate, and the arm or plate *i*, pivoted to said plate on one side of its center and provided with a wrist or wrist-pin, *g*, adapted to engage with any one of said apertures in the face-plate, essentially as described.

5. The pump A, in combination with the spring *c*, by which it is carried, and which provides for the vibration or oscillation of the pump, substantially as specified.

386,604. FRUIT-HOLDING DEVICE. JOHN J. W. PLANK, San Mateo, Fla. Filed June 1, 1887. Serial No. 239,943. (No model.)

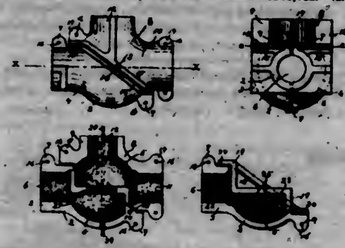


Claim.—In a device for use in removing the rind from oranges, a holder comprising the base A, formed with the raised portion *b*, the flange *a*, and the intermediate juice-receiving groove, *c*, and the spindle E, projecting up from said raised portion, substantially as set forth.

386,605. ELEVATOR-GATE. JAMES H. FRASER, Brooklyn, N. Y. Filed Apr. 26, 1888. Serial No. 271,811. (No model.)

Claim.—1. The combination, with the pivoted guard arm or gate, of the rock-shaft F, to which said guard arm or gate is connected, the segmental brush I upon said rock-shaft, and the brush D upon the side of the elevator-guideway, substantially as set forth.

2. The combination, with the pivoted guard arm or gate K, of the hub E' for the same, a threaded rod, F', and counter-weight F^2, the rock-shaft F, to which the hub E' is connected, bearings for the rock-shaft, a hub, I, and segmental brush I', and a brush, D, upon the side of the elevator-guideway C, substantially as set forth.

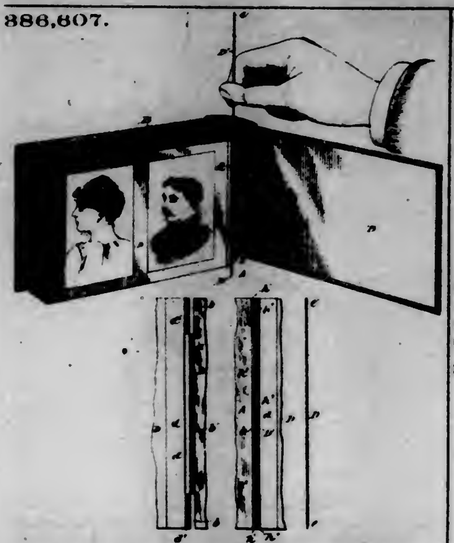


3. The combination, with the pivoted guard arm or gate K, of the hub E' for the same, a threaded rod, F', and counter-weight F^2, the rock-shaft F, to which the hub E' is connected, bearings for the rock-shaft, a hub, I, and segmental brush I', and a brush, D, upon the side of the elevator-guideway C, the bristles or wires of the brush I' being set in lines radiating from the rock-shaft F, and the bristles or wires of the brush D being set at an inclination upwardly, substantially as set forth.

386,605.

386,606. DEVICE FOR MOLDING CORES. ROBERT A. ROBERTS, Baltimore, Md. Filed May 12, 1888. Serial No. 273,712. (No model.)

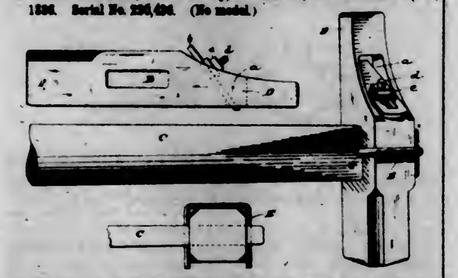
Claim.—1. A core-box for globe-valve cores, consisting of a drag made in two sections and a cope made in two sections, the said cope and drag having matching inclined surfaces which pass obliquely through the axis and through the center of the matrix-cavity, the said cope and drag forming the exterior surfaces of the core, in combination with a subsidiary molding-plate, 18, provided with the molding-surface 21, having therein the recess 23, whereby the upper surface of the valve-seat and a part of the interior walls will be formed, and the molding-plate 19, provided with the molding-surface 25, whereby the lower surface of the valve-seat and part of the interior walls of the valve will be formed, for the purpose set forth.



2. A core-box for globe-valve cores, consisting of a drag made in two sections and provided with an opening, 30, in the bottom thereof, and a cope made in two sections, the said cope and drag having matching inclined surfaces which pass obliquely through the axis and through the center of the matrix-cavity, the said cope and drag forming the exterior surfaces of the core, in combination with a subsidiary molding-plate, 18, provided with the molding-surface 21, having therein the recess 23, whereby the upper surface of the valve-seat and a part of the interior walls will be formed, the molding-plate 19, provided with the molding-surface 25, whereby the lower surface of the valve-seat and part of the interior walls of the valve will be formed, and the wire 29, by which the union of the two parts of the core is strengthened, for the purpose set forth.

386,607. ALBUM. FELIX REICHENBERGER, Brooklyn, N. Y. Filed Jan. 18, 1888. Serial No. 261,126. (No model.)

Claim.—1. The combination, with the album provided with a series of stubs having eyes, of the leaves forming mounts said having strips of textile or other non-metallic fabric pasted along their inner edges and forming eyes at the bends registering with the spaces between the stub-eyes, and the pintles passed through said eyes and removable therefrom, whereby any mount may be removed, passed through a burnisher, and then replaced, substantially as set forth.



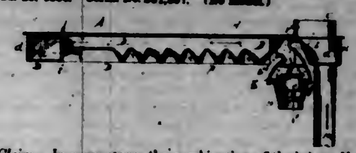
2. The combination, with the album provided with a series of stubs having eyes, of the series of mounts having flexible eyes of textile or other non-metallic fabric, and the removable pintles connecting

386,607.

said eyes, one pintle being exposed between its ends, whereby it may be grasped, pushed outward, and removed to serve as means for forcing the other pintles outward, substantially as set forth.

386,608. COMBINED SHINGLING HAMMER AND PLANE. WILLIAM S. ROSENBERG, New Germany, Nova Scotia, Canada. Filed Dec. 2, 1886. Serial No. 220,494. (No model.)

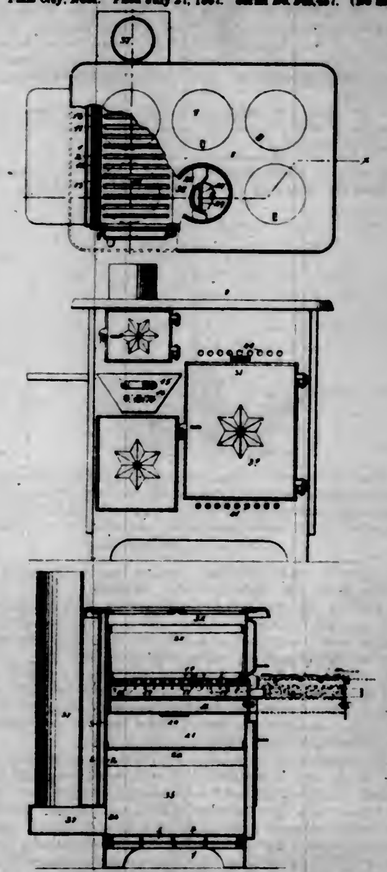
Claim.—1. A hammer having its peen formed at one side of a line running longitudinally and centrally through the hammer-head and perpendicularly to the hammer-face and having a plane-iron secured in the peen end, substantially as described.



2. The combination, with a hammer-head having its peen formed at one side of a line running longitudinally and centrally through the hammer-head and perpendicularly to the hammer-face, of a plane-iron secured in the peen end and removable guides projecting beyond the plane-face of the hammer-head, substantially as described.

3. The combination, with a hammer-head having its peen formed at one side of a line running longitudinally and centrally through the hammer-head and perpendicularly to the hammer-face, and a handle secured in the said head, of a plane-iron secured in the peen end of the hammer-head and a staple inserted in holes in the handle on opposite sides of the head and projecting beyond the plane-face of the hammer-head, substantially as herein shown and described.

4. The combination, with the hammer-head A, provided with a peen, D, formed at one side of a line running longitudinally and centrally through the hammer-head and perpendicularly to the hammer-face and having a flaring transverse aperture, *a*, formed therein, of the plane-iron *b*, placed in the flaring aperture, the stud *d*, projecting through the plane-iron, and the nut *c*, for clamping the iron in the position of use, substantially as described.



5. The combination, with the hammer-head A, provided with a peen, D, formed at one side of a line running longitudinally and centrally through the hammer-head and perpendicularly to the hammer-face and having a flaring transverse aperture, *a*, formed therein, of the plane-iron *b*, placed in the flaring aperture, the stud *d*, projecting through the plane-iron, the nut *c*, for clamping the iron in the position of use, the handle C, provided with apertures *c c'*, the staple F, fitted to the apertures *c c'* and arranged to project beyond the plane-face of the hammer-head, and the steel wedge having cutting-edges *f g*, substantially as described.

386,609. GAS-STOVE. J. J. HENRY BERLAM, Bennett, Pa. Filed Jan. 30, 1888. Serial No. 261,897. (No model.)

Claim.—In a gas-stove, the combination of the burner H, the air-burners E' E' and F' F' on either side of said burner H, the perforated corrugated plate D D, extending from the rear to the front of the fire-chamber, and the flues *a a a a*, encircling said chamber and communicating therewith by the ports *n n n*, the whole structure being suitably incased.

386,610. COOKING STOVE OR RANGE. ISAAC C. SHEVLER, Falls City, Nebr. Filed July 27, 1887. Serial No. 245,057. (No model.)

Claim.—1. A stove provided with a fire-pot consisting of a grate recessed at the top to receive the linings and an air-space intervening one side lining and the end of the stove and the opposite side lining and the oven, both of the side flues leading to the ash-pit and receiving air through apertures at their upper ends, substantially as shown and described, whereby the air in said space is heated and the linings protected from burning, as set forth.

2. A stove provided with an oven having a perforated top, a hot-air chamber above said oven, and a damper sliding in said hot-air chamber, perforated to register with the perforations in the oven-top,

and a flue leading from said chamber to the fire-pot, substantially as shown and described, whereby the air is allowed to pass from said oven into said chamber, as set forth.

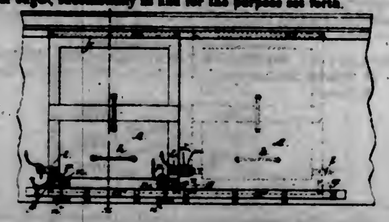
3. A stove having a chamber beneath the fire-pot and separated therefrom by a partition, a combustion-flue passing around the oven and entering said chamber near the top, and an exit-flue near the bottom of said chamber, substantially as shown and described.

4. The combination, with a stove, of a detachable ash-receptacle provided with a detachable longitudinal partially-perforated plate held above the bottom in its forward end, substantially as shown and described, whereby hot coals may be placed upon the plate when the receptacle is drawn outward, and meats broiled thereon, the draft being through the coals and rearward under the grate, as set forth.

5. The combination, with a stove, of a detachable ash-receptacle provided with a detachable longitudinal partially-perforated plate held above the bottom, a draft-opening in the end of said receptacle below the plate, and a series of longitudinally-arranged apertures above the plate in each side, substantially as shown and described, whereby hot coals may be placed upon the perforations of the plate, meats broiled thereon, and the fumes carried up into the fire, as set forth.

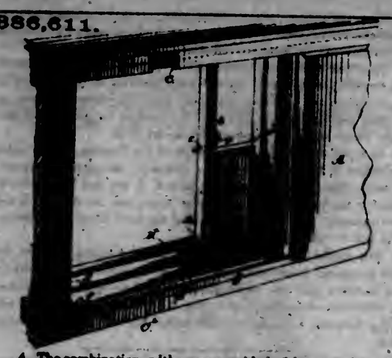
6. The combination of a stove provided with a fire-pot at one end, an outer jacket, 1, covering said end, whereby an air-space, 6, is formed, a series of inlet-apertures, 7, in the base of said jacket, a passage, 11, intervening the inner wall, 2, of said space 6 and the lining 12 of the fire-box and leading to the fire-pot through the ash-pit, and a series of outlet-apertures, 13, connecting said space 6 and passage 11, substantially as shown and described, whereby the air is heated and passed up into the fire, as set forth.

7. The combination, with a stove provided with a fire-pot at one end and an outer jacket, 1, covering said end, whereby an air-space, 6, is formed, a series of inlet-apertures, 7, in the base of said jacket, a passage, 11, intervening the inner wall, 2, of said space 6 and the lining 12 of the fire-box, and a series of outlet-apertures, 13, connecting said space 6 and passage 11, of a trough-shaped partition, 22, supported below the fire-box and passage, whereby hot-air chamber 21 is formed, the hot-air chamber 20 below said partition, and the combustion-flue 32, leading from the fire-pot around the oven into said chamber 20 and through an exit therein, whereby the air in space 6 and chamber 21 will be heated by the products of combustion, substantially as shown and described, and for the purpose herein set forth.



8. The combination, with a stove provided with an air-space, 6, air-inlet aperture 7, and air-outlet apertures 13, a passage, 11, intervening the inner wall of said air-space and the fire-box lining, a trough-shaped partition beneath the fire-box, whereby a chamber, 21, is formed, and a perforated ash-receptacle, 16, adapted to slide in said chamber 21, of an oven, 23, suspended at one side and below the fire-box, provided with an upper air-chamber, 30, a passage, 26, intervening the said chamber 30 and oven and the fire-box and leading into said chamber 21, series of apertures 29 in the oven-chamber 30, the combustion-flues 32 and 34, passing over the chamber 30 and around the oven, the off-take flue 36, and means for conducting the heat from the oven 23 into the chamber 30, all arranged to operate substantially in the manner and for the purpose herein set forth.

386,611. CAR-DOOR. JOHN W. SHOWALTER, Terre Haute, Ind. Filed Nov. 12, 1887. Serial No. 254,902. (No model.)



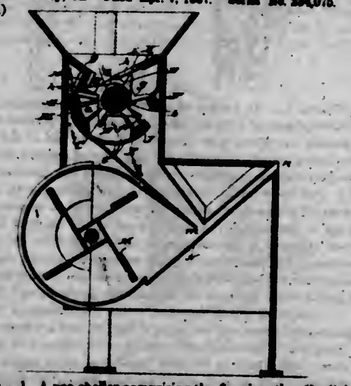
Claim.—1. The combination, with a car provided with grooved trackways and having its door-opening provided with lateral grooves *f* at the top and bottom, of a door having vertically-extending lug or lugs *g* at its upper and lower edges, substantially as and for the purpose described.

2. The combination, with a car provided with grooved trackways and having the top and bottom of its door-opening beveled and provided with lateral grooves *f*, of a door having its top and bottom edges beveled and provided with lugs *g*, substantially as and for the purpose set forth.

3. The combination, with a car provided with inside grooved trackways and lateral grooves at the top and bottom of its door-opening, of a grain-door having its lower portion closed and its upper portion of open-frame construction, and provided with lugs at its top and bottom edges, substantially as and for the purpose set forth.

386,611.

4. The combination, with a car provided with grooved trackways and having the top and bottom of its door-opening inclined in substantially parallel lines and provided with lateral grooves *f*, of a door having its upper and lower edges inclined in substantially parallel lines and having vertically-extending lugs *g* at its upper and lower edges, substantially as and for the purpose described.



5. The combination, with a car having a door-opening provided with inwardly and outwardly extending grooves *f f* at its upper and lower edges and inner and outer longitudinal grooved trackways, C C' D D', of outer door, A, and inner apertured door, B, each of said doors being provided with vertically-extended lugs *g g* at its upper and lower edges, substantially as and for the purpose described.

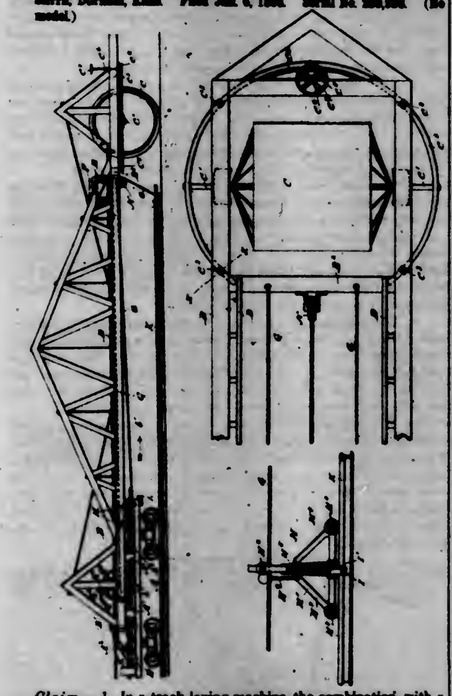
6. The combination, with a car having its door-opening at the top and bottom inclined in substantially parallel lines and provided with inwardly and outwardly extending grooves *f f*, and having inner and outer longitudinal grooved trackways, C C' D D', of the outer door having its upper and lower edges inclined in substantially parallel lines, and an inner apertured door, B, each of said doors being provided with vertically-extending lugs *g g* at its upper and lower edges, substantially as and for the purpose described.

7. The combination, with a car having a door-opening provided with a lateral groove or grooves, *f*, in its upper and lower edges and longitudinal grooved trackways C C', and provided with staples *m* and bolt-socket *n*', of a door provided with vertically-extended lugs *g* at its upper and lower edges and having hasps *l* and sockets *n*, and the bolts *n' p*, substantially as and for the purpose described.

8. The combination, with a car having a door-opening provided with inner and outer caps and sills at its top and bottom, each of which has lateral grooves *f f*, and having socket-holes *r*' in the inner jambs, and inner and outer longitudinal grooved trackways, C C' D D', of an outer door, A, and inner open top door, B, each provided with vertically-extending lugs *g g* at its upper and lower edges, and said inner door having the hole *r* and the bolt *q*, substantially as and for the purpose described.

386,612. PEA SHELLER AND SEPARATOR. WILLIAM A. SLAPPEY, Fort Valley, Ga. Filed Apr. 7, 1887. Serial No. 234,075. (No model.)

Claim.—1. A pea-sheller comprising the framing, the ribs G, having the upwardly-arched central portion, the feed-board having its lower end formed with fingers *k*, terminating over the upwardly-arched central portion, the cylinder journaled below the arched portion of the ribs and having spikes which operate between such ribs



and between the fingers of the feed-board, and the spiked or toothed cocsove below the cylinder, substantially as set forth.

2. In a pea-sheller, the combination of the framing, the ribs G, having centrally arched and depressed end portions, the feed-board K, having its lower end arranged vertically over the center or crown of the arched portions of the ribs, and the toothed or spiked cylinder arranged below said ribs, substantially as set forth.

3. In a pea-sheller, the combination of the framing, the cylinder having spikes E, the bars E J, having spikes *e j*, the plate I, extended below said cylinder and between the bars E J, the bar F, the ribs G, arched over the cylinder and supported at one end on the bar E and at their opposite ends on the bar F, and the feed-board, all substantially as and for the purposes specified.

4. The combination, in a pea-sheller, of the framing, the ribs, the cylinder journaled below said ribs and having teeth or spikes which operate between said ribs, and the feed-board having at its lower end fingers which extend close to the ribs, the teeth of the cylinder also operating between said fingers, substantially as and for the purposes specified.

386,618. MACHINE FOR LAYING RAILROAD-TRACKS. MASON SMITH, Durham, Kans. Filed Jan. 6, 1888. Serial No. 259,998. (No model.)

Claim.—1. In a track-laying machine, the combination, with a flat railroad-car, of a truss-frame supported and pivoted at its rear end on said car, a ring held to turn on the front end of the said truss-frame, and a wheel mounted in the said ring to support the front end of the said truss-frame, substantially as shown and described.

2. In a track-laying machine, the combination, with a flat railroad-car, of a truss-frame supported and pivoted at its rear end on the said car, a ring held to turn on the front end of the said truss-frame, a wheel mounted in the said ring to support the front end of the said truss-frame, a segmental gear-wheel secured to the said ring, a pinion meshing into the said segmental gear-wheel, and a shaft carrying the said pinion and a hand-wheel, substantially as shown and described.

3. In a track-laying machine, a flat railroad-car, a truss-frame supported at its rear end on the said flat car, and a wheel supporting the front end of the said truss-frame, in combination with a rope passing over a pulley held on the said truss-frame, and a gaging and drawing device, P, held on each end of the said rope, substantially as shown and described.

4. In a track-laying machine, a flat railroad-car, a truss-frame supported and pivoted at its rear end on the said car, and a wheel supporting the front end of the said truss-frame, in combination with adjustable ropes held on the said truss-frame, and the gripping and supporting devices H, adapted to travel on the said ropes, substantially as shown and described.

5. In a track-laying machine, a flat railroad-car, a truss-frame supported and pivoted at its rear end on the said car, and a wheel supporting the front end of the said truss-frame, in combination with a rope passing over a pulley held on the said truss-frame, a gaging and drawing device, P, held on each end of the said rope, a set of adjustable ropes held on the said truss-frame, and the gripping and supporting devices H, adapted to travel on the said ropes, substantially as shown and described.

6. In a track-laying machine, a flat railroad-car and rollers mounted at each side of the said car to support the track-rails, in combination with a truss-frame supported at its rear end on the said car, a wheel supporting the front end of the said truss-frame, a pulley mounted on the under side of the said truss-frame, a rope passing over the said pulley, and the gaging and drawing devices P, secured to the ends of the said rope, one being adapted to be fastened to the track-rails on the said rollers and the other to the rails already laid, substantially as shown and described.

7. In a track-laying machine, a flat railroad-car, sets of rollers mounted in longitudinal lines on the sides of the said car and adapted to support the track-rails, and sets of pulleys mounted horizontally on top of the said flat car, in combination with a truss-frame supported and pivoted at its rear end on the said car, an adjustable wheel held on the front of the said truss-frame, a pulley mounted on the under side of the said truss-frame, a rope passing over the said pulley, and the gaging and drawing devices P, secured to the ends of the said rope, substantially as shown and described.

8. In a track-laying machine, a flat railroad-car, a truss-frame supported and pivoted at its rear end on the said car, and a wheel supporting the front end of the said truss-frame, in combination with a set of ropes, each secured by one end to the said truss-frame, and a drum mounted to rotate in the said truss-frame and carrying the other ends of the said ropes, substantially as shown and described.

9. In a track-laying machine, a rail gripping and supporting device consisting of a frame, means for raising and lowering it, two sets of jaws mounted upon said frame the distance of the gage of the track apart, an operating-lever mounted on said frame, and connections between said lever and the said jaws, whereby when the lever is thrown both pairs of jaws will be simultaneously opened or closed, substantially as set forth.

10. In a gripping and supporting device, the combination, with a frame mounted to travel on ropes, of two sets of jaws pivoted on the said frame, links pivotally connected with the said sets of jaws, a wheel to which the said links are pivoted, and a hand-lever for turning the said wheel so as to open and close the said sets of jaws simultaneously, substantially as shown and described.

11. In a gripping and supporting device, the combination, with a frame mounted to travel on ropes, of two sets of jaws pivoted on the said frame, links pivotally connected with the said sets of jaws, a wheel in which the said links are pivoted, a hand-lever for turning the said wheel so as to open and close the said sets of jaws simultaneously, and a pawl adapted to engage ratchet-teeth formed on the said wheel for locking the said jaws in a closed position, substantially as shown and described.

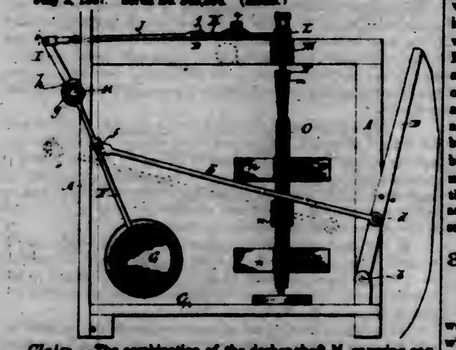
12. In a track-laying machine, a gaging and drawing device provided with two sets of rail guide-bars, and levers having prongs or pins for locking the rails in place in the sets of guide-bars, substantially as shown and described.

13. In a gaging and drawing device, the combination, with a frame provided on each end with two guide-bars, between which the rail is placed, a rod mounted to slide in the middle of the said frame, levers pivoted on the said frame and connected at their free ends with the said sliding rod, and pins or prongs formed on the said levers and adapted to engage the end apertures in the rails held in the said guide-bars, substantially as shown and described.

14. In a track-laying machine, a gripping and supporting device provided with two sets of jaws placed the distance of the gage of the track apart, and arms or supports at opposite sides of the jaws, having rollers journaled at right angles to the axes of the said jaws and adapted to rest upon the tread of a rail held by said jaw, substantially as set forth.

386,614. SAFETY-LOCK FOR MAGAZINE-GUNS. CHRISTOPHER M. SPENCER, Windsor, Conn. Filed Apr. 21, 1887. Serial No. 236,052. (No model.)

Claim.—The combination, in a repeating fire-arm, of the breech-block A, provided with the laterally-projecting shoulder *d*, and the pivoted lever or safety-lock B, provided with the shoulder *c*, in combination with the pin *d'*, affixed to the hammer-arm for imparting motion to the said safety-lock, and thereby carrying its end *f* into engagement with the said shoulder *d*, as and for the purposes set forth.



386,615. HAME. WILLIAM T. SIMMONS, Gettysburg, assignor of one-third to Richard H. West, Littlestown, Pa. Filed May 28, 1888. Serial No. 275,021. (No model.)

Claim.—1. The combination, with a hame, of a staple having notches or cents for the tug-eye, and a spring-actuated bar guided upon the legs of the staple and pressing outwardly toward said cents, substantially as shown and described.

2. The combination, with a hame, of a staple, B, having a series of notches or cents, b, the spring-actuated bar D, having openings at its end, through which the ends of the staples pass, and spiral springs E E wound upon the legs of the staple between the spring-bar D and the hame, substantially as shown and described.

386,616. SHUTTER. THOMAS S. HIBB, Carson City, Mich. Filed July 2, 1887. Serial No. 243,204. (Model.)

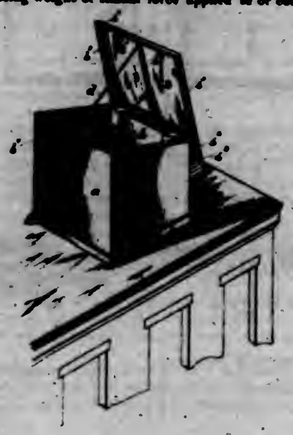
Claim.—The combination of the dasher-shaft M, carrying cog-wheel L, the gear K, meshing therewith, the pivoted hand-lever D, connecting-rod E, the pendulum-rod F, shaft H, upright I, and rod J, pivoted to the upright and gear, as set forth.

386,617. HAIR-TONIC. WILLIAM T. WALLACE, Troy, Tex. Filed Apr. 18, 1888. Serial No. 271,697. (No specimens.)

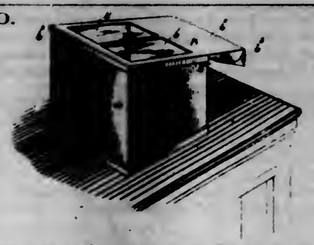
Claim.—The herein-described preparation for use as a hair-restorer, consisting of tincture of cantharides, oil of cocoa, castor-oil, ammonia solution, alcohol, bay-rum, borax, flowers of sulphur, oil of bergamot, olive-oil, and a perfuming substance, in or about the proportions specified.

386,618. TOILET OR WRAPPING PAPER. SETH WHEELER, Albany, N. Y. Filed Nov. 3, 1887. Serial No. 254,157. (No model.)

Claim.—A roll of toilet or wrapping paper containing lines of weakness, each of which is made up of perforations plainly indicating the position of the line, combined with fastenings to increase the weakness of the line and avoid litter, substantially as described.



386,619. SLIDE-RULE. CHARLES WILLIS and JOHN S. PENNIE, Rockport, Mo. Filed Jan. 14, 1888. Serial No. 260,893. (No model.)



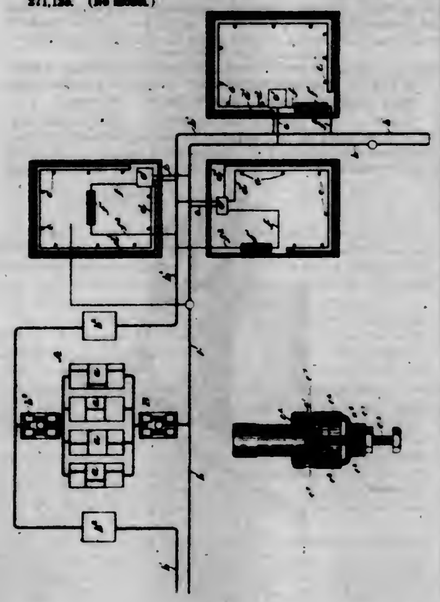
Claim.—The improved ellipsograph herein described and shown, comprising the transom A, having the intersecting ways C C, provided with the inwardly-projecting flanges D D, a socket, H, being formed in the base of one of the ways near the point of intersection of the ways, the slides E F, fitted in the ways and provided with the spindles F F, the slide E being further provided with a tapped aperture, G adapted to align with the socket H when the said slide is at the point of intersection of the ways, a set-screw mounted in said aperture and adapted to engage the socket H, the beam K, having a rigid post, I, at its inner end provided with a socket fitting on the spindle F, the beam being provided at its outer end with a pin, V, the extension-beam having a socket to fit over said pin V, the post N, adjustably mounted on the beam and having a socket in its lower end fitting over the spindle F, and the pencil-slide adjustably mounted on the beam and provided with a socket, S, for the pencil, and a lateral set-screw entering said socket to secure the pencil, substantially as specified.

386,620. SAFETY-COVER FOR ELEVATOR-WELLS, HATCH-WAYS, OR OTHER ROOF-OPENINGS. EDWARD H. ARMSBY, Lynn, Mass. Filed Mar. 19, 1888. Serial No. 267,697. (No model.)

Claim.—1. As a means of automatically providing an elevator-well or other hatchway or roof with an opening, a section forming when closed a cover hinged or connected to a support to be moved by an overbalancing-weight or similar force applied to or connected

386,620.

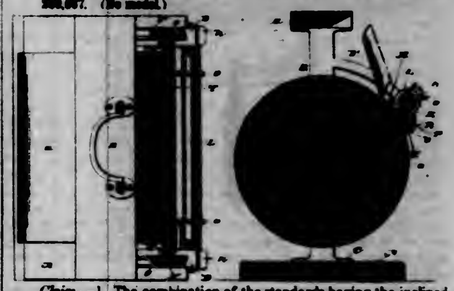
with the section, which section of the casing of the elevator-well, hatchway, or roof is held in normal position against the force of the overbalancing-weight by a holding device destructible by undue heat or flame, as and for the purposes described.



2. The combination of an elevator-well or hatchway with a covering-section hinged or connected thereto to be movable therefrom to expose an opening therein, an overbalancing-weight carried by said covering-section, and a holding device for holding the covering-section to close the opening, which holding device extends to the bottom, or very nearly to the bottom, of the elevator-well or hatchway, as and for the purposes described.

3. The combination of the casing of an elevator-well or hatchway, having the opening *a'* and the inclined upper edge, with the cover B, pivoted to the lower edge, its overbalancing-weight *b²*, and a holding device destructible by undue heat or fire for holding the cover upon the top of the casing, as and for the purposes described.

4. The combination of the casing of an elevator-well or hatchway, a covering-section therefor hinged or connected thereto, an overbalance for automatically opening the same, a holding device destructible by undue heat or flame for holding it in closed position, and a pipe for conducting water, steam, or other fire-extinguishing fluid or vapor, having an outlet in said elevator-well, as and for the purposes described.



5. The combination of the casing of an elevator-well, hatchway, or building-opening, a cover adapted to automatically open upon the release of its holding device, said holding device for holding it in closed position, destructible by undue heat or flame, a pipe for conducting water, steam, or other fire-extinguishing fluid or vapor, having its outlet in said elevator-well, hatchway, or opening, and a valve connected with said cover or its holding device, whereby upon the destruction of the holding device the valve is caused to be opened, substantially as described.

386,621. STEAM SYSTEM FOR EXTINGUISHING FIRES. EDWARD H. AMMIDOWN, Lynn, Mass. Filed Apr. 19, 1888. Serial No. 271,123. (No model.)

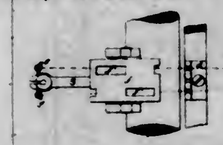
Claim.—The improved system for extinguishment of fire by steam, comprising the employment of an apparatus at a central point for superheating water, a suitable main or mains for distributing the superheated water in the locality or section covered by the system, and for maintaining its circulation, a pump or other suitable means for forcing the superheated water through said main or mains, and for returning the exhausted water to the heating apparatus, a distributing pipe or pipes arranged or placed in the buildings protected by the system, connected with the distributing-main, and, if desired, with the return-main, provided with outlets or openings which are controlled by one or more valves, substantially as described.

386,622. STAND AND CUTTING-KNIFE FOR PAPER-ROLLS. JAMES M. BARNES, Springfield, Ill. Filed Apr. 4, 1888. Serial No. 269,667. (No model.)

Claim.—1. The combination of the standards having the inclined arms provided with the grooves E, said grooves being adapted to form the bearings for a roll of paper, and the shaft L, having its ends arranged in the grooves, the cutting-blade secured to the said shaft, and the roller under the said blade at a distance from the cutting-edge thereof, whereby the cutting-blade will be at all times maintained at a tangent to the roll of paper, substantially as described.

2. The combination of the stand having the inclined arms D, provided with grooves E, the roll of paper having its bearings journaled in the lower ends of the grooves, the shaft L, having its ends arranged in the grooves, the cutting-blade having the ears pivoted or hinged on shaft L, and the roller on the under side of said plate, at a distance from the cutting-edge thereof, for the purpose set forth, substantially as described.

3. The combination of the stand having the arms provided with the inclined grooves E, said grooves being adapted to form the bearings for a roll of paper, the shaft L, having its ends arranged in grooves E, the cutting-blade having the ears pivoted or journaled on shaft L, the roller arranged under the cutting-blade, at a distance from the cutting-edge thereof, and the disks or rollers U at the ends of the cutting-blade, substantially as described.



4. The stand having the inclined arms provided with the grooves or ways E, said grooves or ways being adapted to form the bearings for a roll of paper, the shaft L, having its ends arranged in said grooves or ways above the roll of paper, and the cutting-blade pivoted or hinged to the shaft, as set forth.

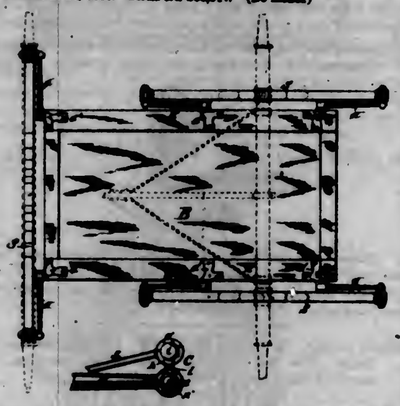
5. The stand having a roll of paper supported thereon, combined with the shaft L, arranged above the roll of paper, and the cutting-blade hinged or pivoted to said shaft and bearing on the paper-roll, whereby the blade will be maintained at all times at an angle to the paper-roll, as set forth.

6. The combination, with the journaled roll of paper, of the shaft L, movable laterally in guides toward and from the roll, and the cutting-blade hinged or pivoted on shaft L and arranged at a tangent to the roll, with its edge in contact with the latter, substantially as described.

386,623. FEED-ROLLERS FOR MAKING FANCY YARNS. THOS. A. BOYD, Glasgow, County of Lanark, Scotland. Filed Nov. 10, 1887. Serial No. 254,730. (No model.)

Brief.—The twisting together of component strands is varied at intervals, so that the yarn may vary in thickness or degree of twist, or so that each strand may alternately appear on the surface more than the others, the effect being produced by forming one or both feed-rollers of a pair with depressions in the surface.

Claim.—1. The herein-described feed-rollers for doubling or doubling and twisting machines, one or both of said rollers having interrupted feed-surfaces, the interruptions for the different yarns being out of coincidence.



2. The herein-described feed-rollers for doubling or twisting and doubling machines, one or both of said rollers having two or more sets of depressions out of coincidence with each other for different yarns.

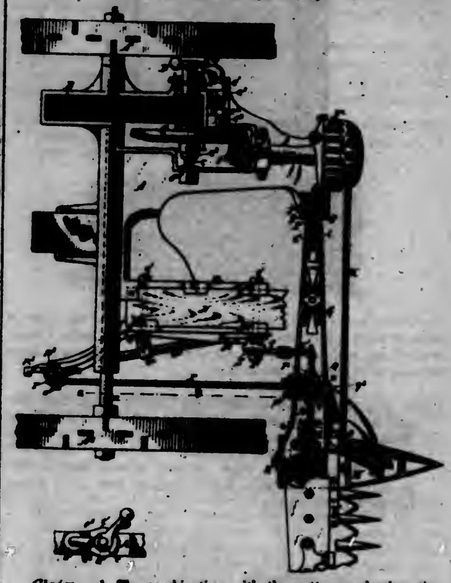
386,624. NUT-LOCK. JAMES T. CLARK, Denver, Colo. Filed Oct. 19, 1887. Serial No. 252,551. (No model.)

Claim.—The herein-described nut-lock, consisting of a bolt having a longitudinal groove in its threaded portion, and a screw-threaded nut fitting on said bolt, having a series of radial recesses in its outer face, in combination with a spring-key placed in the groove of the bolt under the nut, and having its outer end bent upward for engaging with one of the recesses of the nut and its inner end curved upward and backward upon itself, so that it will yield and pass under the threads of the nut when the key is being inserted, but will positively bite or engage against the inner face of one of the nut-threads and prevent its retraction, substantially in the manner and for the purpose described.

386,625. SPRING-VEHICLE. EDWARD CLEY, Rochester, N. Y. Filed Mar. 24, 1888. Serial No. 268,217. (No model.)

Claim.—1. In combination with the axle and body B, the spring S, mounted on the axle, the arms *a a*, projecting rigidly from the body in opposite directions, and swinging couplings *c c*, connecting the ends of said arms to the ends of the spring, substantially as described and shown.

2. In combination with the axle and body B, the spring S, mounted on said axle, the arms *a a*, extending rigidly from the body in opposite directions and each formed with the attaching-plate *d'* in one piece, and rigidly secured to the body and connected at their free ends to opposite ends of the aforesaid spring, substantially as described and shown.



3. In combination with the body-supporting arm formed with the eye *e*, and the spring S, formed with the eye *d'*, the coupling-pins *b B'*, united end to end and arranged eccentrically in relation to each other, as set forth and shown.

4. The combination of the body-supporting arm formed with the eye *e* and recess *r*, and the spring S, formed with the eye *d'*, the collar *d*, seated in said recess, and the coupling-pins *b B'*, projecting from opposite sides of said collar eccentrically in relation to each other and formed in one piece with the said collar, substantially as described and shown.

386,626. WASH-BOILER. WILLIAM H. GUTHRIE, Langdon, Kans. Filed Oct. 29, 1887. Serial No. 253,262. (No model.)

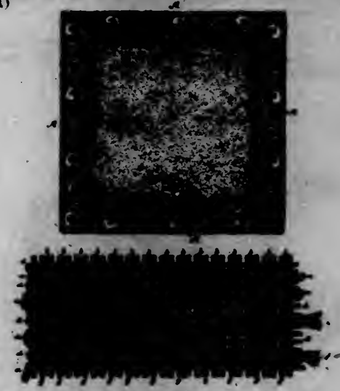
Claim.—The combination, in a washing-machine of the class described, of the rectangular chamber A, having perforated walls, as described, the plate or diaphragm B, flange C, annulus D, arranged on either side of said chamber, and plate G, carrying nozzles E, which latter are arranged to discharge upwardly in said chamber, substantially as described.

386,627. SEWING-MACHINE. GEORGE G. CROWLEY, Little Falls, N. Y., assignor to the Wheeler Mower Company, same place. Filed Sept. 24, 1887. Serial No. 250,251. (No model.)

Claim.—1. The combination, with the cutter mechanism, the longitudinal shaft *f*, provided with the bevel-pinion *f'* and a crank-wheel, and the driving-shaft *a*, provided with a spur-gear, B, of an intermediate transverse arber made lengthwise movable, and a spur-pinion, *b*, and bevel-wheel C, secured together and turning loosely upon the arber, upon which they are held against longitudinal movement, substantially as set forth.

2. The combination, with the cutter mechanism, the longitudinal shaft *f*, provided with a bevel-pinion, *f'*, and a crank-wheel, and the driving-shaft *a*, provided with a spur-gear, B, of an intermediate transverse arber, *c*, a hand-lever, D, and cam-groove *d'*, secured to said arber, a tooth, *e*, secured to the frame and engaging with said cam-groove, and a spur-pinion, *b*, and bevel-wheel C, secured together and turning loosely upon the arber, upon which they are held against longitudinal movement, substantially as set forth.

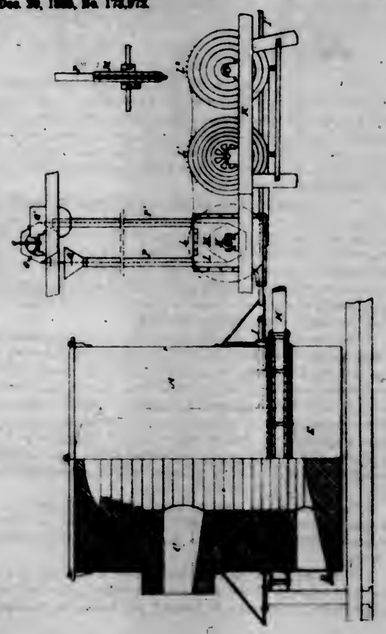
3. The combination, with the main frame, the cutter mechanism, the longitudinal shaft *f*, provided with a bevel-pinion, *f'*, and a crank-wheel, and the driving-shaft *a*, provided with a spur-wheel, B, of an intermediate transverse arber, *c*, a hand-lever, D, and cam-groove *d'*, secured to said arber, a spur-pinion, *b*, and bevel-wheel C, secured together and turning loosely upon the arber, upon which they are held against longitudinal movement, and a tooth, *e*, engaging with said cam-groove and secured to the main frame, and made adjustable therein toward and from the longitudinal shaft *f*, substantially as set forth.



4. The combination, with the main frame A and pole N, of the cast auxiliary frame *o*, provided with a wrought brace, *o²*, which is cast into the frame *o* and connects the ends thereof, substantially as set forth.

5. The combination, with the main frame A and pole N, thrust-bar P, and lever *p²*, of the cast auxiliary frame *o*, provided with a wrought brace, *o²*, cast into the frame *o*, and having its rear end pro-

jecting laterally beyond the frame *o*, forming a pivot, *o'*, for the said thrust-bar and lever, substantially as set forth.



6. The combination, with the transverse connecting-bar G, having upwardly-projecting lugs *g' g'*, provided with upright slots *r*, and the shoe pivoted to the bar G, of the bearing-lever R, arranged lengthwise of the connecting-bar, with its upper arm in the slots *r* and pivoted to the connecting-bar, and means for operating said bearing-lever, substantially as set forth.

386,628. RUG OR MAT. JOHN BAVISHER, Philadelphia, Pa., assignor to Thomas H. Lynn, Mount Holly, N. J., and Charles C. Pettit, Philadelphia, Pa. Filed Apr. 9, 1888. Serial No. 270,042. (No specimens.)

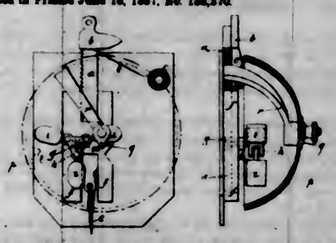
Claim.—A rug or mat having a center portion with tufts of cocoa or other coarse fiber and a border with chenille wefts, a series of which are employed for each row of tufts in the central portion of the mat, all substantially as specified.

386,629. PROCESS OF SMELTING PYRITES. JOHN DIXON, Adelaide, South Australia, assignor of four-fifths to Frederick James Bladen, William Selby Douglas, David Carlick, and William Malcolm, same place. Filed Oct. 10, 1888. Serial No. 289,294. (No model.) Patented in England Sept. 8, 1885, No. 10,981; in South Australia Sept. 19, 1885, No. 601; in New South Wales Sept. 21, 1885, No. 2,066, and in France Dec. 30, 1885, No. 173,972.

Claim.—1. The process herein described of smelting pyrites in air-blast furnaces, said process consisting in introducing crushed raw ore without fuel into the body of the molten metal by an air-blast at a point below the surface-level, near the bottom of the molten charge, as and for the purpose set forth.

2. The process herein described of smelting pyrites in air-blast furnaces, said process consisting in feeding crushed raw ore without fuel into the blast-pipe at a regulated speed, blowing such ore without fuel into the body of the molten metal by the air-blast at a point below the surface-level and near the bottom of the molten charge, all substantially as set forth.

386,630. HORSE-BOOT. JOHN H. FISHER, Chicago, Ill. Filed Mar. 28, 1887. Serial No. 232,463. (No model.)

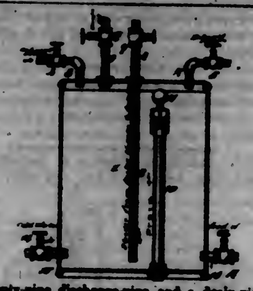


Claim.—A horse-boot consisting of two parts, A B, one overlapping the other and hinged together on opposite sides, in combination with a lining, C, stitched to the upper portion of the part A, but not to the lower end thereof, and a lining, D, stitched to the part B, all constructed and arranged substantially as and for the purpose specified.

386,631. CLAMP. DAVID GARRISON and GEORGE C. EISELMAYR, Philadelphia, Pa. Filed Feb. 2, 1888. Serial No. 262,774. (No model.)

Claim.—The combination, in a clamp, of a U-shaped piece having two parallel arms, and a plate, *m*, pivoted to the inner side of one of said arms, to swing thereon upon a longitudinal axis parallel to the overhanging arm, substantially as set forth.

386,632. CALL-BELL OR ALARM. VICTOR A. GERMAIN, Paris, France. Filed Feb. 15, 1888. Serial No. 264,098. (No model.) Patented in France June 16, 1887, No. 182,870.



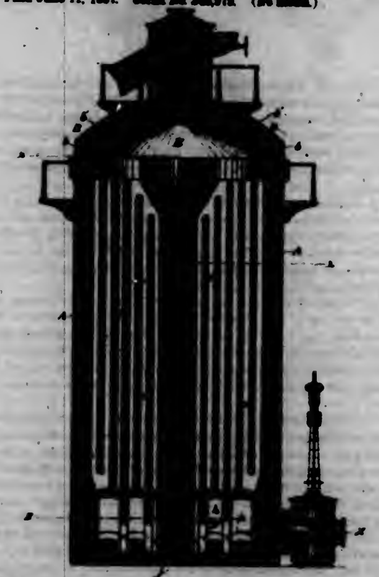
Claim.—The combination, with a call-bell or alarm provided with an internal lug, of the sliding rack *a*, pinion *g*, in gear therewith, internal guides *f f*, for the rack *a*, and of the head *h*, secured to the axis of the pinion *g*, and having radially-extending arms, and pivoted hammers *i*, carried by said radial arms and caused, by the rotation of the latter, to swing outward and successively strike the lug of the bell, substantially as specified.

386,633. STEAM-TRAP. LOUIS GRAFF, Memphis, Tenn. Filed May 7, 1887. Serial No. 237,462. (No model.)

Claim.—1. The combination of the cylinder 1, the exhaust-steam pipes 2 and 3, the escape-pipe 6, bleeder 8, drain-pipe 10, supply-pipe 14, and discharge-pipe 17, arranged as described, for the purpose set forth.

2. The combination of the cylinder 1, exhaust-steam pipes, escape-pipe, bleeder, supply-pipe, discharge-pipe, and a drain-pipe provided with a valve to regulate flow of water and prevent passage of steam therethrough, as set forth.

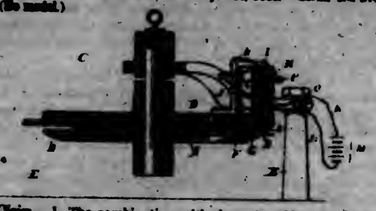
386,633.



3. The combination of the cylinder 1, exhaust-steam pipes, escape-pipe, bleeder, supply-pipe, discharge-pipe, and a drain-pipe provided with the valve 11, for letting off a limited amount of water, as and for the purposes set forth.

386,634. SWEAT-BAND FOR HATS. WILLIAM P. GRIMES, Troy, N. Y. Filed Nov. 2, 1887. Serial No. 254,020. (No model.)

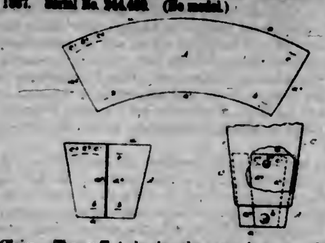
Claim.—The combination of the sweat-band B, consisting of a band with openings therein and plates of mica in said openings, with a hat, the said openings permitting a card to be located between said hat and said plates of mica, the said plates being uncovered on their inner surfaces, substantially as and for the purposes set forth.



386,635. HOT-BLAST STOVE. JOSEPH L. HOFFAR, Pittsburg, Pa. Filed June 11, 1887. Serial No. 240,972. (No model.)

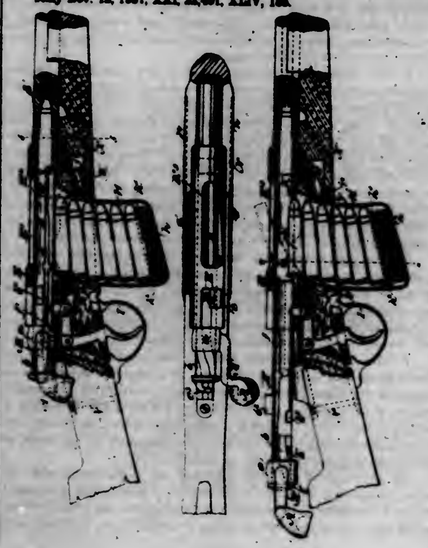
Claim.—1. In a hot-blast stove, a vertical dust-flue situate below the gas-inlet and having a flared mouth, substantially as and for the purpose specified.

2. In a hot-blast stove, a vertical dust-flue situate below the gas-inlet and having an opening at the base leading to the stack-flue and of about the same relative diameter as the heating-flues, substantially as and for the purpose specified.



386,636. LATCH-SETTER FOR KNITTING-MACHINES. LOUIS JONES, Jr., Overbrook, Pa. Filed Apr. 14, 1883. Serial No. 272,712. (No model.)

Claim.—1. The combination, with the series of horizontal needles and the thread-guide, of a magnet arranged above the plane of rotation of the needle-latches and in advance of the thread-guide, substantially as and for the purpose set forth.



2. The combination, with the series of horizontal needles, the thread-guide, and the magnet arranged above the plane of rotation of the needle-latches and in advance of the thread-guide, of a guard-plate arranged at that side of the magnet toward which the needles approach.

386,637. APPAREL-GUFF. WILLIAM KAEMER, Drummond, Wis., assignor of one-half to Andrew Steinacher, Chicago, Ill. Filed July 16, 1887. Serial No. 244,402. (No model.)

Claim.—The cuff A, having the curved upper and lower edges *a a'* and radial ends *a²*, the button-holes *b* in the lower corners, the button-hole *c* in one of the upper corners, and a series of adjusting button-holes, *d d'*, &c., in the other corner, substantially as and for the purpose set forth.

386,638. MAGAZINE FIRE-ARM. SILVESTER KRNKA and KARL KRNKA, Ober-Hietzin, near Prague, Austria-Hungary. Filed Nov. 10, 1887. Serial No. 254,982. (No model.) Patented in England May 5, 1887, No. 6,930; in Austria-Hungary Aug. 21, 1887, No. 15,203 and No. 34,203, and Oct. 31, 1887, No. 37,556 and No. 49,856; in France Sept. 30, 1887, No. 186,121; in Belgium Sept. 30, 1887, No. 79,044, and in Italy Nov. 12, 1887, XXI, 32,491, XLIV, 168.

Claim.—1. In a gun of the class described, the combination, with the breech-frame and the bolt-cylinder having spiral bearing-finds at its rear end, of an operating handle or lever and a sleeve or nut connected therewith, having corresponding bearing-flanges and adapted to slide freely on the rear end of the bolt-cylinder, substantially as and for the purpose specified.

2. In a gun of the class described, the combination, with the breech-frame, the bolt-cylinder provided with a spiral slot at its rear end, and the bolt or firing-pin provided with a longitudinal recess at the rear end thereof, of a lever or handle provided with a sleeve-bearing mounted and sliding longitudinally on the rear end of the bolt-cylinder, and a pin projecting from said bearing through the spiral slot of said cylinder into the recess of the firing-pin, substantially as and for the purpose specified.

3. In a gun of the class described, the combination, with the breech-frame, the bolt-cylinder provided at its rear end with a spiral slot and a spring-abutment, the bolt or firing-pin provided at the corresponding end with a longitudinal recess, and an actuating-spring connected at the forward end with the bolt, of a lever or handle provided with a sleeve-bearing mounted and sliding longitudinally on the rear end of the cylinder, and a pin projecting through the spiral slot of said cylinder into the recess of the bolt, whereby the spring is compressed on moving the bolt rearward, substantially as and for the purpose specified.

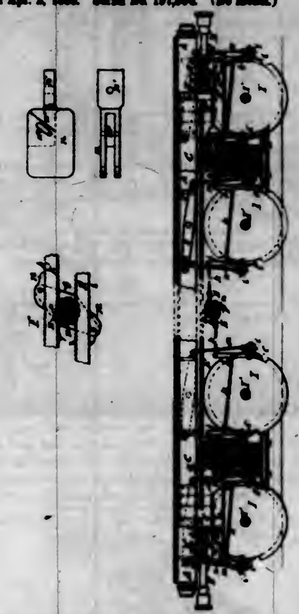
4. In a gun of the class described, the combination, with the breech-frame, the bolt-cylinder provided at its rear end with a spiral slot and a spring-abutment, the bolt or firing-pin provided at the corresponding end with a longitudinal recess, and an actuating-spring connected at its forward end with the bolt, of a lever or handle provided with a sleeve-bearing mounted and sliding longitudinally on the rear end of said cylinder, a pin projecting through the spiral slot in the cylinder into the recess of the bolt, and a locking device to lock the spring against expansion, substantially as and for the purpose specified.

5. In a gun of the class described, the combination, with the breech-frame, the bolt-cylinder provided at its rear end with a spiral slot and a spring-abutment, the bolt or firing-pin provided at the corresponding end with a longitudinal recess, and an actuating-spring connected at its forward end with the bolt, of a lever or handle provided with a sleeve-bearing mounted and sliding longitudinally on the rear end of the cylinder, a pin projecting through the spiral slot of said cylinder into the recess of the bolt, and a stop operating on the sleeve-bearing to hold it against forward movement on the cylinder, whereby the spring is compressed on moving the bolt rearward and locked against expansion, substantially as and for the purpose specified.

6. The combination, substantially as hereinbefore described, with the breech-frame, the bolt-cylinder B, provided at its rear end with a spiral groove, *b'*, and an interior abutment, the shell-extractor fitted in a groove in the periphery of the cylinder, and having a spring-extension, *f'*, the bolt or firing-pin, recessed as at *d*, arranged within the cylinder, and an actuating-spring connected at its forward end with said bolt, of a lever or handle, a bearing-sleeve therefor adapted to slide longitudinally on the bolt-cylinder, and a pin, *d'*, projecting from said sleeve through the slot *b'* in the cylinder and into the recess *d* of the bolt, for the purposes specified.

7. The combination, substantially as herein described, with the breech-frame, the bolt-cylinder and its screw-plug C, both provided with a spiral groove, *b' c*, respectively, the latter groove having a lateral branch, c^3, a lug, *d'*, projecting into the opening at the rear end of the plug C, the bolt or firing-pin, recessed as at *d*, and provided at its rear end with an angular groove or slot, d^3, the actuating-spring secured at its forward end to the bolt, and abutting, when compressed, against the abutment in the cylinder, of the trigger and sear, the latter projecting into the receiver and adapted to engage the forward end of the spring, whereby the bolt may be locked against forward motion by a partial rotation of the screw-plug, for the purpose specified.

8. In a gun of the class described, the combination, with the breech-frame open below the receiver, and a magazine adapted to be applied to the frame below said receiver, and provided with a notched projection on its rear wall, of a trigger-guard having a yielding bearing adapted to engage the notch in the magazine projection to support the same at that end, substantially as described.



9. In a gun of the class described, the combination, with the breech-frame open below the receiver, and a magazine adapted to be applied to the frame below said receiver, and provided with a notched projection, of a trigger-guard and trigger-spring combined, and a bearing on said trigger-guard to engage the notched magazine projection, whereby said parts are held in engagement by the strain of the trigger-spring, substantially as described.

10. In a gun of the class described, the combination, with the breech-frame open below the receiver, for the attachment of a magazine, and the block K, for guiding the cartridges to the breech, of the spring-arm *j'*, provided with a spring, *j*, operating on the block, and two converging spring-plates operating to support the cartridges when the magazine is removed and the gun used as a single-loader, substantially as described.

11. The combination, with the breech-frame open below the receiver, the bolt-cylinder, and a magazine applied below said receiver, of an upwardly-extending stop, *k*, secured to one end of the spring-actuated follower, for feeding the cartridges to the mouth of the magazine, substantially as and for the purpose specified.

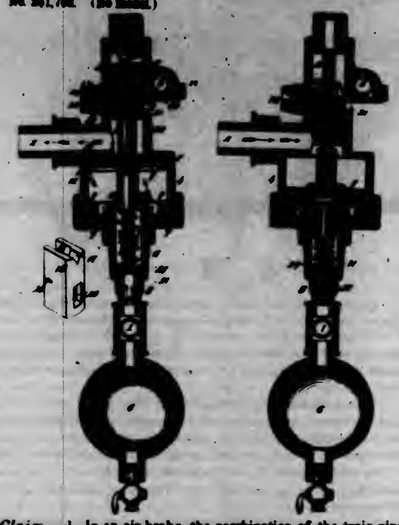
386,639. AIR-BRAKE. CHARLES W. LAWSON, Norwich, N. Y.

Filed Apr. 2, 1888. Serial No. 267,894. (No model.)

Claim.—1. The combination, with a car, of a continuous draw-bar consisting of two draw-heads, respectively at opposite ends of the car and movable longitudinally on the car, an intermediate push-bar arranged movably longitudinally on the car, spring-couplings between the ends of said push-bar and draw-heads, yokes on said spring-couplings to receive the pressure thereof, and torsion-rods connecting said yokes.

2. In combination with the longitudinal push-bar and draw-heads movably connected therewith, springs interposed between said parts and cup-shaped spring-seats having flanges surrounding the springs and of a depth to limit the compression of the springs by the free edges of said flanges brought to a bearing by the compression of the draw-heads, substantially as set forth.

3. The combination of the push-bar C, brackets *d d*, having longitudinal sockets d^2, the draw-heads H, having their stale-bolts H' in said sockets, cups *e e* on the stale-bolts in front of the brackets, springs *g g* in said cups, the yokes *f f*, connected loosely with the draw-heads at the outside of the spring-supporting cups, and tension-rods *h h*, connecting said yokes with each other, substantially as described and shown.



4. In combination with the car frame and trucks, a continuous draw-bar arranged movably longitudinally on said frame, springs for resisting the movement of said draw-bar toward either end of the car, levers pivoted on the car-frame, brake-bars arranged at diametrically opposite points of the wheel-trucks and suspended from the aforesaid levers at opposite sides of the fulcrums thereof, a system of co-operating brake-levers connected with the brake-bars, catches on the draw-bar, and the primary brake-levers adapted to engage the said catches, all combined to operate substantially as described and shown.

5. In combination with the brake-levers, rods connected at one end to said levers, and provided at their adjacent opposite ends with longitudinal racks on their adjacent sides and with ratchets on their outer sides, straps across opposite sides of said ends of the rods, a pinion interposed between the racks and pivoted on the straps, a spring for actuating the pinion in one direction, and pawls pivoted on the straps and engaging the ratchets, substantially as described and shown.

6. In combination with the continuous draw-bar arranged movably longitudinally on the car, brake-bars carrying brake-shoes and arranged movably vertically, a system of co-operating brake-levers connected with the brake-bars, shown *n n*, connected to the continuous draw-bar and provided with serrated inclined heads n^2, the gravitating pawls *w* in said shoes and provided with corresponding serrated inclined ends engaging the heads n^2, the primary brake-levers *l l*, having their upper ends sliding in the shoes *n n* and bearing on the pawls *w*, and the struts *u u*, provided with bearings for the levers *l l* in front and rear thereof, substantially as described and shown.

7. The combination, with the car-frame, continuous draw-bar, truck, brake-bars, and primary brake-lever *l*, of the push-bar *v*, attached to the upper end of said lever, the pearl *v'*, connected with the push-bar by a knuckle-joint, and the lug v^2, attached to the continuous draw-bar, substantially as described and shown.

386,640. AIR-BRAKE. FRANK LAWSON, St. Louis, Mo., assignor of one-half to THOMAS ingle, same place. Filed Jan. 26, 1888. Serial No. 261,782. (No model.)

Claim.—1. In an air-brake, the combination of the train-pipe, receiver-pipe, and brake-cylinder pipe, piston-valve located in a cylinder or housing, through which air passes from the train-pipe to the air-receiver pipe, and a sliding cut-off located on the stem of said valve and provided with a V-shaped notch extending from the top downward, whereby it coincides with said brake-pipe with its apex first, and opening 20, substantially as and for the purpose set forth.

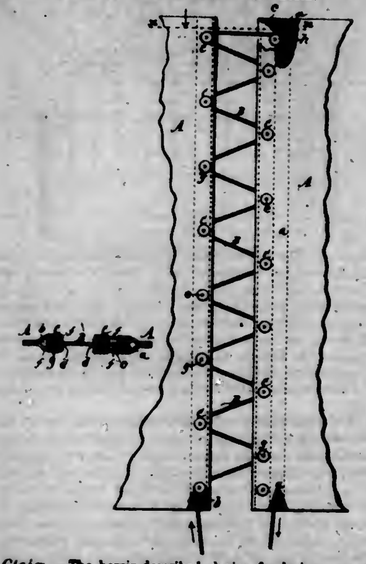
2. In an air-brake, the combination of the train-pipe, air-receiver pipe, cylinder or housing forming a communication between the train-pipe and air-receiver pipe and having a hollow upward extension, valve located in said cylinder, stem extending upwardly from said valve, a cut-off valve on said stem, having a longitudinal and transverse opening and a notch in its upper end, a plug resting in said longitudinal opening, and a spring bearing upon said plug, substantially as and for the purpose set forth.

3. In an air-brake, the combination of the train-pipe, air-receiver pipe, and pipe leading to the brake-cylinder, chamber located between the train-pipe and receiver-pipe, piston-valve located in said chamber and having an upwardly-extending stem, cut-off valve located on said stem, provided with a longitudinal and a transverse opening and a notch extending from the top downward, a spring-plug for forcing the cut-off valve against the wall of the hollow extension, and a screw-cap for compressing said spring, substantially as and for the purpose set forth.

4. In an air-brake, the combination, with the train-pipe 1 and cylinder 4, having the ports 12 13 and the groove 9 in its bottom, of the hollow neck connected to said cylinder, and having ports 10 extending into said groove, a piston-valve in said cylinder, the hollow extension 14, extending from said cylinder axially with said neck and having the ports 21 20, a stem projecting in both directions from said piston into said extension and neck, the pipe 5, receiving said stem and forming communication between the pipe 1 and neck 11, a spring surrounding said stem and bearing upon said pipe, and a slide-valve on said stem in said extension, having the notch 19 and opening 20, substantially as set forth.

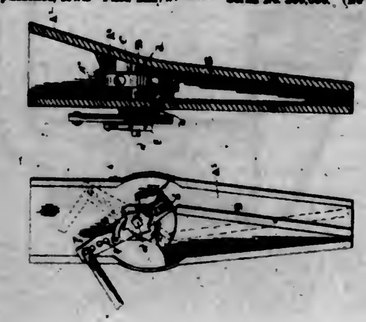
5. In an air-brake, the combination of the train-pipe, receiver-pipe, and brake-cylinder pipe, piston-valve located in the cylinder or housing, through which the air passes from the train-pipe to the air-receiver pipe, the hollow extension 14 and neck 11, projecting from said valve-cylinder, stems projecting from said piston-valve into said extension and neck, a spring surrounding one of said stems for holding said valve in one direction, and the pipe 5 in said neck, forming a guide for the stem therein, and also communication between the train-pipe and said neck, substantially as set forth.

386,641. COFFIN-FASTENER. JOHN P. LEES, New York, N. Y.



Filed Feb. 7, 1888. Serial No. 263,262. (No model.)

Claim.—The combination of the body and lid of a burial-case, with hooks hinged to the upper edge of the body within the outline of the case and each carrying a retaining-screw adapted to bear on the top of the rim of the lid.

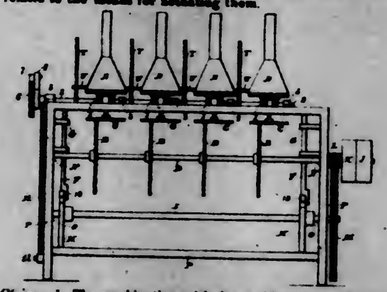


386,642. CORSET-LACING. ADAM S. MANN, Rochester, N. Y.

Filed July 13, 1888. Serial No. 279,598. (No model.)

Claim.—The herein-described device for lacing, comprising a garment having rollers *d* on its meeting edges, and a side channel, *a*, a separate roller, *h*, in a different vertical line from that of said rollers *d*, and in line with said side channel, and a cord passing over said rollers *d* and said separate roller *h* and down said channel, substantially as shown.

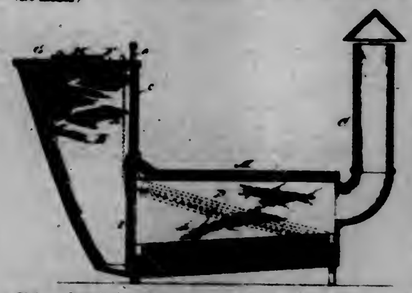
386,643. PUMPKIN-SEED PLANTER. DANIEL MCCARTY, Independence, Iowa. Filed Mar. 31 1888. Serial No. 269,093. (No model.)



Claim.—1. The herein-described plaster attachment, composed of the hopper, having its sides A and A' extended and closed at their edges by the pieces A^2, the grain-wheel, the curved blocks having their upper edges beveled, the curved plates H, one being hinged and held closed by a turn-buckle or other catch, the cut-off or flirt-valve pivoted between its ends, and having an arm that extends through a curved slot in the side A, the ratchet-wheel keyed on a journal of the grain-wheel, the lever mounted on the said journal, and having its lower end extended and engaging with the said arm of the cut-off or flirt valve, and the pawl carried by the lever and adapted to engage with the ratchet-wheel, substantially as and for the purpose specified.

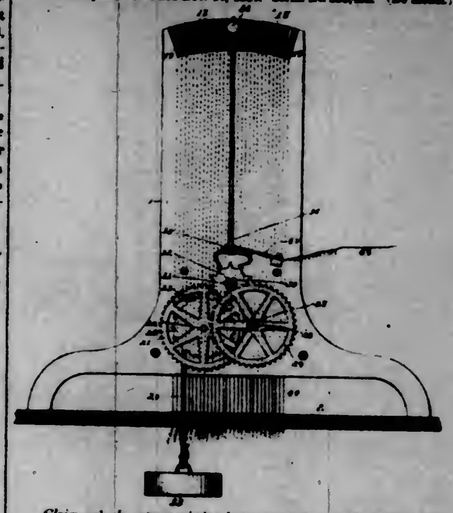
2. The combination, with the hopper, the grain-spout, and the grain-wheel, of the pivoted cut-off or flirt valve, having an arm, the ratchet-wheel keyed on the journal of the grain-wheel, the lever mounted loosely on the said journal, and having a series of openings at its upper end, and having its lower end extended and bifurcated to embrace the said arm, and the pawl carried by the said lever, substantially as described.

386,644. MACHINE FOR WINDING BOBBINS. JOHN MCCREARY, Cohoes, N. Y. Filed Nov. 1, 1886. Serial No. 217,720. (No model.)



Brief.—The feed-screws are rotatable, and the invention particularly relates to the means for rotating them.

Claim.—1. The combination, with the machine-frame, of a hanger mounted thereon and adapted to move vertically relatively thereto, feed-screws on said hanger, and a longitudinal rod or shaft mounted upon and moving with said hanger, worms on said shaft adapted to engage worm-wheels on said feed-screws for imparting rotary motion thereto, thread carriers and guides for securing the proper delivery of the thread to the bobbins, the ratchet-wheel secured to said longitudinal worm-shaft, and the slotted angular pawl-lever for imparting rotary motion to said worm-shaft, substantially as and for the purpose described.



2. The combination, with the machine-frame, of the hanger mounted thereon and adapted to move vertically relatively thereto, the vertical guide-rods and the cam mounted on the driving-shaft for rotating said hanger, the longitudinal shaft on said hanger, the slotted and pivoted crank-arm and pawl and ratchet, whereby said shaft is arranged to be actuated by the upward movement of the hanger, the feed-screws, and mechanism interposed between said shaft and feed-screws for driving the latter, and the thread guides and carriers arranged to be acted upon by said feed-screws, all substantially as and for the purpose set forth.

386,645. HEATER FOR WATERING-TANKS. ALEXANDER MCGOWEN, Independence, Iowa. Filed Mar. 13, 1888. Serial No. 267,092. (No model.)

Claim.—In a heater for watering-tanks, the fire-box A, provided with shield B, and smoke-pipe C, extending up above the same, and the grate D, in combination with the removable cover F, having hole or opening G and the slide H, and the sliding door I, located between the fire-box and shield to close or open communication between the two, substantially as and for the purpose specified.

386,646. ELECTRICAL TYPE-WRITER. JAMES F. MCLAUGHLIN, Philadelphia, Pa. Filed Nov. 17, 1887. Serial No. 255,422. (No model.)

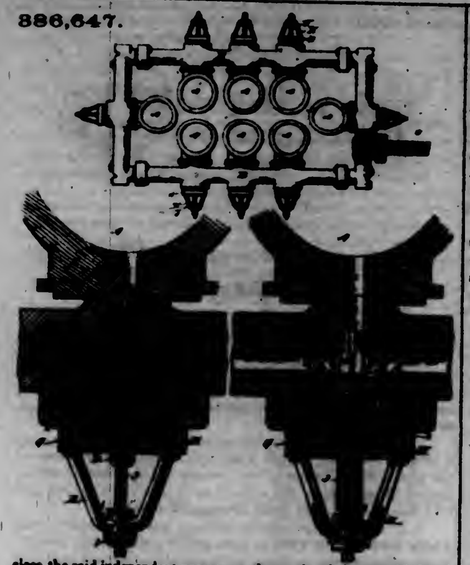
Claim.—1. In a transmitting-instrument, the combination, with a series of segments, each electrically connected with a circuit-controller, of a vibrating commutator electrically in contact with said segments and included in a line-circuit, the circuit, and a circuit-controlling switch for connecting and disconnecting said segments with the circuit.

2. In a transmitting-instrument, the combination, with a series of current-conducting segments, of mechanism for severally directing electric impulses through said segments, an electric circuit including said segments, a circuit-controlling switch for connecting and disconnecting said circuit with said segments, a commutator-arm vibrating electrically in contact with said segments, and a synchronal motor for vibrating said arm.

3. In a transmitting-instrument, the combination, with a series of segments electrically in circuit with a series of corresponding circuit-closers, suitable contacts for said circuit-closers in circuit with a source of electricity, a lever-switch for severally connecting the series of contacts with the series of segments, a vibrating arm electrically in contact with said segments and included in a line-circuit, and a line-circuit, substantially as described.

4. The combination of two instruments, respectively placed at separate stations in a line-circuit and each comprising a series of segments, circuit-closing mechanism for directing the current severally through said segments, a vibrating arm electrically in contact with said segments, a mechanical synchronal motor for vibrating said arm, and a circuit-changing switch for cutting the source of electricity in or out of circuit with a series of segments, substantially as described.

5. The combination, with a series of contacts in circuit with a source of electricity, of a series of segments and a lever-switch for severally electrically connecting and disconnecting said contacts with said segments, substantially as described.

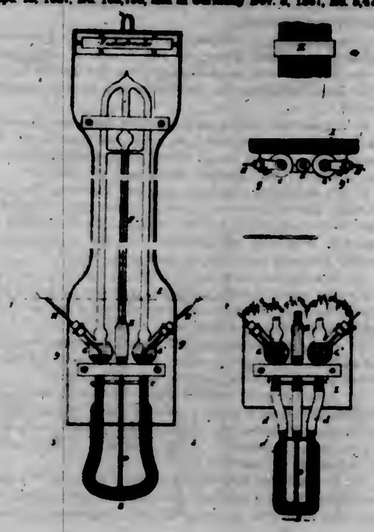


6. The combination of a series of current-conducting segments respectively in circuit with a series of pivoted contacts, a series of pivoted contacts operated in unison by a single movement of a lever, a shifting-lever for said pivoted contacts, and a series of stationary contacts adapted to be electrically connected with their respective pivoted contacts by the single movement of a lever, substantially as described.

7. The combination, with a series of insulated current-conducting segments charged from a suitable source of electricity, of a moving arm provided with a spiral-spring contact electrically in circuit with said series of segments, substantially as described.

386,647. VALVE FOR HYDRAULIC PRESSES. LEWIS MILLER, Philadelphia, Pa. Filed Apr. 12, 1888. Serial No. 270,672. (No model.)

Claim.—1. The combination of the vertical cylinders A, the conduit B, surrounding the cylinders and communicating therewith by means of horizontal independent passages *a*, the horizontal valves D, working in enlarged chambers *b* in the said conduit and adapted to

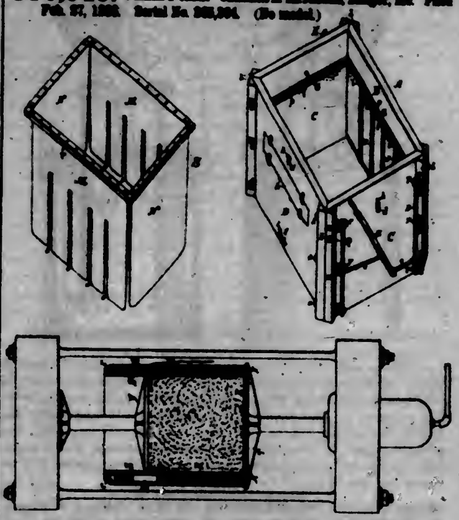


386,647.

close the said independent passages *a*, these valves being provided with radially-winged spiders *d*, which serve to guide them to their seats, a removable bushing inserted in a recess in the conduit, a packing-ring inserted in the bushing, and a gland bolted to the conduit, substantially as described.

2. The combination of a conduit provided with a lateral passage, *a*, this conduit being provided with an internally-shouldered recess opposite the said passage *a*, an internally and externally shouldered bushing, F, inserted in the shouldered recess in the conduit, this bushing being provided with a bevel-seat, *c*, in its inner end, a shouldered packing-ring, G, inserted in the bushing F, a valve, D, passing through the packing and bushing and working in an enlarged chamber, *b*, in the conduit, this valve being provided with a double-beveled head, E, adapted to alternately seat itself over the passage *a* and against the bevel-seat *c* in the bushing, a packing, I, and a gland, H, bolted to the conduit and adapted to press directly against the said packing I and packing-ring G, and means for operating the valve D, substantially as herein described.

386,648. INDUCTOMETER. GUSTAVE HEIM, Paris, France. Filed Mar. 7, 1888. Serial No. 266,620. (No model.) Patented in France Sept. 13, 1887, No. 185,793, and in Germany Nov. 8, 1887, No. 5,478.



Claim.—1. The described apparatus for measuring the intensity of a magnetic field, said apparatus comprising a U-shaped tube, a capillary tube connected with the horizontal part thereof, and a graduated tube above the capillary tube, the U-shaped tube being filled with mercury and adapted for connection in an electric circuit, substantially as set forth.

2. In an inductometer, the combination of the U-shaped tube filled with mercury, and having branch tubes through which pass conductors for inducing the mercury in an exciting-circuit, a vertical capillary tube connected with the horizontal part of the former tube and surmounted by a bulb, and a graduated tube connected with said bulb, substantially as described.

3. An inductometer comprising the U-shaped tube, the capillary tube, and the bulbs, the lower portion of said tubes being connected with the upper part thereof by flexible coupling-tubes, substantially as and for the purpose set forth.

386,649. BALING-CRIB. CHARLES B. HOWARD, Bangor, Me. Filed Feb. 27, 1888. Serial No. 265,904. (No model.)

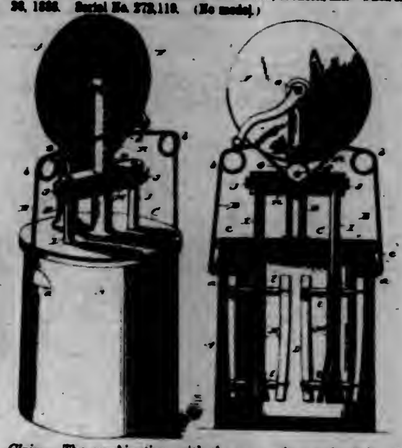
Claim.—1. An expansible baling-crib consisting of the sides B B and ends C C, connected by eyebolts running through their corners, the cam-shafts passing through the eyes of the corner-bolts, and means for releasing the cams; whereby the crib is equally opened or enlarged, substantially as shown and described.

2. The combination of a baling-crib with the bag-holders consisting of a metallic rod pivoted to the inside of the crib, having pointed spurs projecting from one side, and a handle from the opposite side extending through the crib, by which the holder is operated from the outside of the crib, substantially as shown and described.

3. The combination of a baling-crib with the bale-tie holders consisting of a metallic rod having right-angle hooks for holding the ties projecting from one side, and a handle by which the holder is operated projecting from the opposite side, substantially as shown and described.

4. An improved baling-crib having four sides, two of which are provided with vertical grooves and one having a pocket, said sides being connected at their corners by eyebolts passing therethrough, and cam-shafts pivoted in said bolts, and means by which the cams are released for expanding the crib, substantially as shown and described.

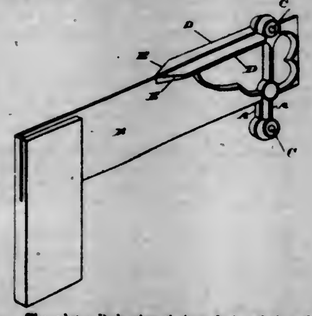
5. The locking device for expansible cribs, consisting of the shafts D, having cams *c* firmly secured thereto, the connecting-rods *c*, and the reciprocating lever E, for the purpose described, and substantially as shown.



6. An improved expansible baling-crib consisting of the sides B B, having vertical grooves J, the bale-tie holders K, having the hooks *m* and operating-handle *l*, the bag-holders G, with spurs *i* and operating-handle *h*, and an aperture, L, the ends C C having also bag-holders G, with their holding-spurs *i* and handle *h*, the sides and ends provided with the vertical battens *k*, and connected at their corners by the eyebolts F, and the locking devices consisting of the vertical shafts D, having projecting cams *c*, the reciprocating levers E, and their connecting-rods *c*, substantially as shown, and for the purpose described.

7. An inside cage for baling fine substances, consisting of four metallic plates having their tops bent at right angles and secured to lon-

gitudinal bars at the top of the crib, and having two of the said plates provided with vertical slots extending from the bottom upward, substantially as shown, and for the purpose described.

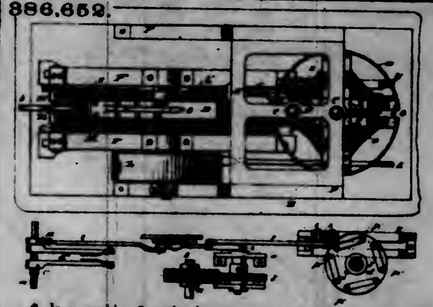


9. The combination of an expansible crib, having its sides connected at the corners by eyebolts containing vertical cam-shafts operated by reciprocating levers and connecting-rods, with a mast and an inside case consisting of metallic posts bent at right angles at their top and secured to have resting on the top of the crib, two of said plates provided with vertical slots extending from their lower edges upward, substantially as described, and for the purpose shown.

386,650. CHURN. GRAHAM G. NEWTON, Trenton, Mo. Filed Apr. 26, 1888. Serial No. 272,119. (No model.)

Claim.—The combination, with the cover, the standards D and E rising therefrom, and the horizontal shafts supported in said standards, of the main drive-pulley and the double-grooved pulley on said shafts, the cross-bar on said standard D and having bifurcated ends, the beater-shafts journaled at their upper ends in said cross-bar, the grooved pulleys on the beater-shafts in the bifurcations of said cross-bar, and the endless cord passed around said pulleys, substantially as shown and described, and for the purpose specified.

386,651. ATTACHMENT FOR SQUARES. CHARLES F. NIEMSEN, San Francisco, Cal. Filed Mar. 27, 1888. Serial No. 268,669. (No model.)



Claim.—The plates D, having their ends beveled, and bolts by which they are secured to the blade of the square, so that the surface is flush with its edge and in a plane transverse thereto, substantially as herein described.

386,652. LEATHER-CRIMPING MACHINE. JOHN F. E. O'CONNOR, Yonkers, assignor to the "Universal" Crimper Company, New York, N. Y. Filed Apr. 6, 1886. Serial No. 298,049. (No model.)

Claim.—1. In a machine for crimping uppers of foot-wear, a mold constructed with an entrance described on an arc of a circle substantially concentric with the path of travel of the plunger, and an outlet of substantially the shape of the profile of the bottom of the crimped upper for receiving the blank for the upper and open throughout its length next to the plunger, combined with the plunger adapted to be forced through the mold in an arc of a circle and carrying with it the blank to crimp it, substantially as described.

386,652.

2. In a machine for crimping uppers of foot-wear, a rotary mold-block having a series of vertical wings containing the molds *a*, the removable plates *p*, arranged in said molds and adjustably secured in place, as by screws, and the springs interposed between the plates and the rigid wings, combined with a plunger and means to rotate it and carry it through the mold from end to end in an arc of a circle, substantially as described.

3. In a machine for crimping uppers of foot-wear, a mold having a channel the outlet through which is of substantially the shape of the profile of the bottom of the crimped upper, combined with a plunger forced through such mold in an arc of a circle and carrying with it and crimping the upper, substantially as described.

4. In a machine for crimping uppers of foot-wear, a mold having a table the surface of which is composed of a plane incline abruptly ending in an upturned curvilinear portion extending outward and above the plane to give initially to the blank of the upper the profile of the crimped upper, combined with the rotary plunger, whose leading end has substantially the same conformation, so as to strike the initially-formed blank and force it at once throughout its length into the mold without injury to the leather, and, continuing to move in an arc of a circle, carry the said blank through and out of the mold, substantially as described.

5. In a machine for crimping uppers of foot-wear, a rotary plunger moving in an arc of a circle and having its leading end formed in substantially the shape desired for the profile of the top of the finished crimped upper, combined with a channel-mold the shape of whose mouth is the counterpart of the leading end of the plunger, having a table the surface of which is an inclined plane ending abruptly in an upturned receding portion elevated above the plane and also of substantially the conformation of the leading end of the plunger, and a press-plate whose shape is the counterpart of the table, substantially as described.

6. In a machine for crimping uppers of foot-wear, a rotary master-wheel, a drum thereon, and a series of plungers projecting from the periphery of such drum, combined with a mold separated from the master-wheel and arranged in the arc of travel of the plungers, substantially as described.

7. In a machine for crimping uppers of foot-wear, a master-wheel provided with a series of plungers and a series of cams, combined with the mold, press-plates co-operating with the mold and plungers, and the lever connecting the press-plates and cams, substantially as described.

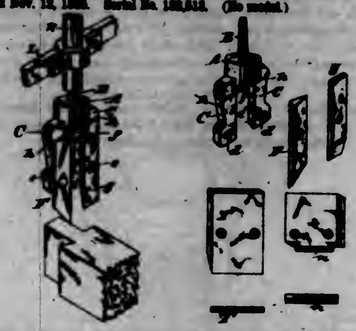
8. In a machine for crimping uppers of foot-wear, the revolving mold-block, the channel-molds made lengthwise in said block, the corrugated plates arranged in the molds, and relieving-springs for said plates, combined with a plunger, substantially as described.

9. In a machine for crimping uppers of foot-wear, the revolving mold-block and its molds and the shaft for said block, combined with a plate on the mold-block shaft and spring-pawls in said plate, the reciprocating cross-head, and a ratchet-tooth and regulating-stop co-operating with said pawls, substantially as described.

10. In a machine for crimping uppers of foot-wear, the plungers and a rotary carrier therefor, combined with the molds and a carrier for them revolving at right angles with the axis of the carrier for the plungers, substantially as described.

11. In a machine for crimping uppers of foot-wear, the revolving mold-block and a plunger, combined with press-plates and the bar *b'*, attached to the press-plates, substantially as described.

12. In a machine for crimping uppers of foot-wear, the press-plates normally elevated by a spring, combined with a rotating cam, and a lever interposed between the cam and press-plates to bring and hold the press-plates in position for securing the work or blank of the upper, substantially as described.



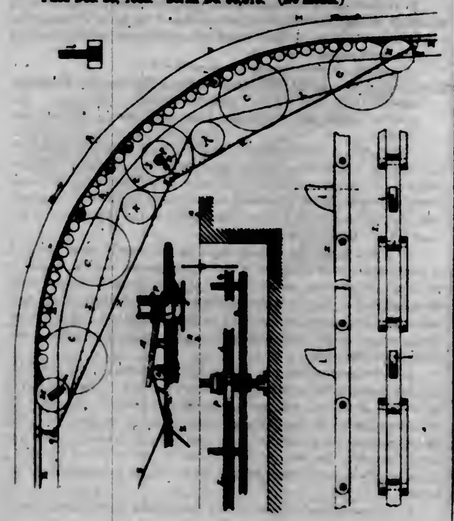
13. In a machine for crimping uppers of foot-wear, the combination of the mold-block and shaft, pawl-plate and spring-pawls, reciprocating cross-head with ratchet-tooth and regulating-stop, crank-connecting rod, and mold-moving geared wheel with a suitable source of power, substantially as described.

14. In a machine for crimping uppers of foot-wear, the combination of the press-plates, shaft, cutlet spring, lever and lever-spring, cam, and master-wheel, with operating mechanism, substantially as described.

15. In a machine for crimping uppers of foot-wear, the combination of the tilting delivery-fingers, their shaft, shaft-spring, crank-connecting rod, and bell-crank, with the crank of the mold-moving geared wheel and suitable driving mechanism, substantially as described.

16. In a machine for crimping uppers of foot-wear, the combination of the mold-block, plunger, drum, press-plates, and tilting delivery-fingers, with the driving mechanism, substantially as described.

386,653. TENSIONING-TOOL. LOUIS F. PAHDE, Cincinnati, Ohio. Filed Nov. 12, 1888. Serial No. 132,513. (No model.)



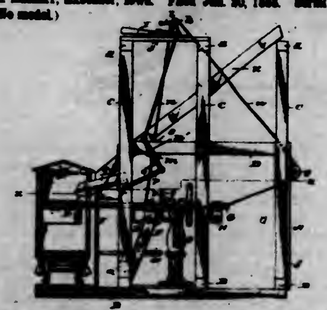
Claim.—1. A tensioning-tool consisting of a body, A, having a shank at one end and extensions C at the other, forming between them a central slot, *i*, for the tenon and adapted to receive bits, and formed with transverse slots *d* for lateral adjustment of the bits, substantially as set forth.

2. A tensioning-tool consisting in the combination of a solid body, A, capable of being connected to the stock of a suitable machine, having two wings, C, extending therefrom, adapted to hold adjustably the cutting-bits which bear against a rest, A, formed by an increase in the metal of the body near their upper ends, and a scale to gage the distance between the bits.

3. In a tensioning-tool provided with wings C, forming between them a central slot, *i*, and having plane surfaces parallel with the line of motion of said tool, and adapted to receive and hold bits the cutting-edge of which may be of different shapes, substantially as set forth.

386,654. APPARATUS FOR MOVING CARS AROUND CURVES OF CABLE RAILWAYS. WILLIAM A. PHILLIPS, San Francisco, Cal. Filed Dec. 30, 1882. Serial No. 80,619. (No model.)

Claim.—1. In a system of propelling cars by means of an endless rope or cable moving in an underground slotted tube or tunnel, the improvement in passing the rope around curves, consisting in the combination of the main cable B, carried around the curve on large horizontal pulleys C C regardless of its relation to the slot in the tube, with a supplemental endless chain or cable, I, having legs or arms *l*, the line of small pulleys G supporting one part of said chain or cable parallel with the slot through which the gripper-shank passes, and the driving mechanism connected to the opposite part of said chain or cable and automatically set in motion and thrown out of motion by the pressure of the gripper-shank against a lever, *q*, substantially as described.



2. In an apparatus of the character described, the combination, with the main cable B, carried around the curve on large horizontal pulleys C C, of the supplemental endless chain or cable I, having legs or arms *l*, the line of small pulleys G, supporting one part of said chain or cable, the loose pulley J, supporting another part of said chain or cable, and the clutch-coupling *p*, mounted upon the same shaft with said pulley J and operated by the pressure of the gripper-shank against levers which are located at each end of the curve and have intermediate connections with said clutch-coupling, substantially as and for the purpose set forth.

3. In an apparatus of the character described, the combination, with the main cable B, carried around the curve on large horizontal pulleys C C, of the supplemental endless chain or cable I, having legs or arms *l*, the line of small pulleys G, supporting one part of said cable parallel with the slot through which the gripper-shank passes, the two pulleys H H, for supporting said chain or cable at the ends of the curve, the loose pulley J, combined with the clutch-coupling *p*, mounted on the shaft of one of the pulleys C for supporting the opposite side of the said chain or cable at a point about central between the two pulleys H H, the two pulleys K K, for pressing the said chain or cable against one side of the loose pulley J, and mechanism for throwing said loose pulley into and out of action by the pressure of the gripper-shank against levers connected with such mechanism, substantially as and for the purpose set forth.

4. In an apparatus of the character described, the combination, with the main cable B, carried around the curve on large horizontal pulleys C C, and the supplemental endless chain or cable I, supported by the line of small pulleys G, and the pulleys H H and K K, of the loose pulley J and the clutch-coupling *p*, mounted on the shaft of one of said large pulleys C, the engaging forked lever R, pivoted at the center, the wedge or inclined plane S, arranged to move under the outer end of said lever, and a rope or cord, Z, connected to this wedge and to levers *q* at each end of the curve, substantially as and for the purpose set forth.

5. In an apparatus of the character described, the line of pulleys G, for supporting the supplemental chain or cable I, all arranged in a continuous metallic box, E, provided with grooves *f*, combined with upper bearing-blocks, *a*, and caps *b*, and lower bearing-blocks, *a*, provided with cavities *c*, substantially as and for the purpose set forth.

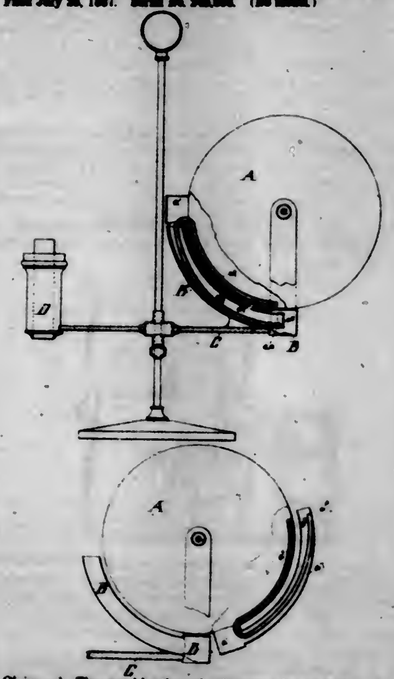
386,655. COAL AND GRAIN DISTRIBUTING APPARATUS. OTTO H. RAIMAT, Ryenister, Iowa. Filed Jan. 20, 1888. Serial No. 261,303. (No model.)

Claim.—1. A coal-loading apparatus having a fixed inclined chute, in combination with a reciprocating chute arranged at the lower end of the main chute and adapted to extend the discharge of the latter, and a rock-shaft having at one end an angular distributer which is adapted to receive material from said chutes and conduct it in opposite directions, substantially as specified.

2. The combination in an apparatus such as described, of a main frame, an inclined chute fixed thereon, a movable chute at base of the fixed chute, a rock-shaft carrying at its outer end an angular distributer, and pivoted jaws M, for clutching the said rock-shaft, substantially as specified.

3. The herein-described loading and distributing apparatus, con-

sisting of the main frame provided with the main chute and the movable chute *g*, the latter being connected by the crank *n'* and rods *n p* to an operating-lever, *l*, the rope passing around the pulleys *g h* and having its ends connected to the rear portion of the said rock-shaft, and the said rope connected to the winding-drum *h*, by which means the rock-shaft and distributer are adjusted into and out of operative position, substantially as specified.

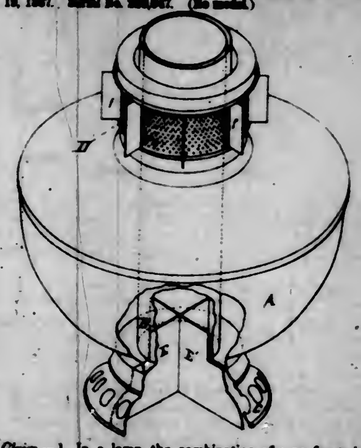


386,656. MANUFACTURE OF LOADED HEEL-BLANKS. FREDERICK P. RAYMOND, 24, Hoyton, Mass. Filed Jan. 19, 1888. Serial No. 261,282. (No model.)

Claim.—1. The improved method of making detached loaded heel-blanks for attachment by flesh nailing to the soles of a boot or shoe, consisting in pricking holes therein at a uniform distance from the edge of the top lift of the heel-blank and inserting in some of said holes nails of one length to serve as attaching-nails and the heads of which are left projecting from the tread-surface of the heel-blank, and the points of which do not extend through the heel-blank, and in other of said holes shorter nails or rings adapted for surface wearing and not for attaching, and interposed between the attaching-nails, as and for the purposes specified.

2. The method of making detached loaded heel-blanks for attachment by flesh nailing to the soles of a boot or a shoe, consisting in forming holes in the heel-blank varying in depth and inserting in said holes nails varying in length, the longer of which are used as attaching-nails, are set in the longer holes, and have their heads projecting from the tread-surface of the heel-blank and their points embedded in the substance of the heel, and the shorter of which are set in the shallower holes and are interposed between the attaching-nails and are driven to bring their heads flush with the tread-surface of the heel-blank before it is attached, as and for the purposes described.

386,657. BAROMETRIC RESERVOIR. FRANK RIDER, Morton, Conn., assignor of one-half to Edward Miller & Company, same place. Filed July 29, 1887. Serial No. 245,502. (No model.)



Claim.—1. The combination of a barometric reservoir, a frame or shell in which said reservoir is supported so as to be capable of axial revolution, an opening in said reservoir, and an exterior tube attached to said opening, bent to a curve substantially concentric with said reservoir and adapted to carry oil to or from said reservoir, substantially as described.

2. The combination of a barometric reservoir, a frame or shell in which said reservoir is supported so as to be capable of axial revolution, an opening in said reservoir, an exterior tube attached to said opening, bent to a curve substantially concentric with said reservoir and adapted to carry oil to or from said reservoir, and a guard-tube attached to said shell or frame and adapted to receive said tube, substantially as described.

3. The combination of a barometric reservoir, a frame or shell in which said reservoir is supported so as to be capable of axial revolution, an opening in said reservoir, an exterior tube attached to said opening, bent to a curve substantially concentric with said reservoir and adapted to carry oil to or from said reservoir, and a siphon-shaped tube partly within said reservoir and projecting through said opening, substantially as described.

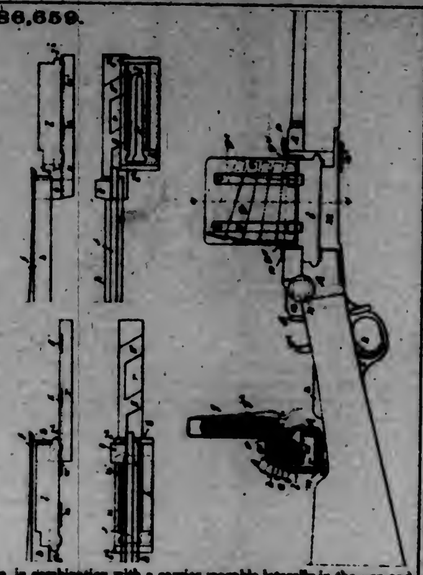
4. The combination of a barometric reservoir, a frame or shell in which said reservoir is supported so as to be capable of axial revolution, an opening in said reservoir, an exterior tube attached to said opening, bent to a curve substantially concentric with said reservoir and adapted to carry oil to or from said reservoir, and a removable plug or cap at the free end of said tube, substantially as described.

386,658. CENTRAL-DRAFT LAMP. FRANK RIDER, Morton, Conn., assignor to Edward Miller & Company, same place. Filed Sept. 19, 1887. Serial No. 249,947. (No model.)

Claim.—1. In a lamp, the combination of a perforated portion, through which air is supplied to the exterior surface of the flame, and one or more wings or wind-guards extending outward from said perforated portion, substantially as described.

2. In combination with a lamp having a perforated portion through which air is supplied to the exterior surface of the flame, a detachable ring or hoop and one or more wings or wind-guards attached to said ring, substantially as described.

386,659. MAGAZINE-GUN. HERR G. H. SALOMON, Stockholm, Sweden. Filed Nov. 5, 1886. Serial No. 218,201. (No model.) Patented in England Mar. 1, 1886, No. 2,953, and in Norway Mar. 24, 1886, No. 62.



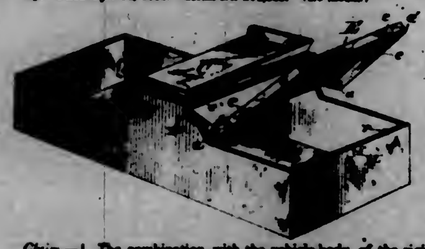
Claim.—1. A breech-loading gun having a barrel, breech-piece, and bolt, in combination with a cartridge-carrier in guides at right angles to the length of the gun and acted on by the bolt to be moved laterally outward from the casing as the bolt is withdrawn longitudinally and to be returned within the casing as the bolt is moved forward, all substantially as described.

2. A breech-loading gun having a barrel, breech-piece, and bolt, in combination with a carrier in horizontal guides at right angles to the length of the gun and having an oblique opening through it for the admission of the cartridge above and the discharge of the shell below, the said carrier being acted on by the bolt to be moved laterally in or out as the bolt is moved longitudinally in or out, all substantially as described.

3. A breech-loading gun having a barrel, breech-piece, and bolt, in combination with a carrier in horizontal guides at right angles to the length of the gun and having an oblique opening through it for the admission of the cartridge above and the discharge of the shell below, corresponding oblique steps, and grooves on the said bolt and carrier, whereby the latter is moved laterally into or out of the casing as the bolt is moved longitudinally in or out, all substantially as described.

4. A breech-loading gun having a magazine, barrel, and breech-

386,659.



piece, in combination with a carrier movable laterally in the gun and having an opening through it for the cartridges from the magazine, and corresponding oblique steps, and grooves on the carrier and bolt, whereby the carrier is moved laterally in or out as the bolt is moved, substantially as set forth.

5. A breech-loading gun having a longitudinally-moving bolt and a cartridge-carrier provided with an opening through it for the admission of the cartridge above and the discharge of the shell below, the said carrier being moved into or out of the breech-casing by the bolt, substantially as described.

6. A breech-loading gun having a longitudinally-moving bolt and cartridge-carrier provided with an oblique opening entirely through it for the admission of the cartridge above and the discharge of the shell below, and with projecting edges at the upper sides of the opening for holding the cartridges, substantially as set forth.

7. A breech-loading gun having a magazine, breech-piece, barrel, and longitudinally-moving bolt, the latter having oblique grooves, in combination with a laterally-movable cartridge-carrier having oblique steps to engage with said oblique grooves, and having an oblique opening for the cartridges, and projecting edges adjacent to said opening on the upper side, all substantially as and for the purpose set forth.

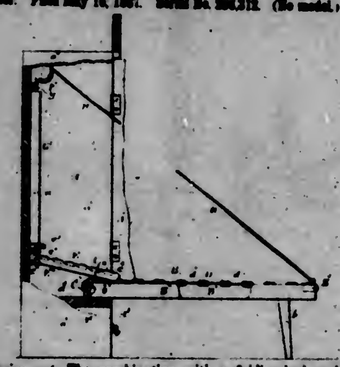
386,660. SPORT-BOAT. FREDERICK SIEBERT, Mount Sterling, Ky. Filed Apr. 26, 1888. Serial No. 271,933. (No model.)

Claim.—1. The combination, with the vehicle-body, of the rigid metallic boot E, shaped to fit said body, pivoted thereto at its forward end, and provided with depending flanges, substantially as set forth.

2. The combination, with the vehicle-body, of the rigid metallic boot E, bent as described, so as to extend upward at its forward end, pivoted to said body at the latter point, and provided with a surrounding strengthening-frame formed from the material which constitutes the top plate of the boot, substantially as set forth.

3. The combination, with the vehicle-body, of the rigid metallic boot E, fitted thereto and hinged at its forward end, substantially as described.

4. The combination, with the portion D of the vehicle-body, of the rigid metallic boot E, hinged thereto at its forward end, the buffers *r*, situated upon the upper part of said portion, and the screws *r'*, passing through said buffers and having their heads below the top surface thereof, substantially as set forth.



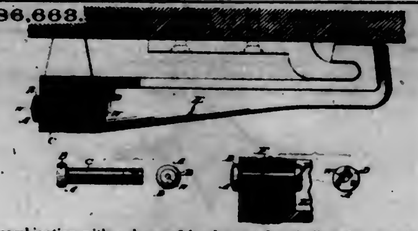
386,661. SECRET SAFETY-LAMP. THOMAS SHAW, Philadelphia, Pa. Filed Dec. 2, 1887. Serial No. 256,602. (No model.)

Claim.—1. The combination, with the burner and casing of a miner's lamp, of a chamber below the burner, an air-tube communicating therewith, and a flexible wall to said casing, substantially as described.

2. The combination of the lower casing containing a reservoir and air-chamber, an air-tube communicating with the chamber, a flexible wall to said chamber, passages from the air-chamber to the top of the casing, a burner, and surrounding transparent casing, substantially as described.

386,662. FOLDING BEDSTEAD. HOWE T. SMITH, Fremont, Nebr. Filed May 16, 1887. Serial No. 238,312. (No model.)

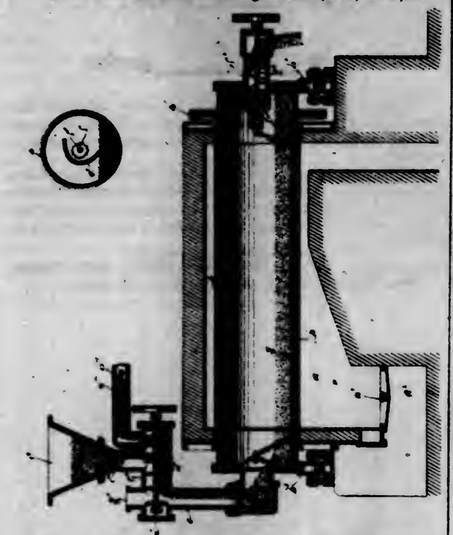
Claim.—1. The combination, with a folding-bed casing, of a swinging bed-frame, B, a horizontal stationary bar, C, attached to the casing, pivots attached to the ends of the bar and engaging the upper ends of the sides of the frame, and a bed-bottom consisting of a flexible fabric attached to the said stationary bar C and to the lower end of the frame, substantially as described.



2. The combination, with a stationary folding-bed casing provided with a fixed horizontal partition, of a bed-frame, B, consisting of an end rail and two side rails and a stationary horizontal bar, C, attached to the said partition and provided at its ends with pivots engaging the ends of the side rails of the frame, and a flexible bed-bottom secured to the stationary bar C and to the lower end of the frame, whereby when the bed is lowered for use the bed-bottom is stretched, substantially as described.

386,663. SEAL FOR LOCKS &c. GEORGE G. SMITH, St. Albans, Vt. Filed Sept. 1, 1887. Serial No. 248,691. (No model.)

Claim.—1. The within-described detached sealing bolt or rivet for sealing and securing locks and other fastenings, the same consisting of a rod or pin of soft metal headed at one end and encircled by a reinforcing sleeve of harder metal extending over a portion of its length and united thereto, substantially in the manner and for the purpose herein set forth.



2. A seal for bolts and other fastenings, consisting of a longitudinally perforated or tubular pin or bolt of soft metal headed at one end,

386,663.

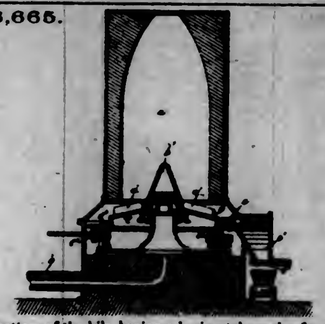
in combination with a sleeve of harder metal encircling the same for a portion of its length, substantially in the manner and for the purpose herein set forth.

386,664. APPARATUS FOR ROASTING SODIUM BICARBONATE. ERNEST SOLVAY, Brussels, Belgium, assignor to the Solvay Process Company, Syracuse, N. Y. Filed Mar. 28, 1888. Serial No. 268,886. (No model.) Patented in Belgium Aug. 11, 1887, No. 78,547; in France Aug. 11, 1887, No. 186,262, and in England Oct. 1, 1887, No. 13,282.

Claim.—1. The combination, with a revolving roasting-cylinder, and a furnace for heating the same, of a mixing-chamber connected to said cylinder and having an inlet for the bicarbonate and one for the carbonate, whereby a mixture is made and fed continuously to the cylinder, substantially as and for the purpose set forth.

2. The combination, with the revolving roasting-cylinder, of an outlet for the soda, provided with a conveyer-shaft having a corrugated roller on its end and a tangentially-curved lifter within the cylinder formed with a corrugated face, whereby the material is continuously discharged and all lumps crushed, substantially as and for the purpose set forth.

3. The combination, with the mixing-chamber of an apparatus for decomposing bicarbonate of soda, of a hopper thereon having a feeding-valve in its bottom, and a pipe connected thereto and provided with a conveyer stopping short of its connecting-point, whereby the material is induced to fill the openings and prevent the admission of air, substantially as and for the purpose set forth.



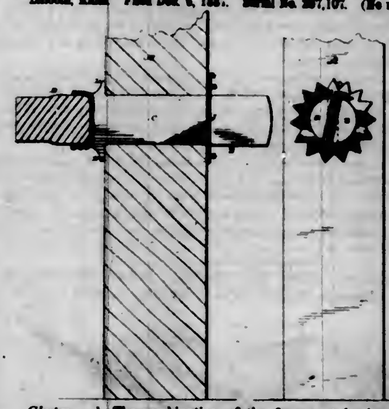
4. The combination, with the rotary roasting-cylinder, of a discharge-pipe and a conveyer therein made shorter than the pipe, substantially as and for the purpose set forth.

386,665. LIMEKILN. ERNEST SOLVAY, Brussels, Belgium, assignor to the Solvay Process Company, Syracuse, N. Y. Filed Mar. 28, 1888. Serial No. 268,887. (No model.) Patented in Belgium Aug. 26, 1887, No. 78,672; in France Aug. 26, 1887, No. 186,907, and in England Oct. 1, 1887, No. 13,282.

Claim.—1. The combination, with a limekiln, of a revolving disk placed in the bottom of the kiln and provided with means for forcing the lime gradually from the center to the outer edge of the disk, substantially as and for the purpose set forth.

2. The combination, with a limekiln, of a revolving conical disk

386,665.



in the bottom of the kiln, having a horizontal annular flange, tangent wings for forcing the material out to and upon the annular flange, and a scraper to sweep the lime off said flange at the point of discharge, substantially as and for the purpose set forth.

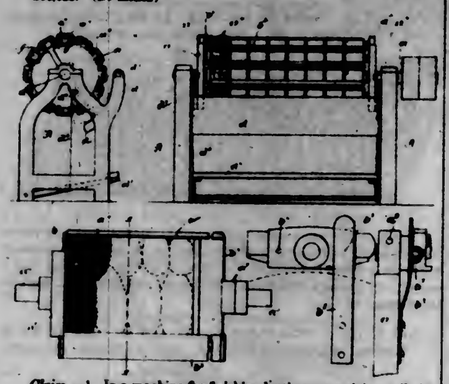
3. The combination, with a limekiln having its inner sides made vertical at the lower end, of a revolving disk in the lower part of the kiln for automatically discharging the material, substantially as and for the purpose set forth.

4. The combination, with a limekiln having its lower end made air-tight, of an air-blast pipe introduced into the lower end of the kiln, and having a discharge nozzle or cone, *b'*, connected to the blast-pipe and extended up into the center of the charge under operation, substantially as shown and described.

5. The combination, with a limekiln, of a cone projecting into the lower center thereof and connected to an air-blast, and a revolving disk surrounding the cone and adapted to continuously work the lime outward to a discharge-point, substantially as and for the purpose set forth.

386,666. TIGHTENER FOR WIRE FENCES. GEORGE TIBBETT, Lincoln, Kans. Filed Dec. 6, 1887. Serial No. 257,107. (No model.)

Claim.—1. The combination of the fence-post having a hole through it, with the wire-tightener composed of a rod or shaft having an open-ended slot through the part which extends through the post, a locking-plate having apertures to receive the forked end *b'* of the shaft, and a fastening or locking device upon the fence-post, substantially as shown.



2. The combination of a fence-post having a hole through it, with a wire-tightener composed of a rod or shaft having an open-ended slot through that end which extends through the post, and provided with a beveled flange upon its head or outer end, and a locking-plate which is applied to the post to prevent the rod or shaft from revolving, substantially as described.

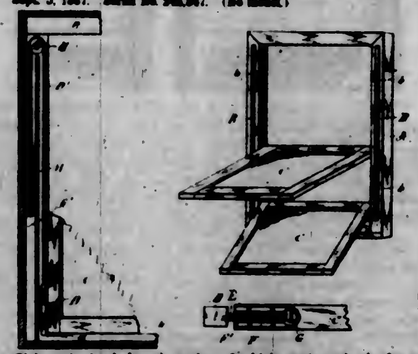
3. The combination of a perforated fence-post with a wire-stretching device composed of a rod or shaft having an open-ended slot through that part which extends through the post, a locking-plate provided with openings to receive the ends of the prongs of the tightening device, and a strip which catches between the prongs, and a locking device on the post to prevent the plate from revolving backward, substantially as set forth.

4. The combination of the tightening device provided with an open-ended slot and having the shoulders F in the inner sides of the

prongs, with the locking-plate provided with serrations in its edge, openings to receive the ends of the prongs of the tightener, and a strip which extends between the prongs, substantially as specified.

386,667. MACHINE FOR THE TREATMENT OF LEATHER. HENRY THOMAS, Skaneateles, N. Y. Filed Jan. 17, 1888. Serial No. 261,033. (No model.)

Claim.—1. In a machine for finishing leather, a revolving cylinder having a series of reversible dresser bars or slats to hold toasels, and a locking device for said bars or slats, combined with a bed or apron to support the leather to be acted upon by the said toasels, substantially as described.



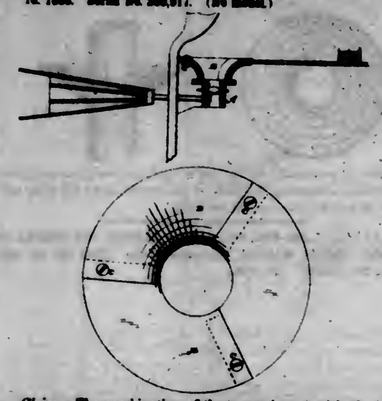
2. In a machine for finishing leather, a rotating cylinder provided with a series of pivoted dresser bars or slats, having one face provided with toasels and one with wire-cloth, the said dresser bars or slats being mounted in the said cylinder, in order that they may be reversed, as desired, to operate substantially as described.

3. In a machine for finishing leather, a rotating cylinder, its series of pivoted dresser bars or slats containing toasels, combined with a locking device to secure the dresser bars or slats in position, substantially as described.

4. In a machine for finishing leather, the combination, with a supporting-frame, of a reversible dresser bar or slat containing toasels, and a locking device to secure the said dresser bars or slats, substantially as described.

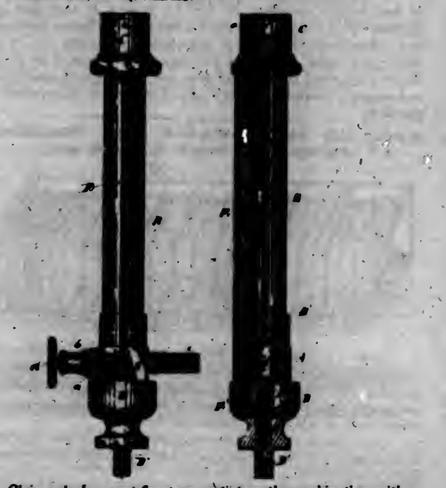
5. In a machine for finishing leather, a supporting-frame and a series of reversible dresser bars or slats containing toasels and wire cards and pivoted to said frame, combined with a locking device to secure the dresser bars or slats, substantially as described.

386,668. WINDOW. WILLIAM P. B. UREN, Newark, N. J. Filed Sept. 9, 1887. Serial No. 248,947. (No model.)



Claim.—1. A window the sashes of which are hung in the frame by attachments, the short arms of which engage in plates at the lower corners of the sashes, and the long arms of which are attached to the cords or straps supporting the weights in the frame, said sashes being adjustably secured at their lower corners at any point in the frame by means of cams acting against the short arms of the attachments, substantially as shown and described.

2. A window provided with swinging steps or cleats, and sashes hung from their lower corners by cords and attachments, said sashes being secured at any point in the frame by a cam acting against the short arms of the attachments, substantially as shown and described.



3. A window sash each sash of which is hung in the frame by cords and attachments, said attachments being crowded by a cam against the frame, forming fixed hinges upon which the sashes can be swung, substantially as shown and described.

386,669. TUYERE. ANDREW VANDERLIP, Goshen, Ind. Filed Jan. 16, 1888. Serial No. 260,917. (No model.)

Claim.—The combination of the tuyere-iron A with the iron cap B, placed thereon and composed of a number of overlapping sections which are bolted together, the cap having an opening through its center and forming the base upon which the fire is built, substantially as shown.

386,670. VENT-PLUG FOR STEAM-RADIATORS. EDWARD P. WARDEMAN, Syracuse, N. Y., assignor of one-half to the Pierce, Butler & Pierce Manufacturing Company, same place. Filed Nov. 30, 1887. Serial No. 256,902. (No model.)

Claim.—1. In a vent for steam-radiators, the combination, with a positive vent-plug formed with a vent escape-passage and an automatic vent-plug also provided with an escape-passage, of a drip-cup secured to the lower end of the device beneath the ends of both escape-passages, substantially as shown and described.

2. The combination, in a vent-plug for steam-radiators, of a positive vent-plug having passages for steam and air and an escape-passage opening through the side of the shell above the drip-cup, an automatic vent-plug mounted on the positive one, a drip-pipe connected to the automatic vent-plug on the exterior of the casing, and a drip-cup on the positive vent-plug to receive the drip from both of them, substantially as and for the purpose set forth.

3. A positive vent-plug provided with a depending screw-threaded hollow stem and an escape-passage opening through the shell at one side of said stem, in combination with a drip-cup secured to said stem, the stem being provided with openings some distance above the bottom of the cup leading through the hollow screw-threaded stem of

the positive vent-plug, and a corresponding passage through the base of the drip-cup, substantially as and for the purpose set forth.

386,671. PIPE-COLLAR. EDWARD P. WARDNER, Syracuse, N. Y., assignor of one-half to the Pierce, Butler & Pierce Manufacturing Company, same place. Filed Dec. 17, 1887. Serial No. 258,149. (No model.)

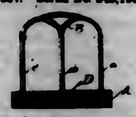
Claim.—A pipe-collar having studs inside its central opening and an elastic band connecting the studs for closely hugging the pipe, substantially as and for the purpose set forth.

386,672. DIE FOR THICKENING BLANKS FOR SPOONS OR FORKS. ROBERT WALLACE, Wallingford, Conn. Filed Apr. 30, 1888. Serial No. 272,969. (No model.)

Claim.—1. The herein-described die for thickening the blanks for spoon or fork handles, consisting of two parts, A B, the adjacent faces of each constructed with grooves *b b*, the said grooves corresponding in length and longitudinal shape to the portion of the blank when thickened, the sides of the said grooves diverging from the inside outward, the said inner sides or narrower portion of the grooves in width corresponding substantially to the thickness of the blank to be operated upon, substantially as described.

2. The herein-described die for thickening the blanks for spoon or fork handles, consisting of, the two parts A B, each part constructed with a longitudinal groove, *b*, upon their adjacent faces, each part constructed with a cheek, *d*, projecting from one side of the groove, the cheek of the one part being on the side of its groove opposite the cheek of the other part, and so as to form overlapping and opposing cheeks on opposite sides of the groove, substantially as described.

386,673. PAPER OR BILL FILE. ARTHUR J. WELLS, Syracuse, N. Y. Filed Sept. 9, 1887. Serial No. 249,192. (No model.)

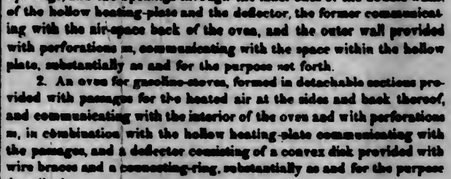


Claim.—1. In a paper or bill file, the combination, with a base formed with longitudinal grooves in its edges, of a series of partitions provided with tongues to engage said grooves, whereby the partitions are readily adjusted to form a series of compartments of various sizes, substantially as and for the purpose set forth.

2. In a paper or bill file, the combination, with a base, of a series of detachable partitions adjustable to and from each other, substantially as and for the purpose set forth.

3. The combination, with the longitudinally-grooved base A, of the metallic slides or partitions C, provided with tongues *c*, to enter the grooved edges of the base, substantially as shown and described.

386,674. PAPER OR BILL FILE. ARTHUR J. WELLS, Syracuse, N. Y. Filed Sept. 9, 1887. Serial No. 249,193. (No model.)



Claim.—1. The herein-described paper-file, consisting of a base adapted to lie upon a desk or table and formed with a series of perforations, and adjustable partitions provided with steps removably fitting into the perforated base, substantially as and for the purpose set forth.

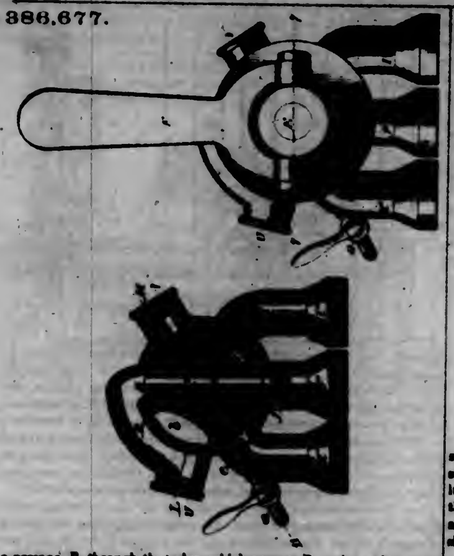
2. The combination of the base A and perforated plate D, secured to its top, and the adjustable partitions B, having the steps *c c*, adapted to enter the perforations, substantially as and for the purpose set forth.

3. The base A, formed with a series of perforations, C, and the adjustable partitions B, having the spring-steps *c c*, substantially as specified.

386,675. PAPER OR BILL FILE. ARTHUR J. WELLS, Syracuse, N. Y. Filed Sept. 9, 1887. Serial No. 249,200. (No model.)

Claim.—The combination of the base A, having rabbets *a* extending lengthwise in the outer edges thereof, rods *b*, detachably secured to the base within the rabbets, and slides C, having depending feet *c* and eyes *d*, through which the rods *b* pass, substantially as and for the purpose set forth.

386,676. OVEN FOR GASOLINE-STOVES. WALTER WELLS, Oskaloosa, Iowa. Filed Feb. 28, 1888. Serial No. 265,916. (No model.)



Claim.—In an oven for gasoline-stoves, the combination, with the double walls thereof at the back and sides, as shown, the escape openings, and the openings through the inner ones of the double walls, of the hollow heating-plate and the deflector, the former communicating with the air-space back of the oven, and the outer wall provided with perforations *m*, communicating with the space within the hollow plate, substantially as and for the purpose set forth.

2. An oven for gasoline-stoves, formed in detachable sections provided with passages for the heated air at the sides and back thereof, and communicating with the interior of the oven and with perforations *m*, in combination with the hollow heating-plate communicating with the passages, and a deflector consisting of a convex disk provided with wire braces and a connecting-ring, substantially as and for the purpose described.

386,677. VALVE FOR FILTERS. ABSHALOM J. WISE, Lake View, Ill. Filed Apr. 30, 1888. Serial No. 272,945. (No model.)

Claim.—1. A valve-chamber provided with an inlet and with outlets I J K upon one side, which communicate with short tubes I' J' K', an outlet, T, located below the outlet J, which outlet T communicates with a passage which leads to the tube J', an outlet, L, for the discharge of dirty water when the filter is washed, an outlet, M, for the discharge of filtered water, an outlet, S, and a passage, R, communicating at one end with the duct S and at the other end with the outlet U, in combination with a hollow valve provided with two openings, N O, either of which can be made to register with the outlet T,

386,677.

a passage, P, through the valve, which passage P can be made to register with outlets J and S or with outlets K and M, and a recess or passage, *b*, which communicates at one end with a pipe, K, and at the other end with the outlet L, substantially as and for the purpose specified.

2. A valve-chamber provided with an inlet and with outlets I J K upon one side, which communicate with short tubes I' J' K', an outlet, T, located below the outlet J, which outlet T communicates with a passage which leads to the tube J', an outlet, L, for the discharge of dirty water when the filter is washed, an outlet, M, for the discharge of filtered water, an outlet, S, and passage R, communicating at one end with the duct S and at the other end with the outlet U, and the passage *d* through the beam G, one end of which passage *d* communicates with duct *c* when it is brought to the proper position, and the other end communicates with the try-cock Q, in combination with a hollow valve provided with openings N, O, and *c*, the openings N O being so arranged that either one can be made to register with the outlet T, and the opening *c* being so arranged that it can be made to register with the passage *d*, and passage P through the valve, which passage P can be made to register with the two outlets J and S, or with the two outlets K and M, and a recess or passage, *b*, which communicates at one end with the pipe K and at the other end with the outlet L, substantially as and for the purpose specified.

3. A valve-chamber provided with an inlet and with outlets I J K upon one side, which communicate with short tubes I' J' K', an outlet, T, located below the outlet J, which outlet T communicates with a passage which leads to the tube J', an outlet, L, for the discharge of dirty water when the filter is washed, an outlet, M, for the discharge of filtered water, an outlet, S, a passage, R, communicating at one end with the duct S and at the other end with the outlet U, and the passage *d* through the beam G, one end of which passage *d* communicates with duct *c* when it is brought to the proper position, and the other end communicates with the try-cock Q, and passage *c* in the beam G, the upper end of which passage *c* communicates with the tube or passage K and the lower end with the passage *d*, in combination with a hollow valve provided with openings N, O, and *c*, the openings N O being so arranged that either one can be made to register with the outlet T, and the opening *c* being so arranged that it can be made to register with the passage *d* and passage P through the valve, which passage P can be made to register with the two outlets J and S, or with the two outlets K and M, and a recess or passage, *b*, which communicates at one end with the pipe K and at the other end with the outlet L, substantially as and for the purpose specified.

386,678. SASH-FASTENER. WILLIAM THLAAR, Jr., Brooklyn, N. Y. Filed Feb. 1, 1888. Serial No. 262,684. (No model.)

Claim.—1. In a sash attachment, the combination, substantially as before set forth, of a rod adapted to be attached at its upper end by a universal joint to the central top part of an upper sash, and a slotted clamping-block capable of a rocking movement, adapted to be secured to the central upper part of a lower sash, to which the lower free end of the said rod may be removably attached.

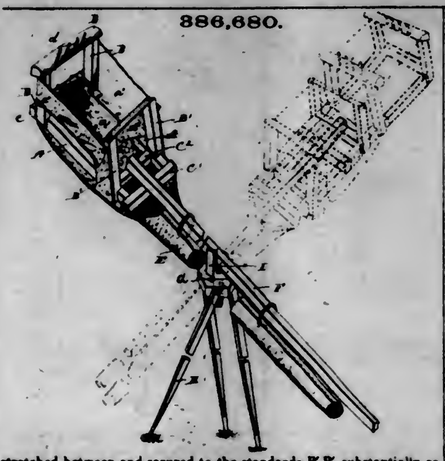
386,678.

2. In a sash attachment, the combination, substantially as before set forth, of a plate provided with an integral screw-threaded socket secured to the central top part of the upper sash, a rod attached at its upper end to said plate and forming a universal joint therewith, the slotted plate secured to the upper central part of the lower sash, and the slotted block capable of a rocking movement, mounted in said slotted plate and having a clamping-screw mounted therein.

3. In a sash attachment, the combination, with the upper sash, of a socketed plate attached to the upper part thereof, a rod having a ball at the upper end thereof pivotally mounted in a yoke and provided with a screw-shank adapted to have a movable bearing in the socketed plate to form a universal joint therewith, the lower sash, the slotted plate formed with ears centrally secured to the upper part of the lower sash, a slotted clamping-block pivotally mounted in the slotted plate, between the ears thereof, capable of having a rocking movement imparted thereto, and the slot thereof adapted to be engaged by the depending free end of the rod, the said block also having shoulders formed therewith to limit its movement, and a clamping-screw mounted in said block, substantially as described.

4. In a sash attachment, a rod having a ball at its upper end pivotally mounted in a yoke having a screw-threaded shank adapted to movably engage with a socketed plate centrally secured to the top of an upper sash, in combination with a self-adjusting rocking clamping-block secured to the top central part of a lower sash, substantially as described.

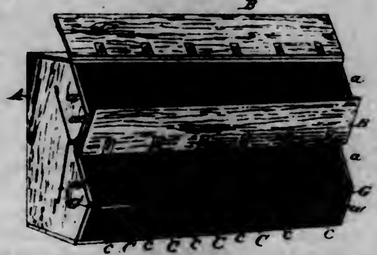
386,679. JOINT FOR RAILROAD T-RAILS. ISAAC G. ALBAUGH and JAMES G. GILLESPIE, Chattanooga, Kans. Filed Nov. 26, 1887. Serial No. 256,102. (No model.)



Claim.—The rails A and B, the fish-plate C, horizontally slotted at its ends, the notched locking-plate having also suitable perforations through it, the headed bolts F, each having a hole in its end, and each fitting into a slot in the fish-plate and passing through one of the perforations in the locking-plate, and the spring-catch G, and bolts and nuts for holding the fish-plate and rail together, all combined substantially as set forth.

386,680. FRUIT-GATHERER. JAMES ALEXANDER, Cherry Fork, Ohio. Filed Aug. 13, 1887. Serial No. 246,572. (No model.)

Claim.—The herein shown and described fruit-gatherer, composed of the frame consisting of the side bars, A, the upper and the lower end bars, C and C', the cross-bar C², the pole or handle secured to the bars C and C², the standards B B and B' B', projecting from the frame, the cross-bar D, uniting the upper ends of the standards B, and provided with teeth *d*, the cheats having the lower ends of its upper end extended over the said frame, the sides extended from the upper to the lower standards and secured thereto, and the end portion, *a*²,



386,680.

stretched between and secured to the standards B' B', substantially as specified.

386,681. HAIL-CASE. WILLIAM G. BARBER, Amsterdam, N. Y.

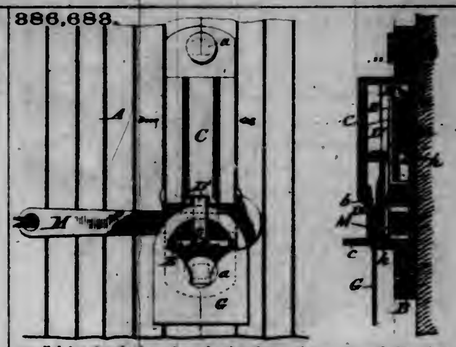
Filed Apr. 30, 1888. Serial No. 272,827. (No model.)

Claim.—The combination of the box A, open on one side, the edges of which side are formed with inclines *a a* and *a' a'*, the horizontal partition D, and vertical partitions C C, for dividing the box into suitable compartments, the vertically-movable lids B B, arranged horizontally across the open side, and the removable drawers or receptacles E E, located within the compartments and having their front ends shaped to correspond to the inclinations of the inclines *a a*, all substantially as described.

386,682. HITCHING-STRAP FASTENER. SILAS R. BAUSER, Cleveland, Ohio. Filed Oct. 24, 1887. Serial No. 253,226. (No model.)

Claim.—1. The combination, with a hitching-strap fastener consisting of an open frame or disk, substantially as described, having notches at diametrically opposite points on its periphery, of an endless strap or band for attaching the fastener to the harness, substantially as set forth.

2. The herein-described hitching-strap fastener, consisting, essentially, of a pair of frames or disks having notches therein and openings suitable for receiving the hitching-strap, and an elastic band seated in these notches for holding the jaws yieldingly together, substantially as set forth.



3. The combination, with holding frame or disk A, of rubber band B and rein C, substantially as set forth.

386,683. SEAL-LOCK. WILLIAM F. BRADLEY, Oxford, N. C. Filed Jan. 16, 1888. Serial No. 260,574. (Model.)

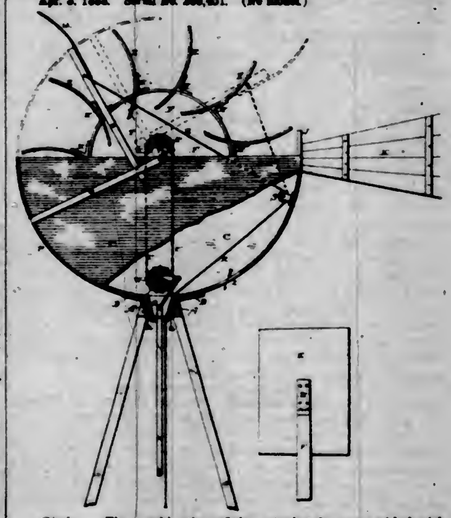
Claim.—1. In a seal-lock, the combination of the base-plate having a slotted staple and parallel interiorly-recessed castings, the cover securely fastened to the base, the sliding bolt having upper and lower ribs, and one or more dogs, all arranged for joint operations, as set forth.

2. In a seal-lock, the combination of a base-plate provided with

386,683.

parallel longitudinal castings, having internal recesses and slotted to communicate with the intervening passage, a dog or dogs pivoted within said castings and projecting into the intervening passage, and a sliding bolt having a notched rib that moves within said passage and is adapted to be engaged by the dog or dogs, substantially as described.

3. In a seal-lock, the combination of the plate B, having slotted staple E and parallel recessed castings H H, the cover C, and the bolt consisting of a flat plate, D, having an upper rib, D', slotted at *b*, and the lower rib, F, suitably notched, all arranged substantially as described.

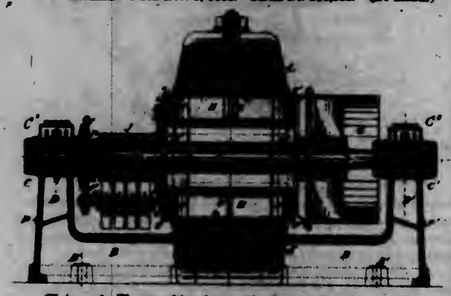


4. In a seal-lock, the combination, with the base B, having staple E, and recessed castings H H, of the spring-dogs located within said castings H H, the sliding bolt having the notched under rib and the slotted and broken upper rib, the cover C, and the seal G, substantially as described.

5. In a seal-lock, the sliding bolt consisting of a plate having a notched under rib and a slotted and broken upper rib, in combination with a lock-casing, a spring dog or dogs, and a seal, as G, substantially as described.

6. In a seal-lock, the combination of the base B, having the slotted staple E and the parallel longitudinal castings H H, recessed at H' and slotted at *h*, the dogs K, pivoted to the base within the recessed castings, having lateral projections *m*, and governed by springs *n*, a sliding bolt having a notched under rib adapted to engage the dog or dogs, and a slotted upper rib broken to receive a seal, substantially as shown and described.

7. In a seal-lock, the combination, with the base B, the parallel recessed castings H H on said base, having the projection *l*, and the spring-dogs, of a sliding bolt consisting of a flat plate having a notched under rib, and likewise a groove, *k*, which receives the projection *l*, and having also a slotted upper rib, substantially as described.

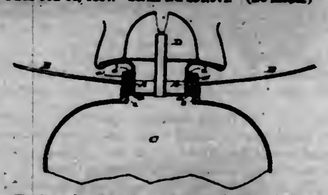


386,684. WINDMILL. ALFRED R. BOWEAR, La Due, Mo. Filed Apr. 3, 1888. Serial No. 269,451. (No model.)

Claim.—The combination of the swiveled frame provided with

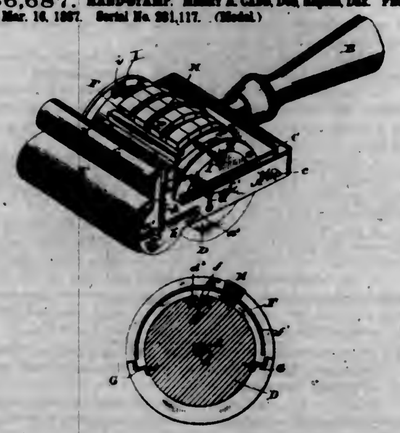
an extension at its rear end and having an opening through its bottom, with the wind-wheel, which is mounted upon the frame and is partially inclosed thereby, substantially as shown.

386,685. DYNAMO AND MOTOR. CHARLES E. L. BROWN, Zurich, assignor to the Werkzeug und Maschinenfabrik Oerlikon, Oerlikon, Switzerland. Filed Nov. 2, 1885. Serial No. 215,268. (No model.)



Claim.—1. The combination, with the brush-bridge E, comprising the two parts *c c'* and screws *d d'*, of the grooved bearing *n*, for said brush-bridge, and the insulated plate *e e'*, in the ends of which bear the spindles for the brush-holders and connectors for the current-conductors, substantially as set forth.

2. The herein-described armature, comprising the wheel N, the compressing-plates *g g'*, having ribs fitting grooves of said wheel, and the insulated rings *f*, held together by said wheel, substantially as set forth.



3. The combination, with the shaft F and the collector J, of the wheel N, the plates *g g'*, the insulated rings *f*, the horseshoe-shaped wires *k*, and the bands *i*, substantially as set forth.

386,686. LAMP-SHADE HOLDER. WILLIAM H. BROWN, San Francisco, Cal., assignor of one-half to Hothan, Dohrmann & Co., same place. Filed Oct. 10, 1887. Serial No. 251,971. (No model.)

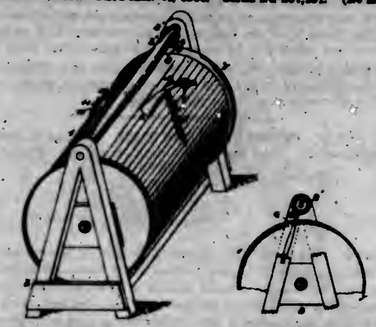
Claim.—The lamp-bowl having an internally-threaded socket and the burner having an externally-threaded base, in combination with the annular hub or ring *h*, having an externally-threaded base screwed into the internally-threaded socket of the lamp-bowl, and an internally-threaded top for receiving the externally-threaded base of the burner, the ring or hub *b*, fitted around the ring or hub *h*, and the arms B, carried by the ring or hub *b*, substantially as herein described.

386,687. HAND-STAMP. HENRY A. CADE, Dell Rapids, Dak. Filed Mar. 16, 1887. Serial No. 231,117. (Model.)

Claim.—1. In a hand-stamp, the combination of the following elements, viz: the roller D, having the type secured on its face, as described, and pivoted in the frame C by its spring-actuated journal, the outer frame, A, in which frame C is pivoted, and the inking-rollers K K', journaled in slots in the end of frame A, and having springs attached to their journals, substantially as described.

2. The roller D, having the bands E at each end and the curved metallic strips F secured to said roller, as described, and each of said strips having curved ribs *f'* on its sides, as set forth, with the type H, grooved on each side at *h*, and the set-screws I, substantially as and for the purposes set forth.

3. The combination of the curved strips F, having curved ribs *f'* on the side, and the type H, with the roller D, having bands E, and the metal flanges G, secured upon the surface of the roller and over the ends of the pieces or strips F, whereby the type are firmly secured in position upon the roller.



386,688. LOOM-PICKER. LEWIS A. CARVER, Saco, assignor to the Loom Picker Company, Biddeford, Me. Filed Jan. 4, 1888. Serial No. 259,782. (No model.)

Claim.—1. A loom-picker comprising a body or shank and a head, the shank being extended into the head and the head being provided with a head-cap and with folded fillings separate from the shank on opposite sides thereof, each filling comprising a plurality of layers integral one with another and folded one upon another, one layer extending along the shank of the picker beyond the rivets which secure the parts together, and another layer terminating inside said rivets.

2. A loom-picker comprising a body or shank and a head, the shank being extended into the head and the head comprising a looped head-piece and folded fillings separate from the shank on opposite sides thereof, each filling comprising integral layers folded one upon another, one layer extending along the shank beyond the rivets which secure the parts together and being integral with said looped head-piece, and another layer terminating inside said rivets, substantially as described.

386,689. OIL-CAN. WILLIAM H. CLARK and WILLIAM J. CLARK, Salem, Ohio. Filed Mar. 14, 1883. Serial No. 267,151. (No model.)

Claim.—1. The combination of A-frames S, having connecting-pieces at top and bottom, the top one of which, connecting the apexes of the A-frames, constitutes a bail or handle, and a revolving oil-can having trunnions journaled in the cross-pieces 2 of the A-frames, substantially as shown and described.

2. The combination of the A-frames S, connected together, the upper cross-piece, 3', constituting a bail or handle, the revolving oil-can 1, mounted in the cross-pieces 2 of the A-frames, the chine or flange 7 of the can, having a notch, 6, and a spring-catch, 8, terminating at one end in a loop, 8', which surrounds the bail, and the other end being fixed in one of the A-frames, the upper end of the spring bearing against the chine or flange of the can and adapted to enter the notch aforesaid, substantially as and for the purpose set forth.

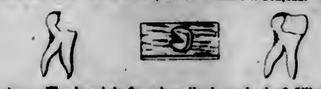
386,690. ART OF SPLICING CABLES. JOHN COLLINS, San Francisco, Cal. Filed Dec. 22, 1887. Serial No. 258,770. (No model.)

Brief.—The object of the invention is to make a simple and effective inlaid splice without having to permanently remove the soft core of the cable.

Claim.—1. In the art of splicing cables, the method of treating and disposing of the strand ends or tucks, which consists in wrapping a division of each of the opposing strand ends or tucks after said

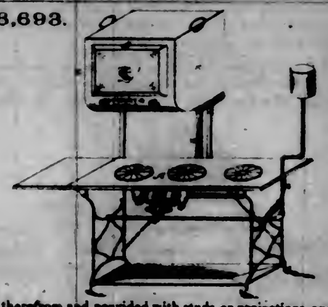
386,690.

divisions have been laid up to form the new strand occupying the vacant score, with the ends of a severed section of the soft core of the cable, cutting off even with the surface of the cable the other divisions of the strand ends or tucks, and then inlaying the wrapped divisions in the heart of the cable, whereby the ends of the core-section are returned to place and the tucked divisions disposed of, substantially as described.



2. In the art of splicing cables, the method of treating and disposing of the strand ends or tucks, which consists in dividing them back to their union with the cable, cutting off even with the surface of the cable one of the divisions of each tuck, laying up the remaining divisions so as to form a splice-strand occupying the vacant score of the cable, severing the soft core of the cable at points beyond each end of the newly-formed splice-strand, and taking out from the cable the ends of the severed section of the core back to each end of the splice-strand, wrapping the ends of the divisions of the splice-strand with said core, and, finally, inlaying the core ends and the divisions about which they are wrapped into the heart of the cable, substantially as described.

386,691. COFFIN-FASTENER. CHARLES A. COMLEY, Aurora, Minn. Filed Dec. 10, 1887. Serial No. 257,593. (No model.)



Claim.—A locking device for a coffin or box, consisting of a longitudinal recess in the top of the side of the coffin or box, a longitudinally-slotted plate secured over said recess and provided with a spring-catch extending part of the length of the slot in the plate and extending down into the recess, in combination with a pin secured to the under side of the lid of the coffin or box, and provided with notches or ratchet-teeth adapted to be engaged by the spring-catch when the lid is placed in position, and to be disengaged from said catch when moved longitudinally in the recess, all constructed, arranged, and operating substantially as shown and described.

386,692. PROCESS OF FILLING TEETH. WILLIAM A. DARBY, Milwaukee, Wis. Filed Feb. 3, 1888. Serial No. 262,982. (No model.)

Claim.—The hereinbefore-described method of filling decayed teeth, consisting in first filling the cavity of decay with a soft material, as wax, and restoring the original form of a tooth out of the same soft material, next taking an impression of this restored tooth in plaster-of-paris and casting a zinc die therefrom in shape like said tooth, then placing a piece of gold or other swageable metal plate on the side of the zinc tooth at a point corresponding to the location of the cavity in the natural tooth, and next placing a piece of soft metal—such as sheet-lead—over the last-named metallic plate and pounding it down onto the die, forming the gold or other plate into the shape of the tooth at that point, removing said plate and coating the inner side thereof with wax and pressing it against the natural tooth at the corresponding point, removing the surplus metal and wax and affixing a pin or pins to the said inside of said plate, next cleaning the cavity in the natural tooth of the first-named soft material and filling it with a suitable plastic material, like cement or gutta-percha, and pressing the pin or pins secured to the plate into said plastic material while the latter is still soft, and keeping the plate in position till said material hardens around said pin or pins.

386,693. VAPOR-STOVE. ESSELEN DAVIS, Cleveland, Ohio. Filed Mar. 3, 1887. Renewed Apr. 21, 1888. Serial No. 271,472. (No model.)

Claim.—1. The combination of a vapor-stove, standards or supports which rise therefrom and which have their upper ends formed into horizontal guides, from which extend studs or projections, and the horizontally-sliding oven placed on the guides and held in position by the studs or projections thereon, substantially as shown.

2. The combination of a vapor-stove, the standards or supports rising therefrom and provided with studs or projections, and the oven which is mounted upon the standards and provided with slots for the studs or projections to catch in, whereby the oven can be adjusted back and forth upon the standards, substantially as set forth.

3. The combination of a vapor-stove, the detachable standards connected thereto and provided with studs or projections upon their tops, and the oven provided with slots in its bottom for the studs or projections to catch in, and which oven is made adjustable back and forth upon the standards, substantially as specified.

386,694. LEMON-SQUEEZER. ALEXANDER ROSS, Butte City, Mont. Filed May 16, 1888. Serial No. 274,021. (Model.)

Claim.—1. The herein-described fruit-squeezer, composed of the bed and the two levers hinged to the ends of the bed, and provided with short arms which extend inward, the fruit being pressed between the bed and the said arms, substantially as set forth.

2. The herein-described fruit-squeezer, composed of the arch-shaped bed and the two levers having their ends expanded laterally, and curved or provided with short curved arms and hinged at the outer ends of the arms to the ends of the bed, whereby the fruit is adapted to be pressed between the bed and the said arms, substantially as specified.

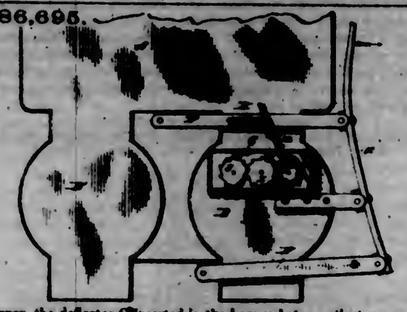
3. The combination, with the two levers, of the yielding bed having its ends connected with the outer ends of the levers, substantially as specified.

4. The combination, with the two levers, of the arch-shaped bed of spring material connected to the outer ends of the levers, substantially as described, for the purpose specified.

5. The combination, with the two levers and the bed, of the supporting-plate, substantially as and for the purpose described.

6. The combination, with the two levers and the bed, of the supporting-plate having slots near each end and the pins passing through the said slots and securing the plate to the levers, substantially as and for the purpose described.

7. The combination, with the bed, of the two levers having their ends expanded, and having the inner ends of the expanded portion hinged together, and having the outer ends hinged to the said bed, substantially as and for the purpose described.

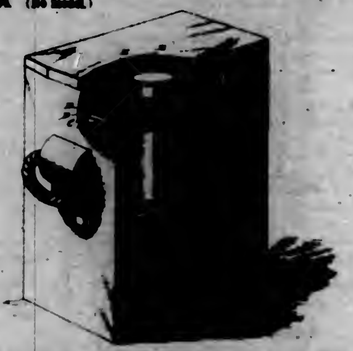


8. The combination, with the levers and the re-enforcing plates secured to the ends of the levers and hinged together, of the bed connected to the outer ends of the levers, substantially as described.

9. The herein-described fruit-squeezer, composed of two levers hinged together at their inner ends and having inward extensions to form stops and jaws, the bed hinged at its ends to the outer ends of the levers and the supporting-plate, substantially as specified.

386,695. GRAIN MEASURING AND REGISTERING DEVICE. FREDERIK H. EHLERS, Montevideo, Minn. Filed Apr. 4, 1888. Serial No. 269,880. (No model.)

Claim.—1. In a grain-measurer, the combination of the hopper, the two depending measuring-chambers communicating with the said

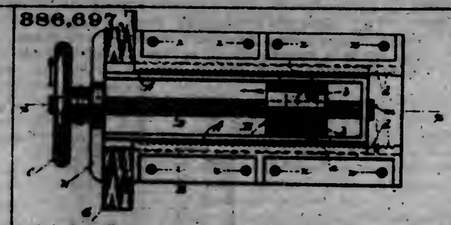


386,695.

hopper, the deflector C, inserted in the hopper between the two measuring-chamber openings, the reciprocating slides D D', for opening and closing the inlet and exit openings of the said measuring-chambers, the vibrating hand-lever, and the links connecting this hand-lever to the reciprocating slides D D', whereby these slides are operated with one movement of the lever simultaneously in opposite directions to alternately open and close the inlet and exit openings of the said measuring-chambers, substantially as described.

2. In a grain measurer and register, the combination, with the hopper and depending measuring-chambers, the slides for opening and closing the inlet and exit openings of these chambers, the vibrating hand-lever, and the links F, connecting the hand-lever to the said slides, of the pivoted vibrating lever L, engaging with one of the links F, the toothed registering-wheels engaging with each other, the springs for retaining these registering-wheels, the spring-actuated pawl M, for actuating the registering-wheels pivoted to the lever L near its lower end, the supplemental toothed wheel H', provided with a pin, R, projecting from its face, the stop S, for limiting the travel of this pin R, this pin being adapted to be struck by the lower end of the lever L in its movements, and the spring P, secured to the first registering-wheel and adapted to engage the notched periphery of the said supplemental wheel H', all arranged as and for the purpose herein set forth.

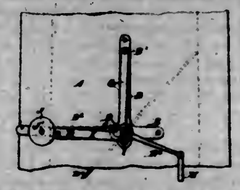
386,696. COMPOSITE TRANSOM FOR AMMUNITION-BOXES. HOWARD P. BOWELL, Washington, D. C., assignor to the Hotchkiss Ordnance Company, (Limited,) of England. Filed Apr. 21, 1888. Serial No. 271,694. (No model.)



Claim.—1. The composite transom consisting of two rigid sections and an interposed section of flexible material, and having the concentric apertures, and the projecting rim of the flexible material for the purpose of forming a packing, substantially as described.

2. The combination, with a cartridge-box, of a composite transom having two external rigid sections, an interposed section of flexible material and concentric apertures, and the projecting rim of the flexible material for the purpose of forming a packing for the cartridges, substantially as and for the purpose set forth.

386,697. VISE. FREDERICK R. FARWELL, Fitchburg, Mass. Filed Apr. 9, 1888. Serial No. 270,131. (No model.)

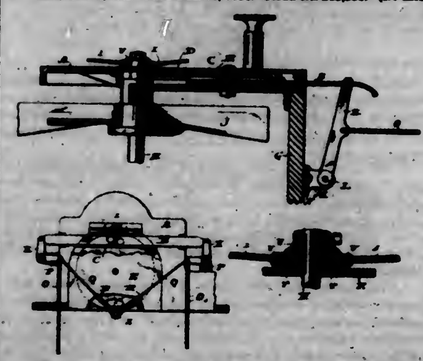


Claim.—In a vise, the combination of the movable body A, provided with the jaw H and having the lateral openings g, provided with the beveled edges r, the rod D, journaled longitudinally in said body and provided with the wheel C, the threaded nut E, disposed on said rod and provided with the chamber v, the pawls a, pivoted to said nut in said chamber and adapted to project through the openings g, the spring f, secured in said chamber in engagement with said pawls,

386,697.

and the body B, provided with the fixed jaw J, and having the ways A, provided with teeth d, with which the pawls engage, all being constructed, combined, and arranged to operate substantially as specified.

386,698. ANTI-FRICTION BEARING. THOMAS F. FLEMING, Brooklyn, N. Y. Filed Oct. 11, 1888. Serial No. 287,594. (No model.)

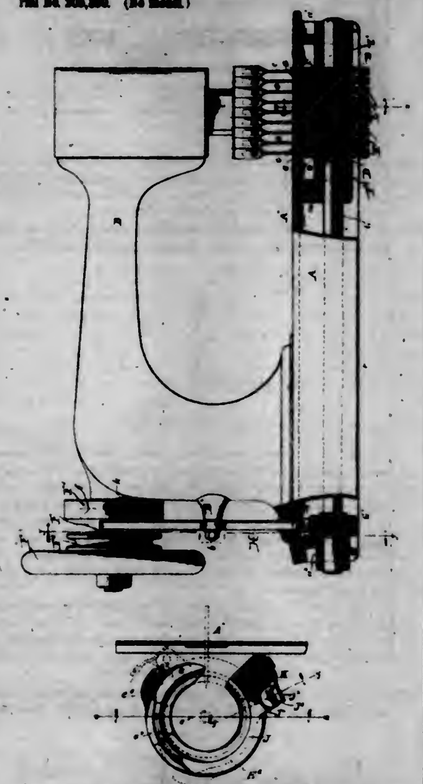


Claim.—1. In combination with a rocking shaft, D, the suspending-links G, having transverse slots g, and pivoted supports E', arranged to serve in supporting the weight of the damper and allowing it to turn with slight resistance by the shifting of the link, as herein specified.

2. The two sets of transversely-slotted links G and I, mounted in angular positions relatively to each other, in combination with supporting-pivots E' E² and with the rocking shaft D, arranged for joint operation in supporting the latter against displacement in any direction, as herein specified.

3. The racks G' in the transversely-slotted links G, in combination with the pivot E', rocking shaft D, and lever D², and rod M, for turning the latter, and with the pinion D', engaging said racks and insuring the correct position of the links relatively to the shaft, as herein specified.

386,699. SEED-SOWER. SEWERS FREEMAN and MORGAN FREEMAN, Benton, Wis. Filed Feb. 24, 1888. Serial No. 265,553. (No model.)



Claim.—1. In a sower, the combination of the sliding gage-plates, levers connected to said gage-plates, springs arranged to draw upon the levers, and pull-rods united at their rear ends to said levers, substantially as set forth.

2. In a sower, the combination of the distributer-shaft, a cap-piece arranged on the shaft, and stirring-pins secured to the cap-piece, substantially as set forth.

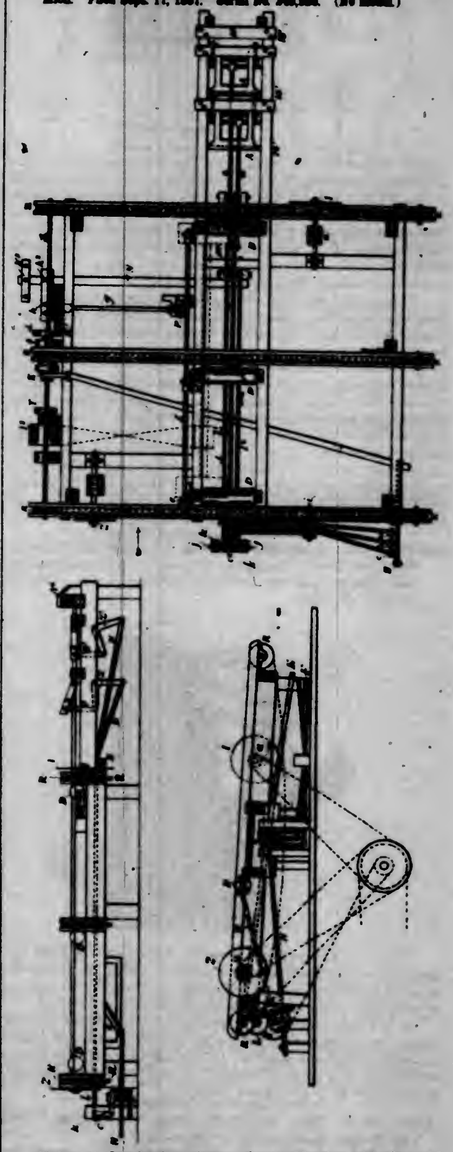
3. In a sower, the combination of the distributer-shaft, a cap-piece arranged on the shaft, stirring-pins secured to the cap-piece, and a lubricating substance confined between said shaft and cap-piece, substantially as set forth.

4. In a sower, the combination of the distributer-shaft, the top plate provided with a flange that surrounds the shaft, a cap-piece arranged on said shaft to cover the top-plate flange, stirring-pins secured to the cap-piece, and a lubricating substance inclosed by said flange and cap-piece, substantially as set forth.

386,700. GANG SEWING-MACHINE. MARSHALL GARDNER, Aurora, Ill., assignor to James Stone and Thomas H. Ball, both of same place, and Simon Fleischaker, Chicago, Ill. Filed June 22, 1886. Serial No. 205,880. (No model.)

Claim.—1. The combination, with a series of reciprocating needles, of a series of bobbins, a series of hooked bobbin-carriers rigidly connected with each other and constructed to oscillate about a common axis, and means giving an oscillatory motion to said bobbin-carriers, substantially as described.

2. The combination, with a series of reciprocating needles and a series of bobbins, of a series of oscillating hooked bobbin-carriers rigidly connected with each other and turning about a common axis, said several bobbin-carriers being provided with lateral openings for the bobbins, admitting the latter edgewise into the carriers, and holding devices for retaining the bobbins within the carriers, substantially as described.



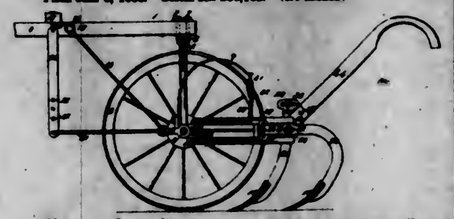
3. The combination, with a series of reciprocating needles and a series of bobbins, of a series of rigidly-connected hooked bobbin-carriers having lateral openings or spaces adapted for the insertion of the bobbins edgewise into the carriers, and provided with movable parts or gates closing said openings and holding the bobbins in place, substantially as described.

4. The combination, with a reciprocating needle and a bobbin, of an oscillating hooked bobbin-carrier having a lateral space or opening adapted for the insertion of the bobbin edgewise into the carrier, and provided with a movable section or gate pivoted to the carrier with its pivotal axis parallel with that of the bobbin, and a means for securing the gate when the latter is closed, substantially as described.

5. The combination, with a reciprocating needle and a bobbin, of a hooked bobbin-carrier having a lateral space or opening adapted for the insertion of the bobbin edgewise into the carrier, and provided with a movable section or gate pivoted to the carrier, with its pivotal axis parallel with the axis of the carrier, and a spring applied to hold the gate in its closed position, substantially as described.

6. The combination, with a reciprocating needle and a bobbin, of a hooked bobbin-carrier having a lateral space or opening adapted for the insertion of the bobbin edgewise into the carrier, and provided with a movable section or gate pivoted to the carrier with its pivotal axis parallel with the axis of the carrier, said gate being provided with a projection or tongue, *j*, engaging a notch or recess in the carrier, and means for holding the gate in its closed position, substantially as described.

386,701. LUMBER-TRIMMER. NEHEMIAH GARLAND, Bay City, Mich. Filed Sept. 17, 1887. Serial No. 249,886. (No model.)

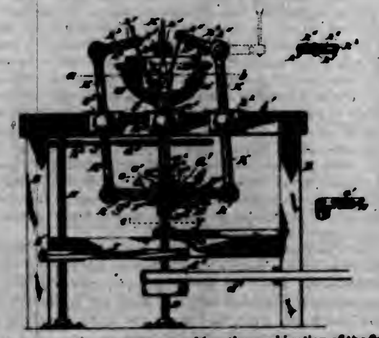


Claim.—1. In a lumber-trimmer, the combination, with the usual carrier device or mechanism for conveying the board sidewise to the trimming-saws, and with the usual stop or stops for gaging or predetermining the length of the trimmed board, of suitable feed-rolls, D, operating, as specified, to feed the board endwise toward and against the stop device, all substantially in the manner hereinbefore set forth.

2. In a lumber-trimmer, the combination, with the feed-rolls D, which operate to feed the board endwise, as specified, the usual carrier device or mechanism for feeding the board sidewise to the trimming-saws, the usual stop or stops for gaging or predetermining the length of the trimmed board, and the driving mechanism for rotating the feed-rolls D, of a shipper-bar for throwing said driving mechanism into and out of gear, and having its free end located or arranged within easy reach of one of the operatives who has to stand at the front of the machine to feed the lumber to the carrier device, the whole constructed and operating together substantially as and for the purposes set forth.

3. In a lumber-trimmer, the combination, with the series of stops and the feed-rolls D, which operate, as specified, to feed the board endwise toward and against the said stops, of mechanism, substantially such as described, which operates to throw the said feed-rolls and also the said stops into and out of operation at the pleasure of one of the operatives of the machine, all substantially in the manner hereinbefore set forth.

386,702. CULTIVATOR. HENRY H. GOSNEY, Jonesburg, Mo. Filed Jan. 9, 1888. Serial No. 260,105. (No model.)



Claim.—1. In a cultivator, the combination of the upwardly and laterally swinging shovel-bearing frames S, consisting of four angle-bars, 23, journal-clips 11, loosely embracing the main axle of the cultivator and having rearwardly-projecting flanges, pivot-bolts 24, connecting the front ends of the angle-bars to said flanges, cross-tree-standard beams 27, pivot-bolts 26, connecting the rear ends of the angle-bars to said cross-trees, the eccentrically-placed slotted yokes 28, and diverse-shaped standards arranged to carry the shovels out of cross-line with each other, substantially as set forth.

2. In a cultivator, the combination of the journal-clips, the compound pivoted frame carried thereby and providing upward adjustment therefor, said frame having fixed pivoted angle-bars, the cross-tree-standard bearer to which their rear ends are pivoted, the eccentrically-placed slotted yokes, the screw-bolts 45, adapted in conjunction with the said yokes to set the adjustment of the diverse-shaped standards 30, the arched axle 2, the braces 5, that connect the tongue to the arch of the axle, and the braces 14, that connect said tongue to the lower sections of the axles, substantially as set forth.

3. In a cultivator, the combination of the upwardly and laterally adjustable shovel-bearing frames constructed with longitudinal angle-bars, the journal-clips to which the latter are pivoted at their front ends, said journal-clips having bearing on the axle, and the cross-tree-standard bearer carrying the rear ends of the angle-bars, the horizontally and vertically presented slotted yokes secured to said cross-trees, and the standards that carry the shovels, one of which on each frame is vertically pendent from the vertical yoke, and the other is carried back at first horizontally from said yoke to carry its shovel out of lateral cross-line with the other shovel, substantially as set forth.

386,703. TRITURATING-MACHINE. GEORGE GILL, Philadelphia, Pa. Filed Oct. 28, 1887. Serial No. 253,269. (No model.)

Claim.—1. In a triturating-machine, the combination of the frame, the mortar supported thereby, the shaft, as D, the cam adjustably connected therewith, the collar or block G, through which said cam passes, and the pestle-supporting arm or arms pivotally connected with said collar or block, together with means—such as the crank-arm, bolt, and nut—for adjustably connecting said cam with shaft D, substantially as described.

2. In a triturating-machine, the combination of the supporting-frame, the mortar, the shaft D, the slotted crank-arm thereon, the cam on said crank-arm, the collar or block through which said cam passes, the arms *k'*, pivoted to said block or collar, the pivoted arms or levers K, the arms *k*², pivoted to the latter, and the pestles secured in said arms *k*², together with the belt passing through said cam and crank-arm, and the rest, substantially as described.

3. The combination, in a triturating-machine, of the frame or table, the shaft *c*², pivoted thereto, the mortar supported by said shaft, the shaft D, the crank-arm thereon, the cam on said crank-arm, the collar or block G, in which said cam works, the pestle-supporting arm or arms pivotally connected with said collar or block, the laterally-adjustable disk C, which forms a step for the lower end of the shaft *c*², and means—such as the bolt G' and nut *g*²—for laterally adjusting said disk, substantially as described.

4. The combination, in a triturating-machine, of the frame or table, the mortar, the shaft supporting said mortar, provided with the pulley *c*², the shaft D, its pulley *d*¹, the crank-arm, the cam secured thereon, the block or collar G, the pestle-supporting arms pivotally connected with said collar, the shaft H, its pulleys *h*² *h*², and the belts I and J, connecting said pulleys *d*¹ and *h'* and *h*² and *c*², respectively, substantially as described.

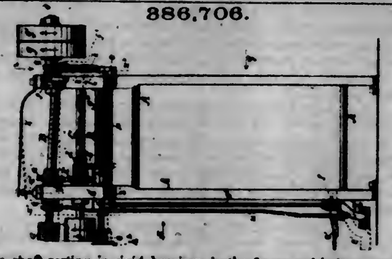
5. In a triturating-machine, the combination of the frame or table, the mortar, the shaft *c*², pivoted in said frame or table and supporting said mortar, said shaft provided with the pulley *c*², the shaft D, its pulley *d*¹, the crank-arm on said shaft D, the cam on said crank-arm, the collar or block G, in which said cam works, the pestle-supporting arm or arms pivotally connected with said collar or block, the laterally-adjustable disk C, which forms a step for the lower end of the shaft *c*², means—such as the bolt G' and nut *g*²—for laterally adjusting said disk, the shaft H, its pulleys *h*² *h*², and the belts I and J, connecting said pulleys *d*¹ and *h'* and *h*² and *c*², respectively, substantially as described.

6. In a triturating-machine, the combination of the supporting-frame, the mortar, the pestles, the pivoted pestle-supporting arms, and the mechanism for actuating the same, the free ends of said arms being formed in two parts and provided with interlocking grooves or dovetails, substantially as described.

386,704. MANUFACTURE OF ALUMINIUM FLUORIDE. LUDWIG GRABAU, Hanover, Prussia, Germany. Filed June 20, 1887. Serial No. 242,722. (Specimens.) Patented in Belgium June 11, 1887, No. 77,730; in France June 11, 1887, No. 178,810; in England Oct. 21, 1887, No. 14,206, and in Austria-Hungary Dec. 2, 1887, No. 42,660 and No. 32,116.

Claim.—The process of producing aluminium fluoride which consists in treating a solution of aluminium sulphate such as described with sodium or potassium cryolite, evaporating the solution, heating the product to redness, and finally washing the same, substantially as described.

386,705. FISHING-REEL. WILLIAM A. GRAHAM, Carlisle, Pa. Filed May 10, 1888. Serial No. 273,420. (No model.)



Claim.—1. The combination, with the cylindrical casing A, having one of its ends open and provided with a central tubular spindle, *a*, of a reel, B, journaled on the said spindle *a*, and completely filling the open end of the cylindrical casing, and the disks C C, provided, respectively, with a central screw-threaded shank, *i*, and a central screw, *i'*, all arranged substantially as herein set forth.

2. The combination, with the cylindrical casing A, having one of its ends open and provided with a central tubular spindle, *a*, of a reel, B, journaled on the said spindle *a*, and completely filling the open end of the cylindrical casing, and the disks C C, provided, respectively, with a central screw-threaded shank, *i*, a central screw, *i'*, the interposed anti-friction rollers *g*, and the spring-actuated click-pin D, inserted in a recess in the hub of the reel and engaging the inner serrated face of the said disk C, substantially as described.

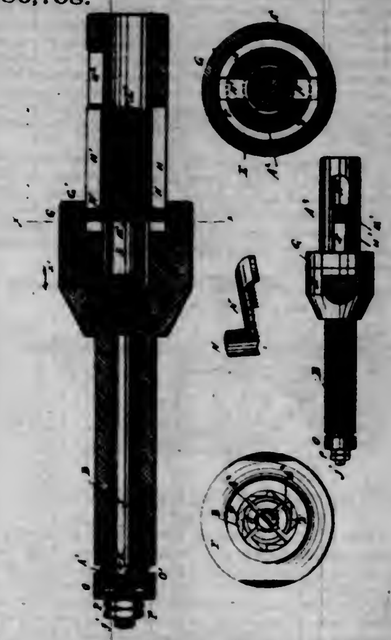
386,706. HEMMING-MACHINE. ANDREW J. HAMM, Rochester, N. Y. Filed Aug. 17, 1887. Serial No. 247,268. (No model.)

Claim.—1. In combination with the frame of a neckband-trimmer, three parallel rotatory shafts, each carrying a roller at its end, the

386,706.

middle shaft resting in rigid bearings in the frame and having rotatory motion in either direction, the outer shafts resting in movable bearings in the frame, each having a rotatory motion in one direction and opposite to each other, said outer shafts being also held to swing toward or from said middle shaft, said outer shafts being each provided with a rigid gear, and said middle shaft having two gears to alternately engage said respective gears of the outer shafts.

2. In combination with the frame of a neck-band-ironer, a roller-shaft provided with a gear outside the frame, a stud rigid with the frame, an arm turning on said stud, a reversing-shaft provided with a rigid arm, a link-bar joining said arms, a driving-pinion on said stud, a gear held by said arm first mentioned, and a second gear held by said link-bar, said pinion and gears all being in the same plane, with means, substantially as shown and described, to turn said reversing-shaft, for the purpose set forth.



3. In combination with the frame of a neck-band-ironing machine, a main roller-shaft provided with a gear within and a gear without said frame, a secondary roller-shaft provided with a gear to co-operate with said gear within the frame of said main roller-shaft, a reversing-shaft provided with an arm and a reverse-lever, a rigid stud holding an arm and driving-pinion, a link-bar joining said arms, intermediate alternate gears for said driving-pinion and said outer gear of said main shaft, a treadle, and a treadle-rod connected with said secondary shaft and said reverse-lever, to operate both, substantially as shown and described.

386,707. SINGLETREE. WILLIAM S. HARRIS, Bardwell, Ky. Filed Apr. 19, 1888. Serial No. 271,102. (No model.)

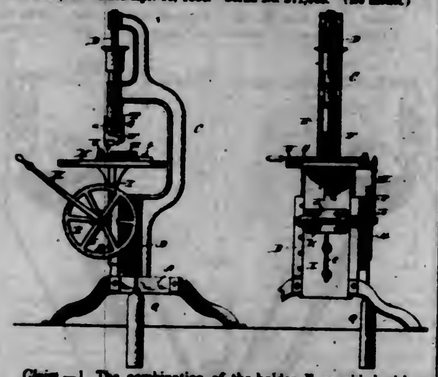
Claim.—A single or double tree formed of two wires connected together, as described, one of said wires bent to form hooks at its extremities, and at or near its center bent to form a looped brace, substantially as and for the purpose set forth.

386,708. REAMER. JULIUS JEFFEL, Elizabeth, N. J. Filed May 28, 1888. Serial No. 274,668. (No model.)

Claim.—1. In an adjustable reamer, the combination, with the tubular stock A, having longitudinal slots throughout a part of its length, the exterior bevel, A', and the interior bevel, W, at said slotted end, the exterior beveled shoulder, C, and the interior beveled shoulder, U, near the inner ends of the slots, the screw-thread D, adjacent to the shoulder C, and the slots H H', of a spindle in the bore of the stock, which spindle is provided at one end with a bevel, K, and with a bevel, M, adjacent to the interior beveled shoulder, U, of the stock, the beveled sleeve E, screwed on the thread D, and angle-clips N in the slots H H' of the stock, which clips are connected with the spindle, the ring G on the sleeve E, and holding said clips against the sleeve, and the cap O, secured on the end of the spindle and having an interiorly-beveled flange, substantially as herein shown and described.

2. In an adjustable reamer, the combination, with the tubular stock A, having longitudinal slots throughout a part of its length, the exterior bevel, A', and the interior bevel, W, at said slotted end, the exterior beveled shoulder, C, and the interior beveled shoulder, U, near the inner ends of the slots, the screw-thread D, adjacent to the shoulder C, and the slots H H', of a spindle in the bore of the stock, which spindle is provided at one end with a bevel, K, and with a bevel, M, adjacent to the interior beveled shoulder, U, of the stock, the beveled sleeve E, screwed on the thread D, and angle-clips N in the slots H H' of the stock, which clips are connected with the spindle, the ring G on the sleeve E, and holding said clips against the sleeve, and the cap O, secured on the end of the spindle and having an interiorly-beveled flange, substantially as herein shown and described.

3. In an adjustable reamer, the combination, with a tubular stock, A, having longitudinal slots throughout part of its length, the exterior bevel, A', and the interior bevel, W, at the slotted end, the beveled exterior shoulder, C, the interior beveled shoulder, U, near the inner ends of the slots, and the exterior screw-thread, D, adjacent to the exterior beveled shoulder, C, of a spindle in the bore of the stock, which spindle is provided with the bevel K at the end, the bevel M, adjacent to the interior beveled shoulder, U, of the stock, the screw-thread M' on the inner end of the stock, the beveled sleeve E, screwed on the screw-thread D, the angle-clips N in longitudinal slots of the stock, which clips have one shank concaved transversely and provided with a screw-thread, a flange-ring for holding the legs of said clips against the sleeve on the stock, and the cap O, held on the outer end of the spindle and having an interiorly-beveled flange, substantially as herein shown and described.



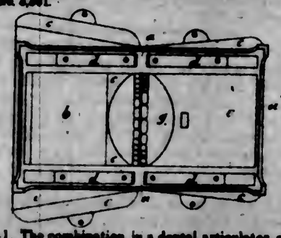
4. In an adjustable reamer, the combination, with a longitudinally-slotted tubular stock, A, having interior and exterior bevels, of a spindle having bevels, the beveled sleeve E, screwed on the stock, the angle-clips N, connected with said sleeve and the spindle, and a beveled cap on the end of said spindle and at the end of the stock, substantially as herein shown and described.

386,709. PRODUCTION OF COLORING SUBSTANCES BY THE REACTION OF AROMATIC HYDRAZIN SULPHONIC ACIDS ON KETONES. WILHELM KELLER, Gallenkirch, Baden, Germany, assignor to the Actien-Gesellschaft für Chemische Industrie, Rheinau, near Mannheim, Germany. Filed Apr. 5, 1888. Serial No. 269,797. (No specimens.)

Claim.—1. The process of manufacturing coloring substances by condensing aromatic hydrazin sulphonic acid with ketonchlorce.

2. The red coloring-matter produced by the condensation of an aromatic hydrazin sulphonic acid with ketonchlorce, and having the characteristics above described.

386,710. CARVING-MACHINE. STEPHEN Y. KYTTLE, Wilkes-Barre, Pa. Filed Apr. 18, 1888. Serial No. 271,003. (No model.)



Claim.—1. The combination of the holder E, provided with an extension, E', the cutter F, provided with the vertical side extensions, *c c*, and the vertical slot *b*, the block or section G, and the securing-bolt *a*, passing through the said block G and slot *b* and into the extension E', the extensions *c c* extending up on opposite sides of the holder E and serving to prevent lateral vibration of the cutter, substantially as described.

2. The combination, with the standard B, provided with vertical ways or grooves and a stationary rack, M, of the table-standard and table, the former having bolted to its face a bearing, J, the horizontal shaft K, journaled in said bearing and provided with a pinion which engages with the said rack M, an operating-lever, and counterbalancing-weight and pulley, substantially as described.

3. The combination, with the standard and the transverse rod R, secured upon the standard, of the vertically-movable table-standard provided with a vertical groove, and the bolts S S, secured adjustably in the said groove and adapted to alternately contact with the said rod R, substantially as described.

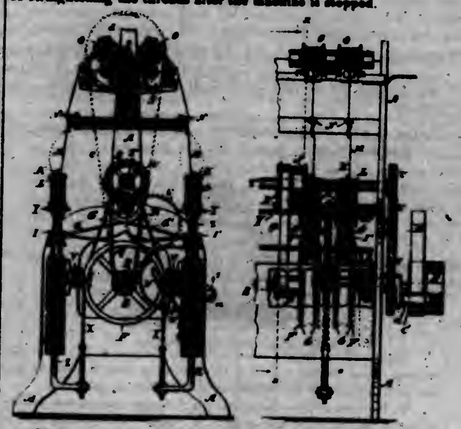
4. The combination, with the table, of the adjustable abutting-plate provided with a V-shaped notch in its front side, the bearing-faces of the said notch being provided with beveled legs A, the adjustable plate V, secured to the table, and the lever pivoted to this plate, substantially as specified.

386,711. DENTAL ARTICULATOR. JOHN I. P. LEMAR, Surbiton, County of Surrey, assignor to FRANCIS LYNCH, Middlesex, England. Filed Apr. 3, 1888. Serial No. 269,492. (Model.) Patented in England Mar. 8, 1888, No. 3,901.

Claim.—1. The combination, in a dental articulator, of a supporting-base, horizontally-sliding frames movable thereupon to and from each other, and a plate movable on the base beneath the frames, substantially as described.

2. The combination, in a dental articulator, of a supporting-base, horizontally-sliding frames movable thereupon, and each having a recessed edge and locking-buttons for holding the plaster, and an adjustable plate located on the base beneath the frames, substantially as described.

386,712. SCOW. FREDERICK A. LOCKWOOD, Boston, Mass. Filed Apr. 20, 1888. Serial No. 272,042. (No model.)



Claim.—1. The combination, with a scow or vessel having a hopper, of a discharge-pipe connected to said hopper and a rotating screw located in said discharge-pipe, substantially as described.

2. The combination, with a scow or vessel having a hopper, of a discharge-pipe connected to the said hopper, a rotating screw located in said discharge-pipe to force the material from the hopper through said discharge-pipe, an engine to drive said screw, and a boiler carried by the scow or vessel, substantially as described.

3. The combination, with a scow or vessel having a hopper, of a discharge-pipe connected to the said hopper, a rotating screw located in said discharge-pipe to force the material from the hopper through said discharge-pipe, an engine to drive said screw, a boiler, and a pump, all carried by the scow or vessel, substantially as described.

386,713. SILK-SPINNING MACHINE. THOMAS MEYER, Paterson, N. J. Filed Sept. 3, 1887. Serial No. 248,128. (No model.)

Brief.—The object of the invention is to prevent kinks in the thread by moving the unwinding-bobbins toward the winding-spools just before the machine is stopped, and then moving them away, and so straightening the threads after the machine is stopped.

Claim.—1. The combination, with the drawing mechanism or rollers O and the spindle K, adapted to receive a bobbin, of the driving-shaft B, having a fast pulley, P, the transmitting-shaft T, having a loose pulley, R, and fast pulley S, the belt Q, the shaft V, having a handle *a*, the gears U, chain X, arm Z, and rail Y, whereby the bobbin is moved toward and from the drawing mechanism, substantially as described.

2. The combination, with the drawing mechanism or rollers O and the spindle K, adapted to receive a bobbin, of the guide N, the movable rail Y, the arm Z, shaft V, connected to the arm Z, and means for imparting motion to said shaft to actuate said rail, substantially as described.

3. The combination, with the drawing mechanism or rollers O, the spindle K, adapted to receive a bobbin, and the rail Y, having arm Z, of the shaft V, having handle *a* and notches *b*, the chain X, for connecting the arm Z and shaft V, and the detent W, substantially as described.

4. The combination of the drawing mechanism or rollers O, the movable rail Y, having arm Z, the spindle K, adapted to receive a bobbin, the shaft B, the transmitting-shaft T, the shaft V, having handle *a*, the chain X, connecting the shaft V and arm Z, and mechanism for actuating the drawing-rollers, spindles, and transmitting-shaft from the shaft B, and for actuating the shaft V from the transmitting-shaft, substantially as described.

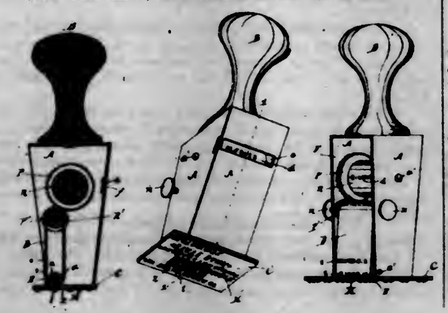
386,714. STAY FOR GARMENTS. BERNARD MOSENTHAL, New York, N. Y. Filed Oct. 28, 1886. Serial No. 217,622. (No model.)

Claim.—A garment-stay consisting of a paper-covered steel and metallic end caps entirely incased by a strip of textile material, both

386,714.

the paper and the tertile margins at the sides of the stay having internal cores, and each margin longitudinally grooved between its core and the edge of the steel, substantially as and for the purpose described.

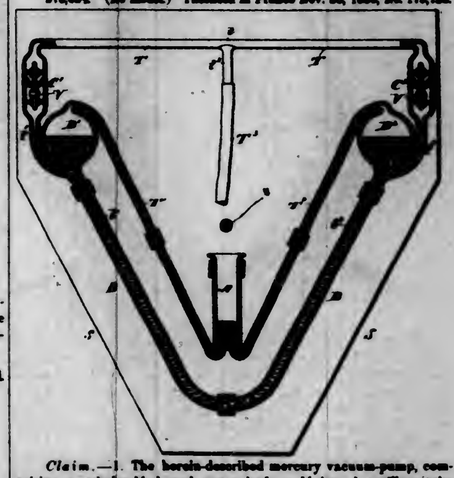
386,715. SIGNAL-LANTERN. A. HENRY MULLINS, Chicago, Ill. Filed Oct. 24, 1887. Serial No. 253,182. (No model.)



Claim.—1. In combination, a lantern oil-pot, A, having a permanent closed bottom, *m*, and a strengthening-plate, D, secured over the under surface of the bottom *m*, substantially as described.

2. In combination, a lantern oil-pot, A, having a permanent bottom, *m*, and a base-flange, *r*, and a plate, D, fitting within and secured to the base-flange, and extending to or substantially to the junction of the base-flange with the oil-pot, substantially as described.

3. In combination, a lantern oil-pot, A, having a permanent bottom, *m*, and a base-flange, *r*, and a plate, D, hollowed out on its under side, producing a peripheral flange which conforms to and fits within the base-flange *r*, and provided with perforated lugs at intervals, where the rivets are inserted to secure it to the base-flange, and with slots *s* to admit the springs E, substantially as described.



386,716. HAND-STAMP. HENRY H. NORRINGTON, West Bay City, Mich. Filed Jan. 17, 1887. Serial No. 224,644. (No model.)

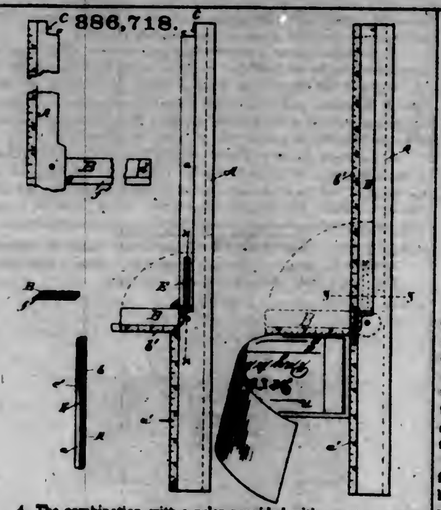
Claim.—1. A hand-stamp having two rollers with a band passing around said rollers, said band having on its outer face printing-characters, in combination with an auxiliary roller geared to one of the former rollers, having on its periphery duplicate characters of those on the band, and a thumb-wheel for revolving said characters, as and for the purposes specified.

2. In combination with the case having the handle, the opening *c*, and base with opening *x*, the rollers B E', the pintons attached to said rollers, the roller E, the band having printing-characters mounted thereon, and a series of duplicate characters, *d*, mounted on the roller E, and the thumb-wheel for revolving said characters, as and for the purpose set forth.

386,717. OSCILLATING PUMP. LOUIS J. P. POITALLIÉ, St. Malo, France. Filed June 20, 1887. Renewed June 23, 1888. Serial No. 278,094. (No model.) Patented in France Nov. 30, 1886, No. 179,736.

Claim.—1. The herein-described mercury vacuum-pump, comprising a tubular V-shaped pump-body, a V-shaped capillary tube formed by two tubes, an exhaust-chamber to which the lower end of said tubes is connected and which chamber contains a sealing medium to seal the said tube ends, and an air-chamber interposed between the upper end of said tubes and the ends of the legs of the V-shaped pump-body, said legs and tubes being connected to the bottom and top of the air-chambers, respectively, in combination with a suction-tube connected with the air-chambers at the base thereof, substantially as and for the purpose specified.

2. The herein-described mercury vacuum-pump, comprising a tubular V-shaped pump-body, a V-shaped capillary tube formed by two tubes, an exhaust-chamber to which the lower end of said tubes is connected and which chamber contains a sealing medium to seal the said tube ends, and an air-chamber interposed between the upper end of said tubes and the ends of the legs of the V-shaped pump-body, said legs and tubes being connected to the bottom and top of the air-chambers, respectively, in combination with a suction-tube connected with the air-chambers at the base thereof, and a valve interposed in the suction-tube in proximity to the air-chambers, substantially as and for the purpose specified.



386,718. COMBINED DESK-RULER AND CHECK-CUTTER. HENRY B. READDY, Norfolk, Va., assignor of one-half to W. H. H. STEVENS, same place. Filed May 1, 1888. Serial No. 272,494. (No model.)

Claim.—1. The combination, with a ruler, of an arm one end of which is pivoted to the ruler between its ends to allow the free end of the arm to swing laterally, said arm being adapted to fold upon the ruler with its bottom surface flush with the bottom surface of the ruler, as set forth.

2. The combination, with a ruler provided with a seat or recess, of an arm pivoted at one end to the ruler at the inner end of said seat, whereby the free end of the arm can be swung outwardly, for the purpose set forth, or can be folded into said seat with its surface flush with the surface of the ruler, substantially as described.

3. The combination, with a ruler provided with a seat, and a ruling or cutting edge extending from said seat to one end of the ruler, of an arm pivoted to the ruler and adapted to swing to and away from said seat, and provided with a ruling or cutting edge adapted to form a continuation of said edge of the ruler in the same plane or at an angle to the plane of said edge, as set forth.

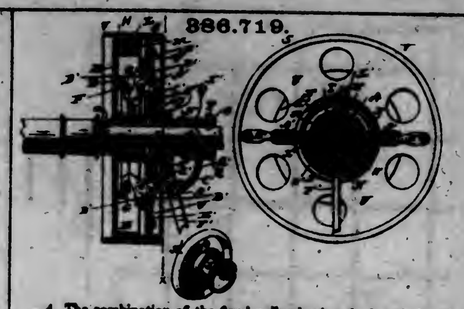
386,718.

4. The combination, with a ruler provided with a seat or recess, and a ruling or cutting edge extending from said seat to one end of the ruler, of an arm pivoted at one end to the ruler and provided upon its outer side with a ruling or cutting edge to lie flush with the paper or other surface and adapted to form a continuation of said edge of the ruler whether in the same plane or at an angle, said arm being adapted to fold into said seat or swing laterally, substantially as set forth.

5. The combination, with a ruler provided with a seat or recess in its upper face, and a ruling or cutting edge extending from said recess to one end of the ruler, of an arm pivoted at one end to the ruler at the inner end of said seat, whereby its free end can swing to and away from said seat, said arm being provided with a ruling or cutting edge forming a continuation of said edge of the ruler, and a spring-catch located in said seat and adapted to removably hold the arm extended at right angles to the ruler, substantially as described.

6. The combination, with a ruler provided with a seat or recess in its upper face, and a ruling or cutting edge extending from said seat to one end of the ruler, and a pin or lug extending laterally from the outer end of said seat, of an arm pivoted at one end to the ruler at the inner end of said seat, to allow its free end to swing laterally to and away from said seat, said arm being provided with a downwardly-extending edge to form a continuation of said edge of the ruler, and with a block or piece at its outer end to receive said pin or lug when the arm is folded in its seat, and a spring-catch to removably hold the arm in its position at right angles to the ruler, substantially as described.

386,719. FRICTION-PULLEY. BELA W. BENDY, Wheat, Pa. Filed Nov. 21, 1887. Serial No. 255,773. (No model.)

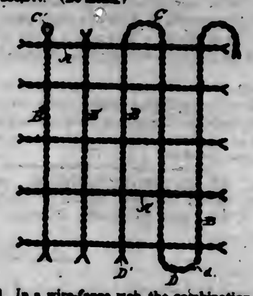


Claim.—1. The combination, with the fixed pulley having the beveled rim formed with the openings, of the spring-actuated friction-blocks and the movable belt-wheel formed with the beveled rim.

2. The combination of the fixed pulley having the beveled rim formed with the openings, the pairs of springs formed with the longitudinal slots in their bent ends, the wooden friction-blocks, and the movable pulley formed with the beveled rim, substantially as set forth.

3. In a friction-pulley, the combination of a fixed pulley having a projecting rim beveled on its outer side and formed with several openings, a movable pulley having a projecting rim beveled on its inner side, and friction-blocks having their ends pressed by springs out through the said rim-openings of the fixed wheel or pulley.

386,719.



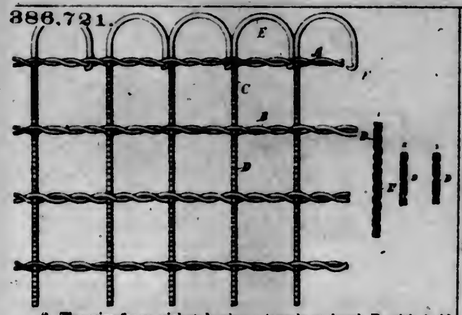
4. The combination of the fixed pulley having the long hub and the beveled rim formed with the openings, the spring-actuated friction-blocks, the sleeve mounted on the shaft, and the movable pulley formed with the long hub and the rim beveled on its inner side.

5. The combination of the fixed pulley having the long hub and formed with locking-ring on its inner side, and the beveled rim having the openings, the spring-actuated friction-blocks, the sleeve mounted on the shaft, the movable pulley formed with the long hub, slots, and the rim beveled on its inner side, and the clamping-hooks.

6. The combination of the fixed pulley having the long hub and formed with the locking-ring on its inner side, and the beveled rim having the openings, the spring-actuated friction-blocks, the sleeve mounted on the shaft, the movable pulley formed with the long hub, the slots, and bearings, and the rim beveled on its inner side, the grooved collar formed with the perforated flange, the screws arranged as described, and a shifting-lever, and the spring-actuated clamping-hooks, substantially as set forth.

7. The combination of the fixed pulley having the long hub and formed with the locking-ring on its inner side, and with the beveled rim having the openings, the spring-actuated friction-blocks, the sleeve mounted on the shaft and held in place by a ring, and having the aperture near its end and the oil-cup, the movable pulley formed with the long hub, the slots and bearings, and the rim beveled on its inner side, the grooved collar formed with the perforated flange, the screws arranged as described, the lever having the pins on the free ends of its arms, and the spring-actuated clamping-hooks, substantially as set forth.

386,720. WIRE-FENCE WEB. GARRET V. S. REMARIS, Vermont P. REMARIS, and HERMIAN GUTHS, Keokuk, Iowa. Filed Dec. 19, 1887. Serial No. 258,377. (No model.)



Claim.—1. In a wire-fence web, the combination of a number of strands each formed of wires twisted together continuously, with cross-pickets B, formed of wires twisted together continuously, having twist corrugations on their sides engaged and held by the wires of the strands, and having their tops turned over loopwise, each end of the loop being held by the web at separate points, whereby the pickets are held properly secure and in position.

2. In a wire-fence web, a picket having twist corrugations on its sides and a loop-head held on each side of the loop at separate points along the web.

386,721. WIRE-FENCE WEB. GARRET V. S. REMARIS, Vermont P. REMARIS, and HERMIAN GUTHS, Keokuk, Iowa. Filed May 19, 1888. Serial No. 274,377. (No model.)

Claim.—1. In a wire-fence web, the combination of twisted strands of wires with a picket formed of a single wire or rod having cross-indentations in its sides, whereby it is made less in section at the indentations than intermediately to engage with the inclosing-wires of the strands.

386,721.

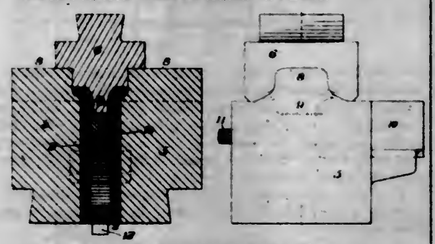
2. The wire-fence picket having a loop-bent head, E, with hold F, to engage with holding-wires of the strand.

3. A wire-fence web composed of a number of strands, each formed of two wires twisted together, holding cross-pickets having indentations in their sides engaging the wires of the strands which inclose and hold them between their twists, said pickets having their tops bent over and hold by the upper strand at other places.

386,722. CONDIMENT-MILL. DANIEL C. RIPLEY, Pittsburg, Pa. Filed Dec. 30, 1886. Serial No. 223,007. (No model.)

Claim.—1. The combination of a condiment-bottle with a grinding-shell secured in its mouth, a perforated revoluble cap, and a runner secured to the cap and operating in conjunction with the grinding-shell, substantially as and for the purposes described.

2. The combination of a condiment-bottle with a grinding-shell removably secured in its mouth, a runner stepped in the shell, and a perforated revoluble cap to which the runner is secured, substantially as and for the purposes described.

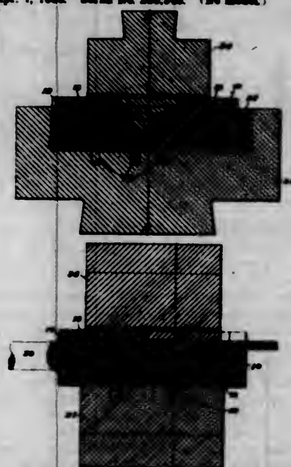


386,723. WAX-END NEEDLE. JOHN T. SMITH, Bellevue, Mich. Filed May 17, 1888. Serial No. 274,149. (No model.)

Claim.—1. As an improved article of manufacture, the metallic bristle, for the purpose set forth, made of a single piece of wire which is bent upon itself and twisted to form an eye at one end, the ends of the wire forming the point of the bristle being connected to each other by solder.

2. A metallic bristle made up of a single piece of wire which is bent upon itself and twisted, said bristle having two or more eyes formed in the body portion, the ends of the wire being secured to each other by solder or equivalent material and pointed, substantially as and for the purpose specified.

386,724. DIE FOR FORMING DRAW-BARS. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed Mar. 12, 1888. Serial No. 266,886. (No model.)



Claim.—1. An improvement in dies for forging draw-bars, which consists of a bed-die having a cavity for the reception of the shank of the draw-bar, and a lateral cavity communicating therewith, and a removable mandrel which is inserted in the said lateral cavity between the side bars of the shank, substantially as and for the purposes described.

2. An improvement in dies for forging draw-bars, which consists in the combination of a bed-die having a cavity for the reception of the shank of the draw-bar, and a mandrel which fits between the side bars of the shank and bears against shoulders on the inner faces of the side bars, substantially as and for the purposes described.

3. An improvement in dies for forging draw-bars, which consists in the combination of a bed-die having a cavity for the reception of the shank of the draw-bar, a mandrel which fits between the side bars of the shank, and a pin which is inserted through the die-block opposite to the end of the mandrel to afford means for removal of the same, substantially as and for the purposes described.

4. An improvement in dies for forging draw-bars, which consists in the combination of a bed-die having a cavity for the reception of the shank of the draw-bar, and a mandrel which fits between the side bars of the shank, said mandrel being secured to the die-block to prevent rise thereof, substantially as and for the purposes described.

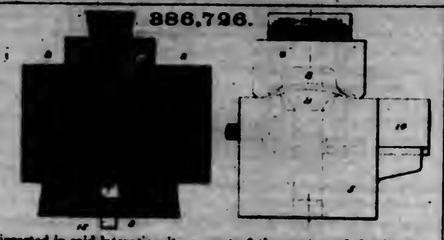
386,725. MANUFACTURE OF COUPLERS. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed Apr. 7, 1888. Serial No. 269,945. (No model.)

Claim.—1. As an improvement in dies for the manufacture of coupler-heads, a bottom die having its cavity shaped to be the counterpart of the coupler-head, and a recess in the die for the reception of the strap of the coupler which is placed therein on the coupler-head, said recess extending to the outside of the die, substantially as and for the purposes described.

2. As an improvement in dies for the manufacture of coupler-heads, a bottom die having a cavity shaped to be the counterpart of the coupler-head, and a recess in the die adapted to form a box on the coupler-head, in combination with a moving die which operates upon the metal in the cavity of the lower die to forge it into shape, and which is provided with a tongue adapted to enter the box-recess, substantially as and for the purposes described.

3. As an improvement in dies, a bed-die having a cavity shaped to be the counterpart of the article to be forged therein, and a pin or pins arranged in the bottom of the die, with their heads bearing against the article and their ends projecting from the die, substantially as and for the purposes described.

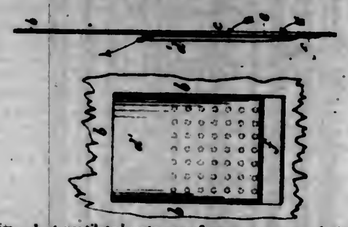
4. As an improvement in dies for the manufacture of coupler-heads, a bottom die for shaping the coupler-head and welding the strap thereto and a movable holder or gage for the strap-blank, said holder or gage being movable and adjustable to and from the die, substantially as and for the purposes described.



5. As an improvement in dies for the manufacture of coupler-heads, a bottom die for shaping the coupler-head and welding the strap thereto and a movable holder or gage for the strap-blank, having a pin which fits through a hole in the strap-blank, substantially as and for the purposes described.

386,726. DIE FOR THE MANUFACTURE OF DRAW-BARS. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed May 19, 1888. Serial No. 274,631. (No model.)

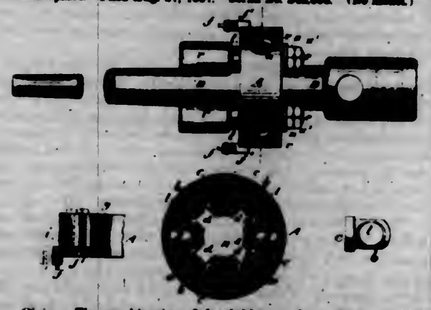
Claim.—1. An improvement in dies for forging draw-bars, which consists in a bed-die of proper surface form to shape the face-plate of the bar, having a cavity for reception of the draw-bar shank, said die having a removable section comprising a part of the face-plate shaping-surface, substantially as and for the purposes described.



2. An improvement in dies for forging draw-bars, which consists in a bed-die of proper surface form, a cavity for reception of the draw-bar shank, and a lateral cavity, and a removable mandrel which is

386,726.

inserted in said lateral cavity, a part of the surface of the die being made integral with the mandrel, substantially as and for the purposes described.

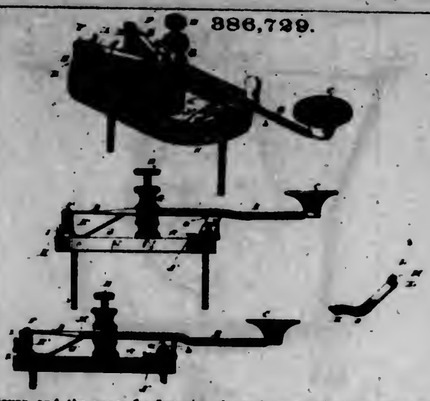


386,727. VENTILATED WATER-PROOF GARMENT. HAPHTALI EVANS, Burdett Road, County of Middlesex, assignor of one-half to Charles Ashford, London, England. Filed May 5, 1888. Serial No. 273,208. (No specimens.) Patented in England Mar. 6, 1888, No. 3,618.

Claim.—1. A ventilated water-proof garment composed of water-proofed material, *b*, having a non-water-proofed or porous portion, *c*, and an inner open-top pocket or lining of water-proofed material, *d d'*, secured to the inner side of the material, *b*, over its porous portion *c*, the outer part, *d*, of the lining being provided with perforations *e* in direct contact with the porous portion *c* of the outer material, *b*, and the inner part, *d'*, of the lining or pocket being unperforated, substantially as shown and described.

2. A ventilated water-proof garment composed of water-proofed material, *b*, having a porous portion, *c*, and the open-top water-proofed pocket or lining *d d'*, having perforations *e* in direct contact with the porous portion *c*, and provided at the lower end of the pocket with an extra thickness of water-proofing, *f*, substantially as shown and described.

386,728. TUBE-EXPANDER. WILLIAM H. THORAS and MARSHALL H. DE LONG, Syracuse, N. Y., assignors of one-fourth to Joseph F. Bonta, same place. Filed Aug. 27, 1887. Serial No. 248,098. (No model.)

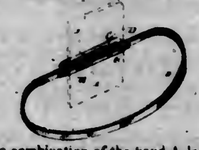


Claim.—The combination of the rigid expander-body A, provided in its face with the radial grooves *i i*, and having slots *g g* extending through it, the lugs *f f*, seated movably in the said grooves, and bolts passing through the slots and adjustably securing the lugs in their positions, substantially as described.

386,729. TELEGRAPH-KEY. LOUIS TOUSSAINT and JOHN H. ASTON, Evansville, Ind. Filed Mar. 15, 1888. Serial No. 267,200. (No model.)

Claim.—1. The combination of the bifurcated key-lever, the base-posts, and the spring bearing with its free end against the bifurcated end of the lever, substantially as and for the purpose shown and set forth.

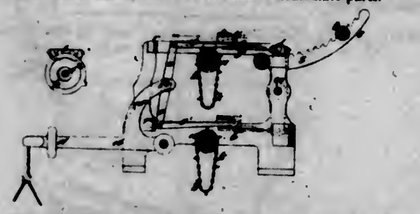
2. The combination of the bifurcated key-lever, the base-posts, the spring, the lower end of which is slightly bent in a V shape to form a shoulder bearing with its free end against the bifurcated end of the



386,729.

lever, and the screw for fastening the spring upon the base, whereby the tension of said spring may be regulated, substantially as and for the purpose shown and set forth.

3. The combination, with the bifurcated key-lever, of the adjustable spring shouldered at its upper end and provided with a lip or projection between said shoulders, said lip bearing against the converging inner ends of the forked part of the lever, substantially as and for the purpose shown and set forth.

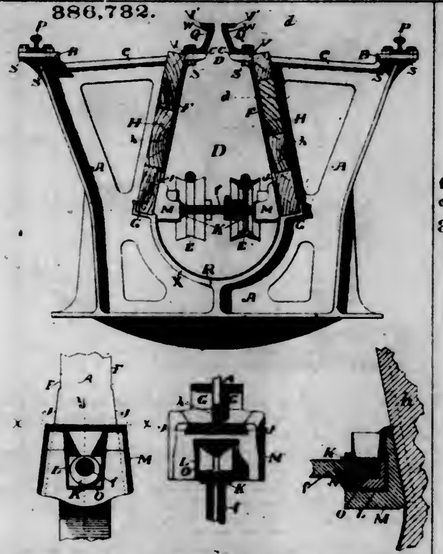


386,730. TICKET-HOLDER. WILLIAM J. WHARTON, Washington, D. C. Filed Apr. 17, 1888. Serial No. 270,978. (No model.)

Claim.—The combination of the band A, loop B, and tube or cylinder C, substantially as and for the purpose shown and set forth.

386,731. LOOM-DOBBY. WILLIAM WILLIAMSON, Pendleton, near Manchester, County of Lancaster, England. Filed June 21, 1887. Serial No. 242,019. (No model.) Patented in England Sept. 21, 1886, No. 11,189.

Brief.—By the use of the improved devices herein shown the hooked jacks are acted on directly by the pegs on the pattern-surface without the intervention of needles or other intermediate parts.



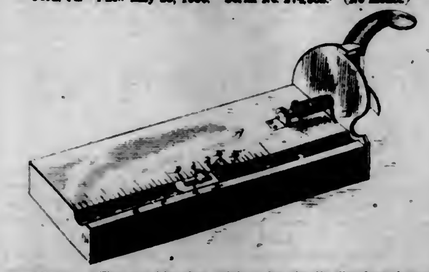
Claim.—1. The combination of pattern chains or barrels, reciprocating knives, and operating devices therefor, with hooks or griffs on which the pattern chains or barrels act directly, levers *o*, to which the hooks or griffs are pivoted, fixed stops *r r'* on the frame, and jacks, to which the levers are pivoted, all substantially as described.

2. The reciprocating knives, operating devices therefor, pattern chains or barrels having bevel-gears *i* on their shafts, and a shaft carrying wheels *k*, having spaced projections, in combination with hooks or griffs on which the pattern chains or barrels act directly, levers to which the hooks or griffs are pivoted, fixed stops *r r'* on the frame, and jacks, to which the levers *o* are pivoted, all substantially as described.

386,732. CONSTRUCTION OF RAILWAYS. FRED W. WEED and JOHN FOWLER, Los Angeles, Cal. Filed Mar. 12, 1886. Serial No. 267,098. (No model.)

Claim.—1. The combination of the yoke provided with the dovetailed and downwardly-broadened flanges J J, the hangers M M, channeled to fit upon the flanges J and provided with a seat for the boxing of the pulley-shaft, the pulley-shaft boxing, and the pulley-shaft.

386,782.



2. The combination of the yoke A, provided with the downwardly-broadened flanges J J, and the hanger M, chanceled to fit upon the flanges J J.

3. The improved cable roadway and tube comprising the yoke provided with the tube-opening D, the downwardly-diverging side arms A A, provided with the flanges F F and brackets G, the top arms, c c, having the track-rail seats B B and slot-rail seats C C, the planking H H, slot-rails Q Q, secured to the seats C, and the track-rails P, secured to the seats B.

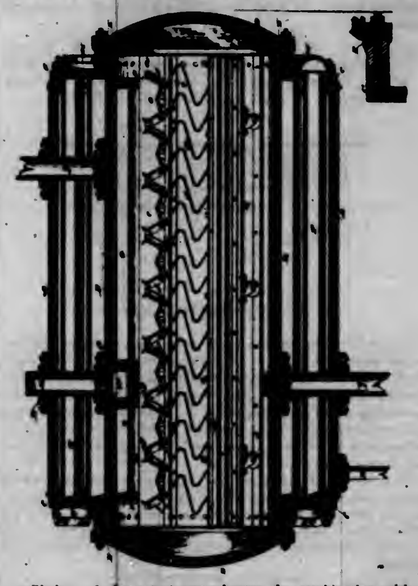
4. The combination of the hangers M M, provided with the chamber L and the upwardly-projecting rib O at the bottom of such chamber, the box K, smaller than the chamber L and provided with the groove N, the pulley E, and its axle.

5. A slot-rail comprising the web of the rail, having at the top thereof a narrow flange projecting from one side of such web, and having a broad flange at the base of such web projecting from the same side of the web as the top flange, and at such an angle with the web that a vertical line drawn from the edge of the top flange will intersect the bottom flange approximately at the base of its junction with the web.

386,733. CIGAR-CUTTER. CHARLES P. YOUNG and JOHN H. THOMAS, York, Pa. Filed May 23, 1888. Serial No. 274,902. (No model.)

Claim.—The combination, with a longitudinally-slotted gage-plate, D, provided with a vertically-slotted extension, D', at its forward end, of a vertical plate, E, provided with a forwardly-extending lip, E', and a set-screw, d, for adjustably attaching the said vertical plate E to the face of the vertical extension D', the set-screw passing through the vertical slot in the extension and tapped into the plate E, substantially as described.

386,734. CAR-HEATER. JAMES ALLEN and GEORGE F. ALLEN, St. Augustine, Fla. Filed Jan. 26, 1888. Serial No. 261,960. (No model.)



Claim.—The combination, with the case having a surrounding water-space, of a door to said case formed with a water-space, and a

386,734.

flexible pipe connecting the water-space of the door with that of the case, substantially as described.

386,735. FEED-WATER HEATER. WILLIAM C. ARMSTRONG, Springfield, Ohio. Filed Sept. 8, 1887. Serial No. 248,668. (No model.)

Claim.—1. In a feed-water heater, the combination, with an outer and an inner shell and heads which secure them together with a space between them, and which close their ends, of water-passages in said annular space, water-pipes which conduct water into the inner shell, sediment-collectors therein, and suitable steam and water inlet and outlet openings.

2. In a feed-water heater, the combination, with inner and outer shells and heads which secure them together with a space between them, and which close their ends, of a continuous water-passage traversing said annular space, a water-pipe which leads into the inner shell, pipe-connections between said pipe and the inlet end of the continuous passage, pipe-connections between the outlet of the said passage and said water-pipe, and cut-offs in said pipe-connections and said water-pipe, sediment-collectors located within the inner shell, and suitable steam-openings and a water-discharge opening.

3. In a feed-water heater, the following elements: an outer and an inner shell and suitable heads which connect them together with a space between them, and which close their ends, a series of pipes passing through said space, caps connecting their ends to form a continuous passage, a water-pipe leading into the inner shell, a water-distributer therein, pipe-connections between the inlet and discharge ends of the passage composed by said series of pipes and said water-pipe, cut-offs in said pipe-connections and said water-pipe, a series of water-troughs under the water-distributer and in the inner shell, sediment-collectors beneath said troughs, a basin beneath the said collectors, and steam inlets and outlets for said shells, and a water-outlet.

4. In a feed-water heater, the combination, with a shell and heads which close its ends, of water-pipes leading thereto and therefrom, a steam-opening, a water-distributer, a series of troughs into which the water is discharged, a series of sediment-collectors beneath the troughs, and a basin beneath the collectors.

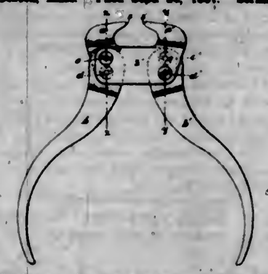
5. In a feed-water heater, the combination, with an outer and an inner shell and heads which secure them together with a space between them, and which close their ends, of a series of pipes passing

lengthwise through said space, two of which connect with inlet and discharge pipes, and caps which connect each pipe at one end with a pipe on one side of it and at the other end with a pipe on the other side of it, substantially as described, to form a continuous water-passage.

6. In a feed-water heater, the combination, with a shell, of a water-pipe, a water-distributer within the shell connected with said pipe, and a series of transverse troughs within the shell and beneath the distributer, whereby the water is introduced into the shell and distributed into separate compartments, whereon it overflows.

7. In a feed-water heater, the combination, with a shell, of a horizontal series or succession of troughs, and a horizontal series of irregular-shaped sediment-collectors located beneath the succession of troughs, and a longitudinal basin located beneath the collectors and arranged to receive the water from them, substantially as described.

8. In a feed-water heater, the combination, with a shell and its head, one or both of which are removable, of tracks secured within the shell, supporting-plates sustained by wheels fitted upon the tracks, and a series of transverse water-troughs connected to said plates, the whole being removable from the shell.



9. In a feed-water heater, the combination, with a shell and its heads, one or both of which are removable, of a basin removably supported within the shell.

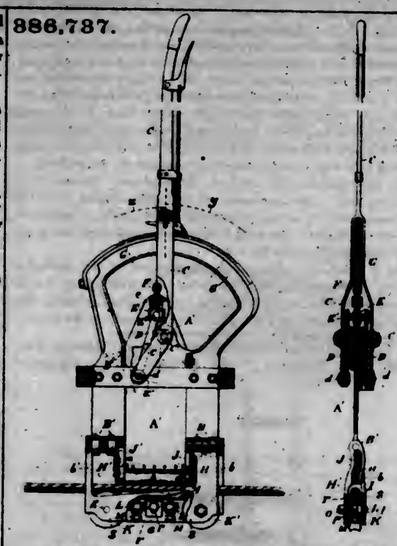
10. In a feed-water heater, the combination, with a shell and its heads, one or both of which are removable, of tracks therein, one above the other, supporting-plates sustained by wheels on the upper tracks, a series of transverse water-troughs connected to said plates, a series of serpentine sediment-collectors suspended from said plates beneath said troughs, a basin supported by the wheels on the lower tracks, and having interior flanges and gutters, said plates and basin being removable from the shell.

11. In a feed-water heater, a water-trough having its bottom inclined downwardly from the middle and the upper edges of its sides inclined inwardly.

12. In a feed-water heater, the combination, with an outer shell and an inner shell, arranged with a space between the two shells, and heads which close the ends of said shells, of sediment-collectors mounted within the inner shells and steam and water inlet and outlet openings for said shells, whereby a steam-jacket is formed round the inner shell, water introduced into the interior of said shell and the impurities thereof separated therefrom, and the water also subjected to the heating action of the steam during the time of its confinement in the said inner shell.

386,736. CUTTING-NIPPERS. HERBERT S. BROWNELL, Boston, assignor of one-third to Charles F. Brown, Reading, and Arthur W. Crowley, Boston, Mass. Filed Sept. 30, 1887. Serial No. 251,082. (Model.)

Claim.—The improved cutting-nippers consisting of the jaws a a', having the oppositely-projecting arms 3 3', and the levers b b', fulcrumed, respectively, on the jaws a a', and having their shorter arms pivotally connected, respectively, to the arms 3 and 3', as set forth.

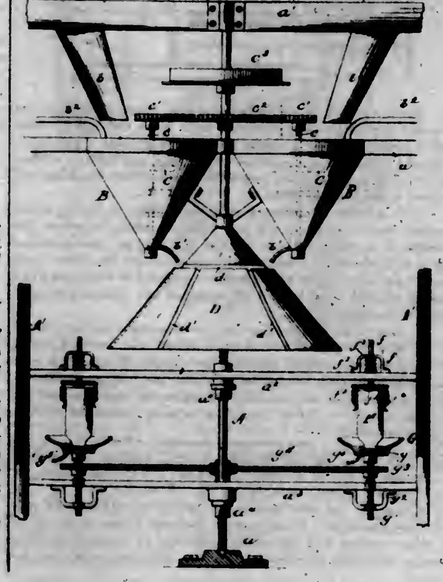


386,737. CABLE-RAILROAD GRIP. GEORGE F. CATER, San Francisco, Cal. Filed Nov. 16, 1887. Serial No. 255,803. (No model.)

Claim.—1. In a cable-railroad grip, a gripping-block the ends of which are furnished with a projecting pin or stud, in combination with the hinged frames H H', provided with cam-grooves on their inner edges, substantially as described.

2. In a cable-railroad grip, a vertically-sliding plate, in the upper end of which is an elongated hole, in which is fitted an adjustable block, the lower end of said plate being furnished with a gripping-block having a pin or stud projecting from each end, in combination with the hinged frames H H', provided with cam-grooves on their inner sides, in which the projecting pins slide to operate the hinged frames H H', substantially as described.

3. In a cable-railroad grip, the combination of the hinged side frames, H H', the inner edges of which are provided with cam-grooves, and a vertically-sliding plate, to the lower edge of which is attached

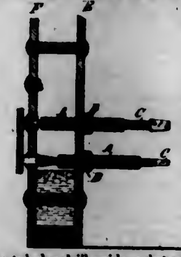


386,737.

a gripping-block provided with pins or studs projecting from its ends suitably located to slide in the cam-grooves on the inner edges of the hinged frames H H', substantially as described.

4. In a cable-railroad grip, the combination of the sliding plate A', having attached to its lower edge the block A, the ends of which are provided with pins or studs adapted to slide in the cam-grooves J J', the upper end of said plate having an elongated hole, C, and an adjustable block, E, and pin E', the hinged frames H H' and their extensions r r, carrying the adjustable gripping-block I and pulleys K K', and provided with holes k l, for the reception of the free ends of the adjusting-screw blocks L L and the roller-carrying pins, the rods b b', for supporting the free ends of r r, the bent operating-lever C, pivoted to the frame of the grip at C', having a suitable pawl for securing it in any desired position, the link D, and toothed segment G, all arranged and operating substantially as described.

386,738. GLASS-GRINDING MACHINE. JAMES J. CHESWIS, Riverside, N. J. Filed Feb. 22, 1887. Serial No. 228,228. (No model.)



Claim.—1. In a glassware-grinding machine, the combination of a driving-shaft, stationary mixing-chambers B, cone D, having annular channel *d*, and longitudinal channels *d'* around said cone, a stationary frame located below said cone, and having spring-acting bars provided at their lower ends with a cushion and spring-fingers, a second stationary frame below the former, having shafts in alignment with said spring-acting bars, cups provided with grinding-dies secured to said shafts, and mechanism between the latter and the driving-shaft for rotating said cups and grinding-dies, substantially as set forth.

2. In combination with shaft A, the stationary frames a^3 a^4, spring-acting rods f', having cushion f^5 and spring-fingers f^6 on one of said frames, cups G, having grinding-dies *g* and shafts *g'*, and mechanisms between shafts *g'* and shaft A, for rotating said cups and grinding-dies, substantially as set forth.

3. In a grinding-machine, the combination of the stationary frames a^3 a^4, spring-acting bars f', having adjustable spring-fingers f^6, rotating cups G, having grinding-dies *g* with inclined grinding edge or surface g^1, and outlet g^3 from said die, substantially as set forth.

386,739. TUBULAR DRILL-GUIDE. JAMES T. CONNELLY, Huntington, W. Va. Filed Apr. 19, 1888. Serial No. 271,131. (No model.)

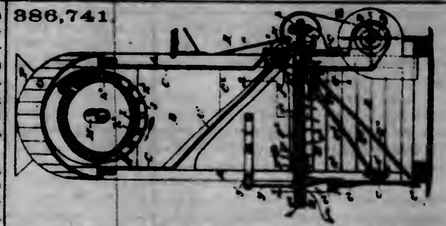
Claim.—1. The tubular drill-guide, substantially as described.

2. The combination of the tubular drill-guide, having its bore extending its entire length, with a drill having its stem passing therethrough, so as to work and be guided therein, substantially as described.

3. The combination of the tubular drill-guide, its jam-nut, and the drill passing through said guide, substantially as described.

386,740. APPARATUS FOR LETTERING SOAP. EDWIN T. EVANS, Buffalo, N. Y. Filed Jan. 16, 1888. Serial No. 261,022. (No model.)

Claim.—1. In a device for lettering soap, the combination of the cylinder A, having a contracted neck at its lower end and provided with a piston, C, having a central aperture, the cylinder B, concentric with said cylinder A and provided with a piston, and having a stationary die in its lower end, and means for simultaneously operating said pistons, substantially as specified.



2. In a device for lettering soap, the cylinder A, having a contracted neck at its lower end and tube *f* extending therefrom, the cylinder B, concentric with the cylinder A, having an open stationary die at its lower end, the stationary cross-head D, and the piston C, surrounding cylinder B and having rods *a a* attached to cross-head *b* and passing through cross-head D, all combined and operating substantially as specified.

3. In a device for lettering soap, the combination of the cylinder A, having a contracted neck at its lower end and provided with a piston, C, having a central aperture, the cylinder B, concentric with said cylinder A and provided with a piston, and having a stationary die in its lower end, and means for simultaneously operating said piston, the tube *f*, and vertical plunger *g*, working therein, all substantially as specified.

386,741. ORE-SEPARATOR. ALVAN P. GRAHAM, Denver, Colo., assignor of one-half to Charles L. Ames and Abel E. Frost, Chicago, Ill. Filed Mar. 2, 1888. Serial No. 265,715. (No model.)

Claim.—1. The combination, in a pneumatic ore-separator, of a vibratory precipitator having corbed apertures, a plate supported at a distance above said precipitator, affording an air-space between them, a suction-fan in communication with said air-space through the

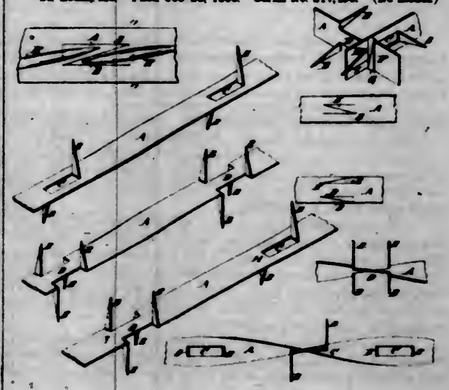
386,741

apertures of the precipitator, a feed-passage for the ore leading from the hopper-opening to the space between the precipitator and the superposed plate, and a feed-regulating roller preventing free passage of air while permitting the passage of the material being fed, substantially as described.

2. A vibratory precipitator having apertures provided with curbs which project above the upper surface of the board, and having a depression or depressions in its surface for the formation of a mineral bed thereon, substantially as described.

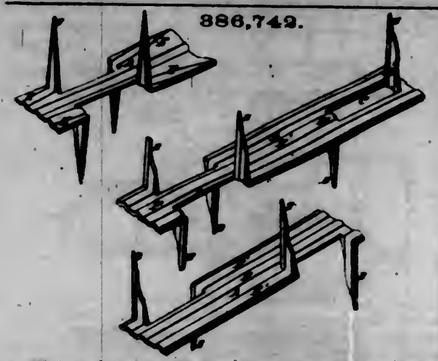
3. The combination of an apertured, inclined, and reciprocating precipitator having its angle of inclination adjustable about an axis at its head, a dressing-plate arranged over the precipitator and also adjustable as to its inclination about an axis which is near that of the precipitator, and a suction-fan in communication with the space between the precipitator and the dressing-plate through the apertures in the precipitator, substantially as described.

4. The combination, in a pneumatic ore-separator, of an inclined reciprocating precipitator provided with curbed apertures and a depression for the formation of a mineral bed, a dressing-plate supported above the precipitator, and a suction-fan communicating with the space between the precipitator and the superposed plate through the apertures in the precipitator, substantially as described.



5. A precipitator for ore-separators provided with apertures having curbs which entirely surround said apertures and which converge at acute angles at their ends and have their greater length in the direction in which the material to be separated moves over the precipitator, substantially as described.

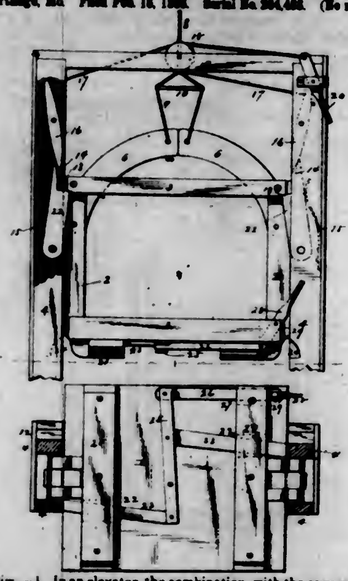
6. The combination, with a precipitator of an ore-separator, a superposed dressing-plate, and a transverse vertically-movable bar and flexible plate supporting the feet of the precipitator, of a lever connected with the transverse bar and having adjustable engagement with the dressing-plate, substantially as described.



7. The combination, with a precipitator and the laterally-inclined inclined board beneath the precipitator having a discharge-passage at its lower margin, of a suction-fan and an upwardly and rearwardly inclined air-passage beneath said board provided with an outwardly-opening valve at its lower end and communicating at its upper end with the suction-fan, substantially as described.

8. The combination, with a frame, a supply-hopper, and a precipitator beneath the hopper, an open space being provided within the frame between the hopper and precipitator, of a transparent dressing-plate over the precipitator, and adjusting devices for the precipitator at said open side of the machine, whereby the effects of adjustment may be conveniently observed while such adjustment is being performed, substantially as described.

386,742. BARBED FENCE-STRIP. CHRISTOPHER J. GRELLER, St. Louis, Mo. Filed Oct. 29, 1886. Serial No. 217,660. (No model.)



386,742.

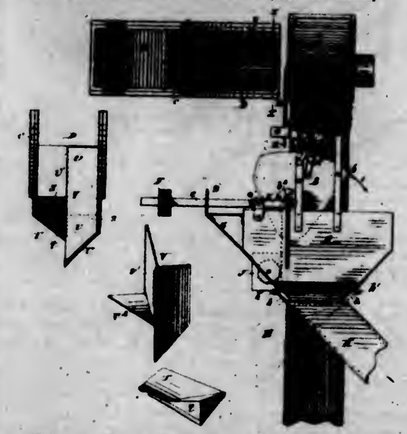
Claim.—1. In a metallic fencing-strip provided with elongated slots having diagonally-divided twin barbs projecting from the uncut blank at each end of said slots, elongated necks alternate therewith, twin barbs cut from the metal body from each side of said necks, said twin barbs being diagonally divided from each other and projecting from opposite portions of the uncut blank contiguous to said necks, substantially as shown and described.

2. In a metallic barbed fencing-strip provided with an elongated slot, a fastening device consisting of an elongated neck, D, adapted to be inserted into said slot, and shouldered portion F, contiguous to the neck D, consisting of the uncut blank and the barbs contiguous to said neck D, against which blank the barbs are folded, said shouldered portion being adapted to engage one side of the strip on each side of the slot to fasten the strip to the supporting object, substantially as set forth.

386,743. AUTOMATIC STOP FOR ELEVATORS. GEORGE P. HINES, Carthage, Mo. Filed Feb. 16, 1888. Serial No. 264,462. (No model.)

Claim.—1. In an elevator, the combination, with the cage and the guide-bars, of pawls pivoted at the lower ends in casings at the sides of the shaft and having upwardly-facing beveled shoulders projecting out into the shaft, springs forcing the pawls outward, levers fulcrumed at their middles in the casings above the pawls and bearing with their lower ends against the upper ends of the pawls, cords attached to the upper ends of the levers and passing around a pulley at the middle of the top of the shaft, and a lever at the side of the shaft having the cords secured to its upper end, as shown, and for the purpose specified.

2. In an elevator, the combination, with the cage and the guide-bars having upwardly-facing notches in the facing sides at the landings, of bolts sliding under the floor of the cage and engaging the said notches, a lever fulcrumed under the floor of the cage and having the inner ends of the bolts pivoted to it, a rod pivoted to one end of this lever, and a hand-lever fulcrumed in a slot in the floor of the cage, and having the other end of the rod pivoted to its lower end, as shown, and for the purpose specified.



386,744. ISABELLA KATE HENDERSON, Shelbyville, Ind. Filed Mar. 23, 1887. Renewed June 20, 1888. Serial No. 276,979. (Model.)

Claim.—1. As a new article of manufacture, the herein-described bustle, made of plaited or braided vegetable material, and comprising an inclined back portion, B, the transversely-inclined inner folds integral therewith and having their upper ends secured to the folded edge of the strip that forms the back portion, B, and the folded outer sides, C C, the upper outer ends of which are secured to the folded edge of the said back strip, likewise integral with said strip, and forming, in connection therewith and the inner folds, the waist portion, all constructed and arranged substantially as described.

2. A bustle made of braided vegetable or other material, and consisting of the inclined back B, the transversely-inclined inner folds integral therewith and having their upper ends secured to the folded edge of the back portion, the folded outer sides, C C, the upper outer ends of which are secured to the folded edge of the said back portion, and a roll, D, located within the back portion, substantially as and for the purposes set forth.

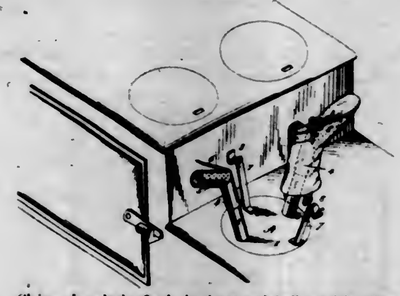
386,745. AUTOMATIC GRAIN-METER. JOHN HENRY, Ardoch, Dak. Filed Oct. 28, 1887. Serial No. 253,413. (No model.)

Claim.—1. The combination, in an automatic grain-weigher, of a hopper, A, a weigh-beam, E, fulcrumed thereon, a grain-box, B, journaled on the weigh-beam at a point below and behind the center of gravity of the box, and a weighted arm, K, held to the grain-box or its shaft and operating to return the box to normal upright position after each tilting of it to discharge its contents, and a tally device connected with the shaft of the box, substantially as herein set forth.

2. The combination, in an automatic grain-weigher, of a hopper, A, a weigh-beam, E, fulcrumed thereon, a grain-box, B, journaled on the weigh-beam at a point below and behind the center of gravity of the box, a weighted arm, K, held to the grain-box or its shaft and operating to return the box to normal position after each tilting of it to discharge its contents, a latch-bar, O, held to a relatively-fixed support and notched at *o*, and an arm, P, on the grain-box, which is engaged by the latch-bar as the box resumes normal upright position.

and the support E on the elevator-spout below the free end of said latch-bar, substantially as herein set forth.

3. The combination, in an automatic grain-weigher, with a hopper, A, a weigh-beam, E, fulcrumed thereon, a bracket, G, fixed to the hopper and having forked upper end, *g*, forming a guide and rest for the arm *e* of said beam, a tilting grain-box, B, journaled on the weigh-beam, and a spout discharging grain or other material into the box, of a cut-off, L, fitted to the spout and provided with an arm, M, and an arm, N, on the grain-box, substantially as shown and described, whereby the cut-off will be operated to open the discharge-spout as the grain-box resumes normal upright position, and the spout will be closed as the grain-box tilts for discharge, as herein set forth.



4. The combination, in an automatic grain-weigher, of a hopper, A, a weigh-beam E, fulcrumed thereon, a tilting grain-box, B, journaled on the weigh-beam, a weighted arm, K, held to the box and returning it to normal position, a spout discharging into the box, a latch-bar, O, held to a relatively-fixed support and notched at *o*, an arm, P, on the grain-box, adapted for engagement by the latch, a cut-off, L, fitted to the discharge-spout and provided with an arm, M, and an arm, N, on the grain-box, all arranged for operation substantially as described, for the purposes set forth.

5. In a grain-weighing apparatus, the combination, with the spout delivering into the weighing-box, of reversely-inclined plates T U and an angular partition, V, arranged to divide the flowing grain to discharge it evenly to the grain-box, substantially as herein set forth.

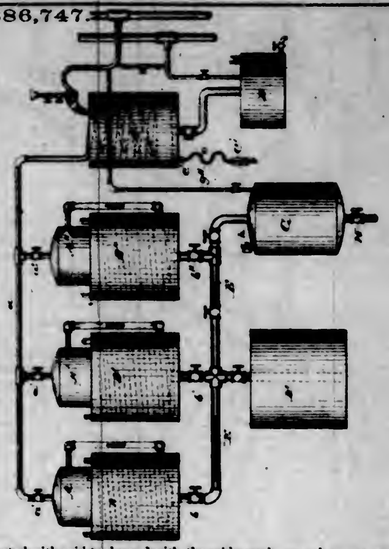
6. In a grain-weighing apparatus, the combination, with the spout D, of reversely-arranged inclined plates T U, a partition, V, and a filling-piece, as *t* or v^3, arranged at the angle or corner between the parts V T, substantially as herein set forth.

7. In a grain-weighing apparatus, the combination, with the weighing-box and the spout delivering into said box, of the inclined plate S, the inclined plate T at right angles thereto, the reversely-inclined plate U, and the angular partition V in the elevator-spout, substantially as and for the purpose specified.

386,746. BOOT-DRIER. GEORGE A. HALL, Maquoketa, Iowa. Filed Oct. 9, 1886. Serial No. 215,762. (No model.)

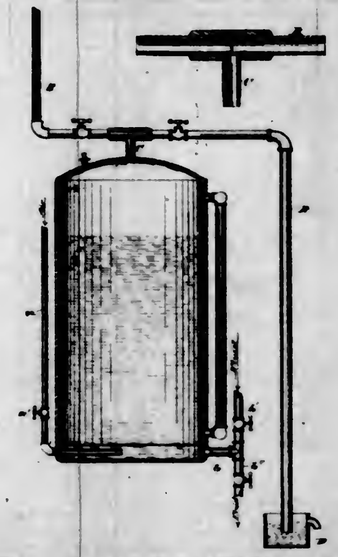
Claim.—In a device for drying boots and similar articles, the combination of a base, tubes secured thereto the upper ends of which are at an obtuse angle and perforated, and a strip secured to the upper ends of each of said tubes and projecting over its upper side.

386,747. VACUUM-DISTILLATION. WILLIAM L. HORNE, Meriden, assignor to the Horne Vacuum Company, Hartford, Conn. Filed Feb. 1, 1887. Renewed Mar. 20, 1888. Serial No. 268,845. (No model.)



Claim.—1. The combination, with two or more distilling-vessels, a condenser, and an air-exhausting device, of a supply-tank, a tank for receiving the residual liquor, a pipe connected with both of said tanks and with each of said distilling-vessels, and cocks controlling the connections between the different parts, substantially as described.

2. The combination with two or more distilling-receptacles, a condenser, and a vacuum apparatus, of a supply-tank and a tank for receiving the residual liquor, said residual tank being connected with an air-exhausting apparatus, a pipe connected with the supply and residual tanks and with the distilling-vessels, and cocks controlling the connections with the different parts, substantially as described.



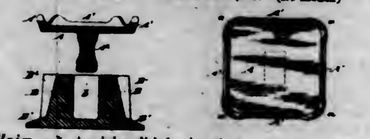
3. The combination, with two or more distilling-vessels, of a residual tank connected with said vessels, a condenser, also connected with said distilling-vessels, a distillate-tank connected with said condenser, an air-exhausting apparatus connected with the condenser and with the residual and distillate tanks, and cocks for controlling the connections with the different parts, substantially as described.

4. The combination, with two or more distilling-vessels, of a supply-tank, a tank for the reception of the residual liquor, a pipe connected with said tanks and with the said vessels, a condenser connected with the distilling-vessels, a distillate-tank connected with the condenser, an air-exhausting device connected with the condenser and distillate and residual tanks, and cocks controlling the connections with the different parts, substantially as described.

386,747.

386,748. PROCESS OF AGING LIQUORS. WILLIAM L. HORNE, Meriden, assignor to the Horne Vacuum Company, Hartford, Conn. Filed Aug. 24, 1886. Renewed Mar. 20, 1888. Serial No. 268,846. (No model.)

Claim.—1. The process of aging distilled liquors, which consists in passing currents of air through the same by placing the liquor in a closed receptacle, exhausting the air above the liquor, and admitting air beneath the same, then cutting off the air-supply and exhausting the air and volatile parts of the liquor, substantially as described.

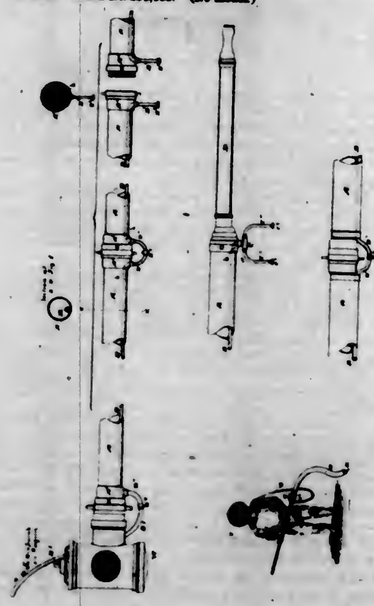


2. The process of aging distilled liquors, which consists in passing currents of air through the same by placing the liquor in a closed receptacle, exhausting the air above the liquor, and admitting air beneath the same, then cutting off the air-supply and exhausting the air and volatile parts of the liquor, forming a vacuum and maintaining said exhaust until ebullition nearly or quite ceases, substantially as described.

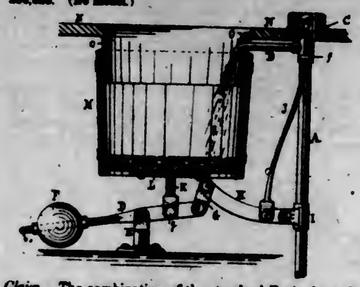
386,749. MEAT-HOOK. JOSEPH W. JOHNSON, Philadelphia, Pa., assignor to Thomas Devlin & Co., same place. Filed Apr. 13, 1888. Serial No. 271,268. (No model.)

Claim.—In a meat-hook, the combination, with a base-piece having an outward flange, a portion of which is cut away, said base being further provided with openings just within the flange, and a central aperture, of the supporting-hook, the plate of which is provided with two lugs, each of which is provided with a toe, and a central lug, and a locking-hook pivotally secured to the base-piece at the cut-away portion of the flange, the free end of which engages with one of the toed lugs of the plate of the supporting-hook when in position.

386,750. DENTAL MIXING-DISH. JOSEPH A. KIMBALL, New York, N. Y. Filed Nov. 7, 1887. Serial No. 254,426. (No model.)



Claim.—1. A mixing-dish having the base A, rim A', and stem A^1, combined and adapted to serve as herein specified.

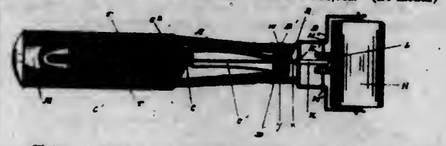


2. The dish described, having the base A, rim A', one or more spouts, *a*, and stem A^1, as herein specified.

3. The dish described, having the base A, rim A', and spout *a*, in combination with the stem or stems A^1, and support B *b*, adapted to hold the dish firmly, as herein specified.

386,751. DEVICE FOR SUPPLYING AIR TO FIREMEN IN BURNING BUILDINGS. SAMUEL L. LOOMIS, Wright's Station, Cal. Filed Oct. 31, 1887. Serial No. 253,985. (No model.)

386,752. AUTOMATIC VALVE FOR WATER-SERVICE PIPES. CHARLES MERRITT, Providence, R. I. Filed Nov. 28, 1887. Serial No. 256,622. (No model.)



Claim.—The combination of the standard E, the lever D, having the screw-thread *b*, the counterpoise F, adjustable upon said screw-threaded lever D, the post K, the seat L, the basin M, the link G, the lever H, the rod J, the valve C, the pipes A B, the shelf N, the funnel O, the pivots *a c d e g*, and the bracket I, substantially as specified.

386,753. COMPOSITION OF MATTER APPLICABLE TO METAL-CUTTING TOOLS. STANLEY G. MENTAGUE, Gainesboro, Ala. Filed Mar. 26, 1888. Serial No. 268,228. (No specimens.)

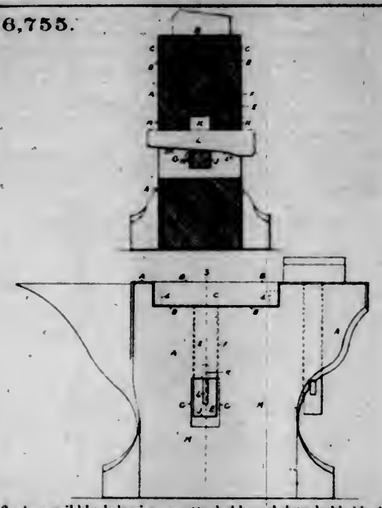
Claim.—The herein-described composition of matter, to be applied and used as and for the purpose described.

386,754. ELECTRO-MEDICAL APPARATUS. JOHN S. MOTT, San Francisco, Cal. Filed Jan. 26, 1888. Serial No. 261,622. (No model.)

Claim.—1. In an instrument of the character described, the combination of the case or handle in which is mounted an induction-coil and a battery, and the frame B, adapted to carry a rolling electrode, and having a circuit-interrupter also mounted on it, the terminals of the induction-coil being brought out at the end of the handle and suitably exposed to make electrical connection with the circuit-interrupter and the electrode H, as hereinbefore described.

2. In an instrument of the character described, the combination, with the frame B, having a rolling electrode mounted in it for rotation, as described, of the detachable handle containing an induction-coil and a battery and having the terminals of the same brought out to the end where the handle sets into the frame, substantially as described.

3. In an instrument of the character described, the circuit-interrupter consisting of the wheel L and the contact-spring K, in electrical connection with the frame B and the primary coil, and driving mechanism, substantially as described, which connects the interrupter-wheel with the rolling electrode to operate the same from the motion of the electrode, as set forth.

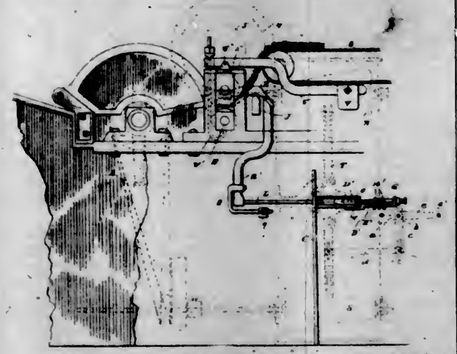


4. In an instrument of the character described, the combination of the handle or part carrying an induction-coil and a battery, and having a surface-electrode, and the frame or other part having a rolling electrode and a circuit-interrupter mounted on it, the said parts being separable, substantially as described.

5. The combination of the rolling electrode in circuit, as described, and the circuit-interrupter having driving wheels or surfaces which are adapted to run against the rolling electrode to be driven by the rotation thereof, substantially as described.

386,755. ANVIL. JOSEPH O'BRIEN, Boston, Mass. Filed Apr. 26, 1888. Serial No. 272,207. (No model.)

Claim.—1. An anvil-block having an attachable and detachable block, C, with a working-face, B, in combination with a recess, D, in the anvil to receive and means to secure said block C on the anvil, substantially as described, for the purpose specified.

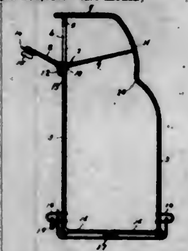


386,755.

2. An anvil-block having an attachable and detachable block, C, with a working-face, B, in combination with a recess, D, in the anvil to receive said block, and means consisting of a shank or stem, E, of said face-block C, a bore, F, of the anvil to receive and a slot, K, in said shank E, and a pin, L, entered in said slot and making bearings at its upper edge against the upper side of an opening, G, in the anvil, and at its under edge against the lower end of said slot, substantially as described, for the purpose specified.

386,756. EVENING MECHANISM FOR COTTON-OPENERS, &c. JAMES C. POTTER, Pawtucket, R. I. Filed Mar. 8, 1888. Serial No. 266,512. (No model.)

Brief.—The object of the invention is to prevent the crimping of the cotton between the evener-roll and the evener-plates.

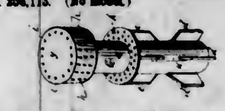


Claim.—1. The combination, with the evener-plates and the feed-roll, of a combined evener and feed-roll, arranged and adapted to co-operate both with said feed-roll and with said evener-plates, substantially as and for the purposes hereinbefore set forth.

2. The combination of the evener-roll, the feed-roll placed beneath the evener-roll, means for holding up said feed-roll against the same with yielding pressure, and the evener-plates placed above and obliquely to the plane of meeting of the two rolls, as described, the arrangement being such that the cotton passes first between the evener-plates and the evener-roll, and thence between the last-mentioned roll and the feed-roll, substantially as and for the purposes hereinbefore set forth.

3. The combination, with the beater, the evener-plates, the cone-drums, and belt-shipper therefor, and mechanism whereby the said belt-shipper is operated from the evener-plates, of the evener-roll and the feed-roll located between the beater and the evener-plates, and arranged and adapted to co-operate with each other and with the evener-plates, substantially in the manner and for the purposes hereinbefore set forth.

4. The combination, with the roll F, supported in fixed bearings and evening devices co-operating therewith, of the feed-roll E, supported in movable bearings below the roll F, and means whereby said feed-roll is held up against the said roll F with yielding pressure, substantially as and for the purposes hereinbefore set forth.



386,757. LETTER-BOX. ROBERT F. RAMSDEN, Baltimore, Md., assignor of one-third to Samuel W. Register, same place. Filed Mar. 9, 1888. Serial No. 266,686. (No model.)

Claim.—1. In a mail-parcel box, the combination of the casing 5, provided with an opening, 6, in one side and near the closed top thereof, a sealing device for protecting the opening 6, consisting of the leaves 8 and 9, which meet and are secured together at an angle one to the other, and hinged at their point of meeting in the bottom of the said opening 6 to the side of the casing, whereby the leaf 8 may be swung outward and downward, and when in the closed position will be flush with the side of the casing to which it is hinged, and the side of the casing which is directly opposite the said opening 6 being provided with a curved surface, 11, the center of which curvature is at the hinged point 10 of the sealing device, whereby the free end of the inner leaf, 9, will be in contact with the said curved surface at all parts thereof when moved thereover, substantially as shown, and for the purpose set forth.

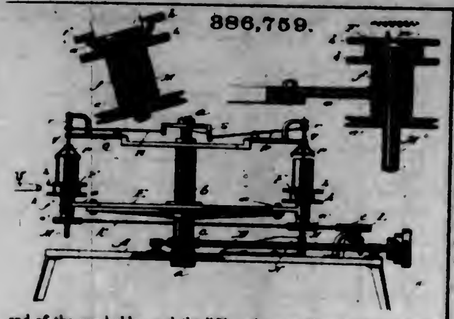
2. In a letter-box, the combination of the casing 5, provided with an opening, 6, in the side thereof, and a sealing device consisting of the leaves 8 and 9, meeting and secured together at an angle one to the other and hinged at their line of meeting to the box at the lower edge of the opening 6, the leaf 8 being provided with a stop for insuring an inclined position of the said leaf 8, for the purpose set forth.

386,758. LAMP. HENRY R. SHAFFER, Rochester, N. Y., assignor to the Rochester Burner Company, same place. Filed Nov. 26, 1887. Serial No. 256,113. (No model.)

Claim.—1. The combination, with the center tube, B, of an Argand lamp, of the air-distributer G, set therein and provided at its top with an enlarged hollow head projecting laterally over the wick-tube, said head provided with vertical sides and perforated over its whole extent, the bottom forming a button to deflect the air beneath the head, as herein shown and described.

2. In an Argand lamp, the combination, with the center tube, B, of the air-distributer G, constructed with the enlarged perforated cylindrical head projecting over the wick-tube, and the annular perforated ring *k*, located around the distributer and within the center tube, as herein shown and described.

386,759. CAN-SOLDERING MACHINE. JOHN SOLTER, Baltimore, Md., assignor of one-half to George L. Kruhs, same place. Filed Apr. 11, 1888. Serial No. 270,302. (No model.)



Claim.—1. In combination, a constantly-revolving table carrying a series of revolving can-holders, heaters for the can-holders, and lifting devices for raising the cans from the holders for the purpose of cooling them and allowing the cans to be removed, all substantially as described.

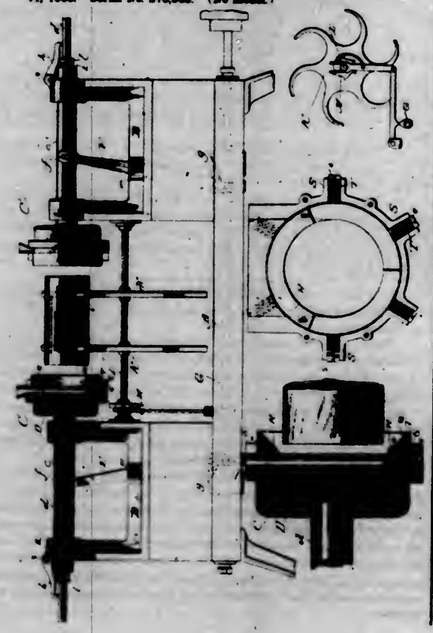
2. In combination with a constantly-revolving table, a series of can-holders mounted on spindles journaled in the table, pulleys on the lower ends of the spindles, and a band encircling the series of pulleys and connected with a main driving-pulley, substantially as described.

3. In combination with a revolving table, a solid can-holder, a heating apparatus arranged to heat the can-holder, said can-holder being provided with a recess on the upper face to receive the can, and with a lifter arranged to lift the can off the heater-seat, substantially as and for the purpose described.

4. In a solid can-holder fitted to turn in a sleeve, a recess in the upper face of the can-holder to receive the can, the pulley on the lower

386,759.

end of the can-holder, and the lifting-pin extending through the can-holder, with means for lifting said pin to raise the can, substantially as described.



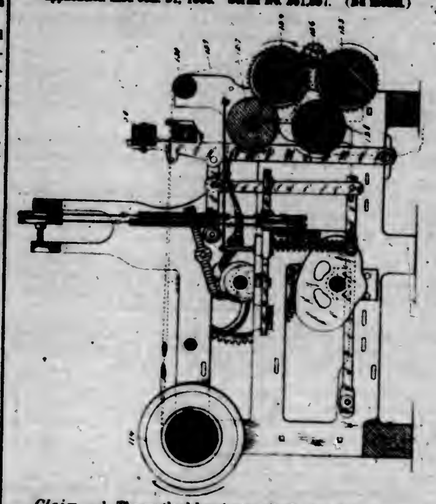
5. In combination, a main driving-shaft, a vertical sleeve carried therewith, a table on the sleeve carrying a series of revolving can-holders, a pulley on the spindle of each can-holder, and a band encircling the series of pulleys and driven by another pulley operated by the main shaft, substantially as described.

6. In combination with a series of can-holders mounted on a revolving table, pulleys on the ends of the spindles of the can-holders, and a band encircling them driven from the main shaft through a pulley, lifting-pins in each can-holder, and a cam-segment on the supporting-table for lifting the pins to raise the cans, substantially as described.

7. In combination with a series of can-holders mounted in a revolving table, pulleys on the ends of the spindles of the can-holders, a band encircling them driven from the main shaft, lifting-pins in each can-holder, a cam-segment for lifting the same, a holding-cap for the top of the cans, and a cam-segment for releasing the can from the said cap, substantially as described.

8. In combination with a constantly-revolving table, a series of can-holders mounted on spindles journaled in the table, pulleys on the ends of the spindles of the can-holders, a band encircling them driven from the main shaft, a heating apparatus for the said holder, and a recess in said holder for the can, having an annular channel of greater depth than the recess for outside soldering, substantially as described.

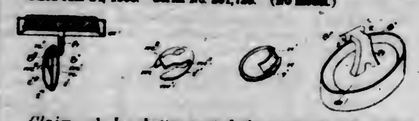
386,760. CAN-HEADING MACHINE. JOHN SOLTER, Baltimore, Md., assignor of one-half to George L. Kruhs, same place. Filed Apr. 11, 1888. Serial No. 270,303. (No model.)



Claim.—1. In combination, in a can-heading machine, arms to move the can-body into line with the dies, a pair of reciprocating die-plungers in the die-cavities, and mechanism for holding the plungers forward while the dies retreat, substantially as described.

2. In a can-heading machine, a pair of dies with plungers in the die-cavities, the shanks of the plungers extending through the hollow die-shanks, levers for operating the dies forward and back, and a catch for holding the plungers in an advanced position when the dies are retracted, substantially as described.

3. In combination with the die, a segmental ring with springs for pressing the segments inward, said ring being located around the inner periphery of the die-cavity, the die having a space in the rear of the ring to receive the can-head, and a plunger for conveying the can-head onto the body and holding it thereon while the die is withdrawn from the headed can, substantially as described.



386,761. METHOD OF FINISHING WOVEN-WIRE FABRICS. SAMUEL T. THOMAS and WINFIELD S. THOMAS, Boston, Mass. Original application filed Feb. 20, 1884, Serial No. 122,276. Divided and this application filed Jan. 31, 1888. Serial No. 261,857. (No model.)

Claim.—1. The method herein described of straining or stretching woven-wire fabrics and of leveling and finishing their surfaces, said method consisting in pressing the said fabrics between two pairs of hard-surfaced rolls, the second pair of which rotates faster than the first pair, substantially as set forth.

2. The method herein described of straining or stretching woven-wire fabrics and of leveling and finishing their surfaces before they finally leave the looms, said method consisting in pressing the said fabrics between the take-up roll and another roll, both of which have hard surfaces, and then pressing the same between a second pair of hard-surfaced rolls, the surfaces of which move faster than the surface of the take-up roll, substantially as set forth.

386,762. BUTTON OR STUD. WILLIAM F. WHITING, Norwood, assignor to Hiram Howard and Stephen C. Howard, Providence, R. I. Filed Jan. 24, 1888. Serial No. 261,720. (No model.)

Claim.—1. In a button or stud, the post having the rocker b^3, combined with the shoe having within it one or more spring-arms, with which the rocker co-operates, and two yielding limiting-stops placed adjacent to but independent of each other, against one or the other of which the said rocker b^3 bears when the shoe is in its respective extreme positions, substantially as described.

2. In a button or stud, the post having the rocker b^3, combined with the shoe composed of the slotted under plate having the stop n', the spring-armed plate having the stop n^2, and the cap i^3, substantially as described.

3. The post bent laterally at its outer end and having the rocker b^3, combined with the shoe composed of a cap, i^3, a spring-plate, i',

and an under plate, *i*, the said under plate having a limiting-stop, as *n'*, near one edge thereof, to operate substantially as described.

4. The bent post having the rocker i^3, combined with the shoe composed of the under plate, *i*, having the stop *n'*, the plate i^2, having the spring-arms *m m'* and the tongue or stop m^3, the rocker i^3, working between the said arms *m m'* and the tongue when the shoe is in one position, and bearing on said arms and against the end of said tongue when in another position, substantially as described.

5. The bent post having the rocker, and the shoe comprising the cap i^3 and two spring-arms, the said rocker being placed between the said cap and spring-arms, and when moved pressing said spring-arms out of their normal position, combined with two limiting-stops placed adjacent to each other, and also adjacent to the cap of the shoe, but at opposite sides of the rocker, substantially as described.

386,763. BUTTON. WILLIAM F. WHITING, Providence, R. I., assignor to Hiram Howard and Stephen C. Howard, same place. Filed Feb. 2, 1888. Serial No. 262,783. (No model.)

Claim.—1. In a button or stud, the head, bent post, and rocker, combined with the shoe composed of the plate, slitted as at 2, and cut away as at *i*, to present the spring-arms *m m'*, and the stop m^3 and the cap i^3, substantially as described.

2. In a button or stud, the head, bent post, and rocker, combined with the shoe composed only of the spring-armed under plate, cut away as at *i*, and the cap, substantially as described.

3. In a button or stud, the head, bent post, and rocker, combined with the shoe composed of the spring-armed under plate, i^2, having the tongue m^3 and cut away at *i*, and the cap i^3, substantially as described.

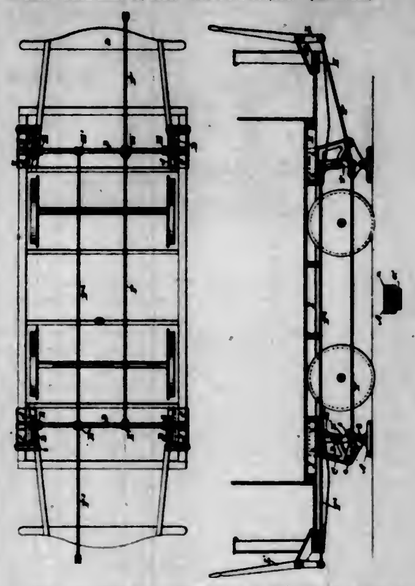
4. In a button or stud, the head, post, and rocker, combined with the shoe composed only of the plate i^2, having the yielding tongue m^3, and the cap i^3, having the projection 3, substantially as described.

386,764. BUTTON OR STUD. WILLIAM F. WHITING, Providence, R. I., assignor to Hiram Howard and Stephen C. Howard, same place. Filed April 30, 1888. Serial No. 272,390. (No model.)

Claim.—1. In a button or stud, the combination, with the bent post and its rocker, of the shoe composed of the spring-armed plate *i'* and the stop or check plate i^3, the cap i^3, and the under plate, *i*, substantially as described.

2. In a button or stud, the combination, with the bent post having the rocker, of the shoe containing the spring-arms *m m'*, and the cap i^3, the rocker being placed between said spring-arms and the cap, and two or more rigid limiting-stops—one on the under plate of the shoe and another on the stop or check plate i^3—said stops terminating adjacent to the cap, and between which the rocker works, substantially as described.

3. In a button or stud, the bent post and its rocker, combined with the shoe containing the spring-armed plate having the projections *o*, the cap i^3, and the under plate, *i*, the rocker being placed between the spring-armed plate and the cap i^3, substantially as described.



386,765. SHEET-METAL BOX. WILLIAM H. ATKINSON, Brooklyn, N. Y., assignor to D. M. Somers, J. L. Somers, G. A. Somers, W. H. Atkinson, and E. B. Somers, all of same place. Filed May 23, 1888. Serial No. 275,260. (No model.)

Claim.—1. A sheet-metal box having its sides provided with inwardly-extending flanges *b* and outwardly-extending locking-flanges *c*, and its bottom provided with inwardly-extending locking-flanges *f*, which interlock with the flanges *c* to form a seam, substantially as described.

2. A sheet-metal box having its sides provided with inwardly-extending flanges *b* and outwardly-extending locking-flanges *c*, and its bottom inset to form shoulders *d*, and provided with locking-flanges *f*, which interlock with the flanges *c* to form a seam, substantially as described.

886,766. BRAKE FOR CARS. HERMAN BOECKMAN, Cincinnati, Ohio. Filed Mar. 19, 1888. Serial No. 267,606. (No model.)

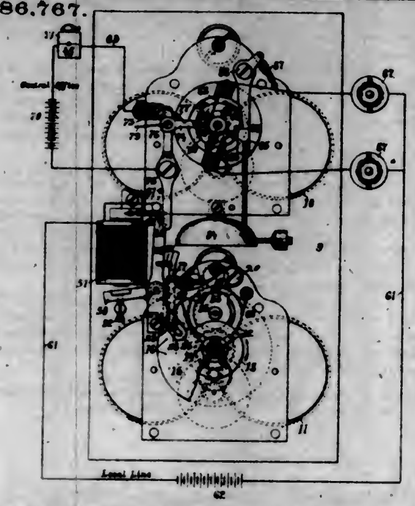
Claim.—1. In a car-brake, the combination, with the brake-shoes, of the arms or yokes to which they are pivotally connected, and pivotal connections between said arms or yokes and the car, and mechanism, substantially as described, for operating said arms or yokes, as set forth.

2. The combination with the brake-shoes, of the slotted arms or yokes and the rods for moving said levers, to which they are connected, and the vibrating lever having the pins or projections entering the slots of the arms or yokes, substantially as described.

3. The combination, with the brake-shoes, of the slotted arms or yokes to which said brake-shoes are hung, the vibratory arms having the pins or projections, the cross-shafts, and connections, substantially as described, for operating all the brake-shoes simultaneously.

4. The combination, with the brake-shoes, of the slotted arms or yokes, the vibratory levers having the pins or projections, the cross-shafts, the arms thereon, the connecting-rods, and the hand-levers at opposite ends of the car, all arranged and operating substantially as described.

5. The combination, with the brake-shoes A, of the arms or yokes B, brackets C, levers E, and shaft D, all constructed and arranged substantially as described.



6. The combination, with the brake-shoes having the friction-faces and the elastic backings, of the slotted arms or yokes to which said brake-shoes are pivoted and the vibratory arms having the pins or projections entering said slots, and rods for moving said arms, substantially as described.

886,767. WATCHMAN'S ELECTRIC TIME-RECORDER. GEORGE P. BOLES, Brooklyn, N. Y. Filed Dec. 28, 1887. Serial No. 259,315. (No model.)

Claim.—1. The combination, with an alarm-circuit and a moving circuit-closing device for periodically acting on the alarm-circuit, of a time-recording mechanism and connections intermediate the circuit-closing device and the recording mechanism, whereby the operation of the recording mechanism may prevent the circuit-closing device from acting on the alarm-circuit and the non-operation of the recording mechanism may allow the alarm-circuit to be acted on, substantially as and for the purpose herein described.

2. The combination, with the alarm-circuit and the alarm device therein, and a traveling circuit-closing device periodically acting on the alarm-circuit and a warning-bell actuated by the circuit-closing device just before the latter is to act on the alarm-circuit, of a recording mechanism and connections intermediate the said mechanism and the circuit-closing device, whereby upon the operation of the recording mechanism the circuit-closing device may be rendered inoperative upon the alarm-circuit, substantially as and for the purpose herein described.

386,767.

3. The combination, with an alarm-circuit and the alarm device therein, the moving circuit-closing device periodically acting on the alarm-circuit, of time-recording mechanism and connections intermediate the said mechanism and the circuit-closing device, whereby the operation of the said mechanism may prevent the said circuit-closing device from acting on the alarm-circuit, an electro-magnet controlling the operations of the recording mechanism, and a local circuit provided with one or more circuit-closers, and including both the said electro-magnet and the said circuit-closing device of the alarm-circuit, substantially as and for the purpose herein described.

4. The combination, with an alarm-circuit having therein an alarm device, and a moving circuit-closing device for periodically acting on the alarm-circuit, of recording mechanism and connections intermediate the said mechanism and the circuit-closing device, whereby the operation of the former may prevent the latter from acting on the alarm-circuit, a hand device and an electro-magnet for independently operating the recording mechanism, and a local circuit provided with circuit-closers, and including the said circuit-closing device and the said magnet, substantially as and for the purpose herein described.

5. The combination, with the alarm-circuit and the alarm device therein, and the moving circuit-closing device periodically acting on the alarm-circuit, of recording mechanism and connections intermediate the said mechanism and the circuit-closing device, whereby the operation of the former may prevent the latter from acting on the said alarm-circuit, and a dial provided with a recording-hand, the said hand advanced by degrees over the dial by means of the said connections intermediate the recording mechanism and the circuit-closing apparatus, substantially as described.

6. The combination, with the alarm-circuit and the alarm device therein, and the circuit-closing device periodically acting on the alarm-circuit, of recording mechanism and connections intermediate the said mechanism and the circuit-closing device, whereby the operation of the former may prevent the latter from acting on the alarm-circuit, a record-dial provided with a hand which may be advanced by degrees over the dial, a hand device and an electro-magnet for independently operating the recording device and advancing the recording-hand, and a local circuit provided with circuit-closers, and including both the said electro-magnet and the circuit-closing device, substantially as and for the purpose herein described.

7. The combination, with the alarm-circuit and an alarm device therein, a moving circuit-closing device operated by a clock movement for periodically acting on the alarm-circuit, and a warning-bell actuated by the said circuit-closing device just before the device is to act on the alarm-circuit, of recording mechanism and connections intermediate the said mechanism and the circuit-closing device, an electro-magnet and a hand device for independently operating the recording mechanism, and a local circuit provided with circuit-closers, and including both the said magnet and the circuit-closing device, substantially as and for the purpose herein described.

8. The combination, with a clock-train and the record-disk mounted on the arbor of the hour-hand of the clock-train, of a pivoted perforating-arm for perforating the record-disk, and a rock-shaft provided with a rocker-arm having a stud engaging and actuating the said perforating-arm, the pawl-arm mounted on the rock-shaft, and the spring-acted pawl mounted thereon, the record-dial provided with a hand having an arbor provided with a ratchet-wheel, a retaining-pawl for said ratchet-wheel, the pawl on the pawl-arm for engaging the ratchet, a spring-acted pivoted rocker-lever provided with a pin engaging the pawl-arm, and the operating hand-lever provided with a spring-acted shaft having a stud engaging the foot of the rocker-lever, substantially as and for the purpose herein described.

9. The combination, with the clock-train having the hour-hand arbor thereof provided with the record-disk, of the pivoted spring-acted bracket and the pivoted spring-acted perforating-arm mounted thereon, the slotted perforating-table for the record-disk, and a cam mounted on one of the arbors of the clock-train and engaging the pivoted bracket for shifting the position of the perforating-arm so that the arm may perforate the record-disk in two concentric circles each twenty-four hours, substantially as and for the purpose herein described.

10. The combination, with the clock-train and the hour-hand arbor thereof, the contact-fingers, a circuit-closing wheel provided with a cog and mounted on the said arbor and acting to periodically make contact with the said contact-fingers, and the local circuit provided with circuit-closers and including the said contact-fingers, of a trip-disk provided with trip-studs and mounted on the said arbor and in electric communication with the said circuit-closing wheel, an alarm-circuit having an alarm device therein, a spring-acted trip-lever provided with a spring-acted pivoted trip-arm and included in the alarm-circuit, and a rock-shaft provided with a rocker-arm for actuating the trip-lever, whereby, when the trip-studs in turn trip the trip-arm and are thereby about to close the alarm-circuit, the operation of the said tilt-lever may act to prevent such closing, substantially as and for the purpose herein described.

11. The combination, with the clock-train provided with the rotating contact-making devices and the local circuit including such devices, of an alarm-circuit having an alarm device therein, the spring-acted trip-lever provided with the spring-acted trip-arm and both included in the alarm-circuit, the said trip-arm actuated by the said contact-making devices and acting to close the alarm-circuit, the rock-shaft provided with a rocker-arm engaging the trip-lever, an electro-magnet included in the said local circuit and having the armature thereof attached to the said rock-shaft, the pawl-arm mounted on the said rock-shaft and provided with a spring-acted pawl, the record-dial and the hand therefor provided with an arbor having a ratchet-wheel engaged by the said pawl, a retaining-pawl for the said ratchet, a hand-lever having a spring-acted shaft provided with a stud, a spring-acted rocker-lever engaging the said pawl-arm and engaged by the said stud on said shaft, a second clock-train and the record-disk mounted on the hour-hand arbor thereof, a pivoted spring-acted perforating-arm, and a slotted perforating-table for the disk to rest against, the said perforating-arm engaged by the said rock-arm, whereby the recording mechanism may be operated independently by the hand-lever and the electro-magnet, thereby perforating the said perforating-disk and advancing the said record-hand on its dial, substantially as and for the purpose herein described.

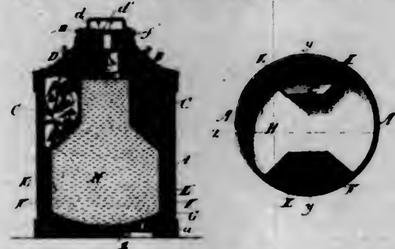
12. The combination, with the spring-acted pivoted bracket and the spring-acted perforating-arm mounted on the said bracket, of an arbor of a clock-train and a disk mounted thereon and provided with a tooth, a ratchet-wheel and a cam mounted on a shaft, and the ratchet-wheel engaged by the said tooth of the wheel, the said cam engaging the bracket and acting to shift the bracket at a predetermined time in order to shift the position of the perforating-arm, substantially as and for the purpose herein described.

13. The combination, with the clock-train 11, having the arbor 12 thereof provided with the carrying-plate 13, and the record-disk 15, mounted on such plate, of the slotted perforating-table 25, the spring-acted perforating-arm 17, provided with perforating-pin 23 and pivoted on the pivoted bracket 19, the rock-shaft 31, provided with the pawl-arm 32, the feed-pawl 48, and the arbor 45, provided with hand 44, and the ratchet-wheel 46, engaged by the pawl 48 and retained by pawl 47, the dial 43 for the hand 44, the hand-lever 38, and the spring-acted shaft 36 therefor, provided with the stud 41, and the spring-acted rocker-lever 33, having the stud 40 engaging said pawl-arm 32, substantially as and for the purpose herein described.

14. The combination, with the pivoted spring-acted bracket 19 and the pivoted spring-acted perforating-arm 17, mounted thereon, of the clock-train 11 and the rotating cam 53, driven by the train and engaging the bracket 19, for shifting the same, substantially as and for the purpose herein described.

15. The combination, with the recording mechanism driven by the clock-train 11, substantially as described, of the rock-shaft 31, provided with the rocker-arm 28, the electro-magnet 51, having the armature 50 mounted on the said shaft 31, the clock-train 10, and the rotating circuit-closing wheel 64, provided with cog 65 and driven by the said train, the contact-fingers 63, engaged by said cog, and the local circuit provided with push-buttons 76, and including said contact-fin-

gers, said magnet and said circuit-closing wheel, the alarm-circuit 69, provided with alarm apparatus 71, and having contact 75, the trip-lever 72 in the alarm-circuit, and the trip-arm and the contact-spring also in the alarm-circuit, and the trip-disk 80, provided with the trip-studs 78 and mounted on the arbor 66, substantially as and for the purpose herein described.



386,768. COVER FOR MAN-HOLES OR CATCH-BASINS. JOHN J. BURROWS, Washington, D. C., assignor of one-half to John T. Springman, Jr., same place. Filed Mar. 26, 1888. Serial No. 268,269. (No model.)

Claim.—1. The combination, with the bed-plate 4, formed with an opening, 5, and provided with the shoulder 9 and the lug 7, of the cover 6, provided with the lug 8 and formed with an opening, 17, the gravity-dog 12, provided with the handle perforated at 16 and mounted on the cover so as to swing freely, and the locking projection 15 for the dog to lock with, substantially as described.

2. The combination, with the bed-plate 4, formed with the opening 5 and provided with the shoulder 9 and the lug 7, of the cover 6, formed with the opening 17 and provided with the lug 8, the eyebolt 11, riveted to the cover, the gravity-dog 12, swinging on said eyebolt and provided with the locking-lip 14 and the perforation 16, and the locking projection 15 for the dog, substantially as described.

386,769. REFRIGERATOR-CAN. LOUIUS J. COSS, Chicago, Ill., assignor to himself, Samuel K. Dow, and Charles G. Cobb, all of same place. Filed Mar. 14, 1887. Serial No. 230,890. (No model.)

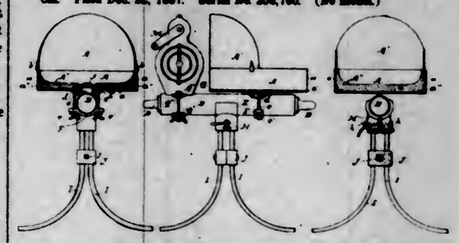
Claim.—1. A refrigerator-can comprising the outer shell, A, having the inner storage-chamber, H, provided with a refrigerating-chamber projecting laterally into its upper part, and a vertical plate, E, forming on one side an air-space between the shell and storage-chamber and on the other side a drip-space leading from the refrigerating-chamber, substantially as described.

2. A refrigerating-can, comprising the outer shell, A, the inner storage-chamber, H, with its bottom located above the bottom of the outer shell to form a water-space, and a refrigerating-chamber projecting laterally into the upper part of the storage-chamber, the can being provided with air and drip spaces, as described, and with the drip-valve *a*, as set forth.

3. The combination, with the outer shell, A, and inner storage-chamber, H, of the hollow cover B, having the perforated plates *c d*, strainer *d'*, and slide *d*², substantially as described.

386,770. STAY FOR WIRE FENCES. LEWIS W. COWELL, Joliet, Ill. Filed May 24, 1886. Serial No. 203,173. (Model.)

Claim.—1. A wire stay for wire fences provided with a number of compound closed and open loops, each of said loops consisting in an oblique bend or fold in the stay-wire, inclined in two directions or planes at an angle to each other, said inclined fold forming an open loop or hook adapted to hook over the fence-wire laterally when the stay is turned in one position, and a closed loop or eye when the stay is turned on its axis into a position at about right angles to said former position, substantially as specified.



2. The wire stay for wire fences, consisting in a single stay-wire, D, provided with compound eyes and hooks *d*, consisting of bends or folds *d'* in the stay-wire, inclined in two directions, substantially as shown and described, in combination with the wires of a wire fence, said stay-wire having a coil, *d*², at its end around one of said fence-wires, substantially as described.

3. The combination, with wire stay D, having compound open and closed loops *d*, formed by bends or folds *d'* in said stay-wire, inclined in two directions, substantially as shown and described, of a locking-wire, E, inserted through said loops *d*, substantially as specified.

4. The stay-wire D, having double compound open and closed loops *d d*, formed by or consisting of the oblique bends or folds *d'* in said stay-wire, inclined in two directions, substantially as shown and described.

5. The stay-wire D, having oblique bends or folds *d'* therein, inclined in two directions, substantially as shown and described, forming an open loop or hook on said stay-wire, and at the same time a closed loop or eye, according to the position the stay-wire is turned on its axis, substantially as specified.

386,771. PORTABLE FORGE. GEORGE CUMMINS, San Francisco, Cal. Filed Dec. 22, 1887. Serial No. 258,760. (No model.)

Claim.—1. A portable forge consisting, essentially, of the hearth-pan, the hollow conduit for wind, the blower, and supporting-legs, the whole being secured together with suitable clamping devices, as herein described, and for the purpose set forth.

2. In a portable forge, the combination of a hearth-pan securely clamped upon a horizontal wind-pipe, a horizontal wind-pipe conveying the blast from the blower to the hearth, a suitable blower clamped upon said horizontal wind-pipe, and a suitable stand or frame to support the whole, arranged and operating substantially as and for the purpose described.

3. The portable stand herein described, consisting, essentially, of the bent legs inserted and held in the half-clamp, the half-clamp constructed and operating substantially as and for the purpose described.

4. As a means of fastening the legs in the clamp-hubs, the combination of the wedge-headed bolt and the rollers arranged and operating together to bind the legs in their sockets, substantially as and for the purposes described.

5. In a portable blowing apparatus, the combination of a horizontal hollow wind-conduit, a blower clamped thereto, and a portable stand, as herein described, consisting of the bent tubular legs and clamping-irons, substantially as shown and described.

6. A fan-blower, as herein described, consisting, essentially, of a shell inclosing the fan and having a removable cover in front to admit the fans, perforated to allow the air to enter, and with a boss in the middle to receive the fan-spindle, the said shell having a set of bearings secured to rear side to support one end of the spindles of the speed-gears; second, a suitable revolving fan inclosed within the shell; third, a cap or cover with internal space to inclose the speed-multiplying gears, fitted and fastened directly to the shell and provided with bearings for the outer ends of the gear-spindles, and, fourth, a set of speed-multiplying gears with spindles and an operating hand-lever, substantially as described.

386,772. ELECTRIC SIGNAL OR ALARM. EDWARD DAVIS, Cambridge, Mass., assignor of one-half to E. B. Welch, same place. Filed May 13, 1887. Serial No. 236,804. (No model.)

Claim.—1. In an electrical signaling apparatus, the combination, with the conducting-strip, the movable contact-arm, one or more projections adapted to be moved into position to cause changes in the relation of the contacts, a catch for holding the projections in position during the passage of the movable contact-arm over them, and a projection connected to the movable contact-arm, adapted to co-operate with and move the catch out of engagement with the projections when the contact-arm has passed by them, substantially as described.

386,772.

2. In an electrical signaling apparatus, the combination, with an electrical contact having a determinate signal indicated thereon, a traveling contact, and a motor for moving it over the first-mentioned contact, of one or more teeth or projections arranged to be projected in the path of the traveling contact, a catch for holding said teeth in projected position, and connections between said catch and motor, whereby the former will be operated by the latter and the teeth or any of them allowed to return to normal position after the signal has been transmitted, substantially as described.

3. In an electrical signaling apparatus, the combination, with a circuit-breaker arranged to transmit a determinate signal, and a motor for operating the same, of one or more teeth or projections arranged to co-operate with the circuit-breaker to vary the signal sent, a catch for holding said teeth in operative position, and connections between said teeth and the motor for releasing the latter when the former are placed in operative position, and other connections between said catch and motor for allowing the return of the teeth to normal position after the transmission of the signal, substantially as described.

4. In an electrical signaling device, the combination, with the circuit making and breaking contacts arranged for sending a determinate signal, of one or more teeth or blocks arranged to co-operate with the circuit making and breaking contacts to vary the signal sent, and a removable key having portions of its operating-surface arranged to operate one or more of said teeth, so as to vary the normal signal to correspond with the surface of the key employed, substantially as described.

5. In an electrical signaling apparatus, the combination, with the circuit making and breaking contacts, of a series of slide-bars provided with insulating-teeth *l*, severally adjustable within the path of movement of the contacts, so as to vary the normal operation of the same, and a key, *y*, for moving said bars to adjust the same, substantially as described.

6. In an electrical signaling apparatus, the combination, with a stationary contact and a movable contact arranged to transmit a determinate signal, of a series of slide-bars, *k*, provided with teeth *l*, adapted to be adjusted within the path of the movable contact, pedal-levers *w*, provided with pins or projections *w'*, and key *y*, substantially as described.

7. In an electrical signaling apparatus, the combination, with the stationary contact and the movable contact arranged to transmit a determinate signal, of a series of slide-bars, *k*, having notches *v*, and provided with teeth *l*, adapted to be adjusted within the path of the movable contact, the levers *s s'*, provided with pins *u*, pedal *w*, provided with pins or projections *w'*, and key *y*, substantially as described.

8. In a signaling apparatus, the combination, with the circuit-varying contacts arranged to transmit a predetermined signal, of one or more projections arranged to operate upon the contacts to cause them to vary the signal from the normal, and a removable key for co-operating with the said projections to place one or more of them in position to vary the signal in accordance with the particular key employed, substantially as described.

9. In a signaling apparatus, the combination, with the circuit-varying contacts arranged to transmit a predetermined signal, of one or more teeth or projections arranged to operate upon the contacts to cause them to vary the signal from the normal, a catch for holding said teeth in position to cause this variance, and a removable key for co-operating with said projections to place one or more of them in position to vary the signal in accordance with the particular key employed, substantially as described.

10. In a signaling apparatus, the combination, with the circuit-varying contacts arranged to transmit a predetermined signal and a motor, of one or more teeth or projections arranged to operate upon the contacts to cause them to vary the signal from the normal when projected, a catch for holding said teeth projected and a projection operated by the motor for releasing said catch when the signal has been sent, and a removable key for projecting one or more of the teeth and thus varying the signal in accordance with the particular key employed, substantially as described.

386,773. ADVERTISING NOVELTY. WILLIAM DEBUS, Philadelphia, Pa. Filed Nov. 22, 1887. Serial No. 256,871. (No model.)

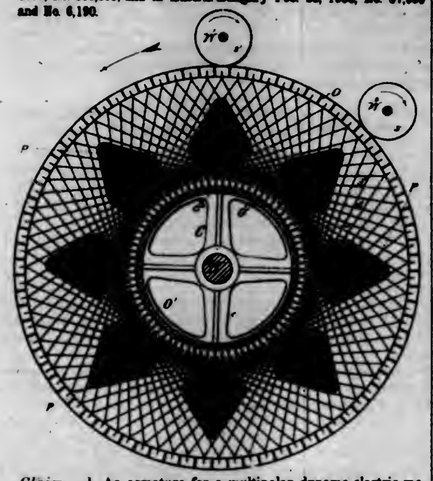
Claim.—1. In a surprise-shield, a base-plate and a movable plate or cover loosely connected thereto, in which the covered face or faces of the said plates are formed with words or characters which it is desired to suddenly expose to the eye by causing the said movable plate, when the shield is open, to lie in a plane parallel to that of the base-plate, in combination with a lock or catch for holding the two parts one in front of the other.

2. In a surprise-shield, a base-plate and a movable plate or cover loosely connected thereto, and in which the covered face or faces of the said plates are formed with words or characters which it is desired to suddenly expose to the eye, in combination with a lock or catch for holding the two parts one in front of the other, and a string connecting with said lock or catch, whereby it may be operated from a distance.

3. In a surprise-shield, a base-plate and a movable plate or cover loosely connected thereto, in which the covered face or faces of the said plates are formed with words or characters which it is desired to suddenly expose to the eye, in combination with a lock or catch for holding the two parts one in front of the other, a string connecting with said lock or catch, whereby it may be operated from a distance, and a spring to forcibly separate said plates when the string is pulled.

4. The combination of the back plate, A, having means for attachment to the wearer, a front plate, B, hinged thereto at the bottom, a catch to hold said front plate up against the back plate, and striking words or characters upon the faces of one or both of said plates, which words or characters on the back plate are normally concealed by said front plate, but are exposed to view by causing said front plate to move to a plane parallel to that of the back plate.

5. The combination of the back plate, A, having means for attachment to the wearer located on its back, a front plate, B, hinged thereto at the bottom, a catch to hold said front plate up against the back plate, and striking words or characters upon the faces of one or both of said plates, a spring to force said plates apart, and a string connecting with said catch, whereby it may be operated from a distance.



386,774. ROTARY ENGINE. CLARK W. DOTEN, Boston, Mass., assignor of three-fourths to Eugene H. Morse, Samuel P. Blackburn, and Calvin A. Austin, all of same place. Filed July 16, 1887. Serial No. 244,566. (No model.)

Claim.—A rotary engine consisting of a cylinder having a greater

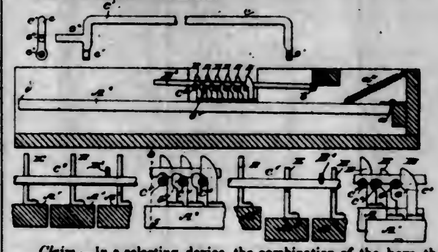
area of steam-space provided in the exhaust portion than in the inlet portion, and provided with a hub having two pistons, and having the heads of the cylinder provided with packing, which forms joints with the opposite end faces thereof, as described.

386,775. DYNAMO-ELECTRIC MACHINE. WALDEMAR PETERSEN, Berlin, Germany. Filed Nov. 4, 1887. Serial No. 254,243. (No model.) Patented in Belgium Sept. 27, 1887, No. 79,008; in France Sept. 27, 1887, No. 186,008, and in Austria-Hungary Feb. 26, 1888, No. 37,980 and No. 6,190.

Claim.—1. An armature for a multipolar dynamo-electric machine having two series of contact-points arranged either parallel to or concentric with one another, a conductor connecting said contact-points, arranged to form a series of partial triangles having their apices at the said contact-points and imaginary bases, the conductor being continued progressively throughout the entire series of contact-points, so that at the termination of the winding said conductor returns upon itself at the point of starting, substantially as and for the purpose specified.

2. An armature for a multipolar dynamo-electric machine having two series of contact-points arranged either parallel to or concentric with one another, a continuous conductor connecting said contact-points, arranged to form a series of partial triangles having their apices at the said contact-points, and imaginary bases slightly greater than the angular distance between two like poles of the field-magnets, the conductor being continued progressively throughout the entire series of contact-points, so that at the termination of the winding said conductor returns upon itself at the point of starting, substantially as described.

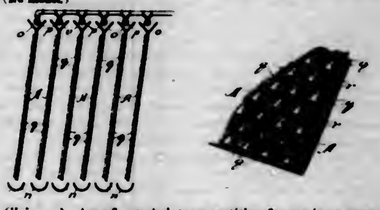
3. An armature for a multipolar dynamo-electric machine having two series of contact-points arranged either parallel to or concentric with one another, a continuous conductor connecting said contact-points, arranged to form a series of partial triangles having their apices at the said contact-points, and imaginary bases slightly greater than the angular distance between two like poles of the field-magnets, the conductor being continued progressively throughout the entire series of contact-points, so that at the termination of the winding said conductor returns upon itself at the point of starting, and field-magnet poles substantially corresponding to the angles produced by the intersections or crossings of said conductor, substantially as described.



4. An armature for a multipolar dynamo-electric machine having two series of contact-points of uneven number, a conductor arranged to form a series of partial triangles or two sides of a triangle with apices at said contact-points in both series, the said conductor being carried continuously and progressively throughout the entire series of contacts until at its termination it returns upon itself at the point of starting, substantially as described.

5. In a disk-armature, a pair of concentric rings, each containing a series of contact-points, and a conductor extending from one to the other ring on lines approximately tangent to the inner ring to one of the contact-points on the other ring, and thence returning directly and substantially at a tangent to another contact-point on the first ring, and so proceeding progressively throughout the entire series of contact-points until it returns upon itself at the starting-point, in combination with a series of field-magnets having poles substantially corresponding to the angles produced by the intersections or crossings of said conductor, substantially as described.

6. The combination, with an armature having a series of peripheral contacts, of a plurality of current-collectors, each comprising two revoluble contacts, one in contact with the armature and the other with a conductive fluid, and a conductive connection between the two, substantially as described.



7. The combination, with an armature having a series of peripheral contacts, of a plurality of current-collectors, each comprising two revoluble conductors, one in contact with the armature and the other in contact with a conducting-fluid contained in a conductive casing provided with means for securing thereto the line-wires, and a conductive connection between said rolling conductors, substantially as and for the purpose specified.

386,776. DEVICE FOR OPERATING A SET OF LEVERS. HERVEY D. GARIS, Chicago, Ill. Filed June 24, 1886. Renewed Apr. 20, 1887. Serial No. 235,197. (No model.)

Claim.—In a selecting device, the combination of the keys, the tumblers, and the tumbler-supports, said tumblers having notches distributed therein, as described, so that there is in each tumbler a notch corresponding to every tumbler-support, and said tumbler-supports being movable to enable them to enter said notches, substantially as described.

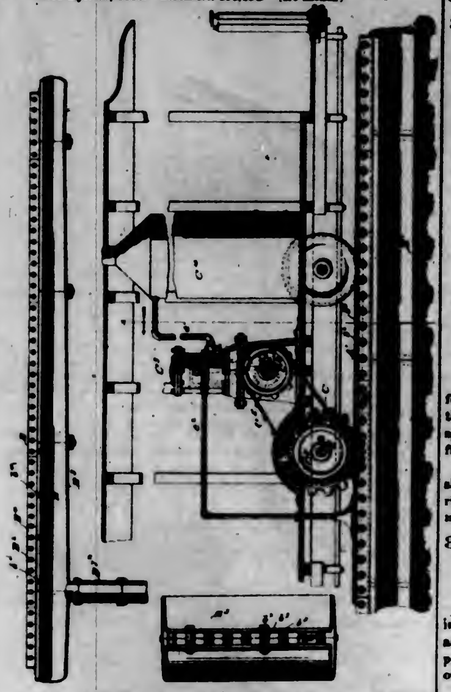
386,777. APPARATUS FOR MOISTENING AND CLEANING AIR. WILLIAM GRIESSER, Chicago, Ill. Filed Oct. 14, 1887. Serial No. 252,360. (No model.)

Claim.—1. A perforated plate or partition for use in an apparatus for moistening and cleansing air, having its surface provided with raised portions forming guide-troughs between perforations, substantially as and for the purpose set forth.

2. In an apparatus for moistening and cleansing air, the combination, with the water-supply, of a perforated plate or partition having its surface provided with raised portions, forming guide-troughs between perforations, and supported in operative position at an acute angle, substantially as and for the purpose set forth.

3. A perforated plate or partition for use in an apparatus for moistening and cleansing air, having lugs *q* upon its surface between perforations, substantially as and for the purpose set forth.

4. A perforated plate or partition for use in an apparatus for moistening and cleansing air, having triangular lugs *q* between perforations and extending to the latter, substantially as and for the purpose set forth.



386,778. SOLE FOR BOOTS OR SHOES. ALEXANDER HARVEY, Steubenville, Ohio. Filed Oct. 29, 1887. Serial No. 253,371. (No model.)

Claim.—1. The combination of a metallic shank forming part of an outer sole, and a wooden shank forming part of an inner sole, with leather fore parts for both, together forming soles for boots and shoes, in the manner substantially as described.

2. The combination of a metallic shank provided with penetrating points, forming part of an outer sole, and a wooden shank forming part of an inner sole, with leather fore parts for both, together forming soles for boots and shoes, in the manner substantially as described.

386,779. RAILWAY TRACTION DEVICE. DEXTER B. HARDY, Lake View, assignor of one-fourth to Melville E. Dayton, Chicago, Ill. Filed Apr. 17, 1886. Serial No. 199,194. (No model.)

Claim.—1. The combination, with track-rails, an upwardly-open conduit, and an open rack, the spaces between the teeth of which communicate with the interior of the conduit, of a car provided with wheels fitted to the track, a motor mounted on the car, and a spur-wheel actuated by the motor and engaging the rack, substantially as described.

2. The combination, with track-rails, an open rack, and a subjacent conduit in communication with the spaces between the rack-teeth, of a car provided with opposite track-wheels mounted on an axle, a spur-wheel mounted loosely on the same axle and engaging the rack, and a motor actuating the spur-wheel, substantially as described.

3. In a traction-railway structure, the combination of an open rack and a subjacent conduit communicating with the spaces between the rack-teeth and provided with discharge-passages, substantially as described.

4. The combination, with an open rack, of a pipe below the rack having a longitudinal slot, which affords communication between the spaces between the rack-teeth and the interior of the pipe, substantially as described.

5. The combination, with an open rack set at or near the surface of a roadway, of a slotted pipe located beneath the surface of the roadway and supporting the rack, substantially as described.

6. The combination, with an embedded slotted pipe, of wrought-metal plates or bars secured in place at opposite sides of the slot of said pipe, and cross-bars connecting said wrought-metal plates and forming the teeth of the rack, substantially as described.

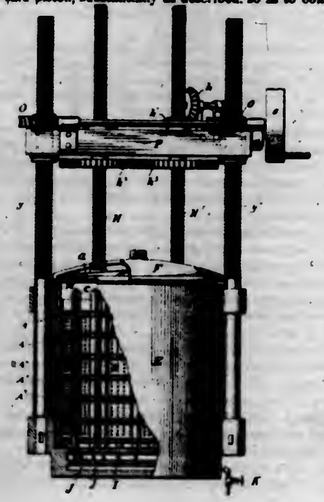
7. In an open rack for traction-railways, the combination, with the side plates or bars of said rack, of metal thimbles inserted between the side plates, and interior supports for said thimbles, substantially as described.

8. In a railway structure, the combination, with the separate side plates of an open rack, of metal thimbles inserted as studs between said plates, and bolts or rivets passing through said plates and thimbles, said bolts or rivets serving as ties, binding the opposite plates against the interposed thimbles, substantially as described.

9. The combination, with track-rails, of an upwardly-open conduit situated below the level of said rails, an open rack applied to the opening of the conduit and situated below the level of the rail-treads, a car fitted to the track and provided with a spur engaging said rack, and a motor rotating the spur mounted on the car, substantially as described.

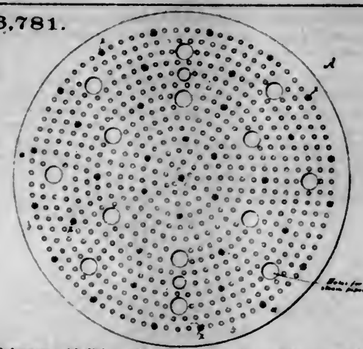
386,780. SIGN, ADVERTISING-CARD, &c. THEODORE P. HEBERLEIN, Connersville, Ind., assignor of one-half to Francis T. Reese, same place. Filed Aug. 18, 1887. Serial No. 247,241. (No model.)

Claim.—1. The sign-blank hereinbefore described, having the folding lines *e*, and having the three characters or designs printed thereon, one on the spaces *f*, another on spaces *g*, and the third on spaces *h*, so that when the blank is folded the three will show, each from a different position, substantially as described.



2. The improved sign hereinbefore described, consisting of the sheet B, folded to form the ribs *b*, and having the spaces between the ribs and the opposite sides of the ribs painted or ornamented in the manner set forth.

386,781. APPARATUS FOR DESICCATING MATERIALS. THOMAS R. HOUSEMAN and CHRISTIAN R. M. STROWLER, Philadelphia, Pa., assignors to the United States Food Fertilizer and Manufacturing Company, of Pennsylvania. Filed Sept. 23, 1887. Serial No. 250,462. (No model.)



Claim.—1. In combination, perforated disks, a series of pipes passing through said disks, into which heat is carried, a piston, and mechanism to operate said piston, substantially as described, so as to compress any material upon said disks and desiccate it, and means to carry off said liquid.

2. In combination, perforated disks, a series of pipes passing through said disks, in which heat is carried and radiated through the mass, a perforated cylinder surrounding said disks, a cylinder surrounding said perforated cylinder, provided with channels, a piston, and mechanism to operate said piston, substantially as described, so as to compress any material upon said disks and desiccate it, substantially as and for the purpose specified.

3. In combination, double perforated disks having supports and divisions between the upper and lower portions thereof, guide or guides upon which said disks are strung, a piston, and mechanism to operate said piston, substantially as described, so as to compress any

386,781.

material upon said disks and desiccate it, substantially as and for the purpose specified.

4. In combination, double perforated disks having supports and divisions between the upper and lower portions thereof, guide or guides upon which said disks are strung, a perforated cylinder having one or more channels surrounding said disks, a cylinder surrounding said perforated cylinder, a piston, and mechanism to operate said piston, substantially as described, so as to compress any material upon said disks and desiccate it, substantially as and for the purpose specified.

5. In combination, double perforated disks, supports and divisions between the upper and lower portions thereof, guide or guides upon which said disks are strung, a series of pipes passing up through said disks in which heat is conveyed, a perforated cylinder surrounding said disks, a cylinder surrounding said perforated cylinder having one or more channels, a piston, and mechanism to operate said piston, substantially as described, so as to compress any material upon said receptacles.

6. In combination, perforated disks, a series of pipes, C, passing through said disks, a pipe, c, in each of said pipes, an inlet for steam into said pipes C, and an outlet from said pipes c for condensed steam, a piston, and mechanism to operate said piston, substantially as described, so as to compress any material upon said disks and desiccate it.

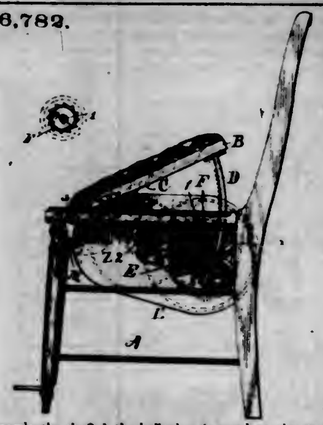
7. In combination, perforated disks, a series of pipes passing through said perforated disks in which heat is carried, a piston, screws H H', bevel-gear *h h'*, spur-wheels h^2 h^3, whereby said piston compresses any material upon said disks and desiccates it.

8. In combination, perforated disks, a series of pipes passing through said disks through which heat is carried, a piston, screws H H', bevel-gear *h h'*, spur-wheels h^2 h^3, beam P, worm-gearing O O, internally threaded, hubs Z Z', and screws *y y'*, whereby said piston compresses any material upon said disks and desiccates it.

9. In combination, a piston, perforated disks, and guides upon which said disks are strung, said guides provided with orifices, whereby the disks may be locked to the guides below the lowermost disk and above the piston.

10. In combination, a piston, perforated disks, guides upon which said disks are strung, said guides provided with orifices, whereby the disks may be locked to the guides below the lowermost disk and above the piston, and mechanism, substantially as described, to elevate said piston, whereby the disks may be elevated.

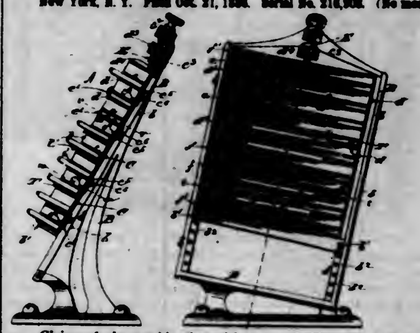
11. In combination, double perforated disks having divisions between the upper and lower portions thereof, guides upon which said disks are strung, a series of pipes passing up through said disks in which heat is carried, a piston, screws H H', bevel-gear *h h'*, and spur-wheels h^2 h^3, whereby said piston compresses any material upon said disks and desiccates it.



12. In combination, double perforated disks having divisions between the upper and lower portions thereof, guide or guides upon which said disks are strung, a series of pipes passing up through said disks, a piston, screws H H', bevel-gear *h h'* and spur-wheels h^2 h^3, beam P, worm-gearing O O, internally threaded, hubs Z Z', and screws *y y'*, whereby said piston compresses any material upon said disks and desiccates it.

13. In combination, perforated disks, a series of pipes passing through said perforated disks in which heat is carried, a piston-beam, P, worm-gearing O O, internally threaded, hubs Z Z', and screws *y y'*.

386,782. SEWING-MACHINE MOTOR. THOMAS W. HUGHES, Atlanta, Ga., assignor of one-half to Wilton G. Fortson, same place. Filed Sept. 1, 1887. Serial No. 248,500. (No model.)



Claim.—In a sewing-machine motor, the combination of the hinged seat B, the spring C, the rack D, the pinion E, ratchets F and F', and

386,782.

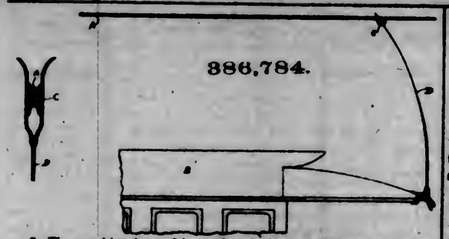
their pawls, the shaft 1, the helical spring and gearing to transmit the power of said spring, and the casing 1, supporting the bearings of said gearing and shaft, substantially as set forth.

386,783. TYPE-LINE HOLDER. LOUIS K. JOHNSON and A. AUGUSTUS LOW, Brooklyn, assignors to The Alden Type Machine Company, New York, N. Y. Filed Oct. 21, 1886. Serial No. 216,903. (No model.)

Claim.—1. In combination with a type-holder, A, substantially such as described, a supporting-frame, B, formed with the inclined flanges or seats *b b*, for supporting the sides of the case A, and with means, substantially such as described, for adjusting the height of the case thereon, substantially in the manner and for the purpose described.

2. A type-holder substantially such as described formed of a shelf-frame provided with transverse shelves and of a base-plate provided with transverse shields, the two parts fitting together and being movable upon and with relation to each other, substantially in the manner and for the purpose described.

3. In a type-holder substantially such as designated, the combination, with the shelf-frame provided with transverse shelves, and with the base-plate formed with transverse shields, said parts being superposed substantially as described, of the adjusting-screw E, for effecting the adjustment of the frame D with relation to the base-plate C, substantially in the manner and for the purpose described.



4. In a type-holder substantially such as described, the combination, with the series of inclined transverse type-channels *c'*, formed with the apertures *e* at their upper ends, of the secondary wall or partition *f*, arranged substantially in the manner and for the purpose described.

386,784. OVERHEAD WIRE-CONNECTION FOR ELECTRIC RAILWAYS. WALTER B. ENTZ, New York, N. Y. Filed May 10, 1886. Serial No. 202,094. (No model.)

Claim.—1. The combination, with an electrically-propelled vehicle, of an elevated supply-wire, a contact-wheel placed on a rod or suitable extension from the vehicle and provided with lateral guards forming an extension of the support and extending above the wire, preventing lateral displacement of the contact-wheel.

2. The combination, with an electrically-propelled vehicle, of a supply-wire, and a contact device adapted to travel along said wire and supported from a vehicle by a flexible resilient rod secured at one end, which presses the said contact device against the wire.

386,784.

3. The combination, with an electrically-propelled vehicle, of an elevated supply-wire, A, a contact-wheel, C, and a flexible resilient rod or whip, D, having a projecting guard extending beyond the bearing of wheel C and having an attachment with the vehicle.

4. The combination, with an electrically-propelled vehicle, of an elevated supply-wire, a flexible resilient rod extending from the vehicle, a contact on said rod adapted to bear against the wire, and a catch for holding said rod in an upright position.

5. The combination, with a car, B, of an elevated supply-wire, A, whip D, contact-wheel C, bearing against the under side of A, and having an extension of D, forming a guard, pivoted holder E, and catch G, for maintaining D in an upright position.

386,785. CHECK-PUNCH. JOHN C. LOWDEN, Kansas City, Mo. Filed Dec. 20, 1887. Serial No. 258,092. (No model.)

Claim.—1. In a paper-perforating machine, the combination of a number of punches, each connected to a lever, 12, and a hand-lever adapted to be moved over any one of the punch-levers, substantially as and for the purpose set forth.

2. In a paper-perforating machine, the combination of a number of punches, each connected to a lever, 12, and a hand-lever adapted to be moved over either one of the punch-levers, and having a horn engaging beneath the lever 12, to enable positive movement to be imparted by the hand-lever to the lever 12, both upward and downward, substantially as set forth.

386,786. METALLIC ROD-PACKING. JAMES MURRAY, Walla Walla Junction, Wash. Filed Jan. 16, 1888. Serial No. 260,992. (No model.)

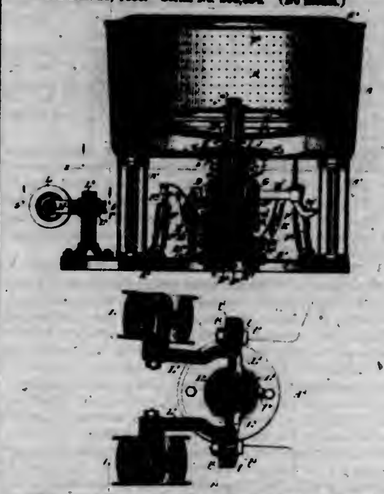
Claim.—1. A metallic packing for valve and piston rods, consisting of the larger rings formed with corresponding interlocking flanges and grooves and provided on one of their sides with a pin or projection, in combination with a series of smaller split elastic rings fitting between and within said larger rings in such manner as that the pins of the larger rings will enter the spaces where they are cut, substantially as described.

2. In a metallic packing for valve and piston rods, the combination, with the studs and adjusting-nuts and the gland or follower K, having grooves *e f*, of the larger metallic rings formed with corresponding interlocking flanges and provided on one of their sides with a pin or projection, and the series of small split elastic rings having the spaces where they are cut entered by the pins of the larger rings, substantially as described.

3. In a metallic packing for valve and piston rods, the combination, with the studs and adjusting-nuts, and the gland or follower K, having grooves *e f*, of the larger metallic rings formed with corresponding interlocking flanges and provided on one of their sides with a pin or projection, and the series of small split elastic rings having the spaces where they are cut entered by the pins of the larger rings, one of the said larger rings being provided with an oil cup or receptacle, substantially as described.

386,787. PENCIL-HOLDER. LEWIS B. MYERS, Fremont, Ohio. Filed Oct. 31, 1887. Serial No. 253,893. (No model.)

Claim.—1. A pencil holder or clasp formed of a single piece of wire bent at one end to form a continuous loop or coil to pass around the pencil, and at the other end bent to form a clamping-arm, substantially as and for the purpose described.



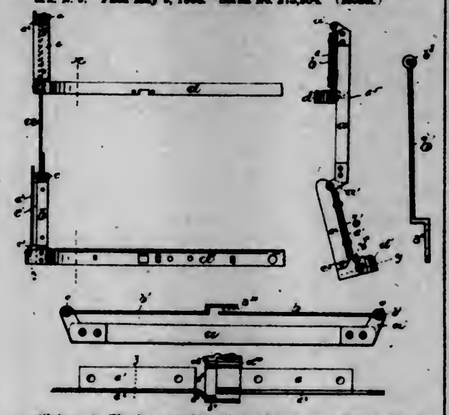
2. A pencil holder or clasp constructed of a single piece of wire bent to form two loops or part loops for passing around the pencil, and a clamping-arm for fastening the pencil to the garment, substantially as and for the purpose described.

3. A pencil holder or clasp constructed of a single piece of wire, one end of which is bent to form a loop or part loop, and at an intermediate point is bent to form another loop carrying a clamping-arm, substantially as and for the purpose described.

4. A pencil holder or clasp constructed of a single piece of wire, bent to form an inner and outer loop for passing around the pencil, the outer loop being provided at a suitable point with coils to form a spring for actuating the clamping-arm carried by the spring, substantially as and for the purpose described.

5. The herein-described pencil holder or clasp, constructed of a single piece of wire bent to form an inner and outer loop for passing around the pencil, a spring clamping-arm at right angles to the loops, and a guide for the clamping-arm, substantially as and for the purpose described.

386,788. CENTRIFUGAL MACHINE. GEORGE C. ROGERS, Chicago, Ill., assignor to the Troy Laundry Machinery Company, Troy, N. Y. Filed Mar. 26, 1888. Serial No. 268,254. (No model.)



Claim.—1. The combination, with the perforated revolving cylinder of a centrifugal extractor, a shaft supporting the same, a bearing for the shaft constructed to allow the inclination of the shaft, and an exterior shell or receptacle provided with an aperture in its bottom larger than the shaft for the passage of the latter, of a ring mounted upon the shaft and adapted to rotate freely thereon and a stationary ring in position for engagement with the ring upon the shaft when said shaft is inclined, substantially as described.

2. The combination, with the perforated revolving cylinder of a centrifugal extractor, a shaft supporting the same, a bearing for the shaft constructed to allow the inclination of the shaft, and an exterior shell or receptacle provided in its bottom with an aperture larger than the shaft, of a ring mounted to rotate freely upon the shaft, said ring being provided with a peripheral cushion, and a stationary ring sustained in position to engage the ring upon the shaft when said shaft is inclined, substantially as described.

3. In a centrifugal extractor, the combination, with the revolving cylinder and shaft, of a drive-pulley upon the shaft, a frame provided with a cylindric standard, L^2, and a horizontal bar, L^3, fitted to slide upon the standard, arms L' L', attached to the said horizontal bar, and guide-pulleys L^5, mounted upon the outer ends of said arms, the joints between said arms and the horizontal bar being formed with concave

and convex surfaces having the form of spherical segments and affording universal angular adjustment of the said arms with relation to the bar, substantially as described.

386,789. BAG OR SATCHEL FRAME. WILLIAM ROEHRS, Newark, N. J. Filed May 9, 1888. Serial No. 273,204. (Model.)

Claim.—1. The improved bag-frame herein described, combining therein end braces, *a a*, having an upwardly-turned extension, *a'*, and inlays *b b'*, in line or approximately in line with the pivots upon said extensions, and longitudinal pieces *d d'*, connecting the free ends of said inlays, substantially as and for the purposes set forth.

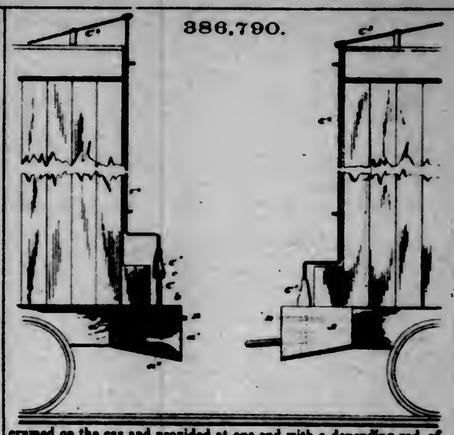
2. The combination, with end braces, *a*, having upward extensions at the ends thereof, and longitudinal pieces *d d'*, of inlays *b b'* for the inner and outer jaws, of which those for the inner jaws are straight at their free extremities, and the others, where they overlie the first said inlays, are bent to form a recess, b^2, substantially as and for the purposes set forth.

3. The combination, in a bag-frame, with vertically-disposed strap-like bars *a*, of hinged pieces *a'*, secured thereon and projecting upward therefrom, strap-like inlays *b b'*, notched, as at b^2, and turned, as at b^3, to receive the hinge-pin *c*, and said hinge-pin, one of the said inlays being bent at its free extremity to allow for the opposite or underlying inlay and longitudinal bars, all said parts being arranged and combined substantially as and for the purposes set forth.

4. In a bag-frame, the combination, with end braces or bars, *a a*, of flanged end pieces, *c c'*, inlays *b b*, and longitudinal pieces *d d'*, connecting the end pieces at the opposite ends of the frame, the flange of one of which end pieces is bent as c^2, where it engages the longitudinal piece *c'*, the body portion of the flanges of the said end pieces of the opposite jaws lying longitudinally in line, the said parts being combined substantially as and for the purposes set forth.

5. The combination, with end braces, *a*, of longitudinal pieces *d d'*, inlays *b b'*, and flanged end pieces, *c c'*, the flange of the inner of said end pieces being beveled, as shown at c^3, said parts being arranged and combined substantially as and for the purposes set forth.

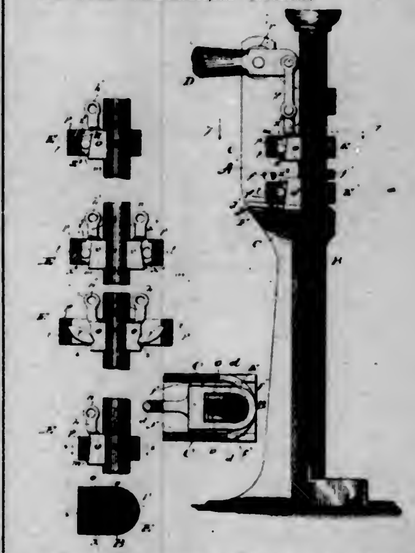
6. The combination, with end braces *a*, inlays *b b'*, and longitudinal pieces *d d'*, of flanged pieces *c c'*, the latter being cut away at their free ends to allow the longitudinal piece to be riveted to the inlay, and projecting, as at c^2, to engage the extremity of the said longitudinal piece and riveted thereto, said parts being arranged and combined substantially as and for the purposes set forth.



7. In a bag-frame, the combination, with end braces and longitudinal pieces, of hinge-pieces *a'*, secured upon said end braces at the opposite extremities thereof, and having upwardly-extending oppositely-inclined extensions adapted to receive or provide pivotal bearings for the jaws of the bag-frame, substantially as and for the purposes set forth.

8. In a bag-frame, in combination with vertically-disposed strap-like braces *a* and longitudinal pieces, hinge-pieces *a'*, riveted to said braces at the opposite ends thereof and provided with upward extensions, inlays *b b'*, pivoted upon said hinge-pieces, said inlays being provided with notches b^2 to receive the hinge-piece, and bent, as at b^3, to engage the hinge-pins, and said hinge-pins, said parts being arranged and combined substantially as and for the purposes set forth.

386,790. CAR-COUPLING. GEORGE STRADER, Olive Hill, Ky., assignor of one-half to Samuel V. Wilcox, same place. Filed Jan. 26, 1888. Serial No. 261,977. (No model.)



Claim.—1. The combination, with a draw-head having a perforated spring-pressed slide above the link-opening, and a lever fulcrumed on the car and provided at one end with a depending rod, of a block secured to the lower end of said rod, and having an open-sided inclined slot, a coupling-pin seated at its lower end in the pin-opening of the draw-head, and its head swivelingly seated at a point below the inclined inner wall of the socket-block, substantially as described.

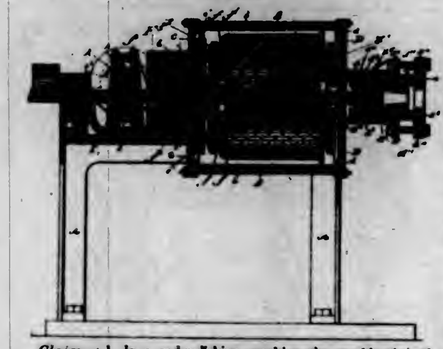
386,790.

2. The combination, with a draw-head having a perforated spring-pressed slide above the link-opening, and a lever fulcrumed on the car and provided at one end with a depending rod having its lower end threaded, of a socket-block provided at top with a tapped opening to receive said threaded end of the rod, and with an open-sided inclined slot, a coupling-pin seated at its lower end in the pin-opening of the draw-head, and having its head swivelingly seated below the inclined inner wall of the slot or socket, substantially as described.

386,791. LIFTING-JACK. AXEL A. STRÖM, Austin, Ill. Filed Mar. 12, 1888. Serial No. 266,946. (No model.)

Claim.—1. In a lifting-jack, the combination of a clutch-box or collar on the lifting-bar, a wedge embraced between the lifting-bar and a side of the clutch-box or collar, which it supports and carries, and in which it is longitudinally movable, and a lever connected with the wedge and operating to move it lengthwise, substantially as described.

2. In a lifting-jack, the combination of a clutch-box or collar on the lifting-bar, a wedge embraced between the lifting-bar and a side of the clutch-box or collar, which it supports and carries, and in which it is longitudinally movable, and having a perpendicular surface against the lifting-bar and an opposite inclined surface, and a lever connected with the wedge and operating to move it lengthwise, substantially as described.



3. In a lifting-jack, the combination of a clutch-box or collar on the lifting-bar, a wedge longitudinally movable in and supporting and carrying the clutch-box or collar, and having a perpendicular surface against the lifting-bar and an opposite inclined surface, a roller confined between the inclined surface of the wedge and the adjacent side of the clutch-box or collar, and a lever connected with the wedge and operating to move it lengthwise, substantially as described.

4. In a lifting-jack, the combination of a clutch-box or collar, *p*, on the lifting-bar, and provided with a removable bearing, *k*, against one inner side, a wedge, *o*, longitudinally movable in and supporting and carrying the clutch-box or collar, and having a perpendicular surface against the lifting-bar and an opposite inclined surface, a roller, *l*, confined between the inclined surface of the wedge and operating to move it lengthwise, and a lever, D, connected with the wedge, substantially as described.

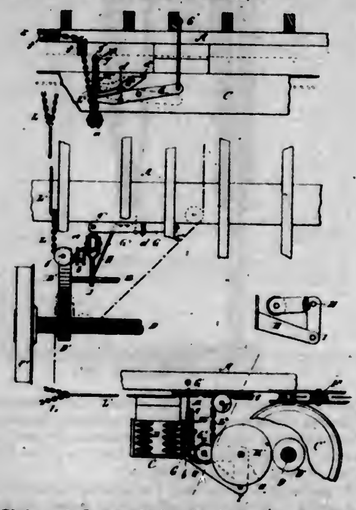
5. In a lifting-jack, the combination of a lifting-clutch, E, comprising a clutch-box or collar on the lifting-bar, and a wedge embraced between the lifting-bar and a side of the clutch-box or collar, in which it is longitudinally movable, a lever applied to the wedge, a stop for the lifting-clutch, a retaining-clutch comprising a clutch-box or collar on the lifting-bar, and a practically stationary wedge embraced between the lifting-bar and a side of the said clutch-box, and a lever, F, for the clutch-box or collar of the retaining-clutch on the stationary wedge to release the lifting-bar, substantially as described.

6. In a lifting-jack, the combination of a lifting-clutch, E, comprising a clutch-box or collar on the lifting-bar, a wedge longitudinally movable in the clutch-box or collar, and having a perpendicular surface against the lifting-bar and an opposite inclined surface, and a roller confined between the inclined surface of the wedge and the adjacent side of the clutch-box or collar, a lever, D, applied to the wedge and operating to move it lengthwise, a stop for the lifting-clutch, a retaining-clutch, E', comprising a clutch-box or collar on the lifting-bar, a practically stationary wedge in the said clutch-box or collar, and having a perpendicular surface against the lifting-bar and an opposite inclined surface, and a roller confined between the inclined surface of the said wedge and the adjacent side of the clutch-box or collar, and a lever, F, for moving the clutch-box or collar of the retaining-clutch on the stationary wedge to release the lifting-bar, substantially as described.

386,792. MACHINE FOR POLISHING RODS. LEROY SUTTERS, Chicago, Ill., assignor to Richard Sauer, Baltimore, Md. Filed Dec. 10, 1887. Serial No. 257,689. (No model.)

Claim.—1. In a rod-polishing machine, the combination of a revolving frame-work, a pair of belt-pulleys mounted in said frame-work, a slack belt running upon said pulleys, means for giving revolution to said frame-work, and means for revolving the pulleys, with a presser-pad secured to said frame and revolving with it and suitably located to press the rod against the belt, substantially as described.

2. In a rod-polishing machine, a revolving frame-work carrying a pair of belt-pulleys whose shafts are journaled in the frame-work and provided with pinions, as *c' c'*, on the ends of said shafts, in combination with a stationary spur-wheel, as E, meshing with the pinions on the ends of the shafts, and means attached to the frame-work for holding the rod against the belt, substantially as described.



3. In a rod-polishing machine, a revolving polisher consisting of a frame suitably mounted and provided with a pair of rollers or pulleys upon which is secured a polishing-belt, with means of giving revolution to the polisher and traveling motion to the belt.

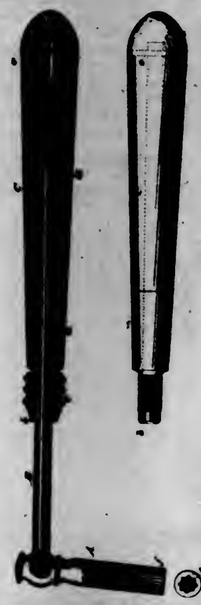
4. In a rod-polishing machine, the combination of a closed drum holding the polishing material with a revolving polisher which is provided with a traveling belt, and means for giving revolution to the polisher and traveling motion to said belt, substantially as described.

5. In a rod-polishing machine, the combination of a cylinder holding the polishing material with a revolving polisher constructed of a frame-work in which are mounted two rollers and upon them a belt, with means for revolving the polisher and of giving running motion to the belt, substantially as described.

6. In a rod-polishing machine, the combination of a cylinder holding the polishing material with a revolving polisher constructed of a frame-work in which are mounted two rollers upon which is based a slack belt, said polisher being also provided with a pressure-pad, substantially as described, to counterbalance the pressure of the belt, and a rod-wiper located outside of the drum and beyond it, substantially as described.

386,793. CAR-BRAKE. WILLIAM B. TURNER, New York, N. Y., assignor to the Turner-Smart Automatic Brake Company. Filed Sept. 21, 1887. Serial No. 249,986. (No model.)

Claim.—1. In a car-brake wherein the inward motion of the draw-bar is requisite for bringing the brake mechanism into operation, the combination, with brake-applying mechanism, substantially as herein shown and described, embracing a spring whose normal tension may be adjusted by hand for regulating or determining the power or pressure of the brake, of auxiliary mechanism consisting of lever G, pivoted on the car-truck, rod G', secured to the car-frame, and rocking block G^2, connecting with rod M, substantially as shown and described, connecting the car-body with said regulating-spring, for the purpose of automatically increasing the tension of the latter, and consequently increasing the brake-pressure in proportion to the increase in weight of the car-load, as set forth.



2. In an automatic car-brake, substantially as set forth, wherein an adjustable pressure-regulating spring is made operative to tighten or slacken the intermediate link between the draw-bar connections proper and the brake-applying mechanism proper, the combination, with said spring and intermediate link, of a device connected therewith and with the car-body, substantially as described, whereby said spring may be compressed and said intermediate link be tightened in proportion to the increase in the car-load by the consequent depression of the car-body, as set forth.

3. The combination, with the elbow-lever I, carrying the friction-wheel shaft, and the intermediate link, I, I', I^2, connecting said lever with the draw-bar connections proper, as set forth, and the pressure-regulating spring, rod, washer, and nut, M M' *g g'*, of rocking block G^2 and lever G, arranged on the car-truck, and the rod G', connecting the said lever G with the car-body, all arranged and operating substantially as and for the purpose set forth.

4. In a momentum car-brake, the combination, with the spring adapted and arranged to be operated or adjusted for regulating the normal pressure of the brake, of a suitable device connecting the said spring and the car-body, substantially as herein shown and described, whereby the former is compressed by the depression of the latter in consequence of and in proportion to the weight of its lading, as set forth.

REISSUES.

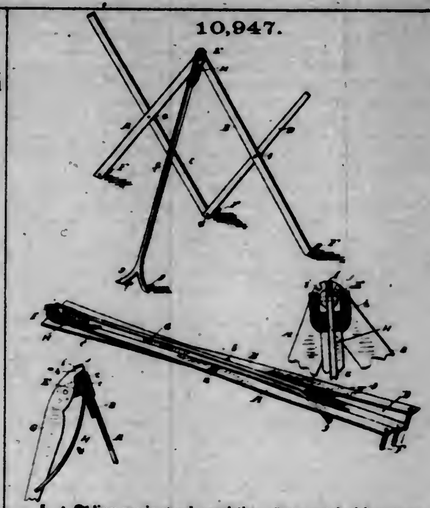
10,946. TUNING-HAMMER. FRANCIS W. HALE, Boston, Mass. Filed Mar. 5, 1866. Serial No. 295,302. Original No. 310,672, dated Jan. 13, 1869.

Claim.—1. The combination of the tubular handle C, the tubular ferrule *a* thereon, having its forward part elongated and reduced, split, and externally threaded, the round stem B, adapted to slide and swivel in said handle, the clamping-nut *c*, and the head A *e f* of the tuning-hammer, as and for the purpose set forth.

2. The combination, of the head A *e f* of a tuning-hammer, formed of steel, threaded at its lower part, and hardened thereat, and the tip *f*, also of steel soft at its threaded nipple and hardened at its lower end, whereby the threads of the tip bind in the head, which prevents the tip from unscrewing when the hammer is turned to let down a string, as set forth.

3. In a tuning-hammer, the combination, with the head A and stem B, united by screw-threaded nipple and socket, of the fork *d* upon the end of the stem, and the fixed pin in the interior of the handle for the purpose of screwing the stem into and unscrewing it from the head, as set forth.

10,947. FOLDING MUSIC-STAND. J. HENRY MAGEE, Jr., Baltimore, Md. Filed Apr. 10, 1868. Serial No. 270,284. Original No. 277,630, dated Feb. 7, 1868.

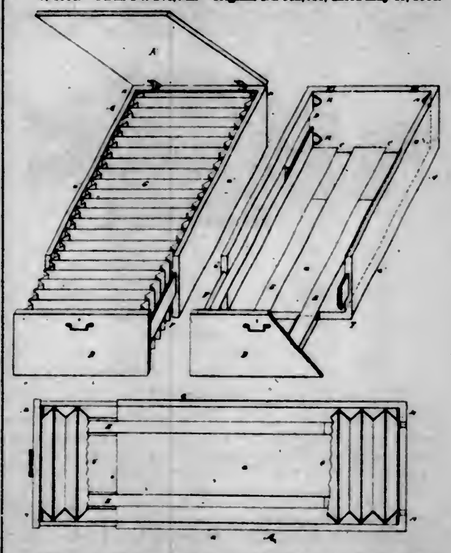


Claim.—1. A folding music-stand comprising a system of pivoted levers forming a support for the music and a leg connected at the junction of two of the levers, and forming with said levers a tripod to support the same, whereby the levers perform the double function of supporting the music and act as legs for the stand, substantially as described.

2. A folding music-stand comprising a system of pivoted levers, a pivoted leg connected to the top joint of the same and forming with said levers a tripod support, and a holder, as the spring H, for keeping the leg in the open position, substantially as described.

3. A folding music-stand consisting of the lazy-tongs, a leg pivoted near the top and forming with two members of said lazy-tongs a tripod support for holding the same in an inclined position, and the spring H, for forcing the leg rearward as the lazy-tongs are separated, as and for the purpose described.

4. A folding music-stand consisting of the lazy-tongs, a supporting-leg pivotally connected with the tongs at its top joint and forming with two members of said lazy-tongs a tripod support, and adapted to fold against said lazy-tongs and to be locked thereto, and a spring interposed between the leg and lazy-tongs for forcing the leg away from the tongs when the latter are separated to release the leg, as and for the purpose described.



10,947.

5. A folding music-stand consisting of the notched lazy-tongs, a supporting-leg pivotally connected to the lazy-tongs, and having a nib or shoulder adapted to enter the notches of the lazy-tongs to prevent the same from spreading, and a spring for forcing the lower end of the leg away from the lazy-tongs, substantially as described.

6. A folding music-stand consisting of the pivoted links A B C D, a stud, E, connected to the meeting end of the links A B, a leg pivoted to the stud, and having a projecting nib, *k*, at its extreme upper end above the pivot-pin, adapted to enter one of a series of notches in the links A B, and a spring for forcing the lower end of the leg away from the tongs, as and for the purposes described.

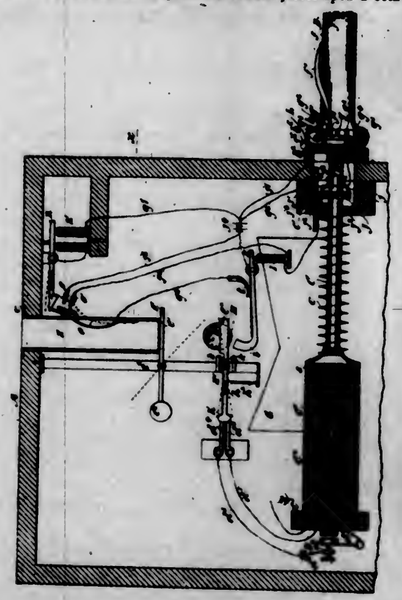
10,948. BILL-FILE. EDWIN L. MATTHEWS, Ada, Minn. Filed June 9, 1868. Serial No. 276,743. Original No. 302,716, dated May 15, 1868.

Claim.—1. The combination, with a pair of telescoping parts, constituting an extensible bill-file case, of an expansible bill-file secured within said telescoping parts, substantially as described.

2. The combination, with an extensible bill-file case, consisting, essentially, of a pair of telescoping parts, of a removable bellows bill-file detachably connected at its opposite ends to the end walls of the telescoping parts of said case, substantially as described.

3. In combination, the box-like body A, having its front end removed and provided with the grooves C D, the end B, provided with the slides E and F, working in said grooves, and the bellows file G, attached at one end to the relatively fixed part A and at the other to the relatively movable part B, as and for the purpose set forth.

4. In combination with a bill-file case, a bellows bill-file adapted to fit the same and having end boards provided with projecting outer edges, and hook-shaped legs secured in the ends of said case in pairs, with their hook-shaped portions facing each other, and adapted to detachably secure the ends of the bellows file to the ends of the case, as and for the purpose set forth.

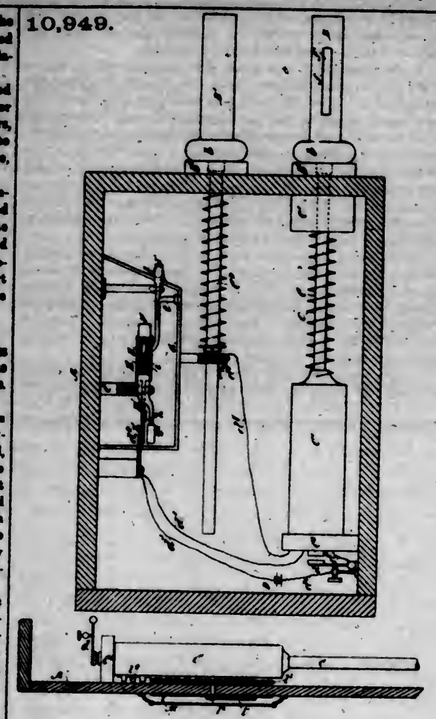


5. The extensible bill-file and expansible bill-file described, consisting of the box-like body A, having one end removed and provided with the grooves C and D, the movable end B, provided with the slides E and F, working in said grooves, the lid K, pivotally secured to the rear end of the body A, and the bellows file G, having its opposite ends secured by the legs H, one end to the relatively fixed part A and the other to the movable part B, substantially as and for the purpose set forth.

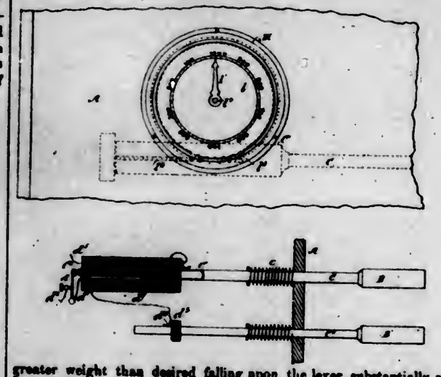
10,949. COIN-OPERATED INDUCTION-COIL. PERRY G. WILLIAMS and ALFRED W. BROWNE, Brooklyn, N. Y.; said Browne assignor to said Williams. Filed Jan. 28, 1868. Serial No. 261,627. Original No. 272,441, dated Nov. 1, 1867.

Claim.—1. The combination, with a case, of an induction-coil, an electric battery for energizing the same, contact-pieces, a normally-open electric circuit comprising the primary of the induction-coil, the battery, and said contact-pieces, a rocking lever adapted to be rocked into contact with said contact-pieces and close the said circuit upon a coin of desired weight and size lodging upon said lever until said coin is removed, a longitudinally-movable part in electrical contact with the secondary of the induction-coil, and two electrodes outside the case, one of said electrodes being longitudinally movable and rigidly connected with said longitudinally-movable part, substantially as specified.

2. The combination, with a case, of an induction-coil, an electric battery for energizing the same, contact-pieces, a normally-open electric circuit comprising the primary coil of the induction-coil, the battery, and said contact-pieces, and a rocking lever adapted to be rocked into contact with said contact-pieces and close the said circuit upon a coin of desired weight and size lodging upon said lever until said coin is removed, substantially as specified.



3. The combination, with a case, of an induction-coil, an electric battery for energizing the same, contact-pieces, a normally-open electric circuit comprising the primary coil of the induction-coil, the battery, and said contact-pieces, and a rocking lever adapted to be rocked into contact with said contact-pieces and close said circuit upon a coin of certain size and weight lodging upon said lever until said coin is removed, and to be moved past said contact-pieces upon a coin of greater weight than desired falling upon the lever, substantially as specified.



4. The combination, with a case, of an induction-coil, an electric battery for energizing the same, an electrical circuit, a lever adapted to be moved by a coin of certain weight to close said circuit and energize the induction-coil, an electro-magnet, an armature for the same, comprising a striker, a battery for energizing the electro-magnet, a circuit therefor, a movable part in contact with the secondary of the induction-coil, an electrode outside the case, and a connection between the electrode and said movable part, which when moved in one direction will cause the circuit on the electro-magnet to be closed, and thereby cause said striker to strike the coin, substantially as specified.

5. The combination, with a case, of an induction-coil, an electric battery for energizing the same, an electrical circuit comprising the primary coil of the induction-coil, a lever adapted to be moved by a coin of certain weight to close said circuit and energize the induction-coil, an electro-magnet, an armature for the same, comprising a striker, a battery for energizing the electro-magnet, a circuit therefor, an electrode outside the case, a press-piece connected with said elec-

10,949.

trode, and a switch adapted to be moved by said prem-piece to close said last-named circuit, energize the electro-magnet, and cause said striker to strike the coin, substantially as specified.

6. The combination, with a case, of an induction-coil, an electric battery for energizing the same, an electrical circuit comprising the primary coil of the induction-coil, a lever adapted to be moved by a coin of certain weight to close said circuit and energize the induction-coil, an electro-magnet, an armature for the same, comprising a striker, a battery for energizing the electro-magnet, a circuit therefor, a movable part in contact with the secondary of the induction-coil, an electrode outside the case, and a connection between the electrode and said movable part, which when moved in one direction will cause the circuit on the electro-magnet to be closed, a contact-piece adjacent to said armature, another electro-magnet, an armature therefor comprising a catch, a shaft down which a coin is to be dropped, and a spring extending into said shaft, adapted to be pressed outward by passing coin into a position where it will be secured by said catch, all being arranged and combined substantially as described, whereby when the first-named electro-magnet is energized and its armature attracted circuit will be closed on the second-named electro-magnet and said spring be released from the catch.

7. The combination, with a case, of an induction-coil, an electric battery for energizing the same, an electric circuit comprising the primary coil of the induction-coil, a lever adapted to be moved by a coin of certain weight to close said circuit and energize the induction-coil, an electro-magnet, an armature for the same comprising a striker, a battery for energizing the electro-magnet, a circuit therefor, an electrode outside the case, a prem-piece connected with said electrode and switch, adapted to be moved by said prem-piece to close said last-named circuit and energize the electro-magnet, a circuit therefor, a contact-piece adjacent to said armature, another electro-magnet, an armature therefor comprising a catch, a shaft down which a coin is to be dropped, and a spring extending into said shaft, adapted to be pressed outward by a passing coin into a position where it will be secured by said catch, all being arranged and combined substantially as described, whereby when the first-named electro-magnet is energized and its armature attracted circuit will be closed on the second-named electro-magnet and said spring be released from the catch.

8. The combination, with a case, of an indicator arranged upon the exterior thereof, and comprising a pointer, an arbor on which said pointer is mounted, a pinion on said arbor, an induction-coil, a longitudinally movable shell on said induction-coil, provided with a rack engaging said pinion, and a longitudinally-movable handle upon the outside of the case, directly connected with the shell and in line with the induction-coil, for moving said shell in one direction, substantially as specified.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE SIMONDS.

Decided July 10, 1888.

1. DIVISION OF APPLICATION.

The question of division, as decided in *ex parte Herr*, (41 O. G., 468,) re-examined, and that decision adhered to. The case of *Mosler Safe and Lock Co.* v. *Mosler, Bahmann & Co.* (43 O. G., 1115) considered.

2. PROCESS AND PRODUCT—PROCESS AND MACHINE.

When a process and product, or a process and machine, are so intimately connected that neither can exist without the other, the process is only the function of the machine, or the structure of the product or method of its construction, and when this relation does not exist the process and product and the process and machine are independent and distinct inventions, to be solicited in different applications. A process which is merely the function of a machine does not constitute patentable matter. Such a process may be an industrial fact or entity inherent in a machine, or such a process may be inherent in its product; but then it possesses no patentable novelty as a separate invention. (*Ex parte Blythe*, 30 O. G., 1294.)

On petition.

METHOD OF AND APPARATUS FOR KNURLING OR CORRUGATING THE SURFACE OF METAL ARTICLES.

Application of George F. Simonds filed November 2, 1887, No. 254,068.

Mr. Joseph P. Livermore for the applicant.

HALL, *Commissioner:*

In this application the examiner required an election of either the method or the apparatus as the sole subject of the application. He relied on the authority of *ex parte Herr*, (41 O. G., 468.) Applicant by petition asks the Commissioner to overrule these requirements.

The general conclusions of the Herr decision in so far as they affect the statutory subjects of invention as the subjects of separate patents and the specific patentable subjects in the premises—viz., the art and the machine—briefly stated are as follows:

It is impossible to consider the question of unitary inventions in one patent without having regard to the divisions of art to which they belong.

The word "art" is here used in the generic sense which it has in the constitutional provision which empowers Congress to promote the progress of science and the useful arts by securing to inventors the exclusive right to their inventions. Congress used the term in the same sense in Revised Statutes, section 4888:

Before any inventor or discoverer shall receive a patent for his invention or discovery, he shall * * * file in the Patent Office a written description of the same and of the manner and process of making, constructing, compounding, and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains or with which it is most nearly connected, to make, construct, compound, and use the same.

Herein a machine is impliedly asserted to be an invention appertaining to some useful art. The word "art" is the generic term which comprehends all inventions. By divisions of arts are meant the natural classes recognized by Congress in the statute which embraces every useful art—namely, the art, the machine, the manufacture, and the composition of matter. In Revised Statutes, section 4886, as is well understood, the word "art," being the definition of a class or division of inventions, has a limited and specific meaning.

The meaning of the above passage from the Herr decision is that in considering the question of unity or plurality of inventions it is necessary to have regard to the classification of inventions recognized by the statute.

41 OFFICIAL GAZETTE, page 468:

It is to be observed that Congress did not create the four general divisions specified in patent law. They exist in the nature of things, and while Congress had the power to disregard natural relations and divisions and establish artificial and arbitrary classifications, it has not seen proper to do so. * * *

Page 468:

Unlike the systems of England and other foreign countries, this one was founded upon the idea of requiring a careful, thorough, and complete examination of every application for a patent, for the purpose of determining the novelty and utility of the invention before it should receive the sanction of security by patent. Such a system could have no practical or successful operation, except by means of a proper and natural classification of the arts and the subjects of invention. * * *

Page 472:

I reaffirm the conclusion of *ex parte Blythe* in so far as it is held that Congress has recognized the natural classification of arts as existing in four great divisions, and that a single and distinct invention found clearly belonging in one ought not to be joined in the same patent with an invention belonging in another division. But I am not able to base this conclusion upon any statutory declaration or any ascertained intention of Congress to affirm or deny what may or may not be embraced in single Letters Patent, except as it may be determined from the system itself. The conclusion arises from the fact that Congress has required that each application for a patent shall be carefully examined by the Patent Office, to determine the novelty and usefulness of the invention, before Letters Patent can be secured; that it has recognized distinctly and clearly classification as a necessary part of the system; has vested the Commissioner with large discretion in the matter, and without such arrangement and classification it is impossible to carry out the express requirement of Congress as to examination. * * *

Page 473:

The definite and settled recognition of the natural and proper classification of patentable subjects will restore the practice in the Office to harmony with the system upon which it is organized, and will necessarily bring about a more definite, methodical, and systematic manner of conducting the examination of applications, and insure greater promptness, certainty, and reliability in the operations of the Office. If fairly recognized and carried out, it will remove the friction between the various divisions; and will avoid the unnecessary delays caused by the presentation of so many motions, petitions, and actions, which consume so much of the time and labor of the Office.

Under these general principles this application contains two inventions separately classified by nature and in the statute, and therefore it should be limited to include but one of these inventions.

The Herr decision treated an application having in

it, beside the question of one machine or two machines, the question raised by the application now under consideration—viz., whether a process (an art) and a machine or part of a machine can both be solicited in the same application.

The following remarks and conclusions of the Commissioner in the Herr decision apply to the case of attempted joint solicitation of a process and machine.

41 OFFICIAL GAZETTE, page 472:

Now, passing from these general considerations to their application to the present case, it will be seen that the application contains claims for a process and sub-process and claims for the mechanism or apparatus that executes these processes. The former fall within the class or division, an art; the latter within another class or division, a machine. I am aware of all that may be said in support of the idea that a process and an apparatus both conduce as means and mutually co-operate to produce a single result. But they are not one invention. They do not co-act and co-operate with each other so as to result in a third invention or combination. The process, to be patentable, must be wholly independent of the apparatus. The process is that which brings into existence the product or result. The apparatus is only the environment, the *vas everi* in or from which it operates, just as the beds of lakes and estuaries on the earth, with their tributary streams and surrounding forests, were the apparatus in which the great processes of nature were enabled in early geological periods to form coal for man in later ages.

An apparatus may combine that which is static with that which is dynamic, as in the case of apparatus for refrigeration by the use of volatile agents. The principle is the same. The apparatus furnishes the conditions, the forces of nature supply the result. So, too, in patentable methods which may be executed by machinery. The method is wholly and entirely separate and distinct from the machine. It is of the very essence and quality of such a method that it must be wholly independent of the machine and the machine of it. * * *

It is well known that the patent authorized by law is for the thing invented and not for the notion or idea existing in the mind or the mental operation which develops the invented thing. The statute does not authorize patents for invention in the latter sense. It is the actual embodied subject invented that may be secured by patent. The mental operation which may be termed "invention" or "inventing" is a subject of the metaphysics of the mind, but not of the patent law. The statute declares that—

"Any person who has invented or discovered any new and useful art, machine, manufacture, &c., may obtain a patent therefor."

It is the specific art, machine, or manufacture which may be patented—not the invention of that art, machine, &c. It is the *vendible* thing, not the *principle*. (Phillips on Patents, 107, 150; Godson on Law of Patents, 52.)

A process can be embodied in words and descriptios; it may exist and be defined for a period coextensive with human knowledge, capable of being exercised without being exercised, just as a machine may exist at rest without being operated; it may be patented, granted, and assigned, because it is a distinct and vendible property; it exists wholly distinct and independent of machine or apparatus, which is also a distinct and vendible property. It can make no difference that the mind of the inventor may have invented and discovered the apparatus and the process in the same mental conception or by the same train of mental operations. The process may be invented by one person and the machine or apparatus by another.

Page 465:

The necessary effects or operations of specific mechanism are not necessarily processes or methods within the meaning of the patent laws. The use of a machine in the manner and for the purpose for which it was constructed is the thing secured and enjoyed under Letters Patent; but it is the machine itself that is patented. A method or process, such as the law recognizes as patentable, must have an existence independent of the machine or apparatus by which it is carried out to its result. It must be a method or process that can be carried out by hand or by various kinds or forms of mechanism or apparatus. If the act or result is simply that of the mechanism itself, so related to it that it cannot exist independently, and it is the sole utterance of the machine, then the supposed method or process does not exist. The function of a machine can have no separate existence and is completely and sufficiently covered by a patent for the latter.

In support of these conclusions are cited *Rubber Co.* v. *Goodyear*, (9, Wall., 788;) *James* v. *Campbell*, (104 U. S., 356;) *Corning* v. *Burden*, (15 How., 252;) *Dederick* v. *Cassell*, (9 Fed. Rep., 306;) *New* v. *Warren*, (23 O. G., 587;) *McKay* v. *Jackman*, (20 Blatchf., 466;) *Hatch* v. *Moffatt*, (15 Fed. Rep., 252;) *Goss* v. *Cameron*, (14 Fed. Rep., 576;) *Gage* v. *Kellogg*, (23 Fed. Rep., 891;) *Cochrane* v. *Deener*, (94 U. S., 780;) *Eachus* v. *Broomall*, (115 Id., 429;) *Vermont Machine Co.* v. *Marble*, (19 Fed. Rep., 307; 20 Id., 117;) *Graham* v. *McCormack*, (11 Fed. Rep., 859;) *Graham* v. *Geneva Lake Manufacturing Co.*, (11 Id., 138;) *Cahn* v. *Wong Town On.*, (19 Id., 424;) *Callender* v. *Griffith*, (18 Blatchf., 110.)

The final conclusions are—

Page 472:

In the present case there are contained in the same application claims for the mechanism and claims for processes. Such inventions are found in separate classes and ought not to be comprehended in the same Letters Patent. I have no reason to believe that a patent covering both would be declared null and void in the courts, for reasons already fully set forth; but this fact furnishes no reason why the principles which underlie the system should be disregarded or the discretion of the Commissioner of Patents should not be exercised in accordance with those principles. Further justification for this conclusion is found in the fact that the apparatus or machine in or by which a method or process is carried out is a distinct and separate thing from the method or process. * * *

Page 473:

It must be regarded as settled by the very highest authority that an apparatus and a process are separate and distinct inventions. There is no requirement of law that they must or ought to be comprehended in a single patent, while there are many reasons why they ought not to be. A claim for a machine or apparatus and a claim for the process should be prosecuted in separate applications, and each, when allowed, should be comprehended in a single patent.

These considerations and conclusions require the separation in different applications of the art and the machine claimed together in this application. These methods or processes—meaning arts—are purely mechanical. The entire result effected by each of them is to change the form of a blank by forging it. They, and all like them, are as clearly as are all kinds of processes (assuming that they are due processes) necessarily to be divided from any machine which can execute them. The last paragraph of one of these passages above cited applies peculiarly to every application in hand:

So, too, in patentable methods which may be executed by machinery. The method is wholly and entirely separate and distinct from the machine. It is of the very essence and quality of such a method that it must be wholly independent of the machine and the machine of it.

See, also, *ex parte Blythe*, (30 O. G., 1324:)

It is argued that the process claim in this case demands of necessity certain apparatus, and that the person who invented the process necessarily and by the same mental act also conceived the apparatus; that the process is such that it is impossible to practice it without using this apparatus. If this is the case, then either the process or the apparatus is lacking in patentable novelty. If the process is such that the recital of it suggests the apparatus, then this apparatus requires no invention to produce it, and the invention is solely in the process. It is in such case but the obvious means of effecting the process, and need not be even described in the specification. (*Tilghman* v. *Proctor*, 19 O. G., 85.) If the process is merely the function or operation of the apparatus, then the process possesses no patentable novelty, but is a necessary consequence of the construction and arrangement of the machine. The courts have frequently held that a "process" which is merely the function of a machine does not constitute patentable subject-matter. (*Dederick* v. *Cassell*, 20 O. G., 1233.) Such a "process" may be an industrial fact or entity inherent in the machine, *or even in a product*, but it possesses no patentable novelty as a separate invention. It may be but a necessary consequence of the real invention.

If, as applicant says, it is entirely impracticable to practice the process without using the apparatus, it would seem unnecessary to patent the process at all, since it would seem that a patent for the apparatus would fully protect the invention. The very purpose of a process patent is so to cover the invention as to protect the practice of the process, even when carried out by different mechanism. This fact of itself establishes the independence of the process as an invention from the apparatus as such.

A basic principle as to process and machine is, if the process be no more than the function of the one machine, it is not patentable. As above cited, "the function of a machine can have no separate existence and is completely and sufficiently covered by a patent for the latter," (the machine.)

An analogous doctrine applicable to process and product is announced by the Supreme Court in *Mosler Safe and Lock Co.* v. *Mosler, Bahmann Co.*, (44 O. G., 1115.) Therein an applicant claiming an article filed another application for the process of making the article, the process being described in his first application and being the necessary method for making the article. The Court said:

In other words, claims 1 and 2 of No. 281,640 are each for an article produced by a described method or process, and the claim of No. 288,136 is for such method or process of producing such article. The method is a purely mechanical method. No. 281,640 was applied for more than eleven months before No. 288,136 was applied for, and was issued twenty-eight days before No. 288,136 was issued. There was no patentable invention in No. 288,136 *when it was applied for*, in view of *what was applied for* by claims 1 and 2 of No. 281,640.

The Court having asserted the principle as applicable to the two cases when in applications now applies it to them when in patents in the following language:

After a patent is granted for an article described as made by causing it to pass through a certain method of operation to produce it—as, in this case, cutting away the metal in a certain manner and then bending what is left in a certain manner—the inventor cannot afterward on an independent application secure a patent for the method or process of cutting away the metal and then bending it so as to produce the identical article covered by the previous patent, which article was described in that patent as produced by the method or process sought to be covered by taking out the second patent.

So, also, in regard to cases of process and product and process and machine, the product and the machine are the only patentable subjects wherever the process is no more than the necessary way of using the machine or the necessary functions of the machine, or is no more than the necessary or obvious manner of effecting the product. In such cases there is no patentable invention in the process in view of the machine or of the product.

This principle that a mechanical process or method is either the function of only one machine, and consequently not patentable, or an invention existing independently of any particular machine, and thus an invention in natural and statutory classification, essentially different from a machine, requires all processes and machines to be solicited in separate applications. Therefore it is unnecessary to consider the specific character and relation of any process and machine so solicited together. Their natures as process and machine require their separation.

As was said in *ex parte Herr:*

But the case is not now before me on its merits, and in pointing out the preceding distinctions I do not intend to determine or even intimate whether the applicant is or is not entitled to claim a process or method in this case, nor whether his process claims cover a process or method or are in fact mere claims for mechanism. The applicant having designated his process claims as such, has the right to prosecute them as such. For the purposes of the present question he is entitled to have them admitted to be such, and the validity and propriety of his claims must be left to the Primary Examiner, unaffected by what is said here.

[The claims herein are omitted, the first being for a die and the second for a process.]

Now, the use of a die is not patentable any more than the sale of it is patentable. Both are monopolies secured by the patent. The die itself is the patentable thing. It seems clear that, in order to sustain this claim, it would be necessary to construe it to be a claim for the pair of dies having the construction of claim 1. As a method, this claim seems to have no patentable substance. It is a mere use. Its substance is the dies. The same idea of the claim may be reached by a different course. In claim 2 the dies of the application have been introduced by their functions rather than by the construction by which they effect their functions. So that the applicant intends the claim to mean:

The method of knurling metal articles, which consists in using any dies which have the functions of my dies, in the manner in which my dies are used.

From this view of the specification and claim it appears that claim 2 is a claim for nothing more than the functions of the dies of this application. If, however, this process claim be anything more than a claim for the use of the dies of this application, or for the functions of those dies, then it is an improvement in an art, an essentially different invention, which cannot be prosecuted in the same application in which the dies are solicited.

For these reasons the examiner's decision must be affirmed.

So all the method claims herein are mechanical. They recite the functions of certain dies which change the shape of a metal blank which is rolled between them. There is certainly no relation between these methods and the dies that execute them which does not exist between any process and a mechanism which executes it.

There is one peculiar circumstance connected with this application which may be mentioned, although it will undoubtedly receive the attention of the examiner, because it throws much light on the series of applications. The applicant so long ago as June 9, 1885—more than two years before the filing of this the earliest of the series of applications in the premises—obtained a series of patents relating to the art of forging. They are No. 319,752, machine for forging car-axles and other metal articles; No. 319,754, die for forging metal articles circular in cross-section; No. 319,755, method of forging metal bars; No. 319,756, die for spherical articles.

The first noticeable thing is that the applicant has taken out separate patents for the machines, the tools, and the method of forging or pressing iron into various shapes. These will be the controlling and dominant patents in the series. The inventor wisely took separate patents for these. But now, seeking to patent the detailed and varied forms of dies, which may become unlimited in number, he united with each claim for a die a claim for its idiosyncrasy or function as a method.

Again, all the dies of this application are declared to be usable to effect all of their purposes in the machines of one of his patents. The improvements on the dies consist in the shapes of a portion of their surfaces, differing only in shape from the forming shapes of the dies of applicant's Patent No. 319,754. These dies are used in the same machine in which the dies of Patent No. 319,754 are used, and the only difference in the form produced in each application of this series is an article of a different shape from that made by the die of his patent. Indeed, he says that the projections of each set of dies in the new applications of which the case under consideration is one may be used on the die of his patent, and in each application he shows the dies of the patent with no change whatever except that the shaping-surfaces are changed in form according as the shape of the article which he desires to make varies in each application.

So it would appear that in each application this applicant has (over the subject of his patents) merely a new die used as the old die was used to forge articles, thus effecting a double use of its process or functions. This appears the more striking when the claim of his method patent is read. It is as follows:

The improved method herein described of forging or rolling metal articles, consisting in treating the bar ingot or fagot at two or more points simultaneously to change its form and spread the metal toward its ends.

Now, the "treating" of that claim is rolling the metal between dies moved in opposite directions horizontally, one over and the other under the ingot, to roll it between them, indent and shape it simultaneously at its top and its bottom, to spread the metal axially, and to continue the two indentations in shapings and the spreading around the rolling ingot until they meet, and to repeat that operation by the continuous rolling of the blank or ingot until it is sufficiently reduced and completely shaped. This is exactly the treatment of the ingot in the application before me. The only difference is that in each application the indenting or shaping surface of the die is specifically changed in shape. Cross-projections give the new shape in one set, to make knobs or knurls in the forging. Another shape is that which makes screw-threads, &c. Another shape is for fluted, toothed, or corrugated cylinders, or other circular articles.

The interesting question is, how can there be any new method over the patented method or the methods included in that method described in the specification of the patented method when there is no new operation of the machine or movement of the dies relatively to the blank, when there is nothing new except the shape of the dies used to execute the method? Doubtless the examiner will notice and treat this question. It is enough for the question before the Commissioner to determine that in this application there is a machine, or parts of a machine, which must be put into another machine to be operated, and an asserted method which is purely mechanical. This determination alone, without any further inquiry, requires a solicitation of the methods and machines of this series of applications severally in separate applications.

The foregoing conclusion has been reached on the assumption that the principles of the Herr decision so far as applicable to the application in hand are yet in unimpaired force.

The applicant has presented an argument against their validity. His contention is:

First. That they are rendered invalid by the decision of the Supreme Court in the Bell telephone cases, (43 O. G., 377.)

Second. That the discretion of the Commissioner ought to be exercised in favor of joinder of a machine and its process when they bear the relations which he says his inventions have toward each other.

In support of the first proposition the language of the Court is cited, as follows:

> It (the claim of Bell's patent) is to be read as a claim for—
> 1. The method of transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth.
> 2. The apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, * * * substantially as set forth.

Again:

> Bell's patent is not alone for the particular apparatus he describes, but for the process that apparatus was designed to bring into use.

Applicant draws from this decision the conclusion that—

> It is not lawful to comprehend in a single original patent both a process and an apparatus for working the process. There is no room for doubt whether a patent containing claims for both process and apparatus is valid.

The answer is that there is just as much room to doubt the validity of a patent containing such claims as there was before the decision in the Bell telephone cases. No direct decision can be found upon the question before that decision was rendered, and that decision did not consider or determine the question. It is a case parallel with *Merrill* v. *Yeomans*, of which the Commissioner said in *ex parte Herr:*

> "It is fairly to be inferred from this statement that if all which is described as new in these specifications is really so the inventor has a right to patent for three inventions:
> "1. For a modification or improvement in the distilling apparatus.
> "2. For a new process or mode of distilling heavy hydrocarbons, oils, * * *
> "3. For the product of this new process of distillation." * * *
> But it is quite certain that in using this expression the Court did not have in mind and did not intend to determine any question relating to comprehending two or more inventions in a single patent. All that was meant was, that the inventor was entitled to protection under the patent law by having his three inventions properly patented. He had already secured the apparatus and the process in a single patent. No question was raised as to its validity on account of its covering two separate inventions. If there had been, the Court would no doubt have sustained the patent as having been granted within the Commissioner's discretion.
> It must be regarded as settled by the very highest authority that an apparatus and a process are separate and distinct inventions. There is no requirement of law that they must or ought to be comprehended in a single patent, while there are many reasons why they ought not to be. A claim for a machine or apparatus and a claim for the process should be prosecuted in separate applications, and each when allowed should be comprehended in a single patent.

The applicant contends that the discretion of the Commissioner ought to be exercised in favor of the joinder of apparatus and process, executed by the apparatus.

Every consideration which the applicant advances in support of the proposition received careful consideration at the hearing and decision of the Herr case. They are presented in the applicant's printed argument in paragraphs numbered from one to ten. They are designated as ten advantages which would result by uniting claims for processes and apparatuses in the same patent. They really recite the disadvantages which would be avoided by putting these different inventions into one patent. The fallacy of these points rests in this—that the disadvantages do not occur by reason of the inventions being process and product or being any other couple of inventions found in different natural divisions of art. The same disadvantages occur when two invention of such nature that one controls the other are separately patented. They occur whenever two arts, two machines, two manufactures, or two compositions are separately patented, which have the relation of a controlling and a controlled inventions. These disadvantages are inherent in the patent system. The only way to avoid them is to grant all inventions in one patent.

Every week the Patent Office issues patents subject to every disadvantage recited by the applicant. Every patentee takes his patent subject to them. For example, whoever obtains a patent for a telephone is subject to these disadvantages, because the Bell patent, a controlling patent, exists. These disadvantages must exist. And the Patent Office must grant patents for single inventions which are found to be new and useful, regardless of the conflicts and disadvantages which the applicant recites. The decision of questions arising from such complications of rights as he suggests, and which are inseparable from the patent system, must be left to courts and juries, not to the Patent Office.

The relation between process and apparatus is necessarily intimate, and this intimacy increases as the approach is made toward the mere function of an apparatus or machine until the process or method ceases to exist as an independent conception. This latter condition is well illustrated in the present case:

> The alleged process requires the mechanism. The mechanism has no use except to perform the operation which constitutes the so-called process. * * *
> The new treatment of the metal, the new way of making a screw, for instance, is a process which can only be performed by an instrument which was invented for carrying out the process and which is incapable of other use.
> The two are inseparable. If the mind is directed to the operation upon the metal, a new way of treating the metal is perceived, due to the peculiar character of the instrument by means of which the operation is performed. If the mind is directed to the instrument, it is seen that it is adapted to perform a new operation and that it has no other use.

Now, here are two things admitted by the applicant to be different and neither a part of the other—the one being a series of acts performed on metal, the other a mechanism by which those acts are effected in succession. They are separately classified in the statute. He claims the things separately, as they must be claimed. He then asserts for them such close relationship that neither can be exercised without exercising the other—that is to say, each of his processes is the function of its machine only. The inseparability of his processes and machines is proof of the non-patentability of the processes. So that it appears that the intimacy of relation between his inventions of different classes is that intimacy which renders one of them unpatentable, according to the settled doctrine of the Blythe and Herr decisions and of the court decisions cited in them. The doctrine of those decisions does not permit a process and apparatus to be claimed in one application in any case whatever.

There appears to be nothing in the positions taken by the applicant which affects the soundness of the Herr decision or removes his inventions from its authority.

The requirement for a division of this application is affirmed.

EX PARTE SIMONDS.

Decided July 10, 1888.

1. DIVISION—WHAT SHOULD BE ELIMINATED FROM THE SPECIFICATION, DRAWINGS, &c.

When an applicant is required to divide his application and eliminate from his specification so much thereof as relates to the invention which he elects to withdraw, the drawings of such invention should also be canceled, unless they are actually necessary to enable those skilled in the art to construct or operate the invention retained. It is not necessary that those skilled in the art should have made the exact subject of the invention, provided the general state of the art is such as to enable them to make it.

2. SAME—SAME.

In such case it is enough for the applicant to state in a general way the manner and means in which his invention can be constructed. The requirement in this particular is necessary to prevent duplication of printing drawings and specifications, to save expense in the examination and preparation for issue, and in the various forms of publication and reproduction of the same; also, to relieve the public of uncertainty as to the scope of the patent and its possible scope as a reissued patent, and to protect the public in other directions.

On petition.

PROJECTILES AND IMPLEMENTS FOR APPLYING A PATCH THERETO.

Application of George F. Simonds filed August 29, 1887, No. 248,159.

Mr. Joseph P. Livermore for the applicant.

HALL, *Commissioner:*

This application originally contained two independent inventions—a projectile having a patch of leather and a tool for applying the patch to the projectile. A division was required. The applicant elected to make the projectile the subject of this application. He expressed this selection by removing the tool from the title of the application, from the general statement of the invention, and from the claim. There remained and still remain in the application an illustration of the tool, being Fig. 6 of the drawings, and, in the specification on page 2, a brief description of Fig. 6, and from line 12 of page 3 to line 12 of page 4 a particular description of the same tool. The examiner required that—

> the description of Fig. 6 on page 2 and all matter descriptive of said figure should be eliminated from the specification. Fig. 6 of the drawing should also be canceled.

Applicant argued against the requirement, basing his argument on section 4888 Revised Statutes. His contention is, in effect, that this section requires every application to contain a written description of the invention and of the manner and process of making, constructing, compounding, and using it in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains or with which it is most nearly connected to make, construct, compound, and use the same.

The examiner replied that the statute does not—

> grant to an inventor the right to include in one application two separate and distinct inventions, as is done in this case, there being no unity of invention between the patched projectile and an implement by which it may be patched.

He then repeated his requirement, substantially as above stated.

The examiner considers this requirement to be a part of his former one, that the application should be brought to contain no more than one invention; that the applicant having begun to comply with this requirement by taking the tool from the title and the claim should complete his compliance by removing the illustration of the tool from the drawings and specification proper. It is true that the statute requires the applicant to describe the manner of making his patched projectile sufficiently to enable a person skilled in the art to which the invention most nearly relates to make the projectile, and he ought to be allowed and even to be required to do so. If persons skilled in the art of patching projectiles, or the broader art of covering rigid materials with elastic materials, would not be able to patch this projectile without knowledge of the construction and operation of the implement herein shown and described, and Fig. 6 were necessary to inform them, then its description should remain in this specification. If, on the contrary, skilled persons on reading the remainder of this specification and the explanatory drawings of their own knowledge could put together the patch and the projectile, then the statute does not require any illustration or description of any tool for applying a patch to a projectile, and all such showing and description should

be removed from this application. This tool holds a leather ring on the outside of stretchers. It stretches that ring radially, inserts the projectile inside of the stretcher-ring and stretchers, and then withdraws the stretchers, permitting the leather ring to contract on the projectile. Applicant states in his argument as follows:

If persons skilled in the art of making projectiles are acquainted with this means and method, or of (sic) any others, of applying leather patches to them, Mr. Simonds is not aware of the fact.

The argument seems to be that if no one ever put a leather-ring patch onto a projectile, when it was first done no one but the man who first did it would have common knowledge or skill enough to do the same thing, unless he was fully informed of the construction and operation of the tool by which the first man did it. Evidently this is a fallacy. There is no such necessity. If there are no workmen skilled in the art of putting leather patches on projectiles, yet there are plenty of workmen skilled in the art of putting elastic tubes on rigid things, for that is as old as the art of rubber-working. Moreover, this tool is used in the art of leather-working, so that rubber-workers or leather-workers, or common skilled mechanics, on reading the specification, would be able of their own common knowledge and skill to stretch this leather ring on this projectile. For example, the patch might be driven off from a stretcher over and around the stationary projectile and the stretcher withdrawn, permitting the patch to contract over the projectile. Applicant's tool would not be used to do this; but any of the tools used to put a rubber nut onto its bolt or to put a gasket onto a bottle-stopper, or, in fact, a common glove-stretcher, would obviously do all that applicant's tool does. The decision of this question rests upon a question of fact merely, whether the illustration and description in contention are necessary to enable a leather patch to be put onto a projectile. From the above considerations I conclude that they are not; that applicant might state in a general way that he stretches the ring by any suitable tool, and then either inserts the projectile within the stretcher and stretched ring or moves the ring so stretched over the projectile, then withdraws the stretcher, allowing the ring to shrink onto it, and that he may do this by any suitable tool. Such a statement would fully meet every requirement of the statute.

There is no more warrant for allowing this applicant to illustrate and describe this tool in the present application than there would be for allowing him to show and describe the machines referred to in his specification from line 23 of page 2 to line 5 of page 3. If he can have this tool shown and described here, then he can also have shown and described herein the roller-forging machines for forging the corrugations shown in the drawing, and which he says are the subjects of other applications. Applicant asserts that the position in this application of this alien matter would work no injury to the public. This matter, foreign to the subject of the application, is accompanied by a reservation of the implement as the subject of a future application. This Office has expressed its opinion of the effect of such practice in *ex parte Blair*, (43 O. G., 113.)

Applicant has, as he thinks, taken care of himself. It is for the Patent Office to care for the public. This duty it performs by requiring an applicant to confine his application in its claim, specification, and drawing to one invention and to no more than is necessary to disclose that one invention. By so doing it saves the public unnecessary expense in the examination and preparation for issue of the application and in the various forms of publication and reproduction from time to time of the specification and drawings of the patent; relieves the public of uncertainties in the scope of an original patent and in their rights under such a patent, and in its possible scope as a reissued patent, and protects the public from single patents for things which were not new and from duplicate patents for the same thing by keeping all patented things of the same kind separately in the same place.

If the Patent Office should generally allow applicants for articles to display in their drawings and specifications the tools and machines which are used in making them, the injury to the Office, to applicants, and to the general public would be unendurable. In such a case as this, where applicant has a reservation for a future application for the machine for making the article, the disadvantage to the Office and public is manifested and seems without any benefit to the applicant. In this application a general statement of the procedure in applying the patch, such as has been suggested, is all that is necessary. Yet, if applicant desires, a cross-reference to another application for the machine, as one by which the patch can be applied to the projectile, would be proper.

Applicant has based his contention on the necessity of the case to conform his specification to the statute. There being no such necessity, or any other apparent reason to the contrary, Rule 71 applies, and requires this decision of the examiner to be affirmed.

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office.
[BY AUTHORITY OF CONGRESS.]

Webster v. Sanford	567
Ex parte Carty	570

Order No. 488.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 24, 1888.

It is hereby directed that the following sub-classes be abolished in Class 2, Apparel, (Division XXIV:)

7. Fur goods.
12. Pants and drawers.
19. Shirts and bosoms.
21. Skirts and protectors.

The establishment of the following sub-classes in the same class is also directed:

34. Armpit-shields.
35. Combination garments.
36. Darning-lasts.
37. Garment-protectors.
38. Muffs and mufflers.
39. Needle-threaders.
40. Nether garments.
41. Shirts.
42. Skirts.
43. Supplemental bosoms.
44. Thread holders and cutters.
45. Work-holders.

BENTON J. HALL, *Commissioner.*

Order No. 489.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 26, 1888.

Hereafter all applications received by Examiners from the Application Room will (unless discovered to be incomplete) be marked "O. K.," which letters will also be entered on the file-wrapper, and will indicate that the petition, specification, and oath have been received and are present.

All subsequent papers relating to the case will be marked and entered by number on the file-wrapper in regular numerical order, with the entries of official actions, according to the present practice.

BENTON J. HALL,
Commissioner.

Proposals for Photolithographing.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 21, 1888.

Sealed proposals will be received at the Office of the Commissioner of Patents until 12 M. of August 6, 1888, for the reproduction by photolithography, or otherwise, of the drawings of the weekly issues of patents, and for the illustrated portion of the OFFICIAL GAZETTE.

Specifications and specimens will be furnished upon application to the Commissioner.

BENTON J. HALL,
Commissioner of Patents.

DESIGNS.

18,485.—HORSE-BLANKET.—*G. Ralston Ayres*, Philadelphia, Pa., assignor to himself, *William Montgomery Ayres*, and *Louis H. Ayres*, all of same place. Application filed April 25, 1887. Serial No. 236,068. Term of patent 14 years.

18,486.—BADGE OR BANNER.—*James Edward Brophy* and *William E. Harvey*, Washington, D. C. Application filed July 3, 1888. Serial No. 278,967. Term of patent 3½ years.

18,487.—HANDKERCHIEF OR BANNER.—*James M. Bryce*, Philadelphia, Pa., assignor to *Edward A. Greene*, *Henry L. Greene*, *William R. Greene*, and *Edward A. Greene, Jr.*, Riverside, R. I. Application filed June 22, 1888. Serial No. 277,339. Term of patent 7 years.

18,488.—TIME-PIECE CHARACTERS.—*Rufus B. Carr*, Boston, Mass., assignor of one-half to *The E. Howard Watch and Clock Company*, same place. Application filed March 5, 1888. Serial No. 266,216. Term of patent 14 years.

18,489.—TOY.—*Daniel Cooke*, Camden, N. J. Application filed July 2, 1888. Serial No. 278,802. Term of patent 7 years.

18,490.—SPOON OR FORK HANDLE.—*Austin F. Jackson*, Taunton, Mass., assignor to *The Reed & Barton Corporation*, same place. Application filed June 15, 1888. Serial No. 277,271. Term of patent 7 years.

18,491.—PENCIL-CASE.—*James Jones*, Brooklyn, N. Y., assignor to *C. D. Jones*, same place. Application filed June 14, 1888. Serial No. 277,148. Term of patent 3½ years.

18,492.—LEAD-PENCIL.—*Samuel Kraus*, New York, N. Y., assignor to *The Eagle Pencil Company*, same place. Application filed June 23, 1888. Serial No. 277,923. Term of patent 3½ years.

18,493.—GONG FOR TABLE-BELLS.—*Adolf Mayer*, Gengenbach, Baden, Germany, assignor to *Alfred Siedle*, Freiberg, Germany. Application filed December 6, 1887. Serial No. 257,167. Term of patent 3½ years.

18,494.—HANDKERCHIEF.—*Mary R. Moore*, Washington, D. C. Application filed June 13, 1888. Serial No. 277,025. Term of patent 3½ years.

18,495.—BOTTLE.—*Benjamin I. Mott*, Brooklyn, N. Y. Application filed June 9, 1888. Serial No. 276,638. Term of patent 7 years.

18,496.—UNDERWEAR.—*George E. Nye*, Philadelphia, Pa., assignor of one-half to *Edward Tredick*, same place. Application filed April 30, 1888. Serial No. 272,396. Term of patent 3½ years.

18,497.—HANDKERCHIEF.—*Rufus H. Rose*, New York, N. Y. Application filed June 29, 1888. Serial No. 278,582. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,736.—BOOKS, PAPERS, AND ENVELOPES USED IN THE BUSINESS OF COLLECTING DEBTS.—*George W. Bristol*, Chicago, Ill. Application filed June 27, 1887. Used since May, 1887.

"The representation of a beet, a pointer dog, and a woodcock, associated with the words 'DEAD,' 'VIGILANCE,' and 'DISPATCH.'"

15,737.—GUNPOWDER.—*Charles W. Curtis*, London, England. Application filed June 6, 1888. Used since 1844.

"The representation of a bird standing amidst foliage and the lock portion of a gun."

15,738.—ROOFING FABRIC.—*Druid Felt Company*, Baltimore, Md. Application filed June 20, 1888. Used since September, 1887.

"The word 'DRUID.'"

15,739.—SOAP IN BARS.—*H. Finn & Sons*, Syracuse, N. Y. Application filed June 25, 1888. Used since March 3, 1888.

"The words 'SALT CITY.'"

15,740.—BITTERS OR TONIC.—*Mayer Bros. & Co.*, Cincinnati, Ohio. Application filed June 20, 1888. Used since April, 1887.

"The word 'MALABAR.'"

15,741.—NEEDLES.—*Henry Milward & Sons*, Redditch, England. Application filed June 20, 1888. Used since January 1, 1887.

"The words 'HENRY MILWARD & SONS CALYX EYED NEEDLES' and the representation of a threaded needle."

15,742.—MEDICAL COMPOUND OF A GRANULAR EFFERVESCING NATURE, BEING A BRAIN AND NERVE FOOD AND A SEDATIVE.—*Reed & Carnrick*, New York, N. Y. Application filed May 26, 1888. Used since March, 1888.

"The compound word 'PHOSPHO-CAFFEIN.'"

15,743.—FODDER-CUTTERS AND THEIR ATTACHMENTS.—*Smalley Manufacturing Company*, Manitowoc, Wis. Application filed April 30, 1888. Used since March 20, 1888.

"The representation of a cornstalk bent around to form a circle and the ears and leaves on the stalk extending horizontally across the circle."

15,734.—CERTAIN TOILET ARTICLES OR PREPARATIONS.—*Leo Sommer*, New York, N. Y. Application filed June 19, 1888. Used since November, 1882.

"The representation of a phenix with outspread wings and the word 'POMPADOUR.'"

15,735.—FEED-WATER PURIFIERS AND HEATERS.—*Warren Webster & Co.*, Philadelphia, Pa. Application filed June 6, 1888. Used since November 15, 1886.

"The word 'VACUUM.'"

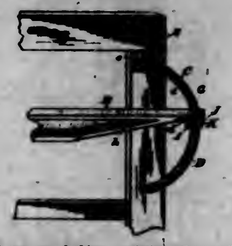
LABELS.

5,664.—Title: "COLORADO STICKY FLY PAPER."—*John T. Billings*, Denver, Colo. Application filed July 3, 1888.

5,665.—Title: "ABSOLUTELY PURE CANADA SAP MAPLE SYRUP."—*Samuel Bliss*, Chicago, Ill. Application filed July 2, 1888.

5,666.—Title: "CLOSSON'S CELEBRATED PAIN RELIEF." (FOR A MEDICINE.)—*W. E. Closson*, Independence, Iowa. Application filed June 2, 1888.

5,667.—Title: "READY" (FOR FUEL BLOCKS AND FIRE KINDLERS.) *William R. Myers*, Haddonfield, N. J. Application filed July 3, 1888.



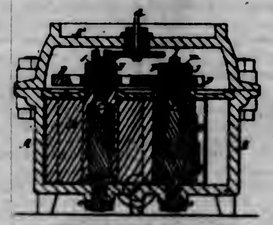
5,668.—Title: "NATIONAL REPUBLICAN BADGE 1888 PRESIDENTIAL CAMPAIGN."—*Reynold's Jewelry Co.*, Providence, R. I. Application filed July 9, 1888.

5,669.—Title: "DR. T. ERSKINE TODD'S STIMULATING BOUQUETS." *T. Erskine Todd*, Laurens, S. C. Application filed May 31, 1888.

PATENTS

GRANTED JULY 31, 1888.

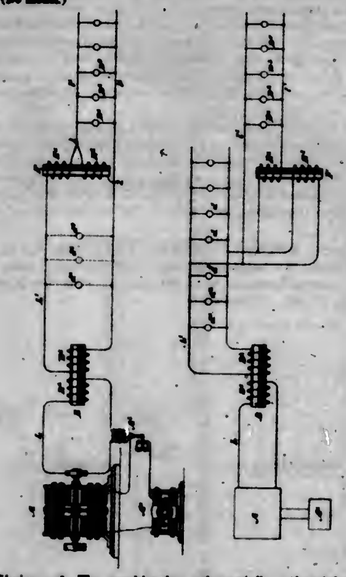
386,794. TRANSOM-LIFTER. JOSEPH J. BALL and JAMES A. MCBURNEY, Syracuse, Ohio. Filed Feb. 16, 1888. Serial No. 264,444. (No model.)



Claim.—1. A transom-holder consisting of curved arms, one of which is attached to the frame of the transom and the other to the sash of the window, the arm attached to the sash being adapted to slide upon the one attached to the frame, and a spring secured to the former for retaining the window in position, as set forth.

2. In a transom-holder, the combination of a pair of curved arms attached to the sash and frame of the window, with clasps connecting the same, and a spring secured to one of said arms to hold it in any desired adjusted position upon the other arm, as set forth.

3. In a transom-holder, the combination of a pair of curved arms adapted to be attached to a sash and frame of a window, a spring secured in a chamber formed in one of said arms, a series of serrations formed in a channel of the other arm, and clasps for retaining said arms in contact, as set forth.



386,795. ROTARY WATER-METER. FREEMAN RAIL, Worcester, Mass. Filed June 14, 1887. Serial No. 241,282. (No model.)

Claim.—1. In a liquid-meter having the rotary piston B suspended upon upright stationary pintles and fitted to work closely between the top and bottom surfaces within the casing, the combination, with the rotary piston, its pintle, and inclosing-casing, of a removable cap-plate, in connection with the hub of the piston, carrying a bearing-piece provided with screw-threads for effecting adjustment of the piston up or down in relation to the inclosing-casing, and means, substantially as described, for cramping or binding said screw-threads to prevent derangement of the adjustment when the meter is in use, as hereinbefore set forth.

2. The combination of the meter-casing, the upright pintle, the rotating piston mounted thereon, with the top and bottom ends of said piston closely adjacent to the inner surfaces of the casing, the adjustable screw-threaded bearing-stud in connection with the top end of the piston, the cramping-plate fitting upon the screw-threads of said bearing-stud, and the binding-screw for giving pressure thereon, all substantially as shown and described.

386,796. AUTOMATIC REGULATOR FOR ELECTRIC LAMPS. REGINALD BELFIELD, Great Barrington, Mass., assignor to George Westinghouse, Jr., Pittsburg, Pa. Filed June 20, 1888. Serial No. 277,547. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a source of electricity, its circuit, translating devices operated by electric energy supplied from said source, means for introducing and withdrawing more or less of said devices from circuit, and an inductive regulator applied to said circuit consisting of a conductor and magnetizable material to which it is applied, portions of said conductor being included in different circuits, thereby rendering the inductive resistance dependent upon the number of translating devices in circuit.

2. The combination, substantially as hereinbefore set forth, of a source of electricity, a circuit for the same, a magnetizing-coil, a mass of soft iron acted upon by currents traversing said magnetizing-coil, translating devices included in a branch circuit around the magnetizing-coil, a second magnetizing-coil applied to the iron, and means for causing variable currents to traverse the same.

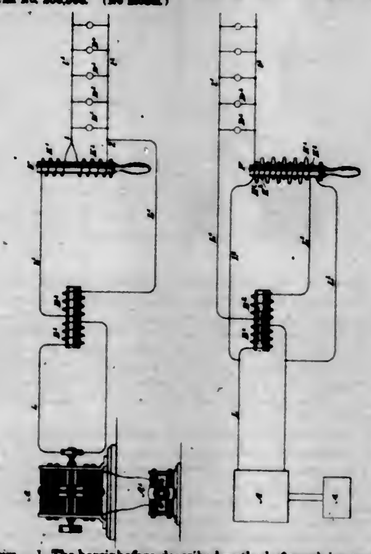
3. The combination, substantially as hereinbefore set forth, of a source of electricity, a circuit supplied from said source, translating devices fed from said source, and an inductorium having its primary coil included in said circuit in series with the translating devices, and its secondary coil included in multiple arc with said translating devices.

4. The combination, substantially as hereinbefore set forth, of a source of electricity, a circuit supplied from said source, two coils included in said circuit, magnetizable material acted upon by currents traversing said coils, a shunt for one of said coils, and translating devices included in said shunt.

5. The combination, substantially as hereinbefore set forth, of a source of electricity, a circuit supplied therefrom, magnetizing-coils

soft iron acted upon thereby, a shunt-circuit around one of said coils, translating devices in said shunt, and an inductorium having its primary circuit included in circuit with said source, and its secondary in circuit with said magnetizing-coils.

6. The combination, substantially as hereinbefore set forth, with an electric generator and a circuit for the same, of an induction-coil having its primary coil in said circuit, a circuit including the secondary coil, means for varying the resistance of the secondary circuit, a soft-iron core and two coils acting upon said core, which coils are included in the secondary circuit.

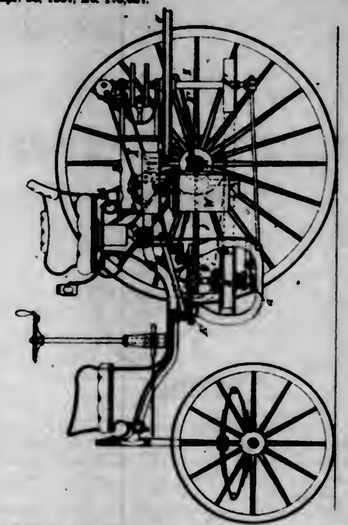


7. The combination of a source of electric currents, a circuit supplied therefrom, two coils included in said circuit, magnetizable material acted upon by currents traversing said coils, and a shunt for one of said coils, in which said translating devices and the remaining coil are included.

8. The combination, substantially as hereinbefore set forth, of a source of electricity, a circuit supplied from said source, two coils included in said circuit, magnetizable material acted upon by currents traversing said coils, a shunt for one of said coils, translating devices included in said shunt, and translating devices connected in multiple arc across the poles of said source.

9. The combination of a source of electric currents, a circuit supplied therefrom, two coils included in said circuit, magnetizable material acted upon by currents traversing said coils, and a shunt for one of said coils, in which said translating devices and the remaining coil are included, and translating devices connected across the poles of said source.

10. The hereinbefore-described method of adjusting the brilliancy of incandescent electric lamps, which consists in opposing an inductive resistance to the currents supplied to the lamps, governing the difference of potential at the terminals of the lamps by said resistance, governing said resistance by another inductive resistance, and governing the latter by the difference of potential at the terminals of the lamps.



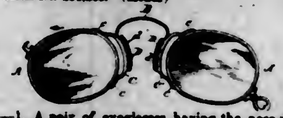
386,797. METHOD OF AUTOMATIC REGULATION FOR ELECTRIC CURRENTS. REGINALD BELFIELD, Great Barrington, Mass., assignor to George Westinghouse, Jr., Pittsburg, Pa. Filed June 30, 1886. Serial No. 206,563. (No model.)

Claim.—1. The hereinbefore-described method of supplying translating devices with alternating, intermittent, or pulsatory currents of any required potential, which consists, first, in establishing in a supply-circuit a constant counter electro-motive force equally distributed throughout a fixed length of said circuit; second, in utilizing the whole or any desired portion of said counter electro-motive force in the production of a composite current, and, lastly, in operating by such composite current translating devices placed in the work-circuit, substantially as described.

2. The hereinbefore-described method of supplying currents of any required potential to a work-circuit from a source of currents of a different potential, which consists in establishing in the supply-circuit a constant counter electro-motive force by the action of the impressed electro-motive force, and superposing the impressed electro-motive force upon the counter electro-motive force, and thereby producing and delivering to the work-circuit a resultant composite current having a different potential from that of the impressed electro-motive force, substantially as described.

386,798. DRIVING-GEAR FOR VELOCIPEDES. CARL BENZ, Mannheim, Baden, Germany. Filed Nov. 26, 1887. Serial No. 256,208. (No model.) Patented in England Apr. 28, 1886, No. 5,780, and in France Apr. 28, 1887, No. 176,667.

Claim.—1. In vehicles with driving-gear, the arrangement of the main driving-shaft V 32 and the axle of the vehicle in one horizontal plane, and in combination with one of these shafts connecting-rods S S on each side, for the purpose and in the manner substantially as described.



2. In vehicles with driving-gear, the main driving-shaft V, a movable frame, A, for said shaft, and the axle T, of the wheels arranged parallel to the main shaft, all substantially as described.

3. In vehicles with driving-gear, a pulley, R, spur-wheels *x x' x''*, arranged inside pulley R, and a wing, M, in connection with lever 3, operating substantially in the manner as described.

4. In vehicles with driving-gear, a starting-lever, 3, in combination with a coupling, K, and a braking contrivance, 5, and in combination with a second lever, 4, arranged and operating substantially in the manner as described.

5. In vehicles with driving-gear, a combined regulating and braking device for regulating the admission of the liquid into the gas-generator and of the gas to the motor, and for braking the vehicle accordingly, all substantially in the manner as described.

386,799. EYEGLASSES. JOHN BOWLES, Washington, D. C., assignor of one-fourth to Joseph R. Bines, same place. Filed May 14, 1887. Serial No. 238,203. (Model.)

Claim.—1. A pair of eyeglasses having the nose-plates thereof provided with strips or pieces of sponge on their opposing faces, substantially as described, for the purpose set forth.

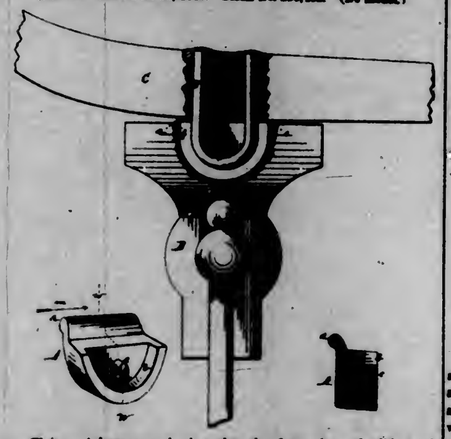
2. As a new article of manufacture, a pair of eyeglasses having the nose-plates thereof provided with a series of lips or prongs and pieces or strips of sponge affixed to the opposing faces of the nose-plates by the lips or prongs thereof, substantially as described, for the purpose set forth.

3. As a new article of manufacture, a pair of eyeglasses having the nose-plates thereof provided with pieces or strips of compressed sponge, substantially as described, for the purpose set forth.

4. As a new article of manufacture, a pair of eyeglasses having the curved nose-plates thereof formed of a single piece of metal and provided with a series of lips or prongs at their side edges, and the pieces or strips of compressed sponge affixed to the opposing faces of the nose-plates, the prongs entering the strips from the side edges thereof, substantially as described, for the purpose set forth.

5. A pair of eyeglasses having frictional bearing-surfaces of sponge secured to that portion of the glasses which bears against the nose, as and for the purpose set forth.

6. As a new article of manufacture, a nose-plate for eyeglasses, provided with a sponge piece, substantially as shown and described.



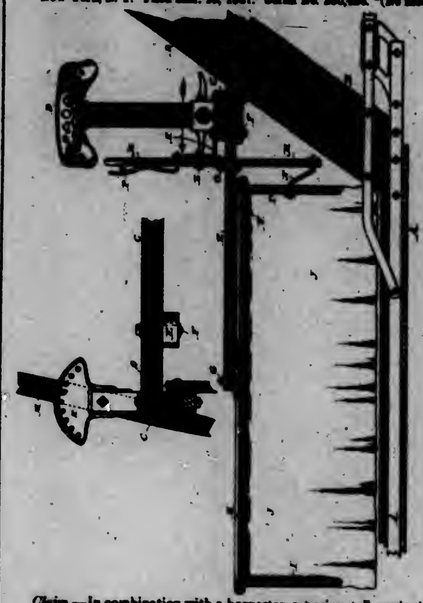
386,800. HINGE. DAVID H. BUTLER, Hendricks, Minn., assignor of one-half to Julius Edward Butler, same place. Filed Oct. 28, 1887. Serial No. 253,552. (No model.)

Claim.—1. A strap-hinge provided with outwardly-turned horizontal flanges lengthwise of their straps, the said flanges having each a series of holes at intervals along their length, substantially as and for the purpose herein set forth.

2. The combination of a door-hinge provided with outwardly-turned flanges on its straps lengthwise of the said straps, and with sets of holes in the said flanges and a brace or rod to hook into different holes in the said flanges, substantially as and for the purpose herein specified.

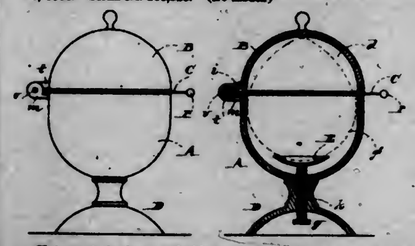
386,801. HARNESS-MAKER'S TOOL. WILLIAM G. BOWERS, Portage, Wis. Filed Dec. 30, 1887. Serial No. 259,452. (No model.)

Claim.—A harness-maker's tool made of one piece of solid metal provided with a shoulder on its rear side and a semicircular recess on its front side, with pin c therein for supporting a hame-staple in the jaws of a vise in the process of riveting the staple to the hame, as set forth.



386,802. WATER-WHEEL. ROUSH M. CARHART, Providence, R. I. Filed May 16, 1887. Serial No. 238,203. (No model.)

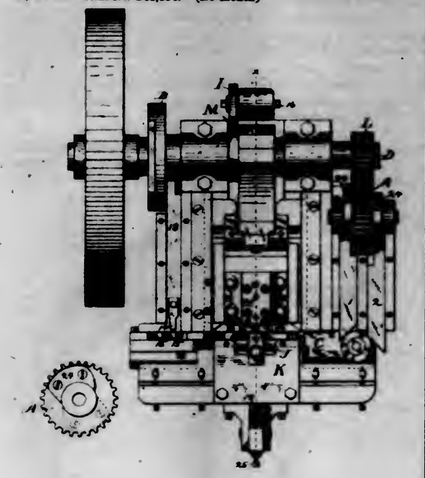
Claim.—1. The combination of a water-wheel decreasing in diameter toward its lower end and provided externally with spirally-extending blades or buckets conforming to the contour of the body, a case or curb for the wheel conforming in shape upon its interior with the shape of the wheel, said case or curb being provided internally with spirally-extending grooves or recesses having spirally-extending end walls, *d'*, extending from the top nearly to the bottom of the case or curb, said grooves or recesses and their rear walls extending spirally in a reverse direction to that of the blades on the wheel and vanishing at their lower ends upon the surface of the curb, substantially as specified.



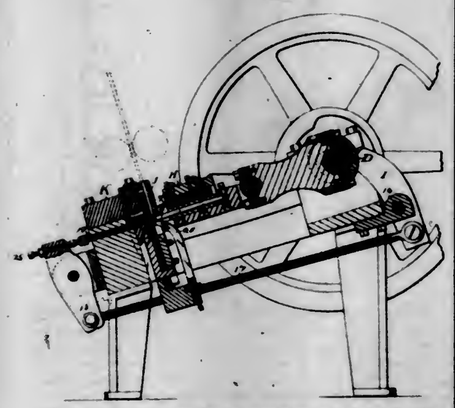
2. The combination, with a water-wheel, of a curb or case therefor, provided at its upper end with an external circumferential rabbet, a cap or cover provided with a downwardly-extending circumferential flange, whereby, when the cap or cover is in place, an annular chamber, as I, is formed, an inlet-pipe communicating with said chamber, and a passage or passages from said chamber to the interior of the curb or case, substantially as specified.

386,803. ADJUSTABLE WIND-BOARD FOR HARVESTERS. HENRY J. GARE, Auburn, assignor of one-half to the D. M. Osborne & Company, New York, N. Y. Filed Mar. 10, 1887. Serial No. 230,498. (No model.)

Claim.—In combination with a harvester, a horizontally-swinging arm overhanging the grain-platform, a wind-board connected to said arm by a vertical pivot, and a hand-lever mounted on a fixed support and connected by links to the wind-board and to the swinging arm, whereby said lever is enabled to move the board forward and backward, and also maintain its parallelism with the finger-bar.



386,804. EGG-CUP. JAMES GARDY, Cambridge, Mass. Filed Mar. 6, 1888. Serial No. 266,226. (No model.)



Claim.—A duplex egg-holder consisting of two cups hinged together, one of said cups constituting the body of the holder and the other the cover thereof when the parts are swung together, the lower

cup or body being provided with a supporting-base, and the upper cup or cover being recessed on its lower edge and provided with a horizontally-swinging knife pivoted to the leaf of the hinge of said cover and swinging in said recess, the cover being adapted to serve as a receptacle for the upper half of the egg when the holder is opened, and the knife serving to hold the upper half of the egg in the cover during the opening operation, substantially as described.

386,805. NUT-MACHINE. GEORGE H. DURHAM, Unionville, Conn., assignor to the Durham Nut Machine Company, same place. Filed June 13, 1887. Serial No. 241,156. (No model.)

Claim.—1. In a nut-machine, the combination of a carrier having two recesses serving as partial dies, a stationary shear-blade, and a blanking-out punch, substantially as described, and for the purpose specified.

2. The combination of a carrier having two recesses and a trimming punch and die, substantially as described, and for the purpose specified.

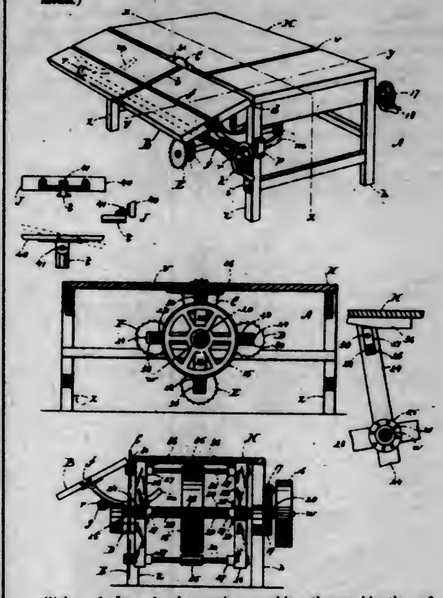
3. The combination of a carrier having two recesses and a blanking-out punch and trimming punch and die, substantially as described, and for the purpose specified.

4. The combination of a carrier having two recesses, a swaging-die, and knock-out pin, substantially as described, and for the purpose specified.

5. The combination of blanking and trimming dies, a carrier having two recesses for receiving the nut-blanks, and mechanism for locking the carrier during the action of the dies, substantially as described, and for the purpose specified.

6. The combination of a central blanking-out shear and two trimming-punches, arranged one on each side of said blanking-shear, substantially as described, and for the purpose specified.

7. The combination of a swage or crowning-die and two trimming-dies, arranged one on each side of said crowning-die, substantially as described, and for the purpose specified.



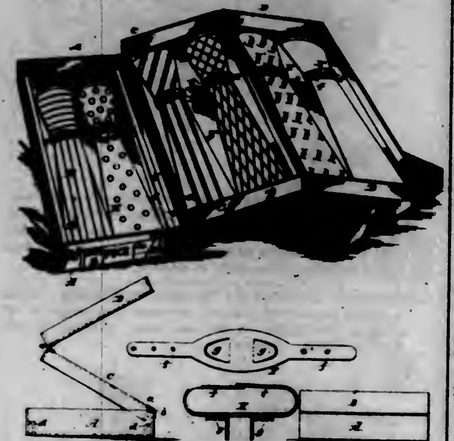
8. The combination of a swage and knock-out pin and two trimming-dies, one on each side of said swage, substantially as described, and for the purpose specified.

9. The combination of a punch and die for punching the central hole, a blanking-out shear and die, a swage and knock-out pin, two trimming punches and dies, said trimming punches and dies located one on each side of said blanking-out shear, substantially as described, and for the purpose specified.

10. The combination of the slide H, bearing punches, the stationary dies and shear, the carrier having two recesses which serve as partial dies, and operating mechanism for said slide and carrier, whereby the slide has two motions to one of the carrier, substantially as described, and for the purpose specified.

11. The combination of a crowning-die, a trimming-die, a blanking-punch, and a carrier moving transversely to the movement of said blanking-punch, and having a recess, which serves the double function of blanking-die in connection with said blanking-punch, and pocket for carrying the blank, substantially as described, and for the purpose specified.

386,806. CIRCULAR SAWING MACHINE. FREDERIC E. PARWELL, Fitchburg, Mass. Filed Apr. 26, 1888. Serial No. 272,370. (No model.)



Claim.—1. In a circular sawing machine, the combination of a supporting-frame provided with a table proper, a main shaft journaled in said frame provided with a driving-pulley, a friction-wheel on said shaft, a sleeve also on said shaft, radial arms fixed to said sleeve provided with vertical slots in their outer ends, adjustable bearings in said slots, springs for forcing said bearings outward, saw-shafts journaled in said bearings, circular saws secured to said saw-shafts, friction-wheels on said saw-shafts, a fixed cam on said frame which is engaged by said bearings for forcing the friction-wheel of one of the saw-shafts into contact with the friction-wheel of the main shaft, and adjunctive mechanism for turning said sleeve to bring different saw-shafts into position for actuating their respective saws.

2. In a circular sawing machine, the combination of a supporting-frame provided with a table proper, a main shaft journaled in said frame provided with a driving-pulley, a friction-wheel on said shaft, a sleeve also on said shaft, radial arms fixed to said sleeve provided with vertical slots in their outer ends, adjustable bearings in said slots, springs for forcing said bearings outward, saw-shafts journaled in said bearings, circular saws secured to said saw-shafts, friction-wheels on said saw-shafts, a fixed cam on said frame, which is engaged by said bearings for forcing the friction-wheel of one of the saw-shafts into contact with the friction-wheel of the main shaft, a worm-gear on said sleeve, and a worm journaled on the frame and intermeshing with said worm-gear, substantially as described.

3. In a circular sawing machine, the combination of the frame-work A, the table proper, H, the shaft w, provided with a driving-pulley, 16, and friction-wheel 15, the sleeve 20, disposed on said shaft and provided with the worm-gear 19, the bars 23 and 24, mounted on said sleeve and provided with slots 26, the blocks 27 and springs 28, disposed in said arms, the shafts 30, journaled in said blocks and provided with the friction-wheels 35, the saws C D E F, mounted, respectively, on shafts 30, the worms 17 for rotating said sleeves, and the cams 36, adapted to engage the blocks 27 when said sleeve is rotated and thereby force one of the friction-wheels 35 into contact with the friction-wheel 15, whereby the saw is made to revolve when power is applied to the driving-pulley 16, substantially as set forth.

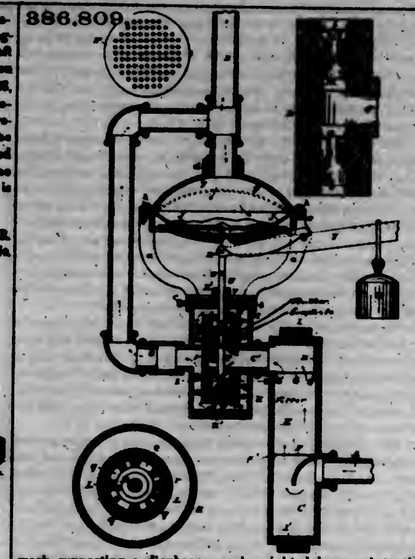
386,807. PACKING AND DISPLAY BOX FOR HOSE-WEAR. JAMES H. PARSONS, New York, N. Y. Filed Apr. 13, 1888. Serial No. 270,515. (No model.)

Claim.—1. The combination, with a box having a removable lid, of a series of trays connected together at their adjacent side edges, one of said trays being hinged at one side edge of the box, whereby the trays can be folded one upon another within the box, substantially as set forth.

2. The combination, with a box, a series of trays hinged together at their adjacent edges, so as to be folded one upon another, one of the end trays being hinged to the side of the box, of a retaining-clip attached to the bottom of each tray and to the bottom of the box, substantially as set forth.

3. The combination, with a rectangular box having shoulders therein and a series of trays hinged together at their adjacent side edges, one of the end trays being hinged to one side edge of the box, so that the trays can be folded one upon another within the box, of clips secured to the trays and box, substantially as set forth.

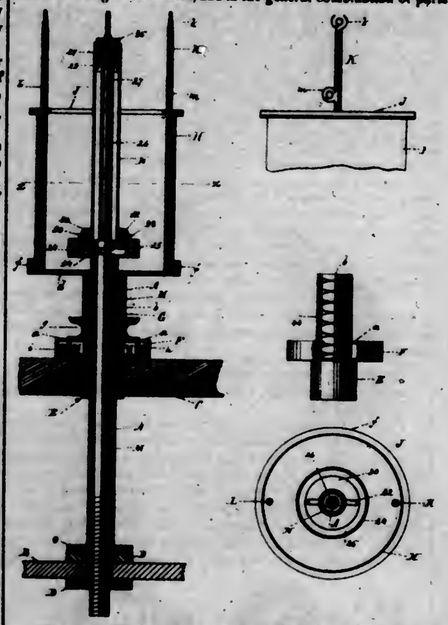
386,808. JOURNAL-BEARING. JOHN W. GARRATT, St. Louis, Mo. Filed Sept. 1, 1888. Serial No. 175,915. (No model.)



Claim.—In a journal-box, the combination, with the outer shell, A, having a plane curved under surface, of an inner shell, B, of brass fitted to the curved under surface of the outer shell and having undercuts, as described, and a lining of Babbitt or other journal-box metal molded in said journal-box and locked thereto between the undercuts of the shell B and the curved under surface of the shell A, as set forth.

386,809. GAS-GOVERNOR. GERHARD A. GUSTER, Fremont, Ohio. Filed Aug. 28, 1887. Serial No. 247,905. (No model.)

Claim.—1. In combination with the two valves N and O, connected by the shouldered rod P, the inner cylinder provided with the valve-seats *m*, *n*, and *o*, and the gas-ports *p p* and *q q*, tapered at their lower ends and arranged on different levels, as described, whereby they come into operation and go out of operation successively, substantially as set forth.



2. In combination with a gas-pressure regulator, a rotary frame-work supporting a diaphragm and weighted lever, substantially as and for the purpose set forth.

3. In an automatic gas-governor and cut-off mechanism, the combination of the cylinder L, valve-stem U, the weighted lever, the flexible diaphragm, and the rotary frame-work, substantially as set forth.

386,810. SPINNING-SPINDLE. RICHARD GILL, Methuen, and WILLIAM H. BUTLER and SAMUEL SMITH, Lawrence, Mass. Filed Apr. 26, 1888. Serial No. 271,981. (No model.)

Brief.—The invention consists in features of construction having particular relation to the lubrication of the spindle and to the regulation of the drag of the bobbin, and in the general combination of parts

Claim.—1. The combination of a spindle proper, having its upper portion reduced, a tube disposed on the lower portion or body of said

spindle, a bushing disposed on said tube and provided with an oil-cup, a sleeve disposed on said bushing and carrying a flier arm or arms, said sleeve being provided with a whirl and adapted to bear in said oil-cup, a bobbin-tube journaled at its upper end on the upper end of the spindle and provided at its lower end with a bearing or boss for supporting the bobbin, and means for securing the bobbin-tube on the spindle, substantially as set forth.

2. The combination of a spindle proper, having its upper portion reduced, a tube disposed on the lower portion or body of said spindle, a bushing disposed on said tube and provided with an oil-cup, a sleeve disposed on said bushing and carrying a flier arm or arms, said sleeve being provided with a whirl and adapted to bear in said oil-cup, a bobbin-tube journaled at its upper end on the upper end of the spindle and provided at its lower end with a bearing or boss for supporting the bobbin, means for securing the bobbin-tube on the spindle, and a guard surrounding the bobbin-tube and adapted to overcome or partially overcome the atmospheric resistance to laying the fibers of the yarn as the bobbin is revolved, substantially as described.

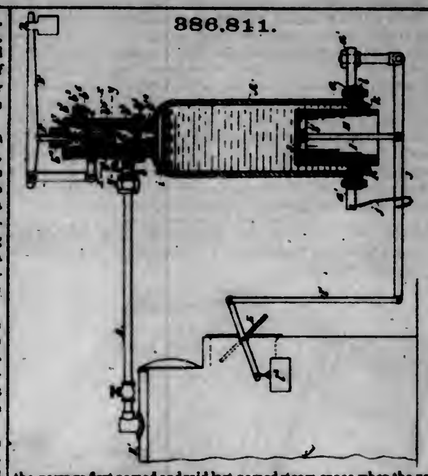
3. The combination of a spindle proper, having its upper portion reduced, a tube disposed on the lower portion of said spindle, said tube being provided at its upper end with a cup-shaped friction-ring, a bobbin-tube journaled at its upper end on the upper end of said spindle and provided at its lower end with a conical boss adapted to fit said cup-shaped ring, and means for raising said tube to increase the tension on said bobbin-tube, substantially as described.

4. The combination of a spindle proper, having its upper portion reduced, a tube disposed on the lower portion of said spindle and provided at its upper end with a flaring friction-ring, a bushing disposed on said tube and provided with an oil-cup, a sleeve disposed on said bushing and carrying a flier arm or arms, said sleeve being adapted to bear in said oil-cup and provided with a whirl above said cup, a bobbin-tube journaled at its upper end on the upper end of the spindle and provided at its lower end with a conical boss adapted to fit the flaring ring of said tube, means for raising said tube to increase the tension of the bobbin-tube, and means for securing the bobbin-tube on the spindle.

5. The combination of a spindle proper, a bushing provided with an oil-cup, and a sleeve surrounding said bushing and having its lower end resting on the bottom of said oil-cup, said sleeve being provided with a whirl and below said whirl with an annular flange depending from the outer lower edge of said whirl and terminating above the bottom of said oil-cup, substantially as described.

6. The spindle A, provided with the nut O, reduced portion 26, and shoulder 27, the tube M, disposed on said spindle and provided with the rest 24 and friction-ring 25, the bobbin-tube N, journaled on said spindle and having the boss or support 30, provided with the projection 32, the bushing E, provided with the oil-cup F, the sleeve G, provided with the whirl *g* and disk *d*, the guard H, flier-arms K L, ring J, and means for securing the bobbin-tube on the spindle, all being combined and arranged to operate substantially as described.

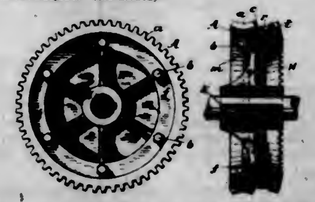
7. The fifteg-rail B and stationary rail C, the spindle A, secured in the rail B and provided with nuts O D, reduced portion 26, and shoulder 27, the tube M, provided with the rest 24 and friction-ring 25, the bushing E, mounted in the rail C and provided with the oil-cup F, having the flange *a*, the sleeve G, provided with the whirl *g*, disk *d*, and oil-chamber *i*, the guard H, mounted on the disk *d*, the ring J, mounted on the guard H, the flier-arms K L, inserted in the ring J and secured to the disk *d*, the bobbin-tube N, journaled on the spindle A and provided with the cap 29 and boss 30, and the pin 34, connected with said boss and inserted in a groove in said spindle, all combined and arranged to operate substantially as described.



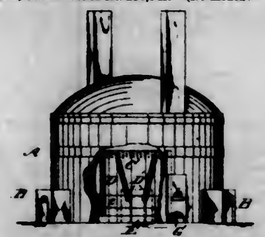
8. The spindle A, nuts O D, rails B C, bushing E, tube M, sleeve G, guard H, ring J, flier-arms K L, tube N, cap 29, boss 30, pin 34, and ring 25, all constructed, combined, and arranged to operate substantially as set forth.

386,811. DAMPER-REGULATOR FOR FURNACES. GEORGE A. GOODENOUGH, Green Point, N. Y. Filed Jan. 20, 1888. Serial No. 261,856. (No model.)

Claim.—The combination, with a steam-boiler and a flue for carrying off products of combustion from a furnace, of a damper arranged in said flue, a lever connected with said damper, a cylinder containing a column of water, a piston in said cylinder connected with said lever, a valve-chest connected with said cylinder above the column of water, a valve in said valve-chest, a steam-space at one end of said valve, a passage leading from said steam-space to the cylinder when the valve is moved in one direction, a steam-space communicating with an exhaust at the other end of the valve, a passage communicating with



386,811.



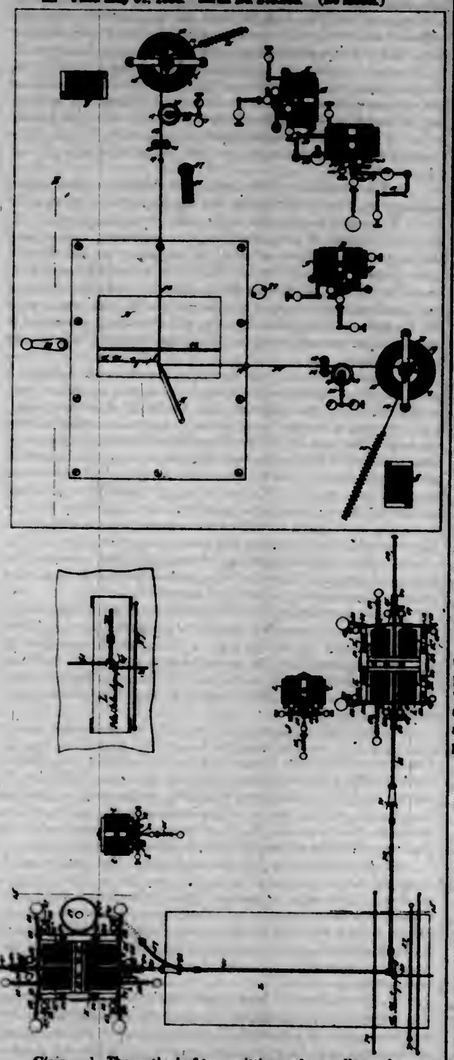
the passage first named and said last-named steam-space when the valve is moved to prevent admission of steam from the boiler to the cylinder, and two seats for the valve arranged at opposite ends of the latter, said valve being held with a yielding pressure against one of its seats by a weight or spring, substantially as specified.

386,812. DRIVING-GEAR FOR SHIPS' WINDLASSES. FRANCIS A. GRATER and EDWIN H. WHITNEY, Providence, R. I., assignors to the American Ship Windlass Company, same place. Filed July 20, 1887. Serial No. 244,817. (No model.)

Claim.—In a ship's windlass, a driving-gear, H, secured to the shaft between the wild-cats, having ratchets *r*, and an annular rim or shoulder, *c*, and an annular worm-gear rim, A, fitting the shoulder *c* and provided with an internal flange, *f*, and bolts *b*, passing through said flange into the driving-gear H, the inner diameter of the flange being somewhat greater than the extreme outer diameter of the wild-cat driving-head, substantially as and for the purpose set forth.

386,813. BRICK-KILN. JAMES B. GRAWCOCK, Churubusco, Ind. Filed Jan. 6, 1888. Serial No. 259,943. (No model.)

Claim.—1. A kiln having a main wall, fire-doors, and a fire-wall, and provided with a lateral flue between the walls on a level with the fire-doors, and communicating with narrow vertical flues extending to the top of the fire-wall, substantially as described.



2. A kiln having a main wall provided with fire-doors, and a fire-wall beveled inwardly at its lower part, so as to form an annular space of greater area than that between the walls above the fire-doors, substantially as described.

3. A kiln having a main wall provided with fire-doors, a fire-wall beveled inwardly at its lower part, and partitions midway between the fire-doors, substantially as described.

4. A kiln having a main wall provided with fire-doors, a fire-wall beveled inwardly at its lower part, vertical partitions midway between the fire-doors, and deflecting-partitions running from the top of the fire-door toward the top of the fire-wall, substantially as described.

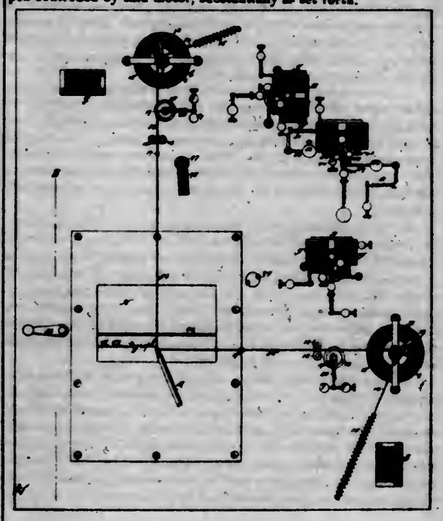
5. A kiln having a main wall provided with fire-doors and an air-space, and a fire-wall having its lower part inwardly inclined and its upper part perforated, substantially as described.

386,814. ART OF TELEGRAPHY. ELISHA GRAY, Highland Park, Ill. Filed May 31, 1888. Serial No. 275,292. (No model.)

Claim.—1. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by transmuting the movements of said transmitting-pen into pulsations of substantially the same effective strength in an electric circuit varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, and transmuting said pulsations through the intervention of an electromotor into movements of the receiving-pen, substantially as set forth.

2. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by transmuting the movements of said transmitting-pen in two directions crosswise of each other into two series of pulsations in two electric circuits, the pulsations of each series being of substantially the same effective strength and respectively varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, and transmuting said two series of pulsations into movements of the receiving-pen in directions crosswise of each other, substantially as set forth.

3. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by transmuting the movements of said transmitting-pen in directions crosswise of each other into two series of pulsations, the pulsations of each series being of substantially the same effective strength and respectively varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, and thereby, through the intervention of an electromotor, causing movements of the receiving-pen, substantially as set forth.

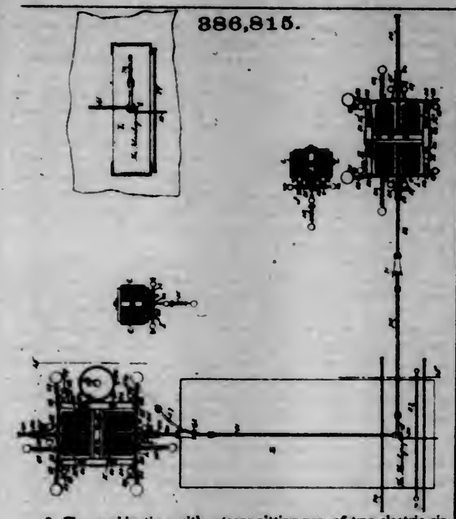


4. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by producing in two electrical circuits through the movement of the transmitting-pen in two directions crosswise of each other two series of pulsations, the pulsations of each series being of substantially the same effective strength and respectively varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, and thereby, through the intervention of two electromotors, causing movements of the receiving-pen in two directions crosswise of each other, substantially as set forth.

5. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by transmuting the movements of said transmitting-pen in directions opposite of each other into pulsations of substantially the same effective strength and of opposite polarity in an electric circuit, respectively varying in number with the linear extents of the movement of said pen in opposite directions and varying in speed of succession with the rapidity of the said movement, and transmuting the said pulsations of opposite polarity into movements in opposite directions of the receiving-pen, substantially as set forth.

6. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen in directions opposite of each other by producing in an electric circuit, through the movement of said transmitting-pen in said opposite directions, pulsations of substantially the same effective strength and of opposite polarity, respectively varying in number with the linear extents of the movements of said pen in opposite directions and varying in speed of succession with the rapidity of the said movements, and thereby, through the intervention of an electrometer, causing movements of the receiving-pen in opposite directions, substantially as set forth.

386,815. TELAUTOGRAPH. ELISHA GRAY, Highland Park, Ill. Filed June 13, 1888. Serial No. 276,921. (No model.)



Claim.—1. The combination, with a transmitting-pen, of an electric circuit, an interrupter operated through said pen and producing pulsations of substantially the same effective strength in said circuit, varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, an electromotor operated through said pulsations, and a receiving-pen controlled by said motor, substantially as set forth.

Claim.—1. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by transmuting the movements of said transmitting-pen into pulsations of substantially the same effective strength in an electric circuit varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, and transmuting said pulsations through the intervention of an electromotor into movements of the receiving-pen, substantially as set forth.

2. The method of transmitting and recording a character by the movements of a transmitting-pen and a receiving-pen by producing in an electric circuit through the movement of said transmitting-pen pulsations of substantially the same effective strength varying in number

386,815.

2. The combination, with a transmitting-pen, of two electric circuits, two interrupters operated, respectively, through the movement of said pen in two directions crosswise of each other and producing two series of electric pulsations in said circuits, the pulsations of each series being of substantially the same effective strength and varying, respectively, in number with the linear extent of the movement of said pen in said crosswise directions and in speed of succession with the rapidity of said movement, two electromotors included in the respective circuits and operated, respectively, through said two series of pulsations, and a receiving-pen controlled by said two motors in two directions crosswise of each other, substantially as set forth.

3. The combination, with a transmitting-pen, of an electric circuit, an interrupter operated through said pen and producing pulsations of substantially the same effective strength in said circuit, varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, an electromotor operated through said pulsations, a receiving-pen controlled by said motor, and a stationary recording-surface over which said receiving-pen is moved, substantially as set forth.

4. The combination, with a transmitting-pen, of an electric circuit, an interrupter operated through said pen and producing pulsations of substantially the same effective strength in said circuit, varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, an electromotor operated through said pulsations, a stationary recording-surface over which said receiving-pen is moved, a circuit-controller and feeding mechanism for shifting the position of the said recording-surface when the reproduction of the characters is suspended, substantially as set forth.

5. The combination, with a transmitting-pen, of an electric circuit, an interrupter operated through said pen and producing pulsations of substantially the same effective strength in said circuit, varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, an electromotor operated through said pulsations, a receiving-pen controlled by said motor, and a pen-rest for lifting said receiving-pen, substantially as set forth.

6. The combination, with a transmitting-pen, of an electric circuit, an interrupter operated through said pen and producing pulsations of substantially the same effective strength in an electric circuit, varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, an electromotor operated through said pulsations, a receiving-pen controlled by said motor, and a circuit-changer for changing the condition of the current in said circuit when the movement of the transmitting-pen is reversed, substantially as set forth.

7. The combination, with a transmitting-pen, of an interrupter operated through said pen and producing pulsations in an electric circuit varying in number with the linear extent of the movement of said pen and varying in speed of succession with the rapidity of said movement, an electromotor operated through said pulsations, a receiving-pen controlled by said motor, and a pole-changer for changing the polarity of the current in said circuit when the movement of the transmitting-pen is reversed, substantially as set forth.

8. The combination, with an electric circuit including an interrupter and receiving-magnets, which are respectively energized by different conditions of the current over the circuit, of a transmitting-pen connected to operate said interrupter to interrupt the circuit, a circuit-changer for changing the condition of the current over the circuit whenever the movement of the pen is reversed, and a receiving-pen moved in two directions through the action of said receiving-magnets, substantially as set forth.

9. The combination, with two electric circuits, each including an interrupter producing pulsations of substantially the same effective strength, and receiving-magnets which are respectively energized by different conditions of the currents over the circuits, of a transmitting-pen connected to operate said respective interrupters by its movements in directions crosswise of each other, circuit-changers for changing the condition of the currents over the respective circuits whenever the movement of the pen in either direction is reversed, and a receiving-pen moved in two directions crosswise of each other through the action of the magnets of the respective circuits and in opposite directions by the respective magnets of each circuit, substantially as set forth.

10. The combination, with a main circuit, including a pole-changer, an interrupter, receiving-magnets, and a polarized relay arranged to direct the current through one or the other of the magnets, according to its polarity, of a transmitting-pen connected to operate said interrupter, a local circuit including the magnet of the pole-changer, and a circuit maker and breaker, which is also connected to and operated by the pen to change the condition of the local circuit, and thereby change the polarity of the current over the main circuit when the movement of the pen is reversed, and a receiving-pen moved in two directions through the action of the said magnets, substantially as set forth.

11. The combination, with two main circuits, each including a pole-changer, an interrupter, receiving-magnets, and a polarized relay arranged to direct the current through one or the other of the magnets, according to its polarity, of a transmitting-pen connected to operate said interrupters by its movements in two directions crosswise of each other, two local circuits each including the magnet of one of the pole-changers, and a circuit maker and breaker, which is also connected to and operated by the pen to change the condition of its local circuit, and thereby change the polarity of the current over the corresponding main circuit when the movement of the pen in either direction is reversed, and a receiving-pen moved in two directions crosswise of each other through the action of the magnets of the respective circuits and in opposite directions through the action of the respective magnets of each circuit, substantially as set forth.

12. The combination, with the receiving-pen and a main circuit, *b* or *c*, including a receiving-magnet for operating the pen, of the brush 12 and disk 13, also included in the circuit, the transmitting-pen, and connections with the transmitting-pen for moving the brush or disk, one with relation to the other, to interrupt the circuit repeatedly by the continued movement of the pen in one direction, substantially as set forth.

13. The combination, with the receiving-pen and a main circuit, *b* or *c*, including receiving-magnets for moving the pen in opposite directions, of the brush 12 and disk 13, also included in the circuit, the transmitting-pen, and connections with the transmitting-pen for moving the brush or disk, one with relation to the other, to interrupt the circuit repeatedly by the continued movement of the pen in one direction, and a retractile, 15, for effecting the same result when the pen is moved in the reverse direction, substantially as set forth.

14. The combination, with the receiving-pen and the circuits *b c*, including receiving-magnets for moving the pen in two directions crosswise of each other, of a brush, 12, and disk 13, included in each circuit, the transmitting-pen, and connections with the transmitting-pen for moving the brush or disk of each circuit, one with relation to the other, to interrupt the respective circuits repeatedly by the continued movement of the pen in two directions crosswise of each other, substantially as set forth.

15. The combination, with a main circuit, *b* or *c*, a transmitting-pen, and means for interrupting the circuit by the movement of the transmitting-pen, of a receiving-magnet included in the circuit and having a two-part armature, each part of which is pivoted to move in two directions, a rod acted on and moved with a step-by-step movement by the armature, and a receiving-pen connected to and moved by the rod, substantially as set forth.

16. The combination, with two receiving-magnets having two-part armatures, each part of which is pivoted to move in two directions, and means for interrupting the currents through the magnets by the movement of a transmitting-pen, of a rod arranged to be acted on and moved with step-by-step movement in opposite directions by the respective armatures, and a receiving-pen connected to and moved in opposite directions by said rod, substantially as set forth.

17. The combination, with two pairs of receiving-magnets, each having a two-part armature, each part of which is pivoted to move in two directions, and means for interrupting the currents through the magnets by the movement of a transmitting-pen, of two rods arranged to be acted on and moved with step-by-step movements in opposite directions by the respective armatures of the respective pairs of magnets, and a receiving-pen connected to and moved in two directions crosswise of each other by said rods, substantially as set forth.

18. The combination, with a pair of receiving-magnets having two-part armatures pivoted to move in two directions, and means for interrupting the currents through the magnets by the movement of a transmitting-pen, of a rod arranged to be gripped and moved in opposite directions by the respective armatures, friction-jaws acting upon the rod, and a receiving-pen connected to and moved in opposite directions by the rod, substantially as described.

19. The combination, with the receiving-pen G, having a fine or capillary bore located above the recording-surface, of the ink-well located at a lower level than the point of the pen, and a flexible tube connecting the pen and ink-well, substantially as set forth.

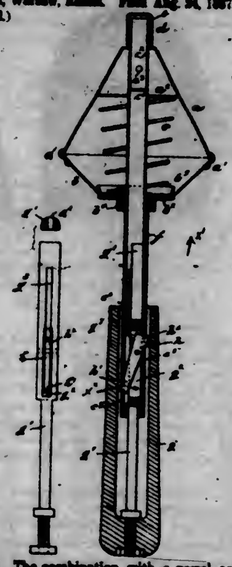
20. The combination, with the receiving-pen having a fine or capillary bore located above the recording-surface, of the ink-well having a fine or capillary discharge-tube and located at a lower level than the point of the pen, and a flexible tube connecting the pen and the discharge-tube of the ink-well, substantially as set forth.

21. The combination, with the transmitting and receiving pens, of a pen-rest for raising the pen from the paper, an electro-magnet controlling the position of the pen-rest, electrical connections having a circuit-controller at the transmitter for energizing and de-energizing said magnet, and a movable table beneath the transmitting-pen for operating said circuit-controller, substantially as set forth.

22. The combination, with the receiving-pen and the main circuits *b c*, through which it is operated, of an electro-magnet, *o*, for controlling the position of the pen, a local circuit including said magnet and reversely-acting circuit-closers, electro-magnets *l*, included in the respective main circuits and controlling said circuit-closers, reversely-acting temporary circuit-breakers located in the respective main circuits, a local circuit including an electro-magnet for operating said circuit-breakers, and a circuit-controller included in said last local circuit and controlled by the position of the transmitting-pen, substantially as set forth.

23. The combination, with the receiving-pen having a movement in two directions crosswise of each other, of a stationary recording-surface over which the pen moves to reproduce the message, a feeding mechanism for shifting the recording-surface at times when the writing is suspended, an electro-magnet for controlling said feeding mechanism, and electrical connections including said magnet, and a circuit maker and breaker at the transmitter, whereby the operator at the transmitter can control the shifting of the paper in the receiver, substantially as set forth.

24. The combination, with the receiving-pen having a movement in two directions crosswise of each other, of a stationary recording-surface over which the pen moves to reproduce the message, an escapement and escapement-lever for effecting the shifting of the recording-surface at times when the writing is suspended, an electro-magnet for operating said escapement-lever, and electrical connections including said magnet, and a circuit maker and breaker at the transmitter, whereby the operator at the transmitter can control the shifting of the paper in the receiver, substantially as set forth.



25. The combination, with the receiving-pen, the recording-surface upon which it acts, and a feeding mechanism for shifting said recording-surface when the writing is suspended, of an electro-magnet for controlling said feeding mechanism, a local circuit including said magnet, and circuit-closing devices for energizing and de-energizing said magnet to control the feeding mechanism, substantially as set forth.

26. The combination, with the receiving-pen and the main circuits *b c*, through which it is operated, of a recording-surface upon which the pen acts, and a feeding mechanism for shifting said recording-surface when the writing is suspended, an electro-magnet for controlling said feeding mechanism, a local circuit including said magnet and circuit-closing devices for energizing and de-energizing said magnet to control the feeding mechanism, electro-magnets included in the main circuits for controlling said circuit-closing devices, and circuit making and breaking devices included in the main circuits at the transmitter for energizing and de-energizing said magnets, substantially as set forth.

27. In a telautograph system, the combination, with a transmitter and a receiver located at one station and the electrical connections constituting the line to another station, of a switch for connecting either the transmitter or the receiver to the line, and a pen rack or receiver connected to the switch and operated by the placing of the pen therein to shift the switch and connect the receiver to the line, substantially as set forth.

28. In a telautograph system, the combination, with a transmitter and a receiver located at one station and the electrical connections constituting the line to another station, of a switch for connecting either the transmitter or the receiver to the line, and a pen rack or receiver connected to the switch and operated by the placing of the pen therein to shift the switch and connect the receiver to the line, and a retractile for automatically shifting the switch to connect the transmitter to the line when the pen is removed, substantially as set forth.

386,816. LOOM-SHUTTLE-THREADING DEVICE. FLORIAN GREBNEL, Warsaw, Russia. Filed Aug. 24, 1887. Serial No. 247,893. (No model.)

Claim.—1. The combination, with a vessel containing a spring and having a compressible bottom, of a tube passed centrally through said compressible vessel, a sliding tube mounted on the first-mentioned tube, a sliding handle on the first-mentioned tube, a latch for engaging said handle with the sliding tube, and a latch-disengaging mechanism, substantially as herein shown and described.

2. The combination, with a vessel, of a tube passed longitudinally through the same and fixed therein, a flexible disk secured over the open end of the vessel and to a plate sliding on the tube, and a tube fixed to said plate and mounted to slide on the outside of the first-mentioned tube that is secured in the vessel, a tubular handle into which the lower end of the tubes can pass, a stem fixed in said handle and passing longitudinally through the same, the upper end of said stem entering into the lower end of the tubes, a pivoted latch on the stem, and a spiral spring in the above-mentioned vessel, which spring can act on the flexible disk, and a latch-disengaging mechanism, substantially as shown and described.

3. The combination, with a conical vessel, *a*, of the tube *c*, passed through and secured in the same, the tip or nozzle *d* on the upper end of the tube *c*, the disk *b*, of leather, secured to the bottom edge of the tubular vessel *a*, the plate b^1, secured to the central part of the flexible disk *b*, which plate b^1 is mounted to slide on the tube *c*, the cap b^2, the ring b^4, the tube *f*, surrounding the tube *c* loosely and connected to the plate b^1, the tubular handle *g*, the stem g', passing from the bottom of the handle longitudinally through the handle, the latch *h*, pivoted in a slot of the stem, the spring g^2, secured to the stem and acting on the upper end of the latch, the projection c^2 on the inside of the tube *c*, and the spring *e* within the vessel *a*, and flexible disk *b*, substantially as shown and described.

4. The combination, with the vessel *a*, having the partition a^2, of the tube *c*, passed longitudinally through the vessel *a* and secured therein, which tube *c* is provided with the apertures c^3 and the partition c' near its upper end, the flexible tip or nozzle *d* on that end of the tube *c* projecting above the vessel *a*, the flexible disk *b*, secured at its edge to the bottom of the vessel *a*, the plate b^1, on which the center part of the flexible ring *b* is held, the cap b^2, the ring b^4, the tube *f*, sliding on the tube *c*, the tubular handle *g*, the stem g', projecting upward from the bottom of the handle through the bore of the same and into the lower ends of the tubes *f* and *g*, the latch *h*, pivoted in the stem, the spring g^2, secured to the stem and acting on the upper end of the latch *h*, the projection c^2 on the inside of the tube *c*, and the

spring *c*, surrounding the tube *c* within the vessel *a*, and flexible disk *b*, one end of said spring resting on cap b^2, placed upon the upper surface of the central part of the ring *b*, and also resting against the partition a^2 of the conical vessel *a*, substantially as shown and described.

386,817. COFFEE-POT. AUGUST HARRY, Los Angeles, Cal. Filed Nov. 5, 1886. Serial No. 218,114. (No model.)

Claim.—1. In a coffee-pot, the combination, as set forth, of the following elements: the can of the pot, a cross-partition dividing it into upper and lower compartments, and a tube opening into the upper compartment flush with the upper side of the partition and extending through the partition and opening into the lower compartment, whereby water forced from the lower compartment into the upper compartment by the pressure of steam when the water is sufficiently heated will afterward be allowed to flow back into the lower compartment.

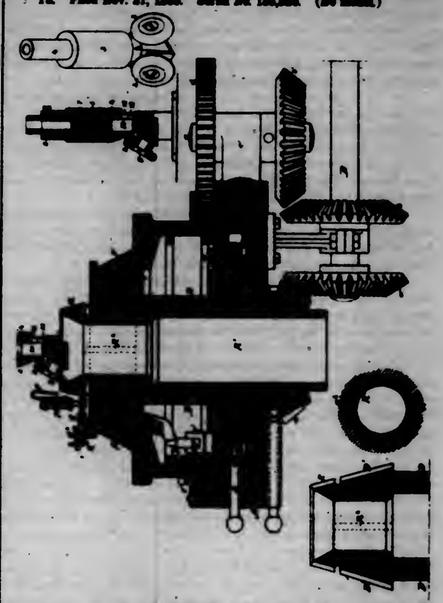
2. A coffee-pot consisting of the following elements in combination, substantially as set forth: the can of the pot, a cross-partition dividing it into upper and lower compartments therein, a tube extending through such partition into the lower compartment, and the valve-closed vent opening into the lower compartment near the top thereof.

3. In a coffee-pot, the combination, substantially as set forth, of the following elements: the can A, partition D, dividing the can into upper and lower compartments, perforated bottom F, tube E, and chamber or passage M, opening into the lower compartment.

4. The combination of cover C, can A, partition D, tube E, perforated bottom F in upper compartment, B, inlet-passage M, valve I, seat J, spout X, and cap V.

5. In a coffee-pot the combination, as set forth, of the following elements: the can A, spout X, passage M, valve-seat L, shaped as a shallow funnel, and ball I, arranged substantially as set forth, whereby when the pot is perpendicular the valve will be closed by the ball, and when the pot is tipped forward to pour the coffee the valve will be opened, substantially as and for the purpose set forth.

386,818. CAR-COUPLING. JOHN T. HAMM, Bear Shores, Simcoe County, Ontario, Canada. Filed Dec. 24, 1887. Serial No. 258,894. (No model.)



Claim.—1. A tongue, D, pivoted near the mouth of the draw-head B, and bent substantially as shown, so as to form a latch, as indicated, in combination with the vertically-operating frame E, carrying one end of said tongue and actuated by the spring F, substantially as and for the purpose specified.

2. A vertically-operating frame, E, having a cross-bar, *c*, formed in it, a spring, F, attached at one end to the under side of the draw-head and acting on said cross-bar, a tongue, D, pivoted at *b* near the mouth of the draw-head B, and bent substantially as shown, so as to extend over the pin *a* in the frame E, in combination with the link C, arranged substantially as and for the purpose specified.

3. A vertically-operating frame, E, having a cross-bar, *c*, formed in it and actuated by a spring, F, a tongue, D, pivoted at *b* near the mouth of the draw-head B, and bent substantially as shown, so as to extend over the pin *a* in the frame E, in combination with the link C and arm H, connected to the frame E and operated by the rod G, substantially as and for the purpose specified.

386,819. KNITTING-MACHINE. SAMUEL RIEMBALL, Philadelphia, Pa. Filed Nov. 21, 1885. Serial No. 183,333. (No model.)

Claim.—1. The combination of the fixed frame of the machine, the needle-cylinder, and cam-box, each capable of rotation, a cam-controlling rib guided in the fixed portion of the frame, means for expanding and contracting said rib, devices whereby the rib is caused to act upon the cams, and gearing whereby either the needle-cylinder or cam-box can be rotated, all substantially as specified.

2. The combination of the needle-cylinder and its needles, the cam-box and its needle elevating and drawing-down cams, a cam-controlling rib, and means for expanding and contracting the same, and devices, substantially as specified, whereby said rib is caused to act upon both the lifting and drawing-down cams, all substantially as set forth.

3. The combination of the rings *h h'*, the frame K, the shaft J, having pinions *n'* and right and left ratchet-wheels *n n'*, and the swinging frame M, having pawls adapted to said ratchet-wheels, and cams for acting upon said pawls to throw them out of gear, as specified.

4. The combination of the shaft J and its right and left ratchet-wheels, the frame K, retaining-pawls for the ratchet-wheels, the swinging frame M, having operating-pawls thereto, cams for acting upon the operating and retaining pawls, and gearing for operating said cams in unison, all substantially as specified.

5. The combination of the needle-carrier and cam-box of the machine, the shifting thread-guide, a slotted operating-lever connected to said thread-guide and engaging with the needle-carrier, a spring acting on said lever, and a pivot-pin adapted to the slot of the lever, all substantially as specified.

6. The combination of the needle-cylinder, the segmental guide-bar adjacent thereto, a thread-guide adjustable on said bar, a slotted lever connected to said guide and engaging with the needle-cylinder, a spring acting on said lever, and a pivot-pin adapted to the slot in the lever, all substantially as specified.

7. The combination of the needle-cylinder, the segmental guide-bar adjacent thereto, a thread-guide adjustable on said bar, a guide-operating lever comprising a pivoted plate and a bar engaging with the cylinder and having a slot for the reception of the pivot-pin, so that it is free to slide on the plate, and a spring acting on said bar, all substantially as specified.

8. The combination of a tapered needle-carrier with a head separate therefrom and with means for adjusting said head longitudinally on the carrier without turning it in respect thereto, all substantially as specified.

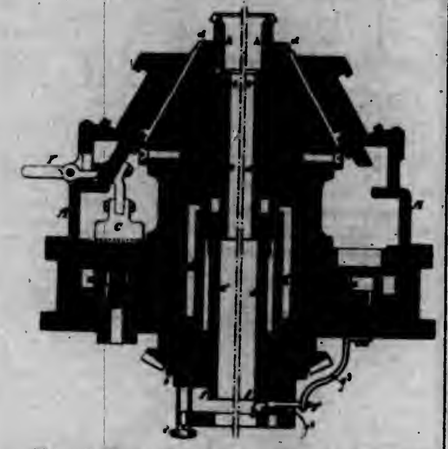
9. The combination of the tapered needle-cylinder, the head R, free to move vertically therein and having threaded end, a sleeve, R', threaded for adaptation to the head R, and means for confining said sleeve vertically to the cylinder and for preventing the head from turning in the cylinder, all substantially as specified.

10. The combination of the drawing-down cam, a spring connected thereto for elevating the cams, a depressing-lever acting on the spring, a rib for operating said lever, and means for adjusting the rib, all substantially as set forth.

11. The combination of the needle-carrier, needles, and thread-guide with the presser, consisting of two rollers, one in advance of the other, a presser-carrier hung to the frame, but free to swing thereon, and means for limiting the extent of movement of the carrier, all substantially as set forth.

12. The combination of the needle-carrier, needles, and thread-guide with a presser, consisting of two rollers, one in advance of the other, and an independent spring-support for each roller, as set forth.

13. The combination of the expanding rib and the rings *h h'*, carrying the cams and having studs *s'*, means for moving said rings, and a stop-pin, *s*, for the studs, as specified.



14. The combination of the tension-spring for the thread with the plate T, over which the thread passes, and a lever, the opposite arms of which form guides for the thread, one of said arms being adjacent to the plate T, all substantially as specified.

15. The combination of the driving-gear of the machine, the belt-shifter and the catch therefor, the screw-shaft and its operating mechanism, and a nut constructed to engage with or be released from said shaft and having a tripper, all substantially as set forth.

16. The combination of the driving-gear of the machine, the belt-shifter and the catch therefor, the screw-shaft arranged vertically at one side of the machine, operating mechanism for said screw-shaft, a nut carried by said shaft and having a tripper and a pointer, and a gage-bar carrying, in connection with the pointer, to regulate the adjustment of said nut, as set forth.

17. The combination of the tapered needle-cylinder, the cam-box fitted on the surface of said tapered cylinder, cams guided in said box and free to slide in an inclined plane parallel with the surface of the tapered cylinder, a cam-operating rib contained in a chamber beneath the cam-box, means whereby said rib is caused to act upon the cams, and mechanism for expanding and contracting the rib, all substantially as specified.

386,820. CIRCULAR-KNITTING MACHINE. SAMUEL RIEMBALL, Philadelphia, Pa. Filed June 3, 1887. Serial No. 240,162. (No model.)

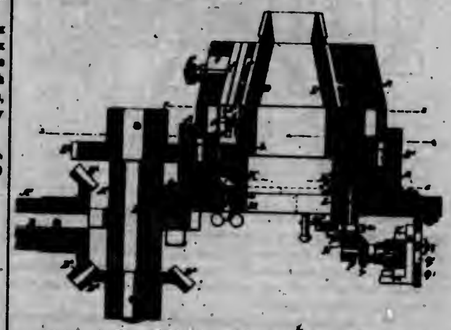
Claim.—1. The combination of the needles and needle-operating cam of a knitting-machine, and the needle and cam cylinders, with an expansion-rib serving as a stop for the cam, and a hand-lever for moving the cam into operative position, all substantially as specified.

2. The combination of the needles and needle-operating cam of a knitting-machine, and the needle and cam cylinders, with a toe pivoted to the cam and free to swing thereon, an expansion-rib serving as a stop for said toe, and a hand-lever for moving the cam into operative position, all substantially as specified.

3. The combination of the needles of a knitting-machine, two needle-operating cams, and the needle and cam cylinders, with an expansion-rib serving as a stop for said cams, and a hand-lever for moving each cam into operative position, all substantially as specified.

4. The combination, in a knitting-machine, of a conical needle-cylinder and its needles with an expansion-ring acting upon the needles and free to move vertically on the cylinder below the upper end of the same, whereby the expansion of the needles may be effected without changing their draft, and means for vertically adjusting the position of the said ring, all substantially as specified.

5. The combination of the conical needle-cylinder and its needles, the conical expansion-ring, a carrier therefor, a threaded ring engaging with said carrier, and pawl-and-ratchet mechanism, whereby said threaded ring is moved on each rotation of the cylinder, all substantially as specified.



6. The combination of a series of take-up hooks with weights carried by said hooks, said weights being arranged in tiers, and the weights of one tier overlapping those of the tier below and resting thereupon when their hooks are free from the fabric, all substantially as specified.

7. The combination of the take-up frame having depending rods with weights guided on said rods and arranged in tiers one above another, so as to overlap, each weight having a take-up hook, all substantially as specified.

8. The combination of the cylinder having an adjustable top section for regulating the stitch, the threaded ring for operating said top section, and rack-and-pinion mechanism for operating said ring, all substantially as specified.

386,821. KNITTING-MACHINE. SAMUEL RIEMBALL, Philadelphia, Pa. Filed Oct. 7, 1884. Renewed Mar. 12, 1888. Again renewed Nov. 20, 1888. Again renewed Oct. 20, 1887. Serial No. 252,234. (No model.)

Brief.—The movable cams are supported in their elevated position by a rib formed of a number of sections, each carried on a movable ring. Devices are provided for moving said rings either by hand or automatically, whereby the rib can be expanded or contracted and widening or narrowing thereby effected.

Claim.—1. The combination of the frame, the needle-carrier and its needles, needle-actuating cams movable into or out of operative position, a supporting-rib for the cams, and means for contracting and expanding said rib, all substantially as and for the purpose set forth.

2. The combination of the frame, the needle-carrier and its needles, needle-actuating cams movable into or out of operative position, the pawls *g*, the supporting-rib, and means for expanding and contracting the latter, as set forth.

3. The combination of the frame, the needle-carrier and its needles, needle-actuating cams movable into or out of operative position, the pivoted arms *f*, having pawls *g*, the supporting-rib *w*, and means for expanding and contracting the latter, as specified.

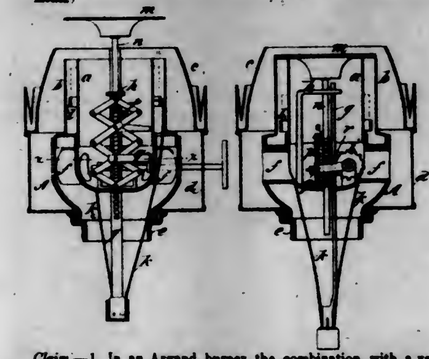
4. The combination of the frame, the needle-carrier and its needles, needle-actuating cams movable into or out of operative position, a fixed lifting-cam, G, located between the movable cams, a supporting-rib, *w*, for said movable cams, and means for expanding and contracting said rib, as set forth.

5. The combination of the frame, the needle-carrier and its needles, needle-actuating cams movable into or out of operative position, the supporting-rib *w*, mechanism for expanding and contracting the same, and means for locking one or both of the movable cams in the elevated or operative position, as set forth.

6. The combination of the frame, the needle-carrier and its needles, needle-actuating cams movable into or out of operative position, the rib *w*, a series of rings, V and W, each carrying a section of the rib, and devices for moving the rings of one set in one direction and those of the other set in the opposite direction, as set forth.

7. The combination of the rings J and K, having racks J' K', the pinions J^3 K^3, the pinion-shaft L, the shaft P, having ratchets $P' P^3$, gearing connecting the shafts L and P, and adjustable pawls for engaging said ratchets, as set forth.

8. The combination of the rings J K, having racks J' K', the pinions J^3 K^3, the pinion-shaft L, the shaft P, having ratchets $P' P^3$, gearing connecting the shafts L and P, and the adjustable slides R R', having pawls $r' r^4$, as set forth.



9. The combination of the frame, the needle-cylinder and its operating mechanism, the cams I I', the rings J K, having rib-sections and

racks, the shaft L and its pinions, pawl-and-ratchet mechanism for operating the shaft, notched disk m, the detent m', and cams m², as specified.

10. The combination of the frame and needle-cylinder, the cams I F, the rib w, and mechanism for expanding and contracting the rib, the said needle-cylinder being adjustable in respect to the portion of the frame carrying the rib and its operating mechanism, so as to widen and narrow on either or both sides of a tube, as set forth.

11. The combination of the frame, the conical needle-carrier and its needles, needle-actuating cams movable into or out of operative position, a supporting-rib for the movable cams, and devices for expanding and contracting the rib, said rib and its operating devices being located adjacent to the lower portion of the cylinder, where its diameter is greatest, as set forth.

386,822. LAMP-BURNER. Edwin H. Hibbs, New York, N. Y.; Mary H. Hibbs administratrix of said Edwin H. Hibbs, deceased. Filed July 16, 1884. Renewed Nov. 17, 1888. Serial No. 212,180. (No model.)

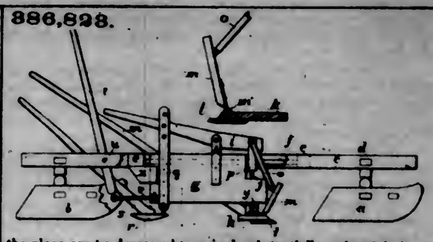
Claim.—1. In an Argand burner, the combination, with a vertically-movable deflector, a wick-adjusting rack, and a wheel for operating the said rack, of a spring for raising the deflector, and means connected with the shaft of said wheel and operated by the wick-adjusting mechanism for causing the descent of the deflector upon the wick, substantially as specified.

2. In an Argand burner, the combination, with a vertically-movable deflector, a wick-adjusting rack, and a wheel for operating the said rack, of a spring for raising the deflector, and a rocking or swinging arm connected with the shaft of said wheel and operated by the wick-adjusting mechanism, causing the descent of the deflector upon the wick, substantially as specified.

3. The combination, with an Argand burner having a central air passage or tube, and the wick-operating mechanism arranged in said tube, of an extinguisher, a vertically-sliding rod supporting the same, extending down into the central air passage or tube, and intermediate connections between the extinguisher-support and the wick-operating mechanism, whereby provision is made for controlling the sliding movement of the extinguisher-rod by the wick-raising mechanism, substantially as herein shown and described.

4. The combination, with an Argand burner having a central air-tube, of the rack *g*, arranged within the air-tube, the ratchet-wheel *i*, and the arms *k*, extending outside of the air-tube and provided with wick-engaging device on their ends, substantially as herein shown and described.

5. The combination, with a lamp-burner, of the rack *g*, placed within the air-tube, ratchet-wheel *i*, arms *k*, extending outside the air-tube, and the ring or holder *l*, substantially as described.



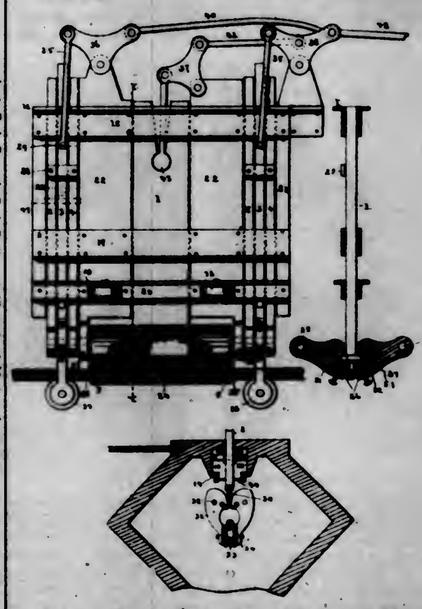
6. The combination, with an Argand burner having a central air-tube, of the toggles *p*, the spring for extending the same, the rod *n*, connected to the toggles, the deflector *n* on the rod, the rack *g*, and means for operating the rack and depressing the toggles by the downward movement of the rack, substantially as herein shown and described.

386,823. ROAD PLANER AND LEVELER. James L. Holmes, Oxford, Ala. Filed Apr. 16, 1888. Serial No. 271,091. (No model.)

Claim.—1. In a machine for repairing roads, the combination, with suitable sleds and frame mounted thereon, of adjustable sliding blocks *g*, supported on rods set in said frame, levers *t*, attached to the sides of said frame, and connecting-links *v*, all substantially as and for the purposes hereinbefore set forth.

2. In a road-machine, the combination, with adjustable sliding blocks, as set forth, of a plane or knife pivoted beneath said block and lever attached to the upper side thereof, whereby the edge of

386,828.



the plane can be depressed or raised, substantially as hereinbefore set forth.

3. In a road-machine, the combination, with adjustable sliding blocks, as set forth, of a plane or knife pivoted beneath said blocks, a lever attached to the upper face thereof, a leveler pivoted near the edge and on top of the plane, and a link connecting said leveler to the block or a standard on the block, all substantially as and for the purposes hereinbefore set forth.

4. In a road-machine, the combination, with adjustable sliding blocks, as set forth, of a lever attached to the top of the block, a rod connected to the end of the lever and passing down through the block, and a plane pivoted to the lower end of the rod, all substantially as and for the purposes hereinbefore set forth.

5. In a road-machine, the combination, with the adjustable sliding blocks *g*, arranged and operated as set forth, of a smoother, *r*, pivoted to the bottom of said block, all substantially as and for the purposes set forth.

386,824. CABLE GRIPPER AND PICK-UP. James B. Holmes and Lewis H. Charles, Washington, D. C., assignors of one-third to Benjamin B. Gibbs, same place. Filed July 20, 1887. Serial No. 245,056. (No model.)

Claim.—1. The combination of a conduit provided with flanges or cams, a picking-up device provided with a bearing to engage said cams, and a gripping device with pivoted jaws adapted to be closed by the forcing of the cable against the same, substantially as specified.

2. The combination of a conduit provided with cams or flanges, a picking-up device consisting of movable jaws or parts and provided with a bearing to engage the cams, a pivoted gripping device, supporting and operating parts of the picking-up device arranged with reference to the gripping device to lift the cable slightly above the latter, and the cable, substantially as set forth, whereby the cable may be automatically picked up and forced into the jaws of the gripper to close the same.

3. The combination of a conduit provided with cams or flanges,

a picking-up device consisting of movable parts or jaws carrying a cable-supporting wheel and provided with a bearing to engage the cams, pivoted gripping-jaws, supporting and operating parts of the picking-up device arranged with reference to the gripping device to lift the cable slightly above the latter, and the cable, substantially as set forth, whereby the picking-up device may be automatically operated to receive and sustain the cable upon a wheel and force it again against the jaws to close the same.

4. The combination of the conduit, a cable, the picking-up device, the gripping device embracing pivoted toggle-levers, their vertical bars supported to move in the slot of the conduit, an operating-lever connected to the vertical bar of the picking-up device to move the wheel of the pick-up above a plane tangential to the lower surface of that part of the cable which is adjacent to or in the grip, to lift the cable and close said grip, and operating devices, substantially as set forth, whereby the cable may be dropped by both picking-up and gripping devices, and the cable subsequently picked up and forced into the jaws of the gripping device to close the same.

5. The combination of the conduit provided with ways immediately below the lips of the slot, and the friction-wheel 13, journaled in the fixed bar 22 of the frame between bars 20 and arranged to engage on either side, according as the bar is inclined, to one side or the other, substantially as specified.

6. The combination of a curved conduit provided with ways immediately below the lips of the slot, the wheel 13, journaled in the fixed bar 22 of the frame between bars 20 and arranged to engage on either side, according as the bar is inclined, the cable, and guide-wheels, substantially as specified, whereby the cable may be kept from contact with the wall of the conduit at curves or elsewhere and the bar be kept in vertical position.

7. The arms of the gripping devices provided with removable jaws and with springs, and having openings in the jaw-holding arms for inserting a tool to remove the springs, substantially as specified.

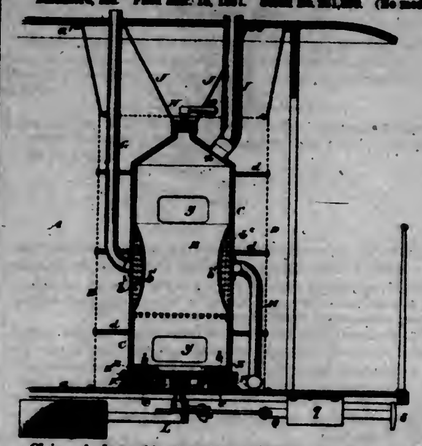
8. The combination of the picking-up device and its cable-supporting wheel, the pivoted gripping levers or arms having jaws movable in their seats, springs located behind said jaws, and operating mechanism whereby a cable may be pressed by the wheel against yielding jaws, and finally receive an unyielding grip, substantially as specified.

9. A cable-gripping apparatus having gripping-levers, one of which is provided with a socket, and a removable gripping-jaw and removable plate in said socket, substantially as specified, whereby the wear of the jaws may be compensated for by the introduction of plates into the socket behind the jaw.

10. The combination of the pivoted arms 5, of the gripping device provided with notches or recesses 43, the operating-bar provided with the head 24 to engage in the recesses of the pivoted arms, and mechanism for raising and lowering the operating-bar to close or open the gripper, substantially as specified.

11. The combination of the arms of the picking-up device, pivoted as shown, the chains secured to said arms, and mechanism for raising and lowering the chains, substantially as set forth, whereby the arms may be opened and closed.

12. The combination of the operating-bar, of the picking-up device made in parts, the spring-catch, the frame, the pin to disengage the catch, the pivoted arms, and the operating mechanism, whereby a part of the operating-bar may be moved to open the picking-up arms while the other parts of said bar are locked, substantially as specified.



13. In a device for picking up a cable, a compound operating-bar, the parts of which are made separately movable, combined with an automatically-acting locking device adapted to lock one member of said compound bar to the frame, and said frame, said locking device having a flange substantially at right angles to the bar and a distinct releasing device, substantially as specified, whereby a positive locking together of the parts may be effected and independent movement provided for at times desired.

14. In a device for picking up a cable, the cable, a compound bar having an independently-movable part, a lever connected to said part, a stop secured to another part to limit the separate movement of said independently-movable part, pivoted arms, and a cable-supporting wheel having an axis secured in a bearing in one arm and free to enter or leave a bearing in the opposite arm, substantially as specified, whereby the gripping device may be vertically moved whether open or closed, and whereby the wheel and axis may be swung beneath the cable and the axis supported at each end when the cable is on the wheel.

15. The combination of the picking-up and gripping devices and their operating-bars, bell-crank levers, a rod connecting the levers, and rods connecting the levers and the operating-bars, the rod between the grip-bar and its corresponding lever being pivoted nearer its center of motion than the rod between the picking-up bar and its lever, whereby the operating-bars can be moved simultaneously but at different rates of speed, substantially as specified.

16. The combination of an operating-lever, bar l, a gripping device, the connecting-rod 43, provided with a head and cross-bars, as 24, substantially as specified, whereby the operating-lever and the grip-sustaining bar are connected for operation.

386,825. STOVE FOR RAILWAY-CARS. John T. Hoffman, Baltimore, Md. Filed Mar. 16, 1887. Serial No. 231,093. (No model.)

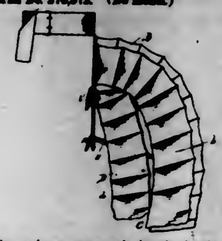
Claim.—1. In combination with a fixed base-plate supported from the floor of a car having a central hole therein, a stove having a pintle at its bottom which passes through the hole in the said base-plate, and another pintle at its upper end, and a fixed casing which surrounds the said stove fastened at its lower end to the said base-plate and at its upper end provided with a hole in which the upper pintle rests, the said stove and its pintles being adapted to turn independently of the said casing and the base-plate, substantially as and for the purpose specified.

2. In combination with the floor of a car, a plate supported from the said car-floor having a central hole therein, a revolvable stove on or over the said base-plate having a pintle which projects through the hole in the said base-plate and through the floor of the car, carrying an arm with a weight at its end, and a casing which surrounds the said stove, substantially as and for the purpose specified.

3. A stove contracted in the middle and a casing surrounding said stove, combined with a pipe for conveying cold air to the chamber formed by the casing and the contracted portion of the stove, and a pipe for conveying the heated air therefrom, substantially as described.

4. A stove having a pintle projecting through the floor of the car, said pintle having an arm attached thereto, and a casing surrounding said stove, combined with a bar, mounted in a box attached to the floor of the car, attached to said arm and adapted to revolve the stove in the event of the cars telescoping, substantially as described.

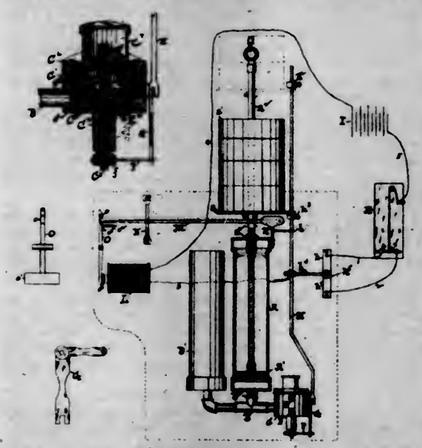
386,826. ROPE-CARRYING DEVICE. George C. Howard, Wallingford, Pa. Filed Aug. 15, 1887. Serial No. 247,087. (No model.)



Claim.—1. In an anti-friction device for guiding a rope or cable in a curved line, the combination of an endless stationary track and an endless carrying-chain composed of blocks jointed together and provided with sustaining-rollers which travel upon the track, said blocks having their outer faces adapted to receive and loosely carry the rope.

2. An anti-friction guide or carrier for ropes and cables, consisting of an endless chain with blocks grooved in their outer faces to

receive and freely support the rope and provided with sustaining-rollers, in combination with a stationary curved track, whereon the rollers freely travel, located within the chain and supporting the rollers opposite or beneath the rope-bearing surfaces.



386,827. BUSTLE. ANNE H. JAMISON, Fremont, Ohio. Filed Apr 11, 1888. Serial No. 270,372. (No model.)

Claim.—1. As an improvement in bustles having a vertical frame and a series of outer downwardly-curved coil-springs, the separate coil-supporting springs disposed within a bag or covering and adjustably secured under said outer springs in an approximately vertical position, substantially as shown and described.

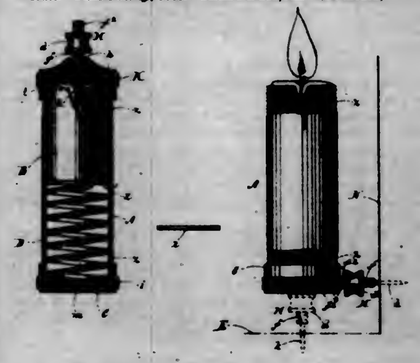
2. The herein-described improved bustle, comprising the vertical frame, the series of outer curved coil-springs connected thereto, the bag or covering therefor, the separate coil-supporting springs disposed in an approximately vertical position, together with their bag or covering, and the adjusting or holding tapes for securing said supporting-springs to said frame beneath said outer springs, substantially as shown and described.

386,828. TEMPERATURE-REGULATOR. CHARLES W. JOHNSON, Holyoke, Mass. Filed Dec. 27, 1887. Serial No. 259,128. (No model.)

Claim.—1. In an apparatus for regulating temperature, the combination of the following instrumentalities, viz: a cylinder containing a piston the stem of which is to be operatively connected with the draft-governing devices of a furnace, a valve operated by the movement of said piston governing the admission of fluid or liquid under pressure to and its exhaustion from said cylinder, a trip-lever and pawl for temporarily suspending the movement of the piston, an electric generator, a thermostat, an electro-magnet, and suitable conductors between said battery, thermostat, magnet, and pawl, whereby the latter will be operated to release the trip-lever by variations in the degree of temperature, substantially as set forth.

2. The apparatus for regulating temperature herein described, comprising, in combination with an electric battery, an electro-magnet, and a thermostat, a vertical cylinder containing a piston, a valve governing the admission of fluid or liquid under pressure to and its exhaustion from said cylinder, a rod operatively connected with the stem of said valve and extending upwardly in a plane parallel with the stem of said piston, steps located upon said rod adapted to be engaged by a contact device upon the piston-stem, a trip-lever located adjacent to the piston-stem and adapted to be engaged by steps upon the latter before the piston arrives at the end of its movement in either direction, a pivoted pawl having at one end an armature located within the field of the magnet and at its opposite end a notch to engage the end of said trip-lever, two contact-pieces located adjacent to the valve-operating rod, a circuit-breaking device secured to said rod and adapted to pass from one of said pieces to the other with the movement of said rod, a wire connecting each of said pieces with one of the contact-points of the thermostat, a wire connecting the battery with the rod of the thermostat, a wire connecting the battery with the magnet, and a wire connecting the magnet with the circuit-breaking device on the valve-operating rod, arranged and operating substantially as and for the purpose described.

3. In an apparatus for regulating temperature, the combination, with cylinder A, containing piston A', of valve C, consisting of shell C', having seats c c' and ducts c^2 c^3 d e, disks C^2 C^3, fitted to said seats and having ports c^4 c^5, respectively, pipe B, communicating with cylinder A and also with said valve by means of said ducts c^2 c^3, and pipes D E, communicating with said valve by means of ducts d e, respectively, substantially as and for the purpose set forth.



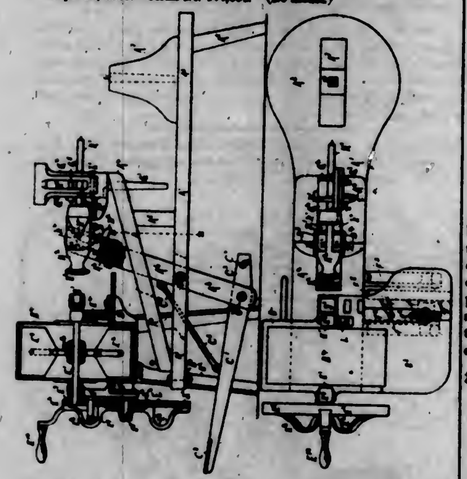
4. In an apparatus for regulating temperature, cylinder A, containing piston A', valve C, supply-pipe D, and exhaust-pipe E, communicating with said valve, air-chamber E', and pipe B, communicating at one end with said air-chamber, at its opposite end with said valve, and between its ends with cylinder A, combined and operating substantially as described.

5. In an apparatus for regulating temperature, a vertical cylinder containing a piston the stem of which is to be operatively connected with the draft-governing devices of a furnace, in combination with valve C, consisting of shell C', having seats c c', disk C^2, fitted to said seat c and having stem C^3, pins c^2, and port c^4, disk C^4, fitted to said seat c' and having port c^3 and orifice c^5, pipe E, communicating by means of duct e with the seat of disk C^2, pipe D, communicating by means of duct d with the valve-chamber above disk C^4, and pipe B, communicating by means of duct c^2 with said chamber between the disks and by means of branch duct c^3 with the seat of disk C^4, said pipe B also communicating with the cylinder, arranged and operating substantially in the manner described.

6. In an apparatus for regulating temperature, cylinder A, piston A', having stem A^2, provided with a contact device, a, valve C, having disks c^2 c^3, operated by stem C^3, pipes D E, communicating with said valve, pipe B, connecting said valve with the cylinder, arm F, secured to said stem C^3, lever G, engaging said arm at one end, and rod H, connected to the opposite end of said lever, said rod having adjustably secured thereon tappets h^2 h^3, lying within the plane of the movement of the contact device on the piston-stem, whereby the valve-disks are operated by said piston-stem, substantially as set forth.

7. As a means for electrically controlling the apparatus for regulating temperature herein described, the combination, with the cylinder, piston, valve, and tappet-rod for operating said valve, arranged and operating substantially as described, of trip-lever M, pivoted to bracket k' and loosely embracing the piston-stem between stops on the latter, pawl O, having notch o at its upper end and armature o' at its lower end, an electric battery, as I, a thermostat, as K, having the contact-points 6 7 thereon, an electro-magnet, as L, facing said armature o', contact-plates k k', arm k^2, secured to the tappet-rod and having mounted thereon roll k^3, bearing upon said plates alternately as the tappet-rod is raised or lowered, wires connecting each of said plates with one of the points 6 7 of the thermostat, a wire connecting the apparatus with the magnet, and wires connecting the battery with the magnet and also with the rod of the thermostat, substantially as and for the purpose set forth.

386,829. POCKET CANDLE-CASE. JAMES H. JOHNSON, Boston, Mass. Filed Feb. 13, 1888. Serial No. 263,843. (No model.)



Claim.—1. In a device of the character described, the combination of the following instrumentalities, to wit: a hollow cylindrical body exteriorly screw-threaded at each end and adapted to receive a candle, a coiled spring disposed in said body and provided at its inner end with a plate or follower for supporting the candle, a screw-cap for closing one end of said body and compressing said spring, said cap being provided with a screw-threaded hole in its bottom and also in its side for receiving a supporting-bead, an interiorly-screw-threaded cover for said body, said cover being provided with a centrally-disposed screw-threaded hole for receiving said bead, and a supporting-bead provided with a rosette and with a head having two exteriorly-screw-threaded portions, one of said portions being adapted to fit the holes in said cap and the other the hole in said cover, substantially as set forth.

2. In a pocket candle-case, the combination of a cylindrical body adapted to receive a candle and provided with an inwardly-projecting flange at its upper end, a screw-cap fitted to the lower end of said body and provided with threaded holes in its bottom and side adapted to receive a screw-threaded supporting-bead, a screw-cover fitted to the upper end of said body and provided with a centrally-disposed screw-threaded hole for said bead, and a screw-threaded supporting-bead inserted in the hole in said cover, substantially as set forth.

386,830. PROCESS OF OBTAINING ROTENE. WILHELM KELBE, Gerbrode, Baden, assignor to the Actien-Gesellschaft für Chemische Industrie, Rheinau, near Mannheim, Germany. Filed Apr. 4, 1888. Serial No. 269,891. (No specimens.) Patented in Luxemburg Sept. 30, 1887, No. 693; in France Oct. 3, 1887, No. 183,693, and in Belgium Oct. 3, 1887, No. 78,978.

Claim.—A process of manufacturing rotene ($C_{30}H_{50}$) from rosin-oil by heating the latter in the presence of sulphur in a vessel until the formation of sulphide of hydrogen is entirely finished, the raw rotene being then obtained from the residues either by distillation or by extraction by means of suitable solvents—such as alcohol, benzine, petroleum-ether, and the like—and finally purified by means of repeated crystallizations, substantially as set forth.

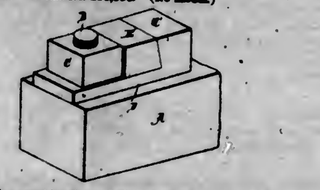
386,831. WORK-BENCH. JAMES KELLY, Carver, Minn. Filed Sept. 21, 1885. Serial No. 177,051. (No model.)

Claim.—1. The combination, with a work-bench having a work-plank thereon, of a lathe mandrel or chuck mounted on a frame secured to the bench, a tail-stock mounted on the plank removable and reversible in position, a lever pivoted to the bench and adapted to move the tail-center to the work, and a treadle for operating the said lever, all arranged in relation to one another substantially as herein set forth.

2. The combination, with a work-bench having a work-plank thereon provided with a socket, of a lathe tail-stock fitted in the said plank-socket removable and reversible therein and provided with clamp-jaws, and a lathe tail-center sliding in one of the jaws of the clamp, substantially as herein set forth.

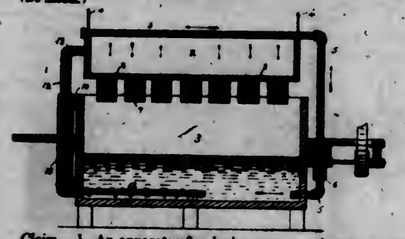
3. The combination, with a work-bench having a work-plank thereon provided with a socket, of a lathe tail-stock fitted in the said plank-socket, a lathe tail-center sliding in the said tail-stock, and a leather-splitting knife inserted in an anvil on the tail-stock, the said tail-center being adapted to act as a guide to the leather split by the said knife, substantially as and for the purpose herein set forth.

386,832. INSOLE. CHARLES W. KING, West Newton, Mass., assignor to Charles A. King, New York, N. Y. Filed Sept. 22, 1887. Serial No. 250,502. (No model.)



Claim.—An insole for boots and shoes, consisting of layers of woven fabric saturated or filled and secured together with gum-shellac dissolved in borax-water or its described equivalent, substantially as set forth.

386,833. BOOT OR SHOE. CHARLES W. KING, West Newton, Mass., assignor to Charles A. King, New York, N. Y. Filed Nov. 14, 1887. Serial No. 255,099. (No model.)

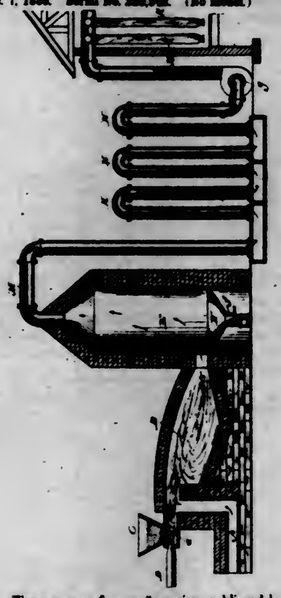


Claim.—The combination, in a boot or shoe, with the outer and inner soles, of fasteners provided with oppositely-projecting prongs placed between the said outer and inner soles inside of the line of the channel of the outer sole, whereby the said outer sole is temporarily secured in place preparatory to its permanent attachment, substantially as set forth.

386,834. NUT-LOCK. MIDDLETON H. KOONTZ, Zoin, W. Va. Filed Mar. 26, 1888. Serial No. 268,534. (No model.)

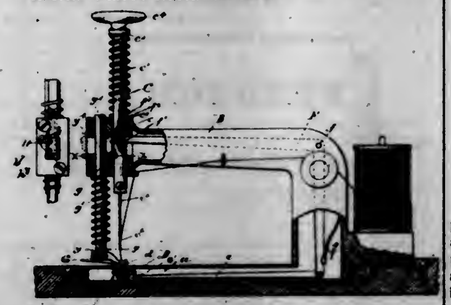
Claim.—The combination of the nut C, the elongated washer D, having a pin, d, standing from its inner surface near one end opposite that adjacent to the bolt-hole, and having a flange, d', with its inner edge beveled inwardly away from the nut, the locking-block E, beveled on its outer edge, fitting closely between the nut and flange d', and provided with a tapped recess, f, and the screw F, passing through a suitable opening in the flange d and engaging in the recess f, the nut, the flange, and the locking-block having their outer surfaces flush with each other, substantially as specified.

386,835. APPARATUS FOR DYEING. FRANK W. LEE and JOHN G. BRADSHAW, Lawrence, Mass. Filed Apr. 14, 1888. Serial No. 270,575. (No model.)



Claim.—1. An apparatus for dyeing yarn or other fibrous material, consisting of two open vats separate one from the other, each vat so uncovered and with the upper vat having depending vessels with a perforated top and bottom located in the upper exteriorly thereof, and liquid-forcing apparatus, as specified, by which the coloring-mixture supplied from the lower vat is permitted by gravity to permeate the material in process, substantially as herein set forth.

2. In apparatus for dyeing yarn or other fibrous material, the open mixing-vat 3, the open dyeing-vat 2, dispersed above and adjustable with respect thereto, combined with the vessels 7, communicating with the mixing-vat and the supply-pipe 5, and forcing apparatus 6, substantially as herein described.



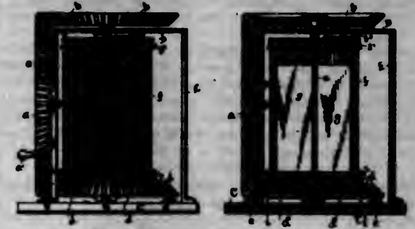
3. The combination, with a fixed mixing-vat, 3, the supply-pipe 10, steam-pipe 12, delivery-pipe 5, and forcing apparatus 6, of the open dyeing-vat 2, vertically adjustable, its overflow 13, and the removable vessels 7, perforated at the top and bottom, located exteriorly of the dyeing-vat, and communicating with the mixing-vat, substantially as stated.

386,836. PROCESS OF MANUFACTURING SUBLIMED LEAD PIGMENT FROM GALENA ORE. GEORGE P. LEWIS, Philadelphia, Pa. Filed Dec. 7, 1886. Serial No. 220,982. (No model.)

Claim.—The process of manufacturing sublimed lead pigment from finely-divided galena, which consists in forming a compound current of intimately-admixed gas, air, and finely-divided galena before entering the combustion-chamber, inflaming said current at the point of entrance into said chamber, maintaining the resultant salts in suspension by the air-blast while being forced through said chamber, cooling the material obtained by the combustion of the gas and galena, and finally depositing the lead salts by forcing them into receptacles of textile fabric, substantially as set forth.

386,837. SEWING-MACHINE. ISAAC W. LITCHFIELD, Warwick, assignor of one-half to Philip H. Dumaresq, New York, N. Y. Filed Sept. 23, 1886. Serial No. 178,365. (No model.)

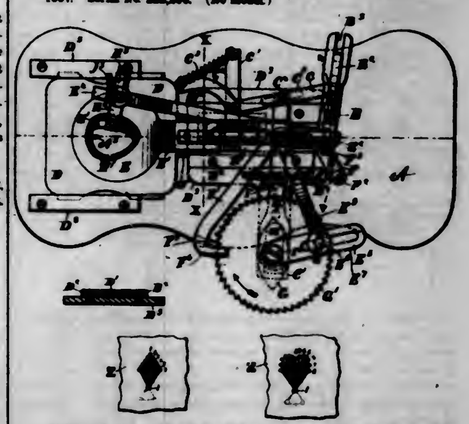
Claim.—1. The combination of the driver-bar C, operated as described, having the recess f^3, provided with the shoulder f^4, the lever F, pivoted at f, the end of which enters the said recess f^3, the connecting-rod e, and looper B, and spring f^5, all substantially as described.



2. The needle-bar supported in a bracket, as described, so as to reciprocate vertically, the bell-crank lever F, pivoted in the frame and having engagement with a shoulder on the needle-bar, the looper-bar e, connected to said lever, and the looper connected to said bar, all in combination, substantially as described.

3. The bracket, the needle-bar reciprocating vertically therein, the presser-foot rod practically parallel with the needle-bar and supported in bearings so as to turn on its own center, a cam-groove in the needle-bar, of the character described, and a spring-pin in the presser-foot rod extending into said groove and guided therein, all combined in a sewing-machine, in the manner and for the purpose described.

4. The combination of the bracket, the needle-bar supported therein and having a spring-lifting device, the presser-foot and its bar parallel with the needle-bar and connected thereto by slot-and-pin connection, and a presser-spring of less strength than the needle-bar spring, all substantially as described.



5. The combination of the needle-bar, the presser-foot bar, and a slot-and-pin connection between the two, the bracket, and a movable stop on the bracket in position to engage the pin of the presser-rod and keep it from rising, as set forth.

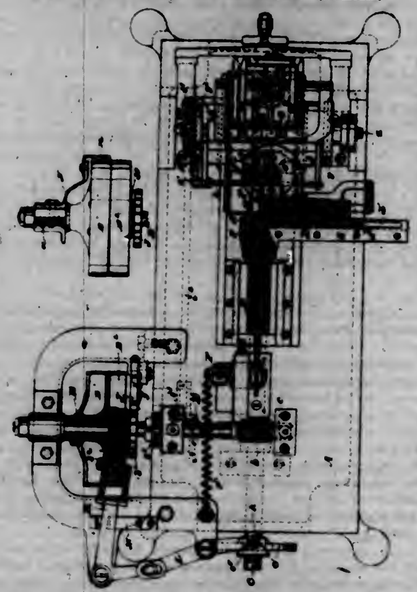
386,838. CHURN. SHADRAH J. LOVEJOY, near Mount Sterling, Ohio. Filed Mar. 29, 1888. Serial No. 268,193. (No model.)

Claim.—The combination, with the bottom plate, C, provided with anti-friction wheels c, of the frame-work B D E, secured to the bottom plate, the miter-wheels a and b, pivoted to the frame-work, the miter-wheel d, pivoted to the bottom plate, the can f, detachably supported on the miter-wheel d, and the dasher-shaft e, substantially as described.

386,839. FLOSSING-MACHINE. JOHN MCDERMOTT, Troy, N. Y., assignor of one-half to Theodore F. Barnum, same place. Filed Jan. 24, 1887. Serial No. 225,206. (No model.)

Claim.—1. In a sewing-machine, a vibratory cloth-plate and plate-actuating lever connected by a link one end of which is movably secured in a slideway extending longitudinally of said lever, and means for operating said lever, in combination with a cam-operated arm pivoted to said link for the purpose of regulating the position of its movable end in said slideway, and means, substantially as described, for actuating said cam, as and for the purposes set forth.

2. In a sewing-machine, a vibratory cloth-plate, a plate-actuating lever, means for actuating the same, a link connected with the said lever, the point of connection being longitudinally adjustable on the lever, a cam and suitable connections for varying the position of the said point of connection, means for connecting the link to the vibratory cloth-plate, in combination with a secondary cloth-plate rotatory on the first-mentioned cloth-plate, an arm connected thereto, a crank, a suitable connection between the arm and the crank, and means for rotating the crank, all substantially as described, and for the purposes set forth.



386,840. SHOE OR SLIPPER. LEVI A. HAMMOND, Stockton, Me. Filed Nov. 30, 1887. Serial No. 256,494. (No model.)

Claim.—1. The improved cut or pattern for shoes or slippers, consisting of the sole A, the quarters C C, extending round the same, ending in the interesting rounded parts d d, the extending sides B B, cut to meet over the instep and extend down the front almost to the toe, and the rounded toe portion i i, turning up around the toe, all cut integral, substantially as described.

2. The combination of the sole A, cut integral with the quarters C C, extending round the same, uniting at the heel, the extending sides B B, meeting over the instep and forming the front of the shoe, and the rounded toe turning up around the same, with the short center-shaped tip F, connecting the parts i i and e e, substantially as described.

386,841. NEEDLE-GROOVING MACHINE. LEMUEL B. MILLER, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Jan. 24, 1888. Serial No. 261,782. (No model.)

Claim.—1. In a needle-grooving machine, the combination, with the needle-grooving and needle-feeding appliances and a cam-shaft having cams to operate the latter, of a driving-shaft for the said cam-shaft, fast and loose pulleys on the said driving-shaft, gears and a ratchet-wheel and pawl to connect the said loose pulley with the said driving-shaft, a belt-shipper mechanism to shift the driving-belt onto the fast and loose pulleys alternately, and a friction-pad to bear on the said fast pulley and prevent the said driving-shaft from overrunning when the speed thereof is changed from fast to slow, substantially as set forth.

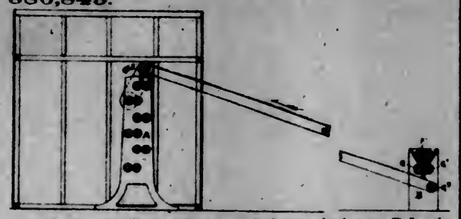
2. In a needle-grooving machine, the combination, with the needle-carriages and the cam-shaft from which they are operated, of a driving-shaft for the said cam-shaft, a needle-removing mechanism operated from the said driving-shaft, needle-grooving cutters operated independently of the said driving-shaft, fast and loose pulleys on the said driving-shaft, a train of reducing-gears to indirectly connect the said loose pulley with its shaft, and a belt-shipper to shift the belt onto the said fast and loose pulleys alternately, whereby the grooving-cutters can be operated at a uniform speed and the other mechanisms of the machine at alternate fast and slow speeds, substantially as set forth.

6. The combination, with the driving-shaft B, the fast and loose pulleys B' and B², a belt-shipping mechanism, a train of gears, a ratchet-wheel, b', loose on said shaft and having a rigid connection with one of said gears, and the pawl J, having the friction-spring j, bearing against the side of the said wheel, to operate substantially as set forth.

7. The combination, with the driving-shaft B, the cam-shaft C, and the needle feeding, grooving, and removing devices, of the fast and loose pulleys B' and B², the planetary gears 28 and 30, carried by the said loose pulley, the fast and loose gears 36 and 34 on the said driving-shaft, the ratchet-wheel b', loose on the said shaft, but rigidly connected with the said loose gear 34, the pawl J, the belt-shipper K, the lever L, and the disk d', having cam blocks or dogs for operating said lever, substantially as set forth.

386,842. SCREW-CUTTING DIE AND STOCK. RASMUSSEN OLSEN, New York, N. Y., assignor to the Adjustable Die and Stock Company, same place. Filed Nov. 2, 1887. Serial No. 254,603. (No model.)

Claim.—1. The forked handle A, combined with the disks B B, having a series of corresponding dies, c, on their rims, each disk B being carried on an arm of said forked handle, substantially as described.

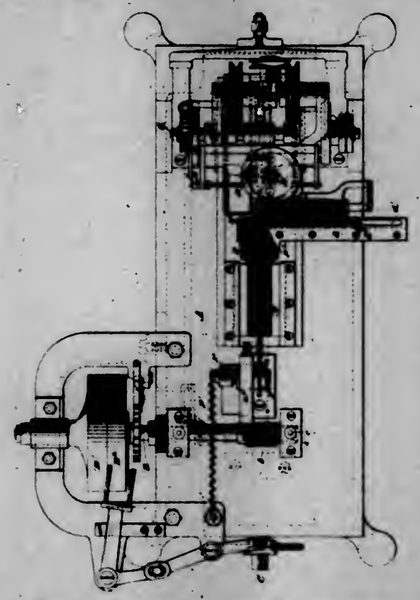


2. The forked handle A, having spring-arms a, combined with the disks B B, having corresponding dies c, substantially as herein shown and described.

3. The handle A, having spring-arms a and screw i, connecting said arms a, combined with the pivoted disks B B, having corresponding dies c, and means for securing the disks in position, substantially as described.

386,843. AUTOMATIC FEED AND DELIVERY APPARATUS FOR GUNPOWDER-MILLS. PAUL A. OLIVER, Oliver's Mills, Pa. Filed June 14, 1887. Serial No. 241,268. (No model.)

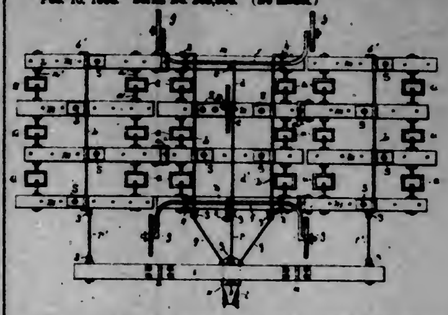
386,843.



Claim.—1. The combination of the supply-hopper F for the unground explosive materials, the conveyer C, the gunpowder-grinding mill A, fed uniformly by the said conveyer, the conveyer D, driving-wheels connecting the said conveyers with the revolving mechanism of the mill, and the discharge-hopper E, the said mill being located at such distances from the supply and discharge hoppers that the explosion of the small quantity of material in the mill will not be communicated to the contents of the hoppers.

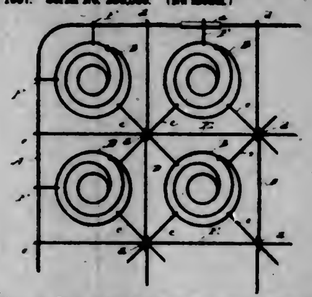
2. The combination of the supply-hopper F for the unground explosive materials, the distributer B, provided with revolving rolls, the conveyer C, driving-wheels connecting the conveyer with the revolving mechanism of the mill, the toothed wheels positively connecting the conveyer with the distributer-rolls, and the gunpowder-grinding mill A, fed uniformly by the said conveyer and located at such a distance from the supply-hopper that the explosion of the material in the mill will not be communicated to the contents of the hopper.

3. The combination, with a gunpowder-mill, of a traveling belt driven from the mill for conveying the inflammable material to the mill, a feed-hopper for the material, and a pair of revolving rolls journaled below the feed-hopper for distributing the material evenly upon the belt.



386,844. NEEDLE-GROOVING MACHINE. HENRY S. PARSONS, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Jan. 24, 1888. Serial No. 261,790. (No model.)

Claim.—1. In a needle-grooving machine, the combination, with the needle-carriage D and the needle holder or magazine carried thereby, of a needle-feeding push-pin arranged to slide longitudinally in said carriage, and actuating mechanism for said pin, to operate substantially as set forth.

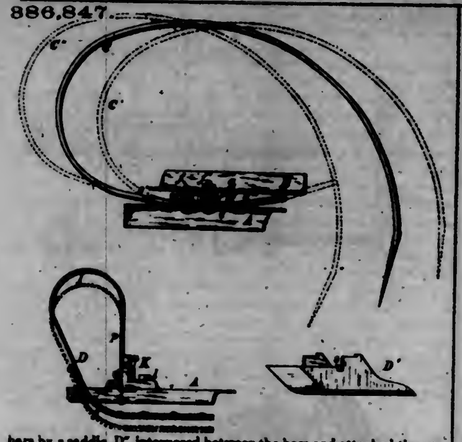


2. In a needle-grooving machine, the combination, with the needle-carriage D and the needle holder or magazine *d*, carried thereby, of the needle-feeding push-pin *p*, sliding longitudinally in said carriage, the shank or spindle p^2, by which the said pin is carried, the slide p^3, the lever P, the cam c^2, and the spring p^4, substantially as set forth.

386,845. HARROW. ROBERT G. PATTON, Kansas City, Mo. Filed Feb. 10, 1888. Serial No. 263,692. (No model.)

Claim.—A harrow composed of sections flexibly connected to each other by loop-like couplings a^4, and each composed of tooth-carrying bars *m*, connected to each other centrally by the cross-bar *b* and at their ends by the loop-like couplings *a*, the crosser-bar *t*, composed of as many sections as there are harrow-sections hinged to each other in line with the couplings a^4, and draft rods or links between each harrow-section and section of the crosser-bar, substantially as described.

386,846. SPRING BED-BOTTOM. DAVID J. POWERS, Chicago, Ill., assignor to the Union Wire Mattress Company, of Illinois. Filed Sept. 24, 1887. Serial No. 250,502. (No model.)



Claim.—1. In a spring bed-bottom, a series of longitudinal wires secured at their respective ends to opposite ends of the structure, a series of transverse wires also secured to the sides of the structure, corresponding to their direction, one series of which is provided with loops at intervals throughout their length, and the wires of the other series inserted through said loops, and a series of spiral springs located within the areas or squares outlined by the two series aforesaid, the outer rows of which are partly secured by wire loops direct to the marginal portions, and conjointly with the interior rows of springs are tied or stayed by wire hooks or links that pass through the loops of the transverse or longitudinal wires aforesaid, two of which tie-wires intersect or converge at said loops and serve to connect springs occupying positions diagonally adjacent to each other, substantially as set forth.

2. In a spring bed-bottom, a series of longitudinal wires secured at their respective ends to opposite ends of the structure, a series of transverse wires also secured to the sides of the structure, corresponding to their direction, one series of which is provided with loops at intervals throughout their length, and the wires of the other series inserted through said loops, and a series of spiral springs respectively located within the areas of squares outlined by the two series aforesaid, the outer rows of which are partly secured by wire loops direct to the marginal wires, and conjointly with the interior rows of springs are tied or stayed by wire hooks or rods that pass through the loops of the transverse or longitudinal wires aforesaid, two of which tie-wires intersect or converge at said loops and serve to connect springs occupying positions diagonally adjacent to each other, in combination with two or more principal marginal wires of quadrilateral form, substantially as described.

386,847. HARROW. HENRY C. PRATT, Canandaigua, N. Y. Filed Sept. 17, 1887. Serial No. 249,980. (No model.)

Claim.—1. The combination, with a cultivator or harrow frame composed of the angularly-arranged angle-iron bars A B, of the adjustable teeth C, secured to the horizontal flanges of one set of the

386,847.

bars by a saddle, D', interposed between the bars and attached thereto, substantially as and for the purposes set forth.

2. The combination, with the bar A of a harrow-frame having a plane upper surface, of the spring-tooth C, curved upward and backward over the bar, so that its point is located below and in rear thereof, and having the end by which it is attached to the bar bent upward and inward toward the curved portion, forming two or more flat plates, *c c'*, adapted to be secured to the upper surface of the bar by being clamped thereto by the saddle D, substantially as described.

3. In a harrow provided with a frame composed of intersecting bars, the combination, with the draw-bar A, cross-bar B, and spring-tooth C, of the saddle D, having a seat on its upper side for retaining the cross-bar and saddle in a fixed relation, and a seat on its lower side for the tooth, by which the tooth is clamped on the draw-bar, and means for securing the parts in place, substantially as and for the purposes set forth.

4. In a harrow provided with a frame composed of intersecting bars, the combination, with the draw-bar A and the cross-bar B, arranged in different planes and connected together by the saddle D, of the curved adjustable spring-tooth C, provided with two or more angularly-disposed flat plates, *c c'*, adapted to be secured to the flat surface of one of the bars, substantially as and for the purposes set forth.

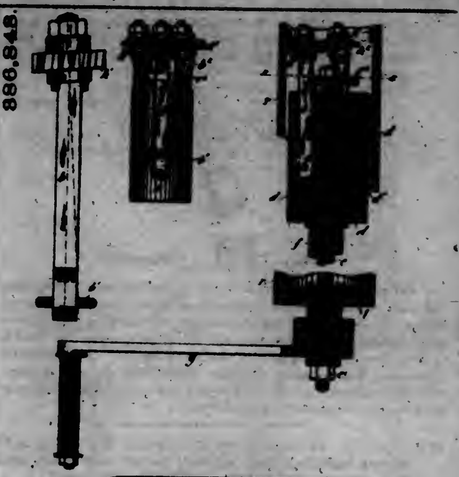
5. The combination, with the angularly-arranged L-shaped bars A and B, of the saddle D', having thickened end *g*, whereby the bars are separated to permit the spring-tooth C to pass between them and the bolts *f f'*, substantially as described.

6. The combination, with the angularly-arranged L-shaped bars A and B, of the spring-tooth C, saddle D', having recess *h*, and bolts *f f'*, substantially as described.

7. The combination, with the angularly-arranged L-shaped bar A of a harrow-frame, of the shoe D', having notched side flanges, *r r*, substantially as described.

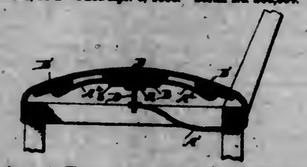
8. The combination, with the angularly-arranged L-shaped bar A of a harrow-frame, of the shoe D', having notched side flanges, *r r*, clip *t*, and bolts *u u'*, substantially as described.

9. The combination, with the angularly-arranged L-shaped bar A of a harrow-frame, of the shoe D', having notched side flanges, *r r*, and secured to the bar by a clamp which permits the adjustment of the shoe lengthwise of the bar, substantially as described.



386,848. TUBE-CLEANER. ADOLF RAIT, Gumbring, near Vienna, Austria-Hungary. Filed Dec. 27, 1887. Serial No. 258,262. (No model.)

Claim.—1. The combination, with the head *a*, of the arms *b*, carrying a plain revolving cutter, b^2, and serrated revolving cutters b' b^3, being inclined or oblique with relation to the center of the rotatable head that carries them, all constructed and arranged as and for the purpose set forth.



2. The combination, with the head *a*, of the arms *b*, carrying a plain revolving cutter, b^2, and serrated revolving cutters b' b^3, being inclined with relation to the center of the rotatable head that carries them, rod *e*, with nut *e'*, and disk e^2, all constructed and arranged as and for the purposes set forth.

3. The combination, with the head *a*, of the arms *b*, carrying a plain revolving cutter, b^2, and serrated revolving cutters b' b^3, being inclined with relation to the center of the rotatable head that carries them, sleeve *d*, rod *e*, with nut *e'* and disk e^2, tube *f*, and crank *g*, all constructed and arranged as and for the purposes set forth.

386,848.

386,849. SEAT OR COUCH SPRING. WILLIAM P. RUPPEL, Granton, R. I. Filed Apr. 6, 1888. Serial No. 269,804. (No model.)

Claim.—1. The spring A, post D, threaded at one end, hub *d*, and disk B, said disk being loosely pivoted upon said post and having free rocking movement thereon, all combined with each other and with the frame or slats of a seat, couch, or analogous article, as shown and described, and adapted to serve as specified.

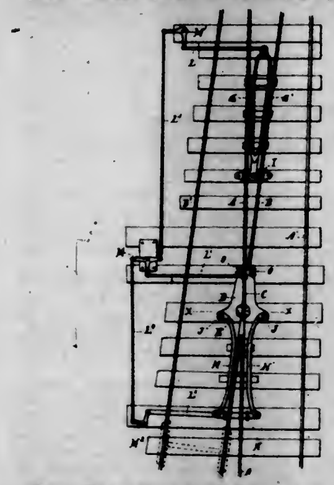
2. The clamping-plate *b*, auxiliary springs A^2, and disks B' B' B', combined with a central disk, B, post *d*, and main spring, as A, to form a cluster spring for seats, couches, and analogous articles, said auxiliary springs radiating from said central disk, and said auxiliary disks B' having each independent free rocking movement pivotally upon upwardly-turned ends of said springs A^2.

3. A spring for seats, couches, and analogous articles, consisting of a main spring and central disk, as shown, combined with one or more springs radiating from said central disk in planes parallel with that of the main spring, and a disk loosely pivoted upon each of said radiating springs and having free rocking movement thereon yieldingly to pressure applied at any angle to its pivotal axis, all arranged, substantially as shown and described, for joint operation, and adapted to serve as specified.

4. In a seat, couch, or analogous article, the spring A, adapted to be secured at one end to the frame of the chair or couch, and a post, D, tapped into the other end of said spring, combined with each other and with a disk, B, carried on the free end of said post, all arranged and adapted to serve to raise or lower said disk to increase or lessen the tension of the seat or couch upholstery.

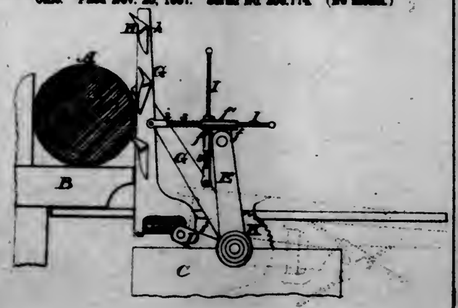
386,850. HOOK. RICHARD SAWYER, Providence, R. I. Filed Apr. 2, 1888. Serial No. 269,260. (No model.)

Claim.—1. The garment-hook herein described, comprising the brace portion *b'*, provided with the hook *c*, and on the opposite side thereof with the hook portion *b*, having an inturned end, *c'*, formed as described, as and for the purpose set forth.



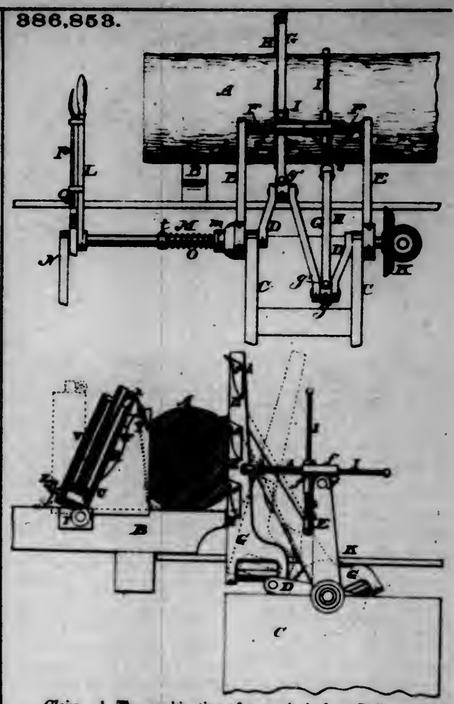
2. The hook A, herein described, comprising the brace portion *b'*, provided with the hook portions *b* and *c*, and further provided with the spring *a*, substantially as specified.

886,851. ART OF MANUFACTURING CARRIAGE-TOP IRONS. FRANK SCHMIDT, Mansfield, Ohio, assignor to the Schmidt & Miller Company, same place. Filed Nov. 14, 1887. Serial No. 255,626. (No model.)



Claim.—The herein-described improvement in the art of forming the joints in carriage-top or similar irons, which consists in first upsetting the iron to form the knuckle; secondly, rolling the iron for giving the body thereof the required form; thirdly, sawing the knuckle to form the interlapping ears of the joint; fourthly, again upsetting to form the inner concave shoulder; fifthly, filing the convex outer ends of the knuckle or ears of the joint, and, lastly, drilling the rivet-holes therein, substantially as described.

886,852. SELF-ACTING CONTINUOUS-RAIL FROG. WILLIAM H. SHARROW, Birmingham, Mich., assignor of one-half to John Hanna, same place. Filed Mar. 27, 1883. Serial No. 268,815. (No model.)



Claim.—The combination, with the inner main and siding rail, interrupted at the point of crossing, of the movable frog-rail C, adapted to register with either rail, the vibrating contact-bars G G' and H H', placed alongside these rails at the approaches to the frog-rail, connecting-bars L, L', L'', L''', and L'''', and the crank-levers M M' M'', the parts being constructed and arranged to operate substantially as described.

886,853. LOG-TURNER. WILLIAM P. SHERMAN, Wilson's Mills, Ohio. Filed Nov. 20, 1887. Serial No. 256,174. (No model.)

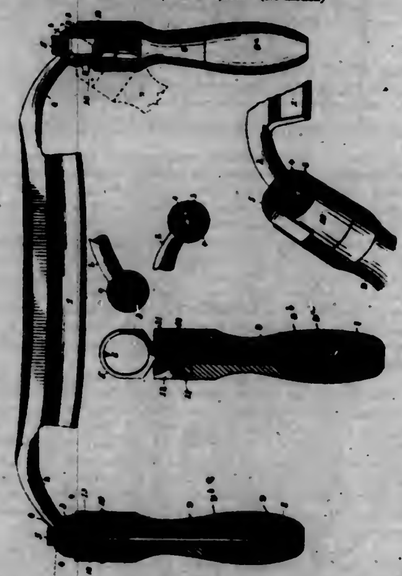
Claim.—The combination, with a draw-head mounted to have a lateral play to one side of the line of draft and cut away at its forward end upon one side to form a solid abutment and extended upon the other side to form a side support for the coupling-hook, a coupling-hook pivotally mounted in said side support and provided with a coupling-arm and a locking-arm, a recess in the side support to receive the locking-arm of the coupling-hook, a lateral offset on said locking-arm, a transverse aperture through the side support, into which the said offset is adapted to engage, a longitudinally-sliding locking-latch seated in the draw-head and provided with a gravity-dog to keep it normally projected, and uncoupling-levers pro-

886,853.

Claim.—1. The combination of a crank-shaft, as D, journaled to suitable supporting-frame, C C, levers G G, connected to and operated by said crank-shaft, and provided with self-adjusting dogs H H, the tilting frame E, journaled onto said crank-shaft, and having on its cross-bar F the sleeves *f f*, carrying the connecting-rods I I, connecting the levers G G with the tilting frame E, and provided with the springs *s s*, and the extension-shaft M, having collar *t* and spring O, journaled in bearing N, and provided with the hand-lever L, having latch mechanism P, all constructed and arranged to operate substantially as and for the purpose set forth.

2. The combination, with the carriage of a saw-mill, of the cylinder R, having cock Z, and journaled to the carriage-frame, and having piston U, provided with tubular rod V, playing through top of cylinder, and having the cord or chain W, playing over a pulley, X, and having the hook Y, for catching into the log, all arranged for lowering the log without concussion, substantially as described.

886,854. CAR-COUPLING. JOHN SERRIER, Flint, Mich., assignor of one-half to Orus Stone, same place. Filed Mar. 6, 1888. Serial No. 266,305. (No model.)



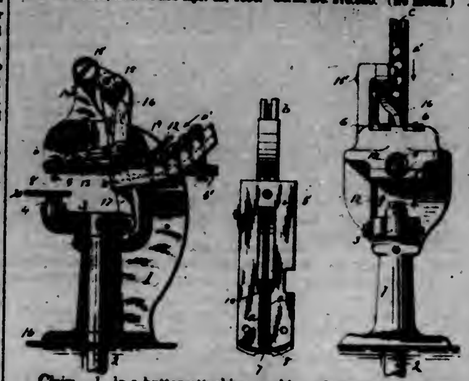
Claim.—1. In a car-coupling, the combination of a draw-head mounted to have a lateral play to one side of the line of draft and cut away at its forward end upon one side to form a solid abutment and extended upon the other side to form a side support for the coupling-hook, a coupling-hook pivotally mounted in said side support and provided with a coupling-arm and a locking-arm, a recess in the side support to receive the locking-arm of the coupling-hook, a lateral offset on said locking-arm, a transverse aperture through the side support, and a longitudinally-sliding locking-latch seated in the draw-head and provided with a gravity-dog to keep it normally projected, and uncoupling-levers pro-

jecting with their inner ends beneath the gravity-dog, substantially as described.

2. In a car-coupling, the combination of a coupling-hook pivotally secured to swing in a vertical plane and provided with a locking-arm extending rearwardly in the closed position of said hook, and a draw-head cut away at one side and extended forward to form a side support in which the coupling-hook is mounted, a recess in the inner face of the side support of the draw-head to receive the locking-arm of the coupling-hook, a horizontally-sliding latch seated in the center of the rear portion of the draw-head and adapted to project beyond the curved rear extension of the locking-arm of the coupling-hook to lock the same in position, a gravity-dog engaging into said latch to keep it normally projected, and an uncoupling-lever adapted to lift said gravity-dog, and thereby withdraw the latch, substantially as described.

3. In a car-coupling, the combination of the draw-head mounted to have a lateral play to one side of the line of draft, and provided at its forward end with a solid abutment on one side and a side support for the coupling-hook on the other side, the coupling-hook pivotally mounted in said side support, and provided with a laterally-extending coupling-arm and a rearwardly-extending locking-arm, the locking-latch of the coupling-hook, and a sliding guard backed by a buffer-spring and secured independently of the draw-head upon the coupling side thereof, substantially as described.

886,855. DRAW-SHAVE. WILLIAM B. SWAN, Seymour, Conn. Filed Feb. 20, 1888. Serial No. 264,982. (No model.)



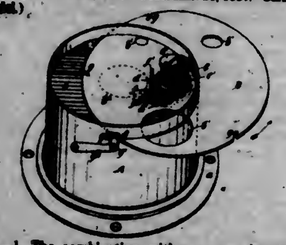
Claim.—1. In a tool-handle, the combination, with a blade having a ball at its outer end provided with holes or recesses, of a loop having a leg on its inner side, at the outer end, adapted to engage the holes or recesses, and a handle having a socket at its outer end which receives the ball when the loop is drawn inward, whereby the handle may be locked at any adjustment relatively to the blade.

2. The combination, with a blade having balls at its outer ends provided with holes or recesses, of loops having legs on their inner sides, at the outer ends, adapted to engage said holes or recesses, and shanks threaded at their lower ends, and handles formed in two parts, the upper parts being provided with sockets to receive the balls when the loops are drawn inward and the lower portions provided with nuts which are engaged by the threaded portions of the shanks of the loops, as and for the purpose set forth.

3. The combination, with a blade having balls at its opposite ends provided with holes or recesses, of loops having legs which engage said recesses, shanks threaded at their lower ends, and handles formed in two portions, the upper portions being provided with sockets to receive the balls and slots to receive the loops and the lower portions provided with nuts which are engaged by the threaded portions of the shanks, substantially as described.

4. The combination, with a blade having a ball provided with holes at the end of its shank, of a loop having a leg to engage said holes and a shank threaded at its lower end, and a two-part handle, the upper portion of which is provided with a recess to receive the ball and a slot to receive the loop and the lower portion provided with a nut which is engaged by the threaded portion of the shank, substantially as described.

886,856. BUTTON-ATTACHING MACHINE. JAMES F. TRAVIS, Providence, R. I. Filed Apr. 13, 1888. Serial No. 270,893. (No model.)



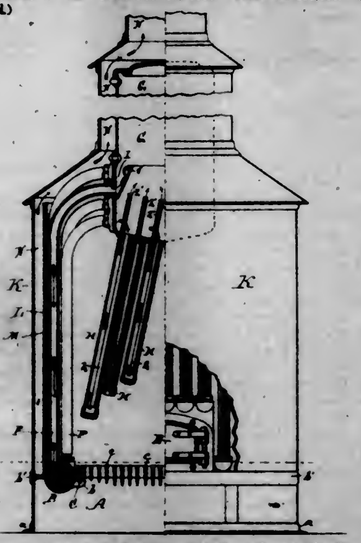
Claim.—1. In a button-attaching machine, a button and fastener holding jaw having a longitudinal slot therethrough, provided at or near the outer end with a ornament recess or concavity on its under side at right angles to the slot, and adapted to receive and retain the crown or arch of a staple-fastener in position for clinching, substantially as herein set forth.

2. In a button-attaching machine, the combination, with a slotted button-jaw, a feeding-finger, and mechanism, substantially as described, for actuating the same, of a slotted raceway communicating with the slot of said button-jaw, a spring-stop for limiting the free movement of the bottom in said raceway, and an adjustable guard, as 12, for limiting the rearward movement of the free end of the feeding-finger, substantially as herein specified.

3. In a button-attaching machine, the combination, with a vibrating feeding-finger and a slotted button and fastener holding jaw provided with a raceway having a slot coincident with the slot in said button-jaw, of an adjustable guard, as 12, located across and above the slot in said raceway in such a position as to limit the rearward movement of the free end of said feeding-finger, substantially as and for the purpose set forth.

4. In a button-attaching machine, the combination, substantially as herein described, of a slotted button-jaw provided with a crescent-recess to receive the crown or arch of a staple-fastener, a raceway attached to the button-jaw, having a longitudinal slot therethrough coincident with the slot in said button-jaw, a spring-stop for limiting the free movement of a column of buttons located across the slot in said raceway, a lifting-spring at one side of the slot in said button-jaw, a feeding-finger, and mechanism, substantially as described, for actuating the same, an adjustable guard over and across the slot in said raceway for limiting the rearward movement of the free end of the feeding-finger, and a clinching-die to clinch the prongs of a staple-fastener, combined and arranged for use substantially as and for the purpose set forth.

886,857. SNAP-SHUTTER FOR PHOTOGRAPHIC CAMERAS. JAMES T. TOWER, Waterbury, Conn., assignor to The Scovill Manufacturing Company, New York, N. Y. Filed Mar. 20, 1887. Serial No. 232,022. (No model.)



Claim.—1. The combination, with a camera lens-tube provided with a transverse partition having an aperture therein; of a revolving shutter adjacent to said partition and provided with an opening or

openings adapted to be brought opposite the opening in said partition, a post or stud secured in said partition about which said shutter rotates, said post or stud being eccentric to the axis of the lens-tube, a spring coiled about said post or stud for effecting the rotation of the shutter, and means, substantially such as described, whereby the shutter may be relieved from the action of said spring, substantially as specified.

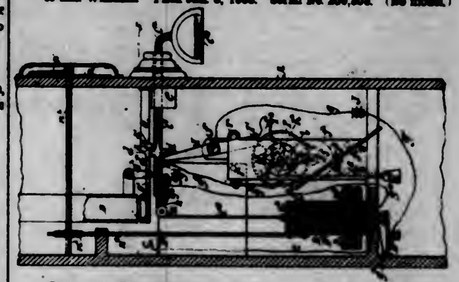
2. The combination, with a camera lens-tube provided with a transverse partition having an aperture therein, of a revolving shutter adjacent to said partition and provided with an opening or openings adapted to be brought opposite the opening in said partition, a post or stud about which said shutter rotates, said post or stud being eccentric to the axis of the lens-tube, a spring coiled about said post or stud and secured at one end to the post or stud, a plate loosely surrounding said post or stud to which the other end of said spring is secured, a spring secured near one of its ends to said plate and near its other end bearing a pin or projection which extends through a hole in said plate, and a lever having a portion adapted to be moved beneath said last-mentioned spring to elevate the same and the pin, or to be moved out from under the same to allow the spring and pin to descend in order to engage the latter with a hole in the shutter, substantially as specified.

386,858. WATER-TUBE STEAM-BOILER. CHARLES WARD, Charleston, W. Va. Filed Dec. 17, 1887. Serial No. 258,196. (No model.)

Claim.—1. In vertical tubular steam-boilers, the combination of a horizontal base tube or chamber, as B, with vertical tubes, as F, a steam drum or chest, as G, and hanging tubes, as H, said hanging tubes having sub-tubes *h* and prolonged tubes *h'*, all substantially in the manner described, and for the purpose of facilitating the circulation of the water and the collection of steam.

2. In vertical tubular steam-boilers, a drum or chest, as G, when provided with a pocket, as I, in combination with a conduit, as *i*, substantially in the manner described, for the purpose of separating the purified and impure water in said drum or chest.

3. A vertical tubular concentric steam-boiler, consisting in the combination of an ash-pit, A, a base-tube or hollow ring, B, having blow-offs P, lugs *b b*, and a T-flange, *b'*, a seat-bar, C, having grate-bars *c c*, a hollow furnace arch or frame, D, a suitable furnace-door, E, tubes F, a drum, G, having a pocket, I, and conduit *i*, hanging tubes H, having sub-tubes *h* and prolonged tubes *h'*, a casing, K, and an escape-flue, N, in the manner and for the purposes described.



4. A vertical tubular concentric steam-boiler, consisting in the combination of an ash-pit, A, a base tube or hollow ring, B, having blow-offs P, lugs *b b*, and a T-flange, *b'*, a seat-bar, C, having grate-bars *c c*, a hollow furnace arch or frame, D, a suitable furnace-door, E, tubes F, a drum, G, having a pocket, I, and conduit *i*, hanging tubes H, having sub-tubes *h* and prolonged tubes *h'*, an outer casing, K, an inner casing, L, and an escape-flue, N, in the manner and for the purposes described.

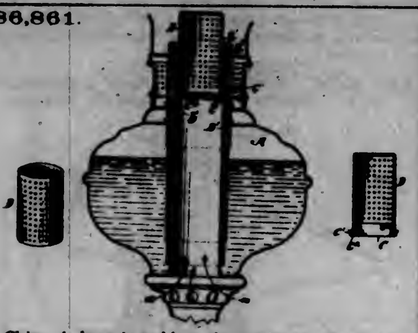
5. A vertical tubular concentric steam-boiler, consisting in the combination of an ash-pit, A, a base tube or hollow ring, B, having blow-offs P, lugs *b b*, and a T-flange, *b'*, a seat-bar, C, having grate-bars *c c*, a hollow furnace arch or frame, D, a suitable furnace-door, E, tubes F, a drum, G, having a pocket, I, and conduit *i*, hanging tubes H, having sub-tubes *h* and prolonged tubes *h'*, an outer casing, K, an inner casing, L, having a non-heat-conducting lining, M, and an escape-flue, N, in the manner and for the purposes described.

386,859. POLYCHROMATIC-PRINTING BLOCK. WILLIAM G. WHITE, Anerley, County of Surrey, and ROBERT A. A. WHITE, Crayford, County of Kent, England. Filed Feb. 21, 1888. Serial No. 264,899. (No specimens.) Patented in England May 24, 1881, No. 2,374.

Claim.—A mixture for blocks to be used in polychromatic printing, consisting of an aniline dye, fat, beeswax, sperm-wax, paraffine, turpentine, poppy or moss oil, and boiled linseed-oil, substantially in the proportions described.

386,860. COIN-OPERATED INDUCTION-COIL. PERCY G. WILLIAMS and ALFRED W. ROOTHS, Brooklyn, N. Y.; said Rooths assignor to said Williams. Filed Jan. 5, 1888. Serial No. 259,956. (No model.)

Claim.—1. The combination, with a case, of an induction-coil, a primary circuit therefor, an electric battery, a secondary circuit comprising electrodes outside of said case, one of said electrodes being capable of being moved outwardly or downwardly, a longitudinally-movable part, as B', in electrical contact with the secondary of the induction-coil, a connection between said longitudinally-movable part and said movable electrode, a circuit breaker and closer in the primary circuit operated upon the movement of said electrode in one direction to close the circuit and upon the movement of said electrode in the contrary direction to open the circuit, time mechanism, and another circuit breaker and closer also in the primary circuit operated by the time mechanism to make and break said circuit, substantially as specified.

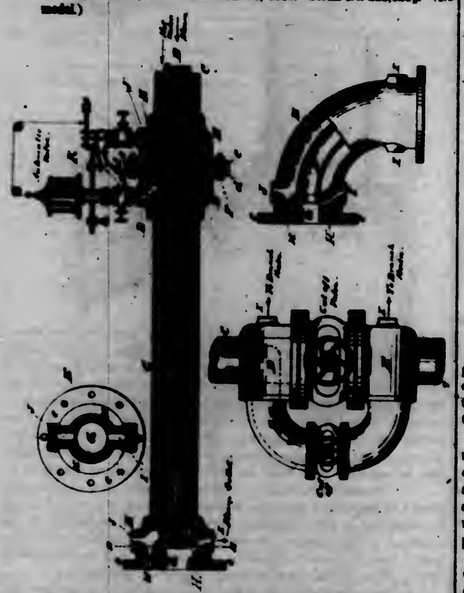


2. The combination, with a case, of an induction-coil, a primary circuit therefor, an electric battery, a secondary circuit comprising electrodes outside of said case, one of said electrodes being capable of being moved outwardly or downwardly, a longitudinally-movable part, as B', in electrical contact with the secondary of the induction-coil, a connection between said longitudinally-movable part and said movable electrode, and time mechanism for breaking circuit to de-energize the induction-coil, and pawl-and-ratchet mechanism, whereby said time mechanism is rewound by the said connection when moving in one direction, substantially as specified.

3. The combination, with a case, of an induction-coil, a primary circuit therefor, an electric battery, a secondary circuit comprising electrodes outside said case, one of said electrodes being capable of being moved outwardly or downwardly, a detent securing said electrode against movement in one direction, a swinging arm, a lever for operating the detent mounted upon said swinging arm, and a stop for limiting the swinging movement of the lever, substantially as specified.

4. The combination, with a case, of an induction-coil, a primary circuit therefor, an electric battery, a secondary circuit comprising electrodes outside said case, one of said electrodes being capable of being moved outwardly or downwardly, a longitudinally-movable rod to which said electrode is connected, a circuit breaker and closer in the primary circuit, a sliding contact-piece comprised in said circuit breaker and closer having a detachable connection with said rod, a projection on said rod, and time mechanism comprising a lever extending into the path of said projection, all being arranged and combined, substantially as described, whereby when the rod is moved in one direction the said projection will be moved away from the lever to permit the operation of the time mechanism and said sliding contact-piece will be moved to close circuit, said projection being moved sufficiently far before circuit is closed to admit of a complete movement of the said lever in one direction, substantially as specified.

386,861. LAMP. GEORGE W. WESTWARD, Brooklyn, assignor to the Ansonia Brass and Copper Company, New York, N. Y. Filed Oct. 31, 1887. Serial No. 253,851. (No model.)



386,861.

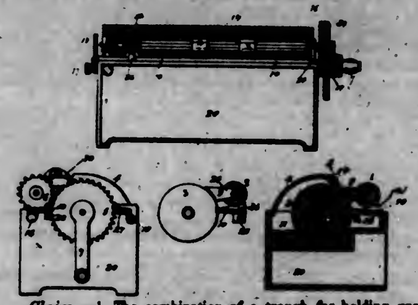
Claim.—1. In an Argand lamp, the combination of a support fitting within the inner shell of the wick-tube and having a vertical portion fitting the inner shell of the wick-tube and a horizontal portion, and a thimble fitting said support so as to be centered in and sustained thereby, substantially as specified.

2. In an Argand lamp, the combination of a support consisting of a vertical portion fitting the inner shell of the wick-tube, a horizontal portion and an upright inner portion, and a thimble resting upon the horizontal portion of the support and centered by the upright portion thereof, substantially as specified.

386,862. PLANT FOR SUPPLYING HEAT AND POWER. ROBERT B. HILL, Newark, N. J. Filed Jan. 21, 1887. Serial No. 225,020. (No model.)

Claim.—1. The hereinbefore-described method of supplying dry steam to consumers from a central plant or station, said method consisting in, first, heating water to a high degree of heat under pressure; second, generating steam; third, conveying the steam within the body of the superheated water to distant points by means of a steam-pipe located within a hot-water pipe, and, fourth, introducing some of the hot water into the steam along the route of the pipe.

2. The process of conveying steam in a gaseous form or dry state from a central plant or station through pipes to distant points of service, which involves the following steps: first, heating water to a high degree of heat under pressure; second, generating steam; third, conveying a part of the hot water through pipes from the generator to distant points; fourth, conveying the steam within the body of hot water to distant points, and, fifth, introducing some of the hot water into the steam along the route of the pipe-mains.



3. The combination, in a pipe-circuit for supplying steam from a central plant or station, of a steam-generator, a steam-pipe, a hot-water pipe surrounding said steam-pipe, automatic differential valves disposed along the pipe-circuit, and pipes connecting said valves with the steam-pipe and the hot-water pipe, substantially as and for the purpose set forth.

4. The coupling-boxes consisting each of two flanged parts or sections, provided with an interior chamber adapted to receive the ends of the steam-pipe, an annular chamber surrounding and concentric to said central chamber and adapted to receive the ends of the hot-water pipes, and ports or outlets communicating with the interior of the central chamber and adapted to be connected to branch pipes or service-pipes.

5. The coupling-boxes consisting each of two flanged parts or sections, provided with an interior chamber adapted to receive the ends of the steam-pipes, an annular chamber surrounding and concentric to said central chamber and adapted to receive the ends of the hot-water pipes, ports or outlets communicating with the interior of the central chamber and adapted to be connected to branch pipes or service-pipes, a port adapted to connect said central chamber with a pipe communicating with the annular hot-water chamber, the said connecting-pipe, and an automatic differential valve located on the same, substantially as and for the purpose set forth.

6. The combination, with the couplings comprising the following elements, viz: a central chamber open at both ends, an annular chamber surrounding said central chamber and open at both ends, ports adapted to connect said central chamber to outside service-pipes, ports adapted to connect said central chamber with its surrounding annular chamber, and a pipe or opening connecting the aforesaid ports, of an automatic differential regulating-valve, substantially as and for the purpose set forth.

386,863. MACHINE FOR GUMMING PAPER. JOHN J. ALLEN, Holbeck, County of York, England. Filed Feb. 14, 1887. Serial No. 227,649. (No model.) Patented in England Nov. 5, 1885, No. 13,303, and in Austria-Hungary May 12, 1886, No. 21,127.

Claim.—1. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, and a stationary guide-bar concaved on its side adjacent to the roller so close to but out of contact therewith and adapted to hold the paper to be gummed against the surface of said roller.

2. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a strickle for wiping off any excess of gum from said roller, a stationary guide-bar concaved on its side adjacent to the roller and adapted to hold the paper to be gummed against the surface thereof, a feed-plate in front of said gumming-roller, and an intake-roller above said feed-plate adapted to draw the paper in and direct it between the roller and said guide-bar.

3. The combination of a trough for holding gum, constructed with notches in its ends, a gumming-roller mounted to rotate therein, a strickle mounted with its ends in said notches closely adjacent to said roller, and adjusting-screws turning in the opposite ends of said strickle and engaging said notches for adjusting the strickle toward or from the roller in order to vary the thickness of the film of gum applied thereto.

4. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a stationary guide-bar having a concave surface adjacent to said roller and adapted to hold the paper to be gummed against the surface thereof, and a take-off finger adapted to project under the advancing edge of the paper as it emerges from said guide-bar and lift it off the surface of said roller.

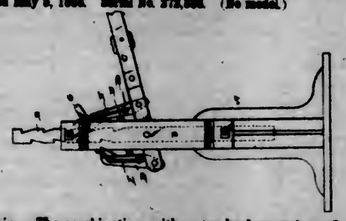
5. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a feed-plate in front of said gumming-roller, an intake-roller above said feed-plate adapted to feed the paper to be gummed toward the periphery of said gumming-roller, and a concaved-surfaced guide-bar adapted to hold the paper against the surface of the gumming-roller.

6. The combination of a trough for holding gum, a gumming-

roller mounted to rotate therein, a strickle for wiping off any excess of gum from said roller, a feed-plate above said strickle, an intake-roller above said feed-plate, and a guide between said intake-roller and the gumming-roller adapted to hold the paper to be gummed against the surface of the gumming-roller.

7. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a feed-plate in front of said gumming-roller, an intake-roller above said feed-plate adapted to feed the paper to be gummed to the gumming-roller, and the bearings for said intake-roller insulated from the feed-plate at one end thereof in order to admit one edge of a sheet of paper thereunder, whereby the edge alone of the paper may be presented to the gumming-roller.

8. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a feed-plate in front of said gumming-roller and having an upwardly-projecting spur near one end, an intake-roller above said feed-plate and formed with a reduced portion, into which said spur projects, and the bearings for said intake-roller insulated from the feed-plate between the end thereof and said spur to admit one edge of a sheet of paper thereunder, whereby the edge alone of the sheet of paper may be presented to the gumming-roller and may be guided by said spur.



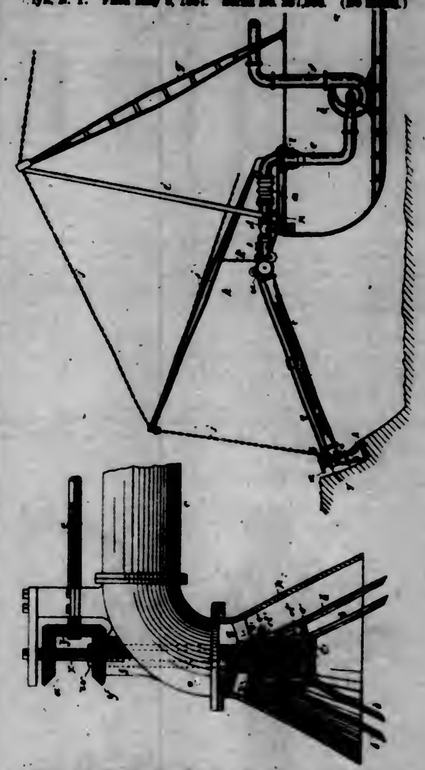
9. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a removable hood constructed to be set over said trough and to partially inclose said roller, and a take-off finger borne by said hood and adapted to project under the advancing edge of the paper after the latter has passed in contact with said roller and to lift it from the surface thereof.

10. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a removable hood constructed to be set over said trough, and locking-plates connected removably to the opposite ends of the trough and adapted when fastened in place to engage and hold down the journals of said roller and the ends of said hood.

11. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a removable feed-plate constructed to be set over said trough in front of said gumming-roller, an intake-roller mounted above and borne by said feed-plate, and locking-plates connected removably to the opposite ends of the trough and adapted when fastened in place to engage and hold down the journals of said gumming-roller and the ends of said feed-plate.

12. The combination of a trough for holding gum, a gumming-roller mounted to rotate therein, a removable feed-plate constructed to be set over said trough in front of said gumming-roller, an intake-roller mounted above and borne by said feed-plate, a guide adapted to hold the paper to be gummed against the surface of the gumming-roller fixed to and borne by said feed-plate, and fastening devices for confining the feed-plate to the trough, whereby it may be readily removable therefrom, and whereby the feed-plate, intake-roller, and the guide are simultaneously removable.

386,864. LIFTING-JACK. ANDREW W. ANDERSON, Goodhue, Minn. Filed May 5, 1888. Serial No. 272,888. (No model.)



Claim.—The combination, with a standard or casing, of a vertically-movable double rack-bar, a hand-lever pivoted thereto, dogs pivoted to the said lever and yieldingly connected, a cam-lever adapted to engage the dogs to release them from the rack, and a spring-clutch adapted to engage the said cam, substantially as specified.

386,865. DEVICE FOR WATERING POULTRY. SILAS A. BAUSH, Dunkirk, Henry County, Ohio. Filed Dec. 14, 1887. Serial No. 258,022. (No model.)

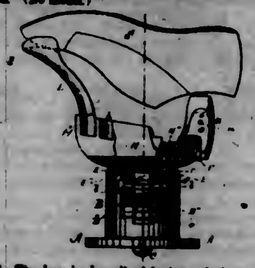
Claim.—The case A, heating-pan C, and liquid-receptacle B, provided with a superimposed open-ended shield, substantially as shown and described.

386,866. DREDGING-MACHINE. HERMAN F. BRAMARD, Brooklyn, N. Y. Filed May 9, 1887. Serial No. 237,802. (No model.)

Claim.—1. The combination, in a dredging-machine, of a section-pipe jointed to the suction apparatus on the dredge-boat, and having a bend or elbow and a funnel-terminal projected directly in the line of the approach of the digger to the work, and a rotary digger in the axis thereof geared through the elbow of the suction-pipe with a driving-shaft carried in bearings on the upper side of the pipe and connected with the motor-gearing at the joint of said pipe with the suction apparatus, said digger adapted to approach the work unobstructedly by any other part of the apparatus, substantially as described.

2. The combination, in a dredging-machine, of a suction-pipe jointed to the suction apparatus on the dredge-boat, and having a bend or elbow and a funnel terminal projected directly in the line of the approach of the digger to the work, and two reversely-revolving diggers in the axis thereof adapted to approach the work unobstructedly by any other part of the apparatus, substantially as described.

3. The combination, in a dredging-machine, of a suction-pipe jointed to the suction apparatus on the dredge-boat, and having a bend or elbow and a funnel terminal projected directly in the line of the approach of the digger to the work, and two revolving diggers in the axis thereof mounted on shafts extending through the bearing-bem on the bent of the elbow and independently geared with the driving-shaft for rotation reversely to each other, substantially as described.

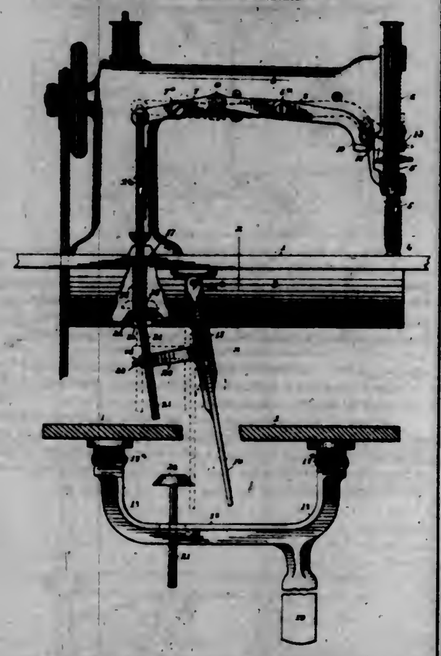


4. The improved rotary digger for dredging-machines, consisting of metallic prongs bolted on the sides of a hub attached to the driving-shaft and projecting in the direction of the approach of the digger to the work and divergently from the axis of the same, substantially as described.

5. The combination, with the funnel-mouth of the suction-pipe in a dredging-machine, of two rotary diggers in the axis of the funnel-mouth, consisting of the prongs bolted on the hubs and arranged divergently from the axis of the cutter-head, substantially as described.

6. The combination, with the funnel-mouth of the suction-pipe in a dredging-machine, of a rotary digger in the axis of the funnel-mouth,

consisting of prongs bolted on the hub and graduated in respect to their radial projection to cut in different planes and cleve, substantially as described.



386,867. SHOE-JACK. WILLIAM C. BATES, Lynn, assignor of one-half to Edwin B. Bell, North Reading, Mass. Filed May 1, 1888. Serial No. 272,493. (No model.)

Claim.—1. The herein-described improved shoe-jack, consisting, essentially, of the following parts, viz: the stationary base A, box B, adapted to be rotated upon said base, plate E, pivotally secured to said box, whereby it may be swung up, as shown, and last-holder H, adapted to be rotated upon said plate, substantially as and for the purpose set forth.

2. The combination of the base A, the bolt C, gasket D, disk *d* and nuts, the box B, provided with the ears B', the bolt I, gasket J, disk K and nuts, the plate E, provided with the hinge E' and flange E'', and the holder H, provided with the heel-support N and toe-support L, substantially as and for the purpose described.

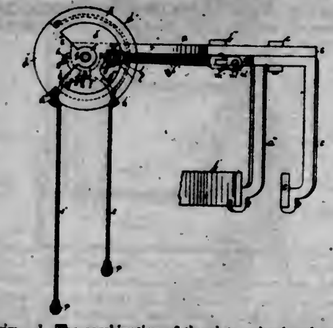
386,868. DEVICE FOR LIFTING SEWING-MACHINE PRESSER-FEET. GEORGE H. BURNS and ANDREW C. CAMPBELL, Bridgeport, Conn., assignors to The Wheeler & Wilson Manufacturing Company. Filed Feb. 20, 1888. Serial No. 264,804. (No model.)

Claim.—A lifting device for sewing-machine presser-foot, consisting, essentially, of two levers pivoted to the machine-arm and to each other, the forward end of the forward lever being adapted to engage the presser-foot bar and the rear end of the rear lever being provided with a rod extending through the bed-plate of the machine, and a spring under the bed-plate and bearing against the bed-plate and against a projection upon the rod, thus acting to draw said rod downward, so that the forward end of the forward lever is lowered, leaving the usual presser-foot spring free to act until said rod is raised, which lifts the presser-foot against the power of the presser-foot spring.

386,869. FLEXIBLE RULER. JAMES H. DOLBEAR and EDWARD T. BRADLEY, Swanton, Vt. Filed Apr. 16, 1887. Serial No. 235,120. (No model.)

Claim.—1. As an improved article of manufacture, a rule or scribing device consisting of a flexible face-strip having guides on its rear side, a flexible back strip movable in the said guides and set-screws, whereby the said strips may be fixed together in adjustably parallel curved positions, substantially as specified.

2. A rule having a flexible face-strip and guides fixed thereto, in combination with a flexible back adapted to be secured to the guides, substantially as specified.



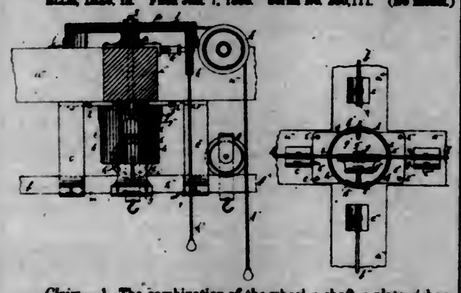
386,870. SPRAY-NOZZLE. DAVID T. ELLIS, Bridgeport, Conn., assignor of one-half to the Bellamy Manufacturing Company, same place. Filed Dec. 3, 1887. Serial No. 256,883. (No model.)

Claim.—1. A hose-nozzle consisting of a base, a cone, 3, depending within it, having an opening, 5, a barrel having a chamber, 9, a tube leading through said chamber, a cone at its lower end closely fitting cone 3, openings in said cone adapted to register with opening 5, and leading to said chamber and said tube, and a cap-plate engaging said tube, which closes said chamber with the exception of a narrow circular opening surrounding said cap-plate.

2. The base and outer cone having opening 5, in combination with the barrel having chamber 9, central tube, 15, cone 12, engaging within the outer cone and provided with openings 13 and 14, the latter being widened at its central portion for the purpose set forth, and a cap-plate nearly closing the outer end of said chamber, whereby partial rotation of the barrel will permit water either to pass out through the chamber, producing a circular ribbon-spray through the tube, producing a full stream or a central spray, or will effect a perfect cut-off.

386,871. SWITCH FOR OVERHANGING TRACKS. EDWARD S. ELLIS, Lake, Ill. Filed Jan. 7, 1888. Serial No. 260,110. (No model.)

Claim.—1. The combination of the plate *a*, having the elongated end *r*, lug *f*, holes *a'*, and slot *a''*, the hangers *a''* and *a'''*, and tracks *b* and *b'*, the hanger *c*, and bolt *d''*, with the connecting-rod *l'*, having the parts *m*, *m'*, *m''*, *n'*, and *l'*, the grooved wheel *d*, having the web portion *d'*, web *d''*, shoulders *d'''* and *d''''*, and pin *l*, the stud-bolt *f''*, the piece *g*, having the prongs *g'*, *g''*, *g'''*, and *g''''*, and fingers *h'* and *h''*, the set-screws *h*, and the cords *o* and *o'*, substantially as described, for purposes stated.



2. In a switch for hanging tracks, the combination of the track-hangers *a''* and *a'''* and the track-hanger *c* with the connecting-rod *l'*, universally jointed at both ends and connected with the hanger *c*, and the wheel *d*, having the fillet *d''*, for forming a stop with the pronged piece *g*, all substantially as set forth, for purposes stated.

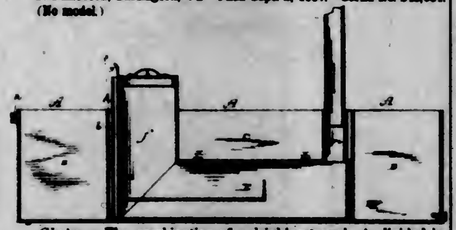
3. The combination of the plate *a*, having the curved slot *a''*, holes *a'*, elongated end *r*, and lug *f'*, with the hangers *a''*, *a'''*, and *c*, the

wheel *d*, the connecting-rod *F*, and the piece *g*, substantially as described, for purposes stated.

4. The combination of the sliding hangers *c* and pieces *m'*, *m''*, and *n'*, the bar *F*, stud *l*, sleeve *l'*, and pins *m*, with the wheel *d*, having the web portion *d''*, and the piece *g*, having the prongs *g'*, *g''*, *g'''*, and *g''''*, substantially as described and shown, for purposes stated.

386,872. SWITCH FOR OVERHANGING TRACKS. EDWARD S. ELLIS, Lake, Ill. Filed Jan. 7, 1888. Serial No. 260,111. (No model.)

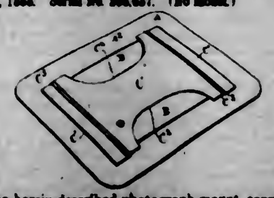
Claim.—1. The combination of the wheel *a*, shaft *g*, plate *g'*, having the shields *h'* and *h''*, hanger *g''*, and track *h'''*, with the tracks *b*, *b'*, *b''*, and *b'''*, the hangers *c*, *c'*, *c''*, and *c'''*, the cylinder *c*, having the four parts *h* and base-plate *c'*, the bolts *c''*, the beams *c'''*, plate *d'*, bolts *d''*, the shield *l*, angle-plates *l'*, the brackets *k*, grooved wheels *k'*, and cords *k''* and *k'''*, substantially as and for the purposes stated.



2. The combination of the plate *c'* and the cylinder *c*, having the four incisions *c'*, the four projecting parts *h*, and the base-plate *c''*, with the wheel *a*, shaft *g*, and the plate *g'*, having the hanger *g''* and shields *h'* and *h''*, substantially as set forth, for purposes stated.

3. In a switch for hanging tracks, the combination of the horizontal grooved wheel *a*, connected with the plate *g'*, having the shields *h'* and *h''* and hanger *g''*, by the shaft *g*, not solid with both wheel *a* and plate *g'* and pivoted in the plate *c'*, beams *c'''*, and cylinder *c*, and rotated within those parts by the cords *k''* and *k'''*, passing over the grooved wheels *k'*, supported upon the brackets *k*, substantially as and for the purposes stated.

4. The combination of the wheel *a*, shaft *g*, cylinder *c*, having the parts *h* and base-plate *c'*, the plate *g'*, hanger *g''*, shields *h'* and *h''*, the track *h'''*, the hangers *c'* and *c''*, and the hangers *c'* and *c''*, substantially as specified.



5. The combination of the plate *g'*, hanger *g''*, and shields *h'* and *h''* with the cylinder *c*, having the base-plate *c'* and parts *h*, substantially as shown and described, for purposes stated.

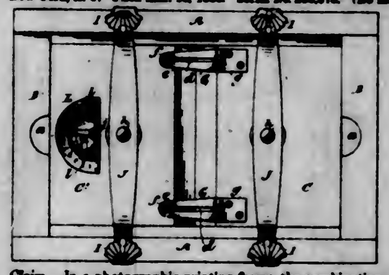
386,873. WATER-TROUGH WITH SUBMERGED HEATER. JAMES F. FERGUSON, Burlington, Vt. Filed Sept. 2, 1887. Serial No. 248,691. (No model.)

Claim.—The combination of a drinking-trough, A, divided by perforated partitions into the compartments B C D, with a heater which is placed in the central compartment, C, and submerged in water, and from which compartment the heated water flows into the compartment D, substantially as shown.

386,874. PHOTOGRAPH-MOUNT. IRVING R. FOLTZ, Rockford, Ill. Filed Mar. 5, 1883. Serial No. 266,637. (No model.)

Claim.—The herein-described photograph-mount, consisting of a front piece having an opening through the central portion thereof for displaying a photograph, and a back piece having the ends thereof gummed to the said front piece, as indicated, and also having the lateral portions of the same cut away, as shown at C^3, and the remaining lateral portions C^2 thereof extending beyond the sides of the photograph, substantially as described, and for the purpose specified.

386,875. MAGNESIUM LIGHT. WILLARD H. FOLLIS, Passaic, N. J., assignor to The Sewell Manufacturing Company, New York, N. Y. Filed Oct. 31, 1887. Serial No. 253,533. (No model.)

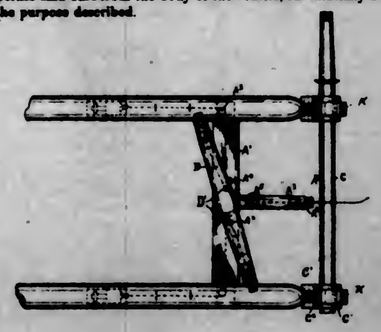


Claim.—1. The combination, with a case or shell, of gun-cotton and magnesium contained therein, and a coating of collodion or equivalent material outside the gun-cotton and magnesium, substantially as specified.

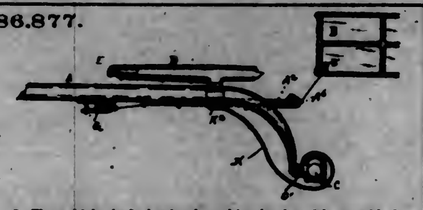
2. The combination, with a case or shell, of gun-cotton and magnesium contained therein, a coating of collodion or equivalent material outside the gun-cotton and magnesium, and a fuse, substantially as specified.

3. The combination, with a case or shell, of gun-cotton and magnesium contained therein, a coating of collodion or equivalent material entirely surrounding the gun-cotton and magnesium, and a fuse, substantially as specified.

4. The combination, with a case or shell weighted at the bottom, of gun-cotton and magnesium contained therein, a coating of collodion or equivalent material outside the gun-cotton and magnesium, and a fuse having a portion embedded in the mass of gun-cotton and magnesium and a portion extending above the surface thereof, substantially as specified.



386,876. PHOTOGRAPHIC-PRINTING FRAME. WILLARD H. FOLLIS, Passaic, N. J., assignor to The Sewell Manufacturing Company, New York, N. Y. Filed Mar. 10, 1888. Serial No. 266,572. (No model.)

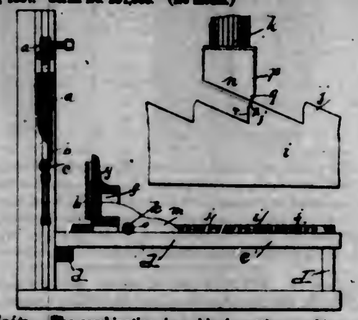


Claim.—In a photographic-printing frame, the combination, with a back composed of two portions hinged together, of a device for retaining said portions in an elevated position, consisting of a hinge having one leaf secured to one of said portions of the back, and a projection on the other portion with which the other leaf of the hinge is connected with a sliding connection, substantially as specified.

386,877. HORSE-DETACHER. PHILIP GETZ, Reading, Pa., assignor of one-half to Reinhard Ringer, same place. Filed Aug. 27, 1887. Serial No. 248,088. (No model.)

Claim.—1. In combination with the shafts, singletree, fore axle, and body of a vehicle, breeching-hooks G and singletree-hooks E, both provided with movable bars, and a series of cords and pulleys adapted to operate said bars from the body of the vehicle, substantially as and for the purpose described.

386,877.

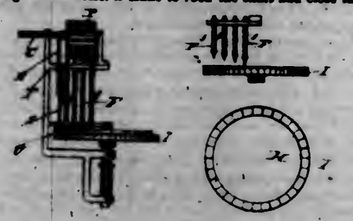


2. The vehicle-shafts having breeching-hooks with movable bars and an extension-arm, A^3, in combination with cords adapted to operate said bars, substantially as set forth.

3. A breeching-hook for a vehicle, consisting of a plate adapted to be attached to the shafts of the same and formed integral with a perforated bracket, G^2, and body G^1, a spring, H^2, bar H with cord-connection H^3, and detachable plate G^3, substantially as shown.

4. In combination with a singletree having ends recessed at D^2, a hook consisting of a body with groove E^2 and a perforated hooked end, a movable bar with cord-arm F', adapted to be guided in said groove, a spring, F^2, and stop-piece D^2, substantially as set forth.

5. A safety apparatus for vehicles, consisting of shafts provided with extension-arm A^3 and supported by a spring, K, breeching-hooks G with movable bars H, singletree with hooks E, provided with movable bars F, cords connecting said movable bars with the vehicle-body, pulleys A^6 and A^5, guideways A^4, connecting-ring A^5, and handle B' for guiding and operating said cord, all constructed and operated substantially as shown, and for the purposes set forth.

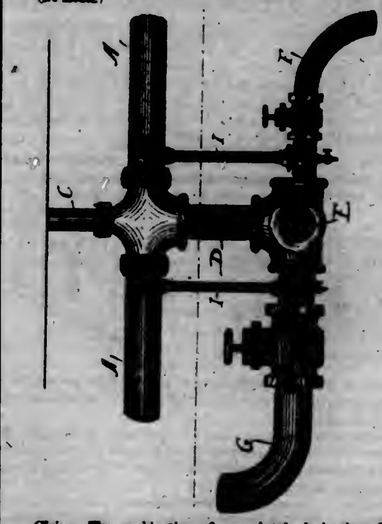


386,878. SHINGLE-CUTTING MACHINE. WILLIAM GOLDER, West Bay City, Mich., assignor to George A. Gage, Chicago, Ill. Filed Sept. 20, 1887. Serial No. 251,002. (No model.)

Claim.—The combination, in a shingle-cutting machine, of the reciprocating gate carrying a cutting-knife and a compression-roller, a carriage provided with devices for holding the shingle-block and having an intermittent movement toward the knife, and a frame supporting the carriage, with the racks *i i*, secured to the said supporting-frame and provided with the teeth *j*, having the short inclined side *s* and the perpendicular side *r*, and the pawl-pieces *k k*, having the ends *n* engaging with the teeth *j*, and provided with the inclined sides *q* and the perpendicular sides *p*, substantially as and for the purpose set forth.

386,879. APPARATUS FOR COUNTING AND RECORDING THE NUMBER OF PACKAGES. MATTHEW GOTTSDIEN, Chicago, Ill. Original application filed Aug. 1, 1884, Serial No. 139,208. Divided and this application filed Jan. 24, 1888. Serial No. 262,012. (No model.)

Claim.—1. The combination, with a way or chute for vessels or packages, of a rock-shaft carrying a series of coiled springs adapted to engage a series of contact-points, a series of contact-points, wires connected with a battery and forming a circuit, mechanism whereby the passage of the vessel is made to rock the shaft and close the circuit, and a suitable recording device, substantially as described, and for the purpose set forth.



2. The combination, with a way or chute for vessels or packages, of arm D, rock-shaft C, spring or springs coiled about said rock-shaft, contact-points, wires connected with a battery and forming a circuit, and a recording device, substantially as described, and for the purpose set forth.

3. The combination, with a way or chute for vessels or packages, of a vibratory platform, a rock-shaft, levers adapted to rock said shaft, a recording device, and an electrical apparatus for operating the recording device and adapted to be operated by the passage of the vessel, substantially as described, and for the purpose set forth.

4. The combination, with a way or chute for vessels or packages, of vibratory platform M, rock-shaft C, lever N, adapted to have its long end depressed and its short end elevated, a recording device, and an intermediate link or links connecting the lever with the recording device, substantially as described.

5. The combination, with a way or chute for vessels or packages, of vibratory platform M, lever N, having one of its ends extended farther from the rock-shaft than the other, coiled spring O, for drawing down the long end and elevating the short end of said lever, and an intermediate link or links connecting said lever with a recording device, substantially as described.

386,880. WASHING-MACHINE. MATTHEW GOTTSDIEN, Chicago, Ill. Filed Apr. 17, 1886. Renewed Jan. 3, 1888. Serial No. 260,854. (No model.)

Claim.—The combination of a wash-tub, drain-pipes C, leading therefrom to a common pipe or receptacle, A, a main pipe, D, leading from such receptacle into a delivery-pipe, E, transparent pipe or pipes I, leading from the common pipe or receptacle A into pipes F G opening into the delivery-pipe E, and the delivery-pipe E, leading to the boiling-kettle, all arranged and operating substantially as described.

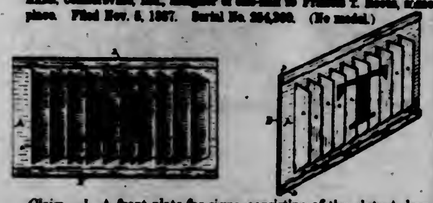
386,881. DETACHABLE PIPE-COUPLING. WILLIAM H. HARRIS and ALBERT B. SMITH, Mansfield, Ohio; said Smith assignor to said Harris. Filed Apr. 7, 1886. Serial No. 263,903. (No model.)

Claim.—The combination of the section 1, having the stem 10, binding-nut 12, and washer 19, with the section 2, having the head 16, recessed, as at 17^a, and having packing-rings 17, seated therein, and having the stem 20, screw-threaded, as at 22, and provided with the nut 23 and washer 18, and having recesses 17^a, in which are seated

386,881.

packing-rings 17, and with the section 3, having the bore 29, and T-head 24, bored, as at 25, to receive the stem 20, substantially as specified.

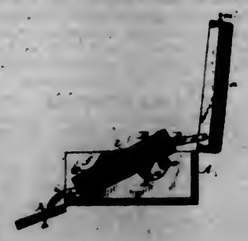
386,882. CLAMPING-COLLAR FOR ATTACHING HOSE. CHARLES HERZ, Midland, Mich., assignor of two-thirds to Henry Bartlett and James H. Whitmore, same place. Filed Mar. 20, 1888. Serial No. 267,864. (No model.)



Claim.—1. In a hose-clamp, the combination, with the split spring-collar provided with overlapping ends and adapted to loosely fit the hose, of the abutment formed at one end thereof, and the connecting-links pivotally connected to the other end, the curved lever embracing the collar and fulcrumed to that link, and having the curved locking-arm and thumb-piece, substantially as described.

2. In a hose-clamp, the combination, with the split spring-collar provided with the overlapping ends and adapted to loosely fit the hose, of an abutment formed at one end thereof, the adjustable connecting-link pivotally connected to the other end, and the curved lever fulcrumed to that link, and having the curved locking-arm and thumb-piece, substantially as described.

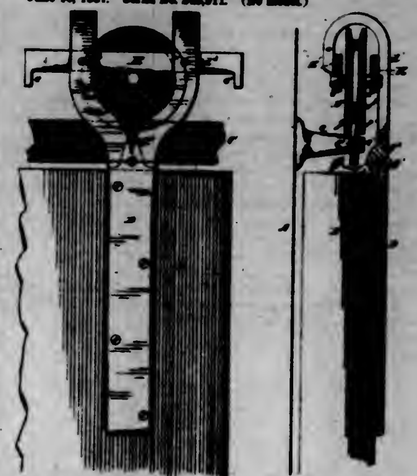
3. In a hose-clamp, the combination, with the split spring-collar of a single piece, formed with the abutment, of the link C, pivotally secured at one end to said collar and formed of two parts, *c d*, screw-threaded and adjustably connected together, and the curved lever pivotally secured to one part of said link and formed with short arm *e*, long arm *f*, and thumb-piece *g*, and the spur A on the inner face of the collar, substantially as and for the purpose specified.



386,883. SIGN OR ADVERTISING-CARD. THEODORE P. HEDEMANN, Connersville, Ind., assignor of one-half to Francis 2. Beste, same place. Filed Nov. 6, 1887. Serial No. 254,209. (No model.)

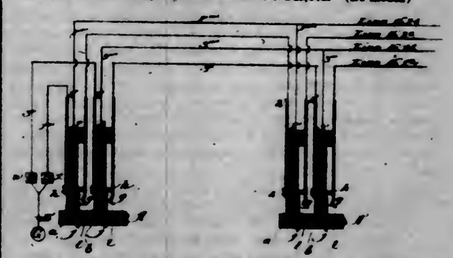
Claim.—1. A front plate for signs, consisting of the plate A, having the slats *a* formed up from and integral with it, substantially as shown and described.

2. A sign consisting, substantially as hereinbefore set forth, of the front plate, A, having the integral slats *a* stamped out from it and turned at a right angle to it, and the back plate, B, said plates being secured together, as described.



386,884. PICTURE-ALBUM. CHARLES HOOD, Turner's Falls, Mass. Filed Apr. 14, 1888. Serial No. 270,704. (No model.)

Claim.—1. The combination, with the box provided with a hinged lid or top and a hinged front, of segments, as described, pivoted to said box, a roller connecting said segments, a straight lever, *f*, centrally pivoted and connected by suitable arms to the box-top, the pivoted segment, and the hinged box-front, as and for the purpose set forth.



2. A box for exhibiting pictures, having a hinged top and a hinged apron, as described, a system of levers in two sets, each set pivoted at two points in the fixed portion of the box, substantially as described, and a roller connecting the two sets of levers, whereby, when the top of the box is lifted, the simultaneous lowering of the apron and raising of the said roller will be effected, as and for the purpose set forth.

386,885. DOOR-HANGER. ERNST J. HEIMER, Reese, Mich. Filed June 16, 1887. Serial No. 242,011. (No model.)

Claim.—In combination, the door-hanger bracket D, having bifurcated arms *d d'*, the track C, the roller F, and the guard G, having an upturned flange or point, *g*, extended in rear of the lower edge of the track, and a shoulder, *g'*, engaged between the bifurcated arms of the bracket, the guard G being secured to the bracket D by means of a screw, substantially as shown and described.

386,886. MULTIPLE SWITCH-BOARD. HIRAM G. KELLOGG, Hyde Park, Ill. Filed July 30, 1887. Serial No. 246,672. (No model.)

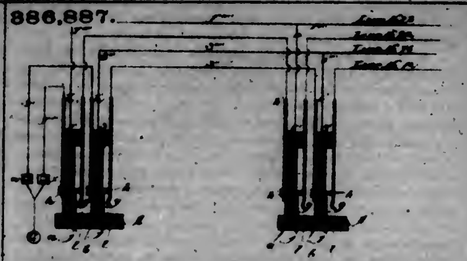
Claim.—1. In a telephone-exchange system, a metallic circuit subscriber's line normally disconnected from the ground at the subscriber's station, in combination with a calling-generator in the circuit of said line at the subscriber's station and a switch co-operating with the normally-open ground to close the same while the generator is being operated, substantially as set forth.

2. In a metallic circuit-exchange system, a subscriber's line normally disconnected from the ground at the subscriber's station and normally connected with a ground wire or connection at the central office, and a calling-annunciator in said ground wire or connection, in combination with a calling-generator at the subscriber's station in the circuit of said line, a ground wire or connection at the subscriber's station normally open to the line, switching devices or means at the central office to temporarily disconnect said line from said ground wire or connection at the central office and connect it with another line for conversation, and switching devices or means at the subscriber's station to temporarily connect said line with said ground wire or

connection at the subscriber's station while the generator is being operated, with the generator between the ground-connection and the calling-annunciator, substantially as and for the purpose set forth.

3. In a telephone-exchange system, a metallic circuit-line normally disconnected from the ground at the subscriber's station, one side or branch of which is normally connected to a ground wire or connection at the central office, the other side or branch of which is normally open at the central office, and a battery in said ground wire or connection, in combination with a switching device at the central office having a pair of contact-points to disconnect said line, at the will of the operator, from said ground wire or connection, a test-receiving instrument, and a switch-testing plug or device connected to one side of said test-receiving instrument, whereby the operator may at will connect said test-receiving instrument, grounded on one side, on its other side to said open end of said metallic circuit-line, substantially as set forth.

4. In a telephone-exchange system, a metallic circuit-line normally disconnected from the ground at the subscriber's station, a ground wire or connection at the central office, a battery in said ground wire or connection, and a switch at the central office having three contact-pieces, two of which are normally in contact with each other and are not in contact with the third piece, one of said pieces which are normally in contact being connected to said ground wire or connection with the battery between it and the ground, the other of said pieces being connected to one side or branch of said metallic circuit-line, and the other side or branch of said line being connected to said third contact-piece, in combination with a double switch-plug having two insulated contact-pieces adapted to be inserted into said switch, and when inserted to disconnect the contact-pieces of the switch which are normally in contact and connect the two contact-pieces which are connected to the two sides or branches of the line to the two insulated pieces of the plug, (one piece of the plug to one piece of the switch and the other piece of the plug to the other piece of the switch,) a test-receiving instrument at the central office, and switch-testing devices or means whereby an operator may at will connect said instrument, grounded on one side, on its other side to said third contact-piece connected to said open end of the line, substantially as and for the purpose set forth.



5. In a telephone-exchange system, a metallic circuit-line normally disconnected from the ground at the subscriber's station, one side or branch of which line is normally connected to a ground wire or connection at the central office and the other side or branch of which is open at the central office, and a battery and a calling-annunciator in said ground wire or connection, in combination with a calling-generator at the subscriber's station in said line, means for grounding said line at the subscriber's station when the generator is being operated with the generator between that ground-connection and the office ground, a test-receiving instrument, and switch-testing devices or means whereby an operator may at will connect said instrument, grounded on one side, on its other side to said open end of the line, substantially as and for the purpose set forth.

6. In a telephone-exchange system, two or more multiple switch-boards, metallic circuit-lines connected thereto, each of said lines being normally disconnected from the ground at the subscriber's station, one side or branch of each line being normally connected at the central office to a ground wire or connection, and the other side or branch being normally open at the central office, and a battery in said ground wire or connection, in combination with switching devices or means to temporarily disconnect the branch of said line from its ground wire or connection and to connect the two branches with the two branches of another line for conversation, test-receiving instruments, one at each board, and switch-testing devices or means at each board whereby an operator may at will connect her test-receiving instrument, grounded on one side, on its other side to the open end of any of said metallic circuit-lines, substantially as and for the purpose set forth.

7. In a telephone-exchange system, a metallic circuit-line normally disconnected from the ground at the subscriber's station, one side or branch of which is normally grounded at the central office, in combination with a test-receiving instrument at the central office grounded on one side, a switch-testing plug or device to connect said instrument on its other side to the other side or branch of the line, said side or branch being open to the ground, and thereby establish a test-circuit when the line is not switched from the ground of the instrument through the metallic circuit of the line to the normal ground of the line, a battery in said test-circuit, and a switching device containing a pair of contact-points in the circuit of said side or branch of the line which is normally grounded, whereby an operator may at will disconnect the line from its normal ground, substantially as set forth.

386,887. MULTIPLE SWITCH-BOARD. HIRAM G. KELLOGG, Hyde Park, Ill. Filed Aug. 26, 1887. Serial No. 247,041. (No model.)

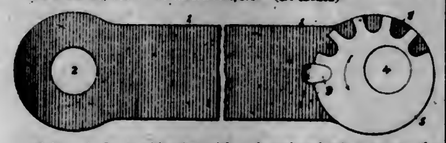
Claim.—1. In a telephone-exchange system, a metallic-circuit telephone-line normally open at one end at the central office and normally grounded at the other end at the central office, and there only, in combination with a battery in the circuit of the line at the subscriber's station, a switching device containing a pair of contact-points or pieces in the circuit of the line at the central office, adapted to remove the ground from the line when it is switched with another line for conversation, a test-receiving instrument at the central office, and a switch-testing-plug or contact-piece connected to one side of the test-receiving instrument, and adapted, at the will of the operator, to connect the test-receiving instrument grounded on one side to the normally-open end of the line on the other side, and thereby determine whether the line is switched for conversation.

2. In a telephone-exchange system, two or more switch-boards at the central office, and metallic circuit-lines connected to them, each line being normally open at one end and connected at that end to each of the switch-boards and normally grounded at its other end at the central office, and there only, and each line having a battery in its circuit, in combination with switching devices, one for each line at each board, each containing a pair of contact-points or pieces in the circuit of the line, adapted to remove the ground from its line when the line is switched for conversation, test-receiving instruments, one at each board, and switch-testing plug or contact-pieces connected to one side of the test-receiving instrument at each board, whereby the operator at any board may connect her test-receiving instrument, grounded on one side, to the normally open end of any line on its other side, and determine whether the line is switched for conversation.

3. In a telephone-exchange system, a metallic-circuit telephone-line normally open at one end at the central office and normally grounded at the other end, and there only, and having a battery in its circuit, in combination with a generator in the circuit of the line at the subscriber's station, an annunciator in the ground wire or connection at the central office, a switching device adapted to ground said line at the subscriber's station between its normally-open end and the generator when the generator is being operated, a switching device containing a pair of contact points or pieces in the circuit of the line at the central office adapted to disconnect the line from the ground when it is switched for conversation, a test-receiving instrument at the central office, and a switch-testing plug or contact-piece connected to one side of the test-receiving instrument adapted, at the will of the operator, to connect the test-receiving instrument, grounded on one side, to the normally-open end of the line on the other side, substantially as and for the purpose set forth.

4. In a telephone-exchange system, a metallic-circuit telephone-line normally grounded at the central office and having a calling-annunciator in its ground wire or connection, and a switching device containing a pair of contact points or pieces in the circuit of the line at the central office adapted to remove said ground and to connect said line with another line in metallic circuit with a clearing-out annunciator in the circuit, in combination with a calling-generator at the subscriber's station, and a switching device having two pairs of contact-points, said switching device being operated in one direction by a spring, and in the other direction by the force which actuates the generator, one pair of said points switching the generator, when it is being operated, into circuit with the line, and the other pair then grounding the line with the generator between this ground and the office ground, the subscriber being thereby enabled to operate the calling-annunciator when it is connected to his line and the clearing-out annunciator when it is looped into the metallic circuit, substantially as set forth.

5. In a telephone-exchange system, a metallic-circuit telephone-line grounded on one of its sides or branches at the central office, and grounded there only, in combination with a battery in the circuit of the line at the subscriber's station, a switching device containing a pair of contact points or pieces in the circuit of the line at the central office adapted to disconnect said side or branch from the ground while the line is switched with another line for conversation, a test-receiving instrument and switch-testing plug or contact-piece connected to one side of the test-receiving instrument adapted, at the will of the operator, to connect said test-receiving instrument, grounded on one



side, on its other side to the other branch of the line open to the ground, substantially as and for the purpose set forth.

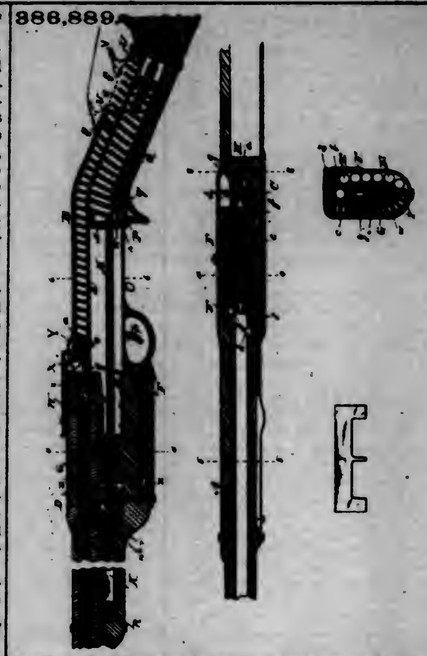
6. In a telephone-exchange system, a metallic-circuit telephone-line grounded on one of its sides or branches at the central office and disconnected from the ground at the subscriber's station, in combination with a battery in the circuit of the line, a switching device containing a pair of contact points or pieces in the circuit of the line at the central office adapted to disconnect said side or branch from the ground while the line is switched with another line for conversation, a test-receiving instrument, and a switch-testing plug or contact-piece connected to one side of the test-receiving instrument adapted, at the will of the operator, to connect said test-receiving instrument, said instrument being grounded on its other side, and said switch-testing plug being adapted, at the will of the operator, to connect with the other branch of the line, which is disconnected from the earth, substantially as set forth.

7. In a telephone-exchange system, a metallic-circuit line normally disconnected from the ground at the subscriber's station and normally connected on one of its sides or branches with a ground wire or connection at the central office, a calling-annunciator in said ground wire or connection, and switching devices or means containing a pair of contact points or pieces in the said side or branch, and another contact point or piece connected to the other side or branch at the central office adapted to temporarily disconnect said line from said ground wire or connection and to connect it in metallic circuit with another line, in combination with a calling-generator at the subscriber's station in said line and switching devices or means containing a pair of contact-points normally open, one of which is connected with the ground and the other one to the line between the generator and the normally-open end of the line, whereby the subscriber, while operating said generator, grounds said line with the generator between the ground and said office ground wire or connection, substantially as and for the purpose set forth.

8. In a telephone-exchange system, a metallic-circuit telephone-line normally disconnected from the earth at the subscriber's station and normally grounded on one side only at the central office and a switching device containing a pair of contact-points in the circuit of the line at the central office, in combination with a generator in the circuit of the line at the subscriber's station while operated, a switching device at the subscriber's station containing a pair of contact-points normally open, and an annunciator in the circuit of the line at the central office, said normally-open contact-points being closed while the generator is operated, one of them being connected to the subscriber's ground and the other to the line with the generator and annunciator between it and the office ground, substantially as set forth.

386,888. LOCOMOTIVE DRAW-BAR. HORACE W. LOCKERBY, Corning, N. Y., assignor of one-half to Joseph F. Moore, same place. Filed Oct. 15, 1887. Serial No. 252,473. (No model.)

Claim.—1. In combination with a draw-bar having an eye, the latter having a notch at one side, a disk situated in said eye and having an eccentric eye and a peripherally-notched flange, and a pin adapted to occupy the notch at one side of the first-mentioned eye and one of the notches in said flange, substantially as and for the purpose set forth.



2. In combination with a draw-bar having an eye, the latter having a notch at one side, a disk having an eye, a peripherally-notched flange at one side of said disk and a tongue at the other, adapted to pass through said notch, and a pin adapted to occupy the latter and one of the notches in said flange, substantially as set forth.

3. The combination of the draw-bar having an enlarged eye at one end, a disk situated in said eye and having an eccentric eye and a flange, the latter having notches on its periphery, a headed pin adapted to occupy one of said notches and having a seat in the draw-bar, and a split key fitting in one end of said pin, substantially as shown and described.

4. The combination of a draw-bar having an enlarged eye, said eye having a notch at one side, a disk having a flange at one side and a tongue at the other, adapted to pass through said notch, substantially as and for the purpose set forth.

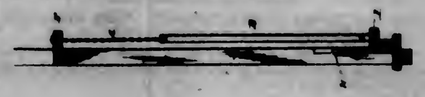
386,889. MAGAZINE FIRE-ARM. RAFAEL MALLEN, Mexico, Mexico. Filed Aug. 25, 1887. Serial No. 247,802. (No model.)

Claim.—1. In a repeating-rifle, a firing-chamber, a storage-chamber alongside said firing-chamber, and a stationary breech-block, in combination with a sliding carriage having sides which constitute the

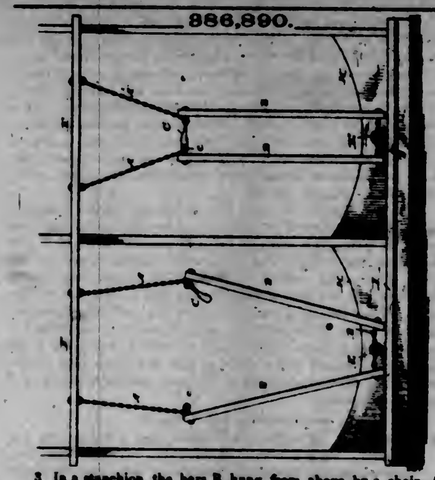
opposite walls of the firing-chamber and which separate the firing and storage chambers, substantially as set forth.

2. In a repeating-rifle, a firing-chamber, a storage-chamber alongside the same, and a stationary breech-block, in combination with a sliding carriage composed of a breech-piece in the rear of the breech-block, side pieces connected to said breech-piece, which constitute the side walls of the firing-chamber, and a firing-pin carried by the breech-piece, substantially as set forth.

3. In a repeating-rifle, a firing-pin, a spring which impels said firing-pin forward to fire the charge, a cylinder alongside the bore of the rifle, and a passage connecting the bore of the rifle with the rear end of said cylinder, in combination with a piston within said cylinder, which is moved forward by the gases generated by the explosion of the charge, a piston-rod connected to said piston, a catch on said piston, which engages said firing-pin when the piston is moved forward, and a spring for retracting said piston and with it said firing-pin, substantially as set forth.



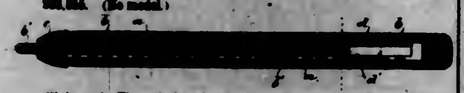
4. In a repeating-rifle, a spring-actuated firing-pin and a catch engaging therewith, in combination with a bell-crank lever connected with said catch, and a sliding trigger-plate which upon being moved comes in contact with said lever and rocks the same, substantially as set forth, whereby said catch is depressed and the firing-pin is released.



5. In a repeating-rifle, a firing-chamber, a storage-chamber, and a sliding carriage whose side pieces constitute the opposite side walls of the firing-chamber, one of which sides separates the firing and storage chambers, in combination with a sliding plunger which occupies the space left vacant by the side piece of the carriage opposite to the mouth of the storage-chamber when the carriage is moved backward, substantially as set forth.

386,890. STANCHION. THOMAS H. MCGRRARY, New Brighton, Pa. Filed Dec. 22, 1887. Serial No. 258,702. (No model.)

Claim.—1. In a stanchion, the bars B, hung at their upper ends from above by flexible connections and connected at their lower ends, and a detachable connection between the upper portions of the bars, substantially as described.



2. A stanchion consisting of two flexibly-suspended bars, B, flexibly joined at their lower ends by a connection passing through a guiding eye or ring, E, and a detachable connection between the upper portions of the bars, substantially as described.

3. In a stanchion, the bars B, hung from above by a chain, A, and connected together at their lower ends by a chain, D, and a detachable connection, C, between the upper portions of the bars, the distance between the upper ends of the chains A being greater than the length of chain D, substantially as and for the purpose set forth.

386,891. PENCIL. OSCAR HEINEMAN, Jr., New York, N. Y., assignor to Eberhard Faber, same place. Filed Feb. 18, 1888. Serial No. 263,855. (No model.)

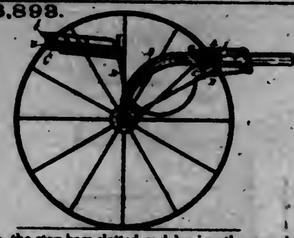
Claim.—1. The tubular sleeve *d*, having an inwardly-projecting tooth, *d'*, in combination with the slotted tubular pencil-lead holder *b*, having teeth upon one edge of the metal at the slot, and over which holder the sleeve is slipped, so as to hold the lead at any point to which it may be moved by the teeth *d'* being brought into the notch between two teeth on the tubular holder, substantially as specified.

2. The combination, with the tubular body *a*, having a tapering end, of a tubular lead-holder passing freely into the tubular body, and a conical collar, *c*, on the tubular lead-holder, into which the tapering end of the tubular body passes, substantially as specified.

3. The combination, with the tubular body *a*, having a tapering end, of a tubular lead-holder passing freely into the tubular body, and a conical collar, *c*, on the tubular lead-holder, into which the tapering end of the tubular body passes, and a sleeve sliding on the slotted tubular lead-holder and having a tooth passing into the lead-holder at the end of the lead, substantially as specified.

386,892. PENCIL. OSCAR HEINEMAN, Jr., New York, N. Y., assignor to Eberhard Faber, same place. Filed Mar. 5, 1888. Serial No. 266,291. (No model.)

Claim.—1. The combination of the tubular body or sheath *a*, divided by a slot at one end, with a tubular metal end cap that is adapted to fit over the end of the divided portion of the tubular body and compress the same to cause a friction on the lead or stylus, substantially as specified.



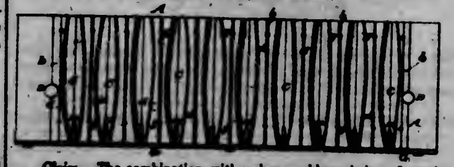
2. The combination, with the tubular body or sheath *a*, slotted at one end, of a tubular portion, *c*, adapted to fit over the end of the tubular body and to compress its divided end to cause a friction on the lead, and the tubular portion *c'*, sliding within the portion *c*, for moving the lead endwise, substantially as set forth.

386,893. TWO-WHEELED VEHICLE. JAMES A. ORELL, Kalamazoo, Mich. Filed Apr. 14, 1888. Serial No. 270,793. (No model.)

Claim.—1. The combination of the thills, wheeled axle, seat-bars or body hinged at the forward end, the spring sustaining said seat-bars from the ends of said spring, and the re-enforcing spring and adjustable bands, substantially as set forth.

2. The seat comprising the frame, the cross-bar, the standard having the loop at the end, the side bottom boards and lids hinged

386,893.



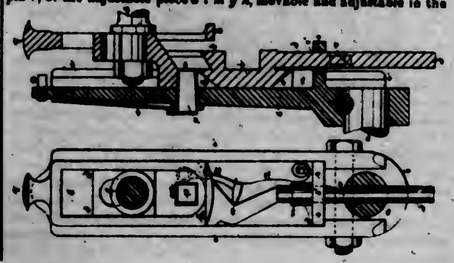
thereto, the stay-bars slotted and having the cross-bar of the frame loosely in said slots, and the two-part rail lapped and loosely passed through the loop of said seat-standard, substantially as set forth.

3. The combination of a vehicle-body with a seat having the sliding side parts to the bottom and lids hinged thereto, substantially as set forth.

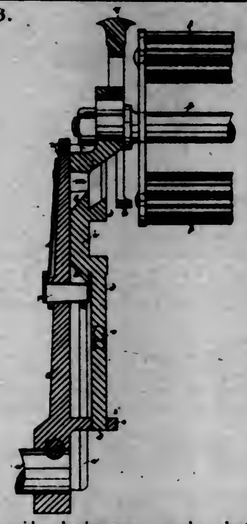
4. The combination of the thills, seat-bars, the two springs separated at the end, and the bands thereon for re-enforcing the spring by adjusting them, the extensible seat having the side bottom boards adapted to slide, and the hinged lids, whereby the spring may be made stiffer when the seat is widened for two persons, substantially as set forth.

386,894. CIGAR-MOLD. HENRY C. FLEMMING, Davenport, Iowa. Filed Apr. 10, 1888. Serial No. 270,168. (Model.)

Claim.—The combination, with a cigar-mold consisting of a series of matrices and plungers, of the strip G, secured to the edge thereof adjacent to the ends of the matrices at which the heads of the cigars are formed, and a plurality of pins, *m*, secured to said strip and extended into said molds, substantially as and for the purpose specified.



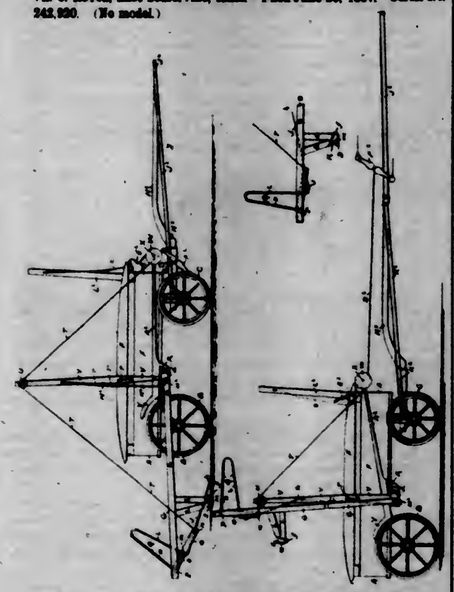
386,895. FIRE-KINDLER. TREAT T. PHIPPEN, Lakeside, Ill. Filed Aug. 16, 1887. Serial No. 247,070. (No model.)



Claim.—The combination, in an oil-burning cylinder, of shell or case A, slits *a a*, arranged in series on said shell A, cup-shaped heads C, perforations *c' c'* in said heads, washer B, of less diameter than head C and extending from the center thereof over the cup-shaped portion a sufficient distance to be adapted to the placing of a stove-lifter cover or other like article thereunder for the lifting of said cylinder, and porous non-combustible material placed in said shell or case, substantially as described.

386,896. ADJUSTABLE CRANK FOR VELOCIPEDES. FRANZ L. RENK, Hinterberg, Saxony, Germany. Filed Dec. 27, 1887. Serial No. 258,682. (No model.) Patented in Germany Aug. 27, 1887, and in England Nov. 17, 1887, No. 15,982.

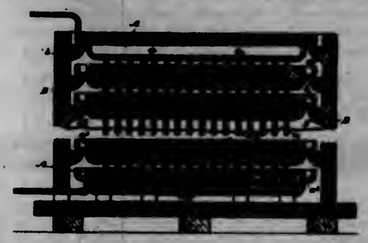
Claim.—The combination, with the shaft *a* and the arm *b*, mounted upon said shaft, having the guide *c*, having the socket *n*, the projection *o*, the hole *o'*, the pin *p*, the spring *o*, the pawl *t*, the spring *s*, and the pin *r*, of the adjustable piece *d i m g h*, movable and adjustable in the



386,896.

hole *d*, and the guide *c*, having curves *a* and *c*, adapted to the pawl *f*, having inclined surfaces adapted to the pin *p* and supporting the shaft *l* of the pedal *f*, all substantially as and for the purpose set forth.

386,897. APPARATUS FOR RAKING AND LOADING HAY. MARVIN O. ROYCE, East Somerville, Mass. Filed June 29, 1887. Serial No. 242,920. (No model.)



Claim.—1. A frame, G H, at one end portion pivotally attached to and projected from the rear of a wagon-body, and a hay-rake having its frame journaled and swinging on said frame G H and adapted to engage it and the two frames to swing as one on the wagon-body, in combination with brake-shoes for the wheels of the wagon, lever-arms carrying said shoes and fulcrumed in the wagon, a horizontal shaft, X, turning on said arms, means adapted to hold said shaft against turning and to release it to turn, a sliding wagon-pole, J^3, a stationary support and guide, K^3, for said pole, a movable whiffletree, F^3, to which said pole the horse is to be hitched, rope D^3, connecting the whiffletree and said shaft, and rope T, having suitable guides connecting said shaft and rake-frame, substantially as described, for the purpose specified.

2. A horizontal bar, D, detachably attached to a wagon-body, a frame, G H, at one end portion, pivotally attached to said bar and extended to the rear of the wagon, a hay-rake journaled on said frame G H and adapted to engage it and the two frames to swing as one on said bar, and means connected to said rake-frame and adapted to swing it and its supporting-frame into operative raking position and into a position over the wagon to dump the contents of the rake thereon, in combination with brake-shoes for the wheels of the wagon, pivoted to said bar, and having operating lever-arms connected to and operated by said means for swinging said rake-frame, substantially as described, for the purpose specified.

3. In combination, a frame, G H, at one end portion pivotally attached to and projected from the rear of a wagon-body, a hay-rake having its frame journaled and swinging on said frame G H and adapted to engage it and the two frames to swing as one on the wagon, a horizontal rotatory shaft, X, of the wagon-body, means adapted to hold said shaft against turning and to release it to turn, rope T, having suitable guides and connecting said rake-frame and shaft, a sliding wagon-pole, J^3, a stationary support and guide, K^3, for said pole, a movable whiffletree, F^3, to which and said pole J^3 the horse is to be hitched, and rope D^3, or such like, connecting whiffletree and said shaft, substantially as described, and for operation and purposes as specified.

386,898. SECONDARY BATTERY. JOHN S. SELLON, The Hall, Sydenham, County of Kent, England, assignor to The Electrical Accumulator Company, of New York. Filed Sept. 30, 1887. Serial No. 250,891. (No model.) Patented in England Nov. 10, 1886, No. 14,902.

Claim.—1. The combination, in a secondary battery, of a frame or support having shelves or projections arranged one above the other, and two or more elements in the form of a dish or tray adapted to hold the electrolyte, independently supported upon the said shelves or projections.

2. The combination, in a secondary battery, of two or more elements in the form of a tray or vessel adapted to contain the electrolyte, arranged one above the other and furnished with connecting-passages, whereby the overflow from one is conducted to another.

3. In a secondary battery, a couple in the form of a tray or vessel adapted to contain the active material of one element and the electrolyte and furnished with ribs or projections upon its under side, having holes or perforations in which the active material of the other element is placed.

4. In a secondary battery, a couple in the form of a tray or vessel adapted to contain the active material of one element and an electrolyte, and having perforated ribs or projections upon its under side, forming a support for the active material of the other element.

5. In a secondary battery, an element in the form of a tray or vessel adapted to contain the electrolyte, combined with a groove or gutter surrounding the element to catch the overflow.

6. In a secondary battery, an element in the form of a tray or vessel adapted to hold the electrolyte and having ribs or projections containing holes or perforations in which the active material is placed.

7. In a secondary battery, the combination of a series of couples, each in the form of a tray or vessel adapted to contain the active material of one element and an electrolyte and furnished with ribs or projections upon its under side, having holes or perforations in which the active material of the other element is placed, said couples being located one above the other, the perforated ribs of one element being immersed in the electrolyte of the adjacent element.

8. In a secondary battery, the combination of an element consisting of a support to which is applied an active material containing an oxide of lead and an element consisting of a support to which is applied an active material containing an oxide of manganese.

9. In a secondary battery, the combination of an element consisting of a support to which is applied an active material consisting of an oxide of lead mixed with a porous inert material and an element consisting of a support to which is applied an active material consisting of an oxide of manganese mixed with a porous inert material.

386,899. CAR-AXLE BOX. WILLIAM S. GRAFFIUS, Denver, Colo. Filed Sept. 26, 1887. Serial No. 251,015. (No model.)

Claim.—1. The combination, with the axle, the surrounding case formed with ends embracing the axle, and the long rolls therein around said axle, of a hardened-steel washer within said case between the ends of said case and the ends of the roll to take the end-thrust of the rolls, substantially as described.

2. The combination, with the axle and the endwise-movable case carrying the long rolls and surrounding the axle, of the casting likewise movable on said axle and designed to support the load, substantially as described.

3. The combination, with the axle, the surrounding case, and the long rolls, of the casting and the transverse rolls arranged between said case and casting, substantially as and for the purpose specified.

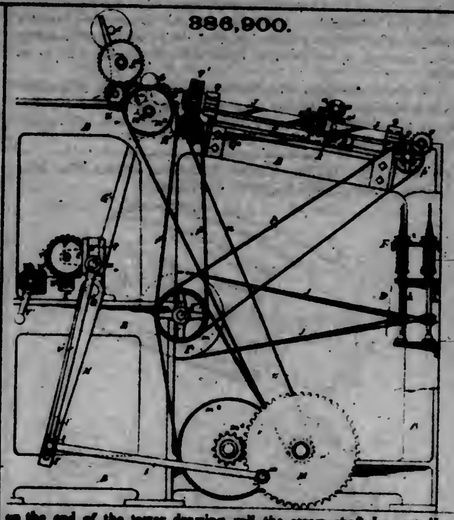
4. The combination, with the axle and wheels, of the casting designed to support the load, and provided with eyes surrounding the axle, and the balls arranged between said eyes and the inner faces of the wheels, substantially as and for the purpose specified.

5. The combination, with the axle, the surrounding case and the long rolls, of the casting designed to support the load, and springs arranged to keep said case in the center of the axle, substantially as described.

6. The combination, with the axle, the surrounding case, the long rolls, and the casting designed to support the load, of the springs arranged as described, and the transverse rolls between said case and casting, substantially as and for the purpose specified.

7. The combination, with the axle, the endwise-movable case, the long rolls, and the endwise-movable casting designed to support the load, of an elastic connection between said case and casting, transverse rolls between the case and casting, and the balls H, all substantially as and for the purpose specified.

386,900. SPINNING-MACHINE. GEORGE W. SWORMSTEDT, Dalton, Pa., assignor of two-thirds to Edward Miller, same place, and Alfred Harvey, Scranton, Pa. Filed Apr. 4, 1887. Serial No. 233,613. (No model.)



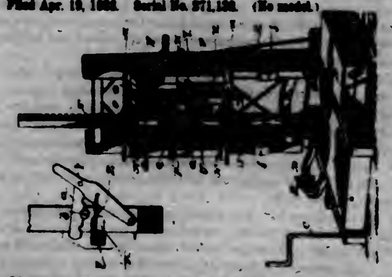
Brief.—The invention consists in certain improvements upon the machine described in Letters Patent No. 357,864, relating particularly to the mechanism for driving the drawing-rolls and for regulating the travel of the carriage.

Claim.—1. The combination of the frame of a spinning-machine, the feed-rolls thereon, a carriage adapted to suitable ways on the frame, drawing-rolls mounted on said carriage, mechanism for reciprocating the carriage toward and from the feed-rolls, a screw-shaft situated at one side of the carriage, a nut adapted thereto, and gearing connecting the nut with the drawing-rolls, substantially as specified.

2. The combination of the frame of a spinning-machine, the feed-rolls thereon, a carriage adapted to suitable ways on the frame, drawing-rolls mounted on said carriage, mechanism for reciprocating the carriage toward and from the feed-rolls, a screw-shaft situated at one side of the carriage, and having a nut adapted to travel with the carriage, and gearing connecting the nut with the drawing-rolls, substantially as specified.

3. The combination of the carriage A, mechanism for reciprocating the same, drawing-rolls mounted on said carriage, a bevel-wheel on the end of the lower drawing-roll, the screw-shaft J, a nut, K, thereon, and a bevel-wheel on the nut gearing into the bevel-wheel on the lower drawing-roll, the nut K mounted in bearings on the carriage A and adapted both to slide and to turn on the shaft J, through which motion is imparted to the drawing-rolls, substantially as described.

386,900.



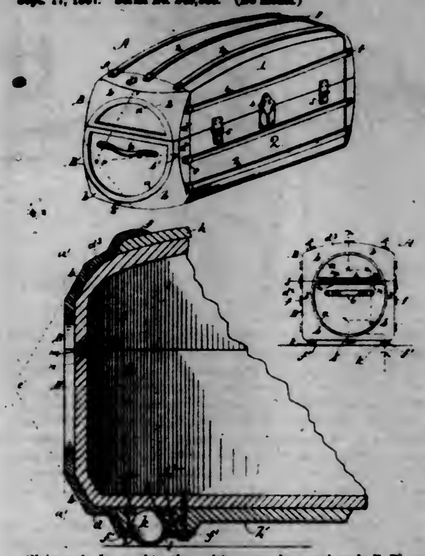
4. The combination of the carriage A, the feed-rolls thereon, mechanism for reciprocating the carriage, a screw-shaft, J, a nut, K, thereon, gearing connecting the nut and feed-rolls, a worm and worm-wheel, a detachable pulley, *r'*, the main shaft, and a belt adapted to pass around the pulley *r'* and around the pulley on the main shaft substantially in the manner and for the purpose set forth.

5. The combination of the carriage A, carrying the drawing-rolls, shaft G, arm G', connecting-rod G^2, and arm H, carried by said shaft, a block, *l*, on the arm H, and mechanism for moving the block *l* toward or from the fulcrum of the lever, and mechanism connected to the block by which the arm H is vibrated to reciprocate the carriage, substantially as described.

6. The combination of the shaft G, levers G' and H thereon, driving mechanism for vibrating the lever H, the feed-roll carriage, devices connecting the same to the lever G', block *l*, adapted to ways on the lever H and connected to the driving-rod for said lever, a block, U, and an arm, U', connected to the block *l*, a worm and worm-wheel, intervening gearing between the worm-wheel and the block U, and mechanism for turning the worm by which the block is raised or lowered and locked in position, substantially as described.

7. The combination of the shaft G, levers G' and H thereon, driving mechanism for vibrating the lever H, and a carriage connected to the lever G', through the medium of which the carriage is vibrated, block *l*, adapted to ways on the lever H and connected to the driving-rod therefor, a block, U, connected to the block *l*, and a handled shaft, V, and gearing through the medium of which the block U can be raised or lowered by turning the handled shaft V while the machine is in motion, substantially as set forth.

386,901. POST-HOLE AUGER. FRANK P. STANLEY, Spencer, Iowa. Filed Apr. 19, 1888. Serial No. 271,120. (No model.)



Claim.—1. The combination, with the base, of the drill-carrying frame mounted over the same and the bit-cleaning knives secured to the side of the base, as set forth.

2. The combination, with the base and the standard erected thereon, of the swinging frame hinged to the standard and the sliding frame mounted on the swinging frame and carrying the drill, as set forth.

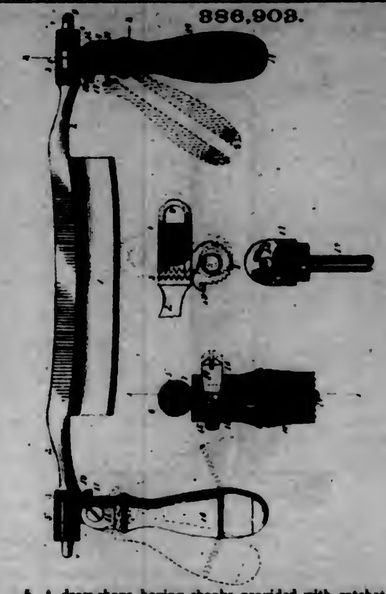
3. The combination, with the frame having a slot, X, of the shaft passing through said slot, the lever pivoted below said slot and connected to said shaft, and the rack-bar pivoted to the lever and adapted to engage a stud on the frame, as set forth.

386,902. TRUNK. WILLIAM B. SULLIVAN, Madison, Wis. Filed Sept. 17, 1887. Serial No. 249,903. (No model.)

Claim.—1. In combination with a trunk, metal ends B B', provided with conoidal pyramidal surfaces *b*.

2. The combination, with a trunk provided with metal ends having side flanges to fit the body of the trunk and lugs to receive the ends of slats, of a loosely-fitting ring in a recess in the ends of said slats at the bottom of the trunk as a bearing-surface for a ball-caster, as set forth.

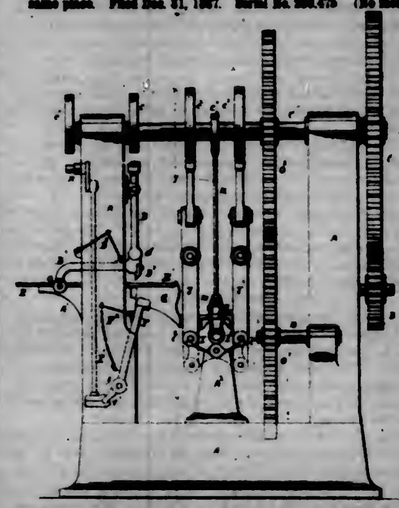
386,903. DRAW-SHAVE. JAMES SWAN, Seymour, Conn. Filed Feb. 20, 1888. Serial No. 264,617. (No model.)



Claim.—1. In a draw-shave, the combination, with eye 6, having an inwardly-inclined opening and teeth upon its outer periphery, of a handle having at its upper end a slot adapted to receive the eye, a lug, 13, at the base of said slot, and a screw-pin in the handle, which passes through the eye and is provided with an incline which engages the inclined opening in the eye, forcing the latter inward when the pin is turned in, so that lug 13 engages the teeth upon the eye, thereby locking the handle at any desired adjustment toward or from the cutting-edge.

2. Eye 6, having inwardly-inclined opening 7 and teeth 8 upon its outer periphery, in combination with a handle, the head of which is provided with a slot to receive the eye, said slot having a lug, 13, at its base, and a screw-pin having an incline, 18, which engages the opening in the eye, drawing the latter inward relatively to the handle, whereby the lug and teeth are caused to engage to lock the handle at any desired position.

3. Eye 6, having an inwardly-inclined opening and teeth upon its outer periphery, and a handle having a head provided with a slot through it to receive the eye, a lug, 13, at the base of said slot, an opening, 16, on one side of the head, and a threaded opening, 15, on the other side, in combination with a screw-pin, the respective ends of which engage openings 15 and 16, and which is provided with an incline, 18, adapted to engage the inclined opening in the eye, as and for the purpose set forth.



4. A draw-shave having a shank provided with ratchet-teeth 3, a collar on said shank, having ratchet-teeth engaging teeth 3, and a thumb-nut engaging the shank to lock the collar in any desired position, in combination with an eye, 6, made integral with or secured to the collar and provided with an inwardly-inclined opening, 7, and ratchet-teeth 8, a handle having a slot to receive the eye, and a lug 13, and a screw-pin in the handle having an incline engaging the opening in the eye, substantially as described.

386,903.

5. A draw-shave having shanks provided with ratchet-teeth 3 and threaded at their outer ends, and collars on said shanks, having teeth engaging teeth 3, in combination with eyes made integral with or secured to said collars, handles adjustably secured to said eyes, and thumb-nuts engaging the shanks, whereby the collars may be locked at any desired position.

386,904. MACHINE FOR MAKING HORSESHOES. Ansner M. SWINEY, Marquette, Mich., assignor of one-half to Arthur Uddenberg, same place. Filed Dec. 31, 1887. Serial No. 259,475. (No model.)

Claim.—1. In a machine for the manufacture of horseshoes, the combination with a supporting-bed and a pattern-head, of reciprocatory shaping-presses pivoted to a support stationary with respect to the pattern-head, and means for actuating the presses to form the body of the shoe, substantially as set forth.

2. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a pattern-head and reciprocatory shaping-presses pivotally secured to the bed, and means for actuating the presses to bend the metal of the shoe about said head, substantially as described.

3. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a removable pattern-head and reciprocatory shaping-presses pivotally secured to the bed, and means for actuating the presses to bend the metal of the shoe about said head, substantially as described.

4. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of reciprocatory shaping-presses pivotally secured to the bed and flanged upon their working-faces, and means for actuating the presses, substantially as and for the purpose described.

5. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of shaping-presses to form the body of the shoe, said presses pivotally engaged upon said bed and eccentrically operated, substantially as described.

6. In a machine for the manufacture of horseshoes, the combination, with the supporting-bed and frame provided with a driving-arbor, of shaping-presses to form the body of the shoe, said presses being pivotally secured to the supporting-bed and operated by an eccentric upon said arbor, substantially as set forth.

7. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a reciprocatory press, I, to bend the heel-calks, substantially as set forth.

8. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of an eccentrically-operated press to bend the heel-calks, substantially as described.

9. In a machine for the manufacture of horseshoes, the combination, with a supporting bed or frame, of a driving-arbor provided with an eccentric and a press to bend the heel-calks, said press operated by said eccentric and having a pivotal engagement upon said bed, substantially as set forth.

10. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a reciprocatory press, N, constructed to move in a right line toward and away from its work, substantially as and for the purpose set forth.

11. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a reciprocatory press, N, constructed to move, in a right line toward and away from its work and provided with a stamp, Q, substantially as and for the purpose set forth.

12. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a reciprocatory press, N, constructed to move in a right line toward and away from its work and provided with a stamp, Q, said stamp provided with a series of punches, substantially as and for the purpose set forth.

13. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a press, N, and a rotatable shaft, O, said press operated from said shaft, substantially as described.

14. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a rotatable shaft, O, and a press, N, provided with a sliding head engaged upon said bed, said head eccentrically operated from said shaft, substantially as described.

15. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of a reciprocatory press, N, constructed to move in a right line toward and away from its work, and a releasing device, substantially as described.

16. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of reciprocatory shaping-presses and a reciprocatory cutter independent of the shaping-press, substantially as described.

17. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of reciprocatory shaping-presses to form the body of the shoe and an auxiliary reciprocatory press to bend the heel-calks, substantially as set forth.

18. In a machine for the manufacture of horseshoes, the combination, with a supporting-bed, of reciprocatory shaping-presses to form the body of the shoe, an auxiliary reciprocatory press to bend the heel-calks, and a reciprocatory press, N, to perforate the shoe, substantially as set forth.

19. In a machine for the manufacture of horseshoes, the combination, with the supporting bed or frame, of shaping-presses pivotally secured at one end to a suitable frame and operated by eccentric connections connected with their opposite ends, substantially as set forth.

20. In a machine for the manufacture of horseshoes, the combination, with a supporting bed or frame, of a cutter-arm pivotally engaged at one end therewith, a driving-arbor provided with an eccentric, said arm operated by said eccentric, and a spring to retract said arm, substantially as described.

21. In a machine for the manufacture of horseshoes, the combination, with a supporting bed or frame, of the vibratory arm F, substantially as and for the purpose set forth.

22. In a machine for the manufacture of horseshoes, the combination, with a supporting bed or frame, of the vibratory arm F, pivotally engaged thereupon, and a driving-arbor eccentrically connected with said arm, substantially as described.

23. In a machine for the manufacture of horseshoes, the combination, with a supporting bed or frame, of reciprocatory shaping-presses to form the body of the shoe, a cutter, and means for feeding the metal to said presses, substantially as described.

24. In a machine for the manufacture of horseshoes, the combination, with a supporting bed or frame, of a driving-arbor, shaping-presses I, F, auxiliary press L, press N, and cutter, said presses and cutter driven from said arbor, substantially as described.

25. In a machine for the manufacture of horseshoes, the pattern-head and shaping-presses mounted upon a pedestal, A^1, and removably connected therewith, substantially as described.

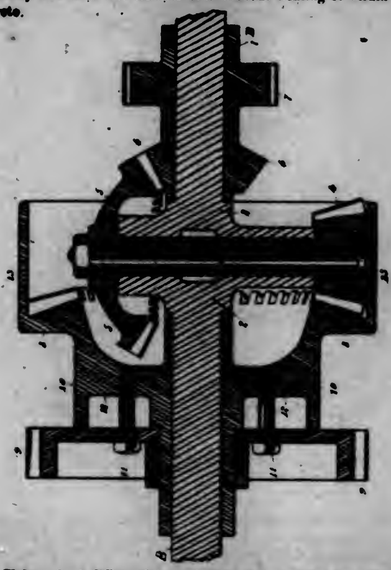
386,905. GRAIN-BINDER. Andrew Winans, St. Paul, Minn. Filed Nov. 9, 1886. Serial No. 218,402. (No model.)

Claim.—1. In a grain-binder, the combination, with the needle-arm, of compressor-arms, a link, as F, connecting the arms to the shaft of the needle-arm, a depresser-arm pivoted to the frame at one end adjacent to the hub of the needle-arm, and connecting mechanism between the needle-arm and depresser-arm, whereby the latter is moved by the needle-arm to force the compressor-arms toward the needle-arm, substantially as described.

2. In a grain-binder, the combination, with the main frame carrying a fixed lug, of the needle-arm, a compressor-arm, a link on which the compressor-arm is loosely hung, an arm connected fixedly to the compressor-arm to cause them to move together, and carrying an offset arranged to bear against said fixed lug to lock the compressor-arm in its elevated position, and an intermediate arm bearing on the arm connected to the compressor, said parts being arranged substantially as described, whereby as the knot is being tied said intermediate arm bears upon and moves the arm connected to the compressor out of engagement with the fixed lug, and at the same time forces the compressor toward the gavel to produce a final compression.

3. In a grain-binder, the combination, with the main frame provided with a fixed lug adapted to carry an anti-friction roller, G, of the needle-arm, a compressor-arm, a pivoted link on which the compressor is loosely hung, arm E, connected to the compressor and carrying a projecting offset or rib, *c*, the end of which normally bears against the said roller, and thereby supports the compressor-arm in its elevated position, and a trip device which forces the end of the rib *c* out of engagement with roller G, which then rides upon the upper face thereof and permits the compressor to fall, substantially as described.

4. The combination, with the needle-arm having a lug, *b*, of a depresser-arm, I, having a projection, *i*, whereby the lug of the needle-bar engages with the projection upon the depresser-arm and forces the latter downward, substantially as described.



5. The combination, with the throw-off arm C, having a lug, *c*, on its hub, of the depresser-arm I, having a projection, *i*, engaging with the lug *c*, substantially as described.

6. The combination, with the compressor-arms D and the curved arm E, supporting the compressor-arms, of a depresser-arm, I, having projections *i i'*, the needle-arm having lug *b*, and the throw-off arm having lug *c*, the whole combined and operating substantially as described, to insure the release of the curved arm from its locking device, as set forth.

7. The combination of compressor-arms, a depressor-arm, the needle-arm and throw-off arms operating said depressor-arm, and a lug on the frame of the machine for locking the compressor-arms until released by the depressor-arm, substantially as described.

386,906. DIFFERENTIAL MOTION FOR SLUBBING AND ROVING FRAMES. SAMUEL TWEEDALE, Accrington, County of Lancaster, England. Filed Jan. 28, 1887. Serial No. 225,527. (No model.) Patented in England Nov. 20, 1884, No. 15,750; in France Mar. 27, 1885, No. 172,091, and in Austria-Hungary May 30, 1886, No. 5,717.

Brief.—The object of the invention is to provide an improved construction of jack or differential motion which shall avoid the centrifugal action inherent in the old constructions, and which shall consequently run with less friction and without heating or strain due thereto.

Claim.—1. A differential gearing consisting of the combination of a shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears fixed to the opposite ends of said cross-shaft, and bevel-gears mounted to turn on an axis concentric with the axis of said shaft and gearing, respectively, with the gears on opposite ends of said cross-shaft.

2. A differential gearing consisting of the combination of a shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears of different size fixed on the opposite ends of said cross-shaft, and bevel-gears mounted to turn on an axis concentric with the axis of said shaft and gearing, respectively, with the bevel-gears on opposite ends of said cross-shaft.

3. A differential gearing consisting of the combination of a shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears of different size fixed on the opposite ends of said cross-shaft, the larger one of said gears arranged nearer the main axis of rotation than the other in order to compensate for the difference in their weight and thereby equalize, or partially so, their centrifugal tendency, and bevel-gears mounted to turn on an axis concentric with the axis of said main shaft and gearing, respectively, with the bevel-gears on opposite ends of said cross-shaft.

4. A differential gearing consisting of the combination of a shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears fixed on the opposite ends of said cross-shaft, and two bevel-gears arranged on opposite sides of said transverse boss turning loosely on the main shaft and gearing, respectively, with the bevel-gears on opposite ends of said cross-shaft.

5. A differential gearing consisting of the combination of a shaft formed with a transverse bearing-boss, one arm of which is longer than the other, and the shorter arm of which is formed of greater thickness in order to counterbalance its weight against the weight of the longer arm, and thereby to equalize, or approximately so, the centrifugal force, a cross-shaft mounted to turn in said bearings, bevel-gears of different size fixed on the opposite ends of said cross-shaft, and bevel-gears mounted to turn on an axis concentric with the axis of said shaft and gearing, respectively, with the bevel-gears on opposite ends of said cross-shaft.

6. A differential gearing consisting of a shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears fixed to the opposite ends of said cross-shaft, a variable-speed bevel-gear gearing with one of the gears on said cross-shaft, and a driven bevel-gear gearing with the other gear on said cross-shaft, in combination with speed-carrying coned pulleys, their driving-belt and belt-shipper, and gearing driven by the variable-speed pulley and driving said variable-speed bevel-gear.

7. The combination of a main shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears fixed to the opposite ends of said cross-shaft, a coned pulley geared to said main shaft, a reversed coned pulley, a belt connecting said coned pulleys, a belt-shipper for moving said belt along said pulleys to impart a variable speed to the driven pulley, a bevel-gear turning loosely on said main shaft driven by said driven pulley and gearing with one of the gears on said cross-shaft, and a bevel-gear turning loosely on said main shaft and gearing with the other gear on said cross-shaft.

8. The combination of a main shaft formed with a transverse bearing-boss, a cross-shaft mounted to turn in said bearing, bevel-gears fixed on the opposite ends of said cross-shaft, fliers geared to and driven from said main shaft, a coned pulley geared to said main shaft, a reversed coned pulley, a belt connecting said coned pulleys, a belt-shipper for moving said belt along said pulleys to impart a variable speed to the driven pulley, a bevel-gear turning loosely on said main shaft driven by said driven pulley and gearing with one of the gears on said cross-shaft, a bevel-gear turning loosely on said main shaft and gearing with the other gear on said cross-shaft, and bobbins geared to and driven from said last-named bevel-gear.

386,907. PHOTOGRAPHIC-PLATE HOLDER. ABNER G. THRELL, Brooklyn, N. Y. Filed Aug. 20, 1887. Serial No. 247,422. (Model.)

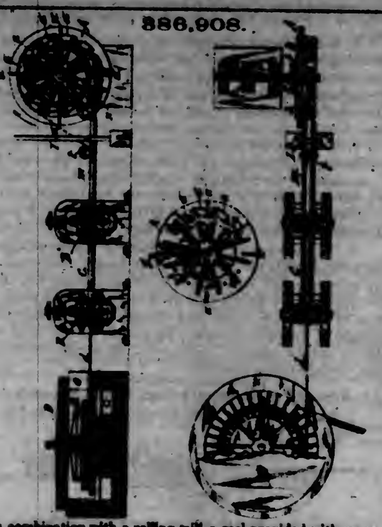
Claim.—1. As a new article of manufacture, a photographic-plate holder having frame-sections each composed of three pieces of wood suitably attached, the grain of the central pieces running lengthwise of the sections and the grain of the exterior pieces running at right angles to the grain of the central pieces, the said frame being provided with a channel groove or grooves formed in the said exterior pieces transverse to the grain thereof, substantially as described.

2. In a photographic-plate holder provided with an exposing-shutter and grooves for the said shutter, the combination of the pieces D D D and the pieces E E E, and the grooves for the exposing-shutter, formed in the pieces E, transverse to the grain thereof, the grain of the several pieces composing the sections running substantially as described.

3. In a photographic-plate holder, the combination of the frame having grooves for the exposing-plate, a back, K, a spring which forces the plate upward, and a head-block lying close to the said back K and having its edge adjacent thereto beveled to the same, as at *b*, whereby the force of the spring is caused to press the plate close against the back, substantially as described.

386,908. APPARATUS FOR REELING METALLIC BANDS. JAS. H. WHITMAN, Fulton, N. Y. Filed Oct. 20, 1887. Serial No. 252,869. (No model.)

Claim.—1. In combination with a rolling-mill, an automatic gripping-reel having an annular series of grippers with tangential entrances for the hoop or rod between the grippers, as set forth.



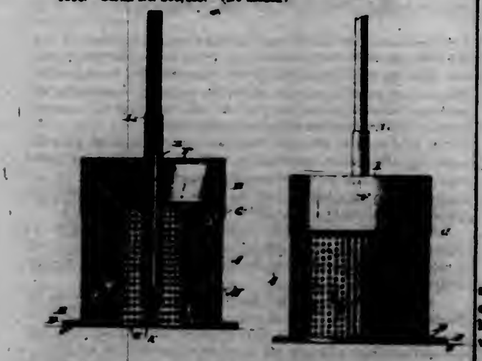
2. The improved reel herein described, consisting of a pivoted disk or spider, and an annular series of grippers pivoted on the face of said disk or spider to swing in a plane parallel with the same and contained adjustably in their positions, as set forth and shown.

3. In combination with a rolling-mill, an automatic gripping-reel having an annular series of grippers with tangential entrances for the hoop or rod between the grippers and a guide arranged tangentially to the reel and in range with the aforesaid entrances, as set forth and shown.

4. In combination with a rolling-mill, an automatic gripping-reel having an annular series of grippers with tangential entrances for the hoop or rod between the grippers, and an elastic guide arranged tangentially to the reel and in range with the aforesaid entrances and adapted to yield to the enlargement of the coil wound upon the reel, substantially as set forth.

5. In combination with a rolling-mill, a reel provided with an annular series of grippers with tangential entrances between them, and a guide arranged tangentially outside of the reel and in a uniform plane parallel with that of the reel, as described and shown.

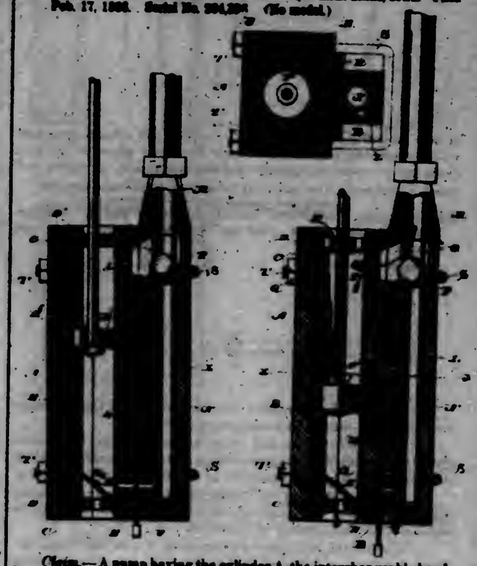
386,908.



6. In combination with a rolling-mill, a reel provided with an annular series of grippers and with tangential entrances between said grippers, a guide in range with said entrances, and a guide arranged tangentially outside of the reel and in a uniform plane parallel with that of the reel, substantially as described and shown.

7. In combination with a rolling-mill, a reel revolving in a vertical plane and provided with an annular series of grippers and with tangential entrances between the grippers, a guide in range with said entrances at the base of the reel, a guide arranged vertically tangentially outside of the reel and in a uniform plane parallel with that of the reel, and a guide-roller on one of said guides, substantially as described and shown.

8. The improved automatic gripping-reel consisting of the disk A, the elongated gripping-blocks *a a*, each pivoted at one end on the face of said disk, the collar *c*, pivoted concentric with the disk or spider, and the rods *b b*, connecting said collar with the free ends of the gripping-blocks, substantially as described and shown.



9. The reel A, provided with grippers *a a*, and slots *s* between said grippers, substantially as and for the purpose set forth.

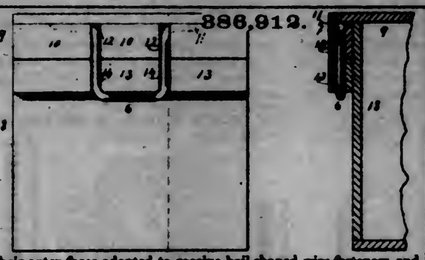
386,909. FILTER. DAVID WISE, Ashland, Ohio. Filed Apr. 3, 1888. Serial No. 269,415. (No model.)

Claim.—The improved filter herein described and shown, comprising the outer porous cylinder, A, having a solid bottom, B, the said bottom having an integral outstanding flange, C, projecting beyond the cylinder, and the upstanding lip D, arranged concentrically with the cylinder, the inner porous cylinder arranged on the bottom concentric with the outer cylinder, its upper edge being flush with the upper edge of the outer cylinder, the filtering material placed between the said cylinders, the cap F, having an air-chamber, H, resting on the upper edges of the cylinders and provided with a depending flange, G, fitting around the upper edge of the outer cylinder, thereby securing the cap in place, the rigid imperforate tube passing vertically through the air-chamber in the cap but not communicating therewith and depending within the inner cylinder, the perforated tube K, arranged at the center of the bottom B and secured to the lower end of the rigid tube, and the flexible tube secured to the upper end of the rigid tube, substantially as specified.

386,910. PUMP. HENRY H. WYMAN, Grand Mound, Iowa. Filed Feb. 17, 1888. Serial No. 264,294. (No model.)

Claim.—A pump having the cylinder A, the interchangeable heads D and D', the former being provided with inwardly-opening valves and the latter being solid, the interchangeable plungers, one of which is solid and the other is provided with an upwardly-opening valve, the block L, having the bore N, communicating with the bore of the cylinder near the upper end lower ends thereof, the valve P, arranged in the bore N, and the slide U, adapted to establish or cut off communication between the lower end of the cylinder and the bore N, substantially as described.

386,911. RUNNER FOR GRAIN-DRILLS. JOHN L. ASHURST, Hawes, assignor to Lewis R. Ashurst, Kilburn, Ill. Filed June 15, 1887. Serial No. 241,260. (No model.)



Claim.—As an improved article of manufacture, the runner described, formed of a single piece of metal wedge-shaped, as shown, and cut away at the heel, as at *b*, to form wings B B and C C upon different horizontal planes, and the rear upper corners of the wings B bent outwardly and over, as at *c*, substantially as and for the purpose specified.

386,912. BOX-FASTENER. WILLIAM H. BAIRD, Louisville, Ky. Filed Jan. 27, 1888. Serial No. 262,162. (No model.)

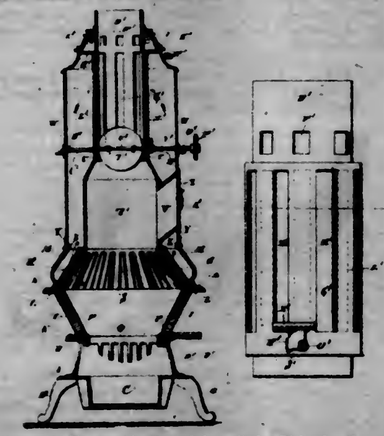
Claim.—1. The combination of a box-lid having cross-cleats grooved in their upper edges beneath the lid-top and grooved vertically across their outer faces, a box having cleats grooved vertically across their outer faces to register with the corresponding grooves in the said lid-cleats, and ball-shaped fasteners adapted to fit the said virtual grooves, and hung in the groove in the edge of the lid-cleats and secured therein by the lid being fastened upon the lid-cleats, substantially as shown and described.

2. In a box-fastener, the cleats grooved in their upper edges and

886,912.

in their outer faces adapted to receive ball-shaped wire fasteners, and a lid-top adapted to be secured upon the upper edges of the said cleats and to cover the grooves therein, substantially as shown and described, whereby wire bails may be secured in the said grooves.

886,913. COMBINED WASHING JACK AND TRUCK. WILLIAM BERKERT, Allegheny, Pa. Filed Apr. 14, 1888. Serial No. 270,698. (No model.)



Claim.—1. In a combined jack and truck, a rolling telescopic frame provided with jacks, substantially as described.

2. In a combined jack and truck, two or more jacks connected together by extensible sliding bars arranged to slide one past the other in a telescopic manner, substantially as described.

3. In a combined jack and truck, two or more jacks connected together and made adjustable in relation to each other by means of telescopic rods, substantially as described.

4. A combined jack and truck consisting of a rolling frame composed of telescopic rods provided with locking-screws, and having lifting-jacks located at the corners of said frame, in the manner and for the purpose set forth.

886,914. STOVE. JAMES H. BROWN, Vernon, Ill. Filed Oct. 18, 1887. Serial No. 252,730. (No model.)

Claim.—1. The combination of the cylinder D', having the opening G', the cylinder L', mounted on the cylinder D' and having openings M', adapted to register with the openings G', the rack-teeth N' on the cylinder L' near its lower end, and the shaft O', journaled in the lower end of the cylinder D' and provided with a spurred segment, R', engaging the rack-teeth N', as set forth.

2. The combination of the cap H, having the horizontal partition H' and the openings F above said partition, the cylinder D', extending through the partition and above the cap and having the openings F', and the damper K', adapted to close the openings F, as set forth.

3. The combination of the drum T, the cylinder D', resting thereon and having vertical openings, and the cylinder L', surrounding the cylinder D' and rotating thereon, and provided with vertical openings adapted to register with the openings in the said cylinder D', as set forth.

4. In a stove, the cylinder D', arranged within the outer casing, extending through the top of the stove, and having the openings G', in combination with the outer cylinder, L', arranged on the cylinder D', adapted to turn thereon, and having the openings adapted to register with the openings G', and the damper T, arranged in the cylinder D' below the said openings, substantially as described.

5. In a stove, the cylinder D', arranged within the outer casing and having the openings G', in combination with the outer cylinder, L', arranged on the cylinder D', adapted to turn thereon, and having the openings adapted to register with the openings G', and the shaft U', geared to the cylinder L', and having the damper T arranged in the cylinder D', for the purpose set forth, substantially as described.

6. The stove having the upper grate or cap, R, arranged on the fire-pot and within the outer casing, the drum T, rising from the said cap or upper grate, the damper A', communicating with said drum, the cylinder D', extending from the drum and through which the products of combustion escape, said cylinder having the openings G', the cylinder L', having the openings adapted to open or close the openings G', and the damper T, arranged in the cylinder below the openings, substantially as described.

886,915. CAR-COUPLING. JOHN H. CORE, Ridgewood, and OLIVER C. PERRY, Chicago, Ill. Filed Feb. 11, 1888. Serial No. 263,702. (No model.)

Claim.—In a car-coupling, the combination of the draw-head having a beveled recess, E, in one side, provided with the shoulders K, and the detent or dog mounted in the front end of the mid recess and having a beveled front side and an abrupt rear side, the said detent or dog being adapted to swing rearward at its free end and having its forward movement limited by the said shoulders K, substantially as and for the purpose specified.

886,916. SURGICAL TABLE. BYRON H. BARNEY, Buffalo, N. Y. Filed Oct. 7, 1887. Serial No. 251,741. (No model.)

Claim.—1. In a table of the kind described, the combination, with the table-legs, of a shelf connected therewith and a platform adjustable from the shelf, the said platform when extended having its fulcrum of support at a point entirely within the space bounded by the table-legs, whereby the patient may step upon the platform in mounting the table without disturbing its equilibrium.

2. In a table of the kind described the combination, with the table-legs, of a frame located entirely within the space bounded by said legs and connected at its corners thereto, a shelf sustained by said frame and having a hollow interior, and a platform adjustable from the shelf, substantially as described.

3. In a table of the kind described, the combination, with the frame-work and top, of a universal joint connecting the two at one corner and props for retaining the top in tilted adjustment, substantially as set forth.

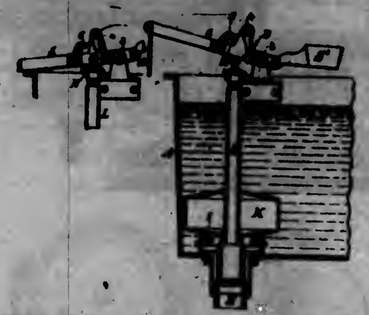
4. In a table of the kind described, the combination with the frame-work and top, of an end prop and a side prop intermediate between the said top and frame, and springs for throwing said props into operative position when the top is raised, substantially as set forth.

5. In a table of the kind described, the combination, with the frame-work and top, of a universal joint connecting the two at one corner and a stop-guide for limiting the movement of the top, substantially as set forth.

6. In a table of the kind described, the combination, with the frame-work, of the top containing sliding leaves and stirrups located side by side, with their edges in sliding contact, whereby the said leaves and stirrups may be drawn out together to form a broad support, or the stirrups alone drawn out, substantially as described.

7. In a table of the kind described, the combination, with the frame-work, of the top having an interior receptacle containing the oppositely-sliding leaves dovetailed with respect to each other, substantially as set forth.

8. In a table of the kind described, the combination, with the frame-work, of the top connected thereto by a universal joint, a drop-prop connected with the top, and an upwardly-swinging leaf connected with the frame, the said leaves being located in planes substantially parallel to the ends and sides of the frame-work, substantially as set forth.



9. In a table of the kind described, a retaining-frame removably attachable to the top edges of the table, and consisting of a head-board, knee-guide, and ankle-rest, substantially as described.

10. In a table of the kind described, the combination, with the top, of an ankle-rest hinged at one corner of said top, the inner end of said ankle-rest when in operative position abutting against the end of the top, substantially as described.

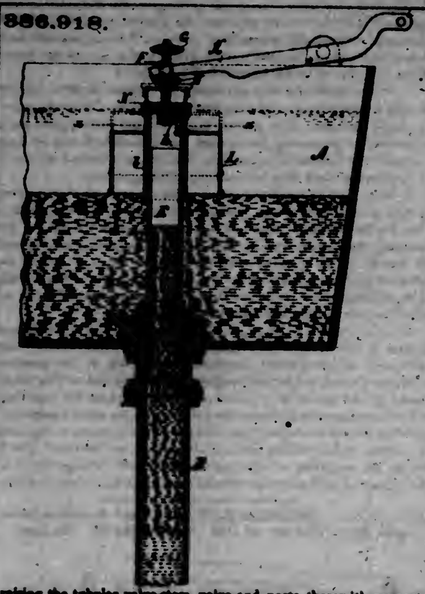
11. In a table of the kind described, a retaining-frame removably attachable to the top edges of the table, and consisting of a head-board, a side board hinged to said head-board, and an ankle-rest hinged to the end of said side board, substantially as described.

12. In a table of the kind described, the removable retaining-frame consisting of a head-board, knee-guide, and ankle-rest hinged together, the head-board and knee-guide having retaining-catches and the ankle-rest having a locking-recess, in combination with the stirrup engaging within said locking-recess, substantially as set forth.

886,917. GUTTER FOR WATER-CLOSETS. JOHN BERARDY, New York, N. Y., assignor to The J. L. Mott Iron Works, same place. Filed Aug. 26, 1887. Serial No. 247,923. (No model.)

Claim.—1. The combination, with the water-closet cistern and a button-headed valve-stem, and a valve and float connected to the valve and sustaining the same when raised, of a lever pivoted upon the cistern and having a finger, 6, above the valve-stem; and a pivoted hanging hook upon the lever, the said hook being adapted to engage the button-headed valve-stem when the lever is depressed and to fall away from said button-head after the valve has been lifted, substantially as set forth.

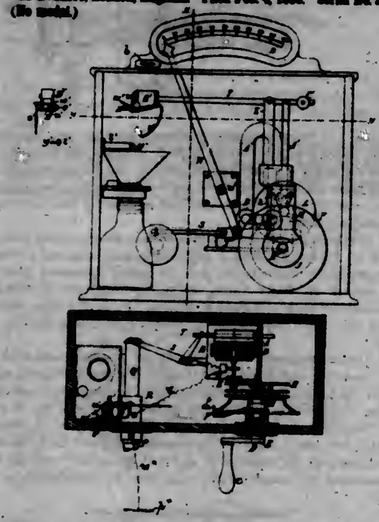
2. The combination, with the water-closet cistern and a button-headed valve-stem, and a valve and float connected to the valve and sustaining the same when raised, of a weighted lever pivoted upon the cistern and having an elongated eye and a finger, 6, above the valve-stem, a hanging hook within the eye, and a pivot-pin connecting the hook to the lever and at one side of the valve-stem when raised, so that the hook will fall from the button-head upon the valve-stem after the valve has been lifted, substantially as set forth.



886,918. OVERFLOW-VALVE FOR WATER-CLOSET CISTERNS. JOHN BERARDY, New York, N. Y., assignor to The J. L. Mott Iron Works, same place. Filed Dec. 13, 1887. Serial No. 257,781. (No model.)

Claim.—1. The inverted or bell float having a central tube perforated above the top of the float, a cap screwed upon the top of the tube, and a valve below the cap for closing the upper end of the overflow-tube, for the purposes and substantially as specified.

2. The combination, with the closet-cistern, the flushing-pipe, and the valve and seat, of a tubular stem forming the overflow-pipe, the inverted bell-shaped float having a central tube around the overflow-pipe, with openings in the upper part above the float, a cap screwed on the said tube and a valve confined by the cap, a rod and lifter for



886,919.

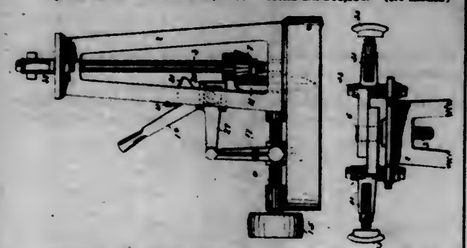
raising the tubular valve-stem, valve and parts therewith connected, substantially as set forth.

886,919. GEN-OPERATED ELECTRICAL APPARATUS. PERCIVAL EVERITT, London, England. Filed Feb. 4, 1888. Serial No. 263,022. (No model.)

Claim.—1. In an electric machine adapted for giving an ache to the person and provided with magneto-electric devices, a handle connected with such devices and serving the double purpose of completing the circuit and also as a means for revolving the same to generate the electric current.

2. An electric machine adapted for giving shocks to the person and provided with magneto-electric devices, and having one handle serving for completing the circuit connected to said devices and serving as a means for revolving the same, and another handle and regulating devices connected therewith adapted for increasing or diminishing the current.

3. In an electric machine adapted for giving shocks and provided with magneto-electric devices, a coin-receiver, and a coin-operated unlocking device, a handle connected with and serving to operate the



magneto-electric devices to generate the electric current, combined with means, substantially as described, serving to lock the machine and prevent its operation until the locking device acted upon by the introduction of a coin or its equivalent shall be released.

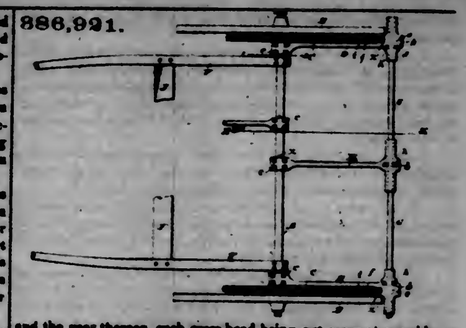
4. In an electric machine provided with magneto-electric devices and with a coin-receiver and coin-operated devices, the combination of a handle connected with and serving to operate the magneto-electric devices for generating the current, and a locking device serving to prevent such handle being operated until the introduction of a coin or its equivalent shall have released such locking device.

5. In an electric machine provided with magneto-electric devices and with a coin-receiver and coin-operated devices, the combination of one handle connected with and serving to operate the devices for generating the electric current, a locking device serving to prevent such handle being operated until the introduction of a coin or its equivalent shall have released the locking device, and another handle and regulating devices connected therewith adapted for increasing or diminishing the current and completing the circuit.

6. In an electric machine provided with magneto-electric devices and with a coin-receiver and coin-operated unlocking devices, the combination of two handles connected, respectively, to the positive and negative wires, one handle being connected with and serving when released by the agency of a coin to drive the machine for revolving the electro-magnets to generate the current, and the other handle and regulating devices connected therewith adapted to increase or diminish the current, and a locking device, substantially as described, which prevents the operation of the machine until said locking device is acted upon and set free by the introduction of a coin or its equivalent.

386,920. SURFACING-MACHINE. JAMES J. FITZGERALD, Minneapolis, Minn. Filed Mar. 26, 1888. Serial No. 268,864. (No model.)

Claim.—1. The combination, in a machine of the class described, with the frame 2, of the vertical shaft 3, mounted therein and provided at its upper end with the eccentric 5, the horizontal arm 31, mounted upon the vertical pivot 33 and provided at its outer end with the burnisher 35, and having its inner end engaged by the eccentric 5, substantially as described.

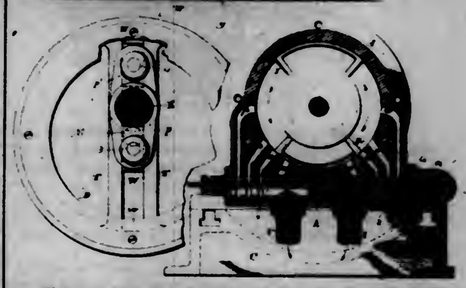


2. The combination, in a machine of the class described, with the frame 2, of the vertical shaft 3, mounted in said frame and provided at its upper end with the eccentric 5, the arms 31, mounted upon opposite sides of the frame 2 upon vertical pivots 33, and provided at their outer ends with a burnisher, 35, and having the inner ends of both of said arms engaged by the eccentric 5, substantially as described.

3. The combination, in a machine of the class described, with the frame 2 and the shaft 3, mounted therein and provided at its upper end with the eccentric 5, of the horizontal pivoted arm 31, provided with the burnishers 35 and engaged by said eccentric 5, the friction-gear 7, the sliding shaft 9, provided with the friction-gear 11, adapted to engage said gear 7, the lever 17, connected with said shaft, the shaft 13, provided with the eccentric 25 and the hand-lever 19, and the arm 27, connecting said eccentric with said lever 17, substantially as described.

386,921. TEDDER. LEANDER S. HEALD, Bath, Me. Filed Nov 26, 1888. Serial No. 319,979. (No model.)

Claim.—In a hay-tedder, the combination, with the axle, the wheels, the tedder-shaft, and the side gears for driving the shaft, of side arms, D, supporting said shaft, each side arm consisting of a straight bar rigidly attached at one end to the axle and provided with a side stud; *i*, as a bearing for one of the side gears, and with a divided hollow box or cross-head at the other end, adapted to receive the shaft



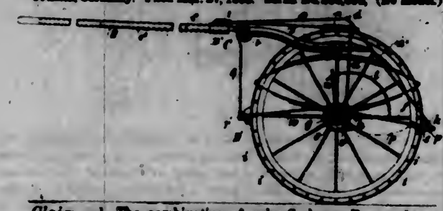
and the gear thereon, such cross-head being cut away at one side, as at *x'*, to expose the last said gear, substantially as set forth.

386,922. CONCENTRIC-PISTON STEAM-ENGINE. Gustavus W. BENHAM, Windsor, Vt. Filed Feb. 15, 1888. Serial No. 264,094. (No model.)

Claim.—1. In a concentric-piston steam-engine, the combination, with a cylinder and segmental pistons adapted to revolve therein, of a steam-chest having a series of live-steam and exhaust-steam passages leading thereto from the cylinder, a partition in the steam-chest between the live and exhaust steam passages, and a sliding valve adapted to open or close the live-steam passages, substantially as set forth.

2. In a concentric-piston steam-engine, the combination, with a cylinder and segmental pistons adapted to revolve therein, of a steam-chest having a series of live and exhaust steam passages leading therefrom to the cylinder, a partition in the steam-chest between the live and exhaust steam passages, pipes leading out of the two chambers of the steam-chest, and a sliding valve for opening or closing the live-steam passages, substantially as set forth.

3. In a concentric-piston steam-engine, the combination, with a cylinder and segmental pistons adapted to revolve therein, of a steam-chest having live and exhaust steam passages leading therefrom to the cylinder, a partition in the said chest between the live and exhaust steam passages, pipes leading out of the two chambers of the steam-chest, and a sliding valve for opening and closing the live-steam passages, said valve having a perforation therein to allow the steam to pass therein to equalize the pressure on the ends of the valve, substantially as set forth.



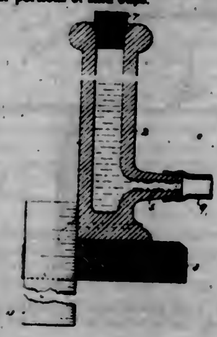
4. In a concentric-piston engine, the combination, with an annular cylinder, a steam-chest, a series of live-steam passages, and an equal number of exhaust-passages, of a central partition-wall located between the live-steam and exhaust-steam passages, a balanced sliding valve, and a valve-rod to move the valve endwise, so as to cover one or more live-steam passages, substantially as set forth.

5. In a concentric-piston engine, the combination, with a fly-wheel, a fly-wheel shaft, and a pedestal that rotatably supports the fly-wheel shaft, of an annular steam-cylinder, a pair of shafts, one within the other, said shafts having cranks on adjacent ends, those cranks having sliding connection with the fly-wheel, segmental pistons mounted on the shafts, adapted to move steam-tight in the cylinder, a steam-chest, live-steam passages leading from the chest into the cylinder, exhaust-passages connecting the steam-chest and cylinder, a valve, a partition in the steam-chest to separate the live-steam and exhaust passages, a hollow shaft, a shaft located in the hollow shaft, a bracket-stand that supports those shafts in a plane removed from the plane of the fly-wheel shaft, independent devices to connect the two concentric shafts to the pistons, and mechanism to connect the concentric shafts to the fly-wheel and cause the fly-wheel to rotate by the movements of the pistons, substantially as set forth.

6. In a concentric-piston steam-engine, the combination, with a cylinder, segmental pistons adapted to revolve therein, concentric shafts connected with the segments, and a fly-wheel, with which said shafts have a sliding connection, of steam-chest having a series of live-steam and exhaust-steam passages leading thereto from the cylinder, a partition in the steam-chest between the live and exhaust steam passages, and a sliding valve adapted to open or close the live-steam passages, substantially as set forth.

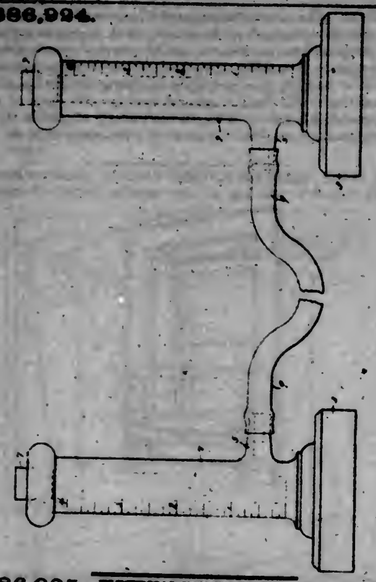
7. In a concentric-piston steam-engine, the combination, with a cylinder, segmental pistons adapted to rotate therein, a pair of concentric shafts having connection with those segmental pistons, said shafts having cranks on one end, and a fly-wheel mounted on a suitable shaft, said fly-wheel having a pair of guides therein, with which the cranks on the ends of the concentric shafts have a pivotal sliding connection, of a steam-chest having a series of live-steam and exhaust-steam passages leading thereto from the cylinder, and a sliding valve adapted to open or close the live-steam passages, substantially as set forth.

386,923. CAR STARTER AND BRAKE. ADOLF PERSIN, Bremen, Prussia, Germany. Filed Mar. 27, 1888. Serial No. 268,693. (No model.)



Claim.—1. The combination of poles C, sleeves B, cross-bar *c*, draft-bars *a*, *a'*, *f*, and *e*, hinged to each other, and hooks *k*, with bolts *i* projecting on each side of the felly of the wheels, chains *p*, and springs *o*, secured to the axis *g*, substantially as and for the purpose described.

2. The combination of cross-bar *c*, spring-bars *s*, levers *u*, brake-rod *w*, with spring-rods *q*, and brake-blocks D, as and for the purpose set forth.

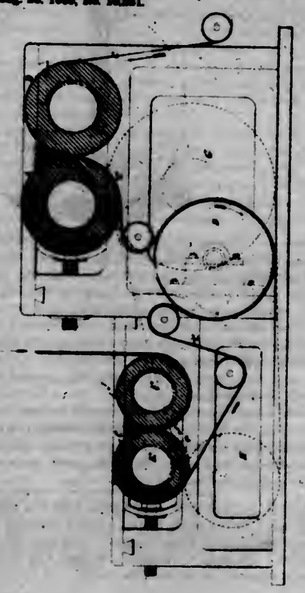


3. The combination of poles C, sleeves B, and cross-bar *c* with sleeve or head B', bolt *d'*, and loop *d''*, substantially as and for the purpose specified.

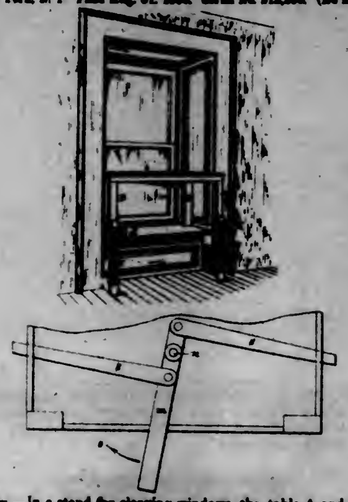
386,924. LEVELING-INSTRUMENT. ADAM KERR, Minneapolis, Minn. Filed Apr. 26, 1887. Serial No. 236,510. (No model.)

Claim.—The leveling-instrument herein described, comprising, in combination, the two cups each provided with a scale, and a flat base, 3, having a notch or opening, 11, formed therein, and a flexible tube connecting the lower portions of said cups.

386,924.

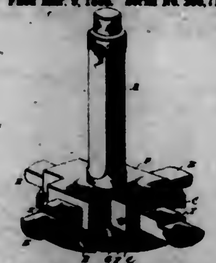


386,925. MATERIAL FOR CONDUCTORS. CHARLES T. LEE, Boston, and CHARLES H. WARD, Medford, assignors of one-half to the Gould & Watson Company, Boston, Mass. Filed Aug. 24, 1887. Serial No. 247,726. (No model.)



Claim.—A non-conductor consisting of a sheet or layer of textile fabric saturated or filled and covered with a compound composed of comminuted mica and an adhesive material, as glue, substantially as set forth.

386,926. PROCESS OF MANUFACTURING LINOLEUM FLOOR-CLOTH. CHARLES H. LEWIS, Staines, County of Middlesex, England. Filed June 11, 1887. Serial No. 240,992. (No model.) Patented in England Aug. 20, 1886, No. 10,951.

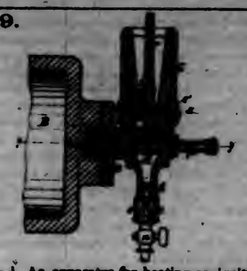


Claim.—The hereinbefore-described improvement in the process of manufacturing linoleum floor-cloth, which consists in applying heated linoleum material upon one face of a strip of canvas, spreading it thereon to form a film or layer of uniform thickness, uniting it therewith by pressure, then cooling and hardening this film and afterward applying heated linoleum material upon the other face of the canvas, spreading it thereon to form a film or layer of uniform thickness, and uniting it therewith by pressure, substantially as herein set forth.

386,927. STAND FOR CLEANING WINDOWS. FREDERICK HEYER, New York, N. Y. Filed Aug. 31, 1888. Serial No. 313,988. (No model.)

Claim.—In a stand for cleaning windows, the table A and fixed legs B thereof, in combination, with the legs C, adjustable on legs B, the lever *m*, fulcrumed underneath said table, and the bracing and steadying arms *s s*, connected with said lever and operating to brace the stand in a window-frame, substantially as and for the purpose specified.

386,928. APPARATUS FOR WALLING WELLS. JOHN HOSER, Perrysburg, Ohio. Filed Mar. 9, 1888. Serial No. 266,713. (No model.)



Claim.—1. The combination of the stem or rod, the plate or disk secured thereto to turn with it, and formed with the slots, and the table fitted loosely thereto to permit the stem and slotted plate to turn about it, and provided with the fingers to drop into the slot when brought opposite to each other, substantially as described.

2. The combination of the stem or rod formed with the angular part *a* and circular part *b*, the table fitted to said circular part and provided with the swinging fingers, and the plate or disk fitted to the angular part and formed with slots for the passage of the fingers, substantially as described.

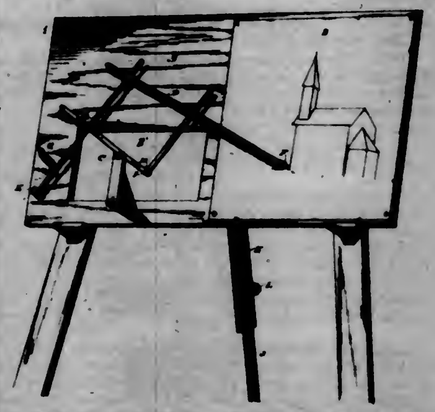
3. The combination of the stem or rod, the plate or disk formed with the slots, the table formed with the sockets, and having pivoted therein the fingers adapted to drop into the slots when brought opposite to each other, and means for holding said parts on the stem or rod, substantially as described.

386,929. IGNITING APPARATUS FOR GAS-MOTOR ENGINES. NICOLAUS A. OTTO, Cologne, Prussia, assignor to the Gas Motoren Fabrik Deutz, Deutz-on-the-Rhine, Germany. Filed Sept. 26, 1887. Serial No. 250,730. (No model.) Patented in England Aug. 26, 1887, No. 11,444, and in Germany Oct. 16, 1887, No. 41,282.

Claim.—1. An apparatus for heating an igniting-tube for gas-motor engines, consisting of a gas-injector, A, casing D, ring C, igniting-tube *r*, and chimney B, with lateral openings, substantially as described.

2. In an igniting apparatus for gas-motor engines, the combination, with the casing D, having a passage, A, leading to the cylinder, of the tubular gas-chamber *r'*, forming a prolongation of the passage A, the vertical igniting-tube *r*, entering the passage A between the cylinder and the gas-chamber *r'*, and an injector fixed to the bottom of the casing D, substantially as described.

3. In igniting apparatus for gas-motor engines, the combination, with the igniting-tube *r*, and passage A leading to the cylinder, of the tubular gas-chamber *r'* to the rear of the opening of the igniting-tube, and means, substantially as described, for allowing the escape of the non-combustible gases under pressure from the said passages and tubes, substantially as described.

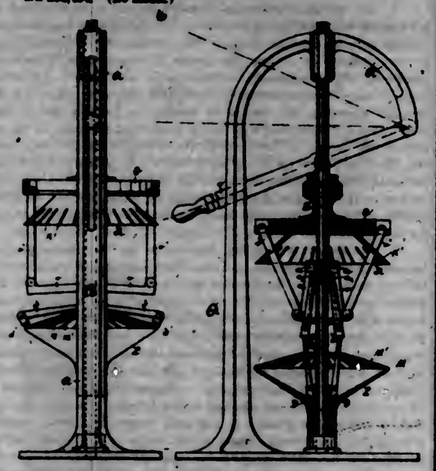


386,930. VENTILATOR FOR HATS. CHARLES POTTER, Stockport, County of Chester, England. Filed Nov. 5, 1888. Serial No. 313,988. (No model.) Patented in England Jan. 12, 1888, No. 472.

Claim.—1. In a ventilator for hats or other head-coverings, the fan *a*, capable of oscillating in or on a frame, *c*, in combination with a rigid pendulum, *b*, which is set going by reason of the constant movement of the head, and imparts an oscillating motion to the fan *a* through the medium of the diagonal spindle *d*, attached below its center of oscillation, all substantially as set forth.

2. In a ventilator for hats or other head-coverings, the combination of a fan, *a*, capable of vibrating on a frame, *c*, provided with a spring-pendulum, *b*, which imparts a vibrating motion to the fan *a* by reason of the constant movement of the head, all substantially as set forth.

386,931. ARTIST'S MECHANICAL SKETCHING APPARATUS. JOSEPH PULSIFER, Williams, Cal. Filed Aug. 26, 1887. Serial No. 247,979. (No model.)



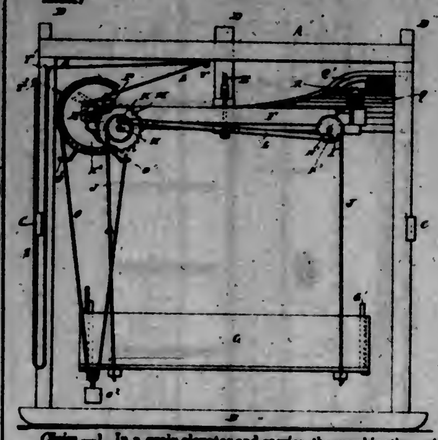
Claim.—1. A mechanical sketching device consisting of the frame or table upon one end of which the paper or surface to receive the sketch is secured, while the other is provided with an eyeglass supported in front of an opening therein, in combination with a jointed frame or pantograph, one end of which is pivoted to the frame or table and the other provided with a pencil or marking-point, while the intermediate joint has a hole or sight, substantially as herein described.

2. The frame or table upon one end of which the paper or drawing-surface is clamped and upon the other end a pantograph or jointed frame, pivoted so that the free end carrying a pencil approaches the paper-surface, a hole and sight-piece made through the intermediate joint of the frame, in combination with a fixed or stationary sight-opening, through which and the sight in the jointed frame the object to be drawn is observed, and by which it is transferred to the paper by following the outline or details by thereon sight-openings while the pencil is moved over the paper, substantially as herein described.

3. The frame or table supporting the drawing-surface at one end, having the other end perforated, with a fixed sight-piece in the front of the opening, in combination with a jointed frame or pantograph having a pencil or drawing-point attached to the end which moves over the paper, while the other end is pivoted to the opposite end of the frame or support, and has a spiral or other spring, G, connected with it, substantially as and for the purpose herein described.

386,932. WRAPPED-PLAITING MACHINE. HERM. SAMTMANN and LUDWIG J. F. HEDLAU, Bremen, Germany. Filed Dec. 28, 1887. Serial No. 259,454. (No model.)

Claim.—1. In a machine for making crossed or plaited paper wrappers, the combination, with a vertical spindle, of two hubs on the same, a set of blades hinged to each hub, the blades on said hub being adapted to pass in between the blades of the other, and links connecting the swinging ends of the blades with plates mounted on the spindle to move toward and from each other, substantially as shown and described.



2. In a machine for making crossed or plaited paper wrappers, the combination, with a spindle, of two hubs on the same, a set of blades pivoted to each hub, the blades of one set being adapted to pass in between the blades of the other, two plates mounted to slide toward and from each other on the spindle, links connecting said plates and the free ends of the blades, and guides on said plates for guiding the links, substantially as shown and described.

3. In a machine for making crossed or plaited paper wrappers, the combination, with a vertical spindle, of plates C and L, mounted to slide toward and from each other, the blades *c* and *d*, pivoted on hubs on the spindle, the links *c'*, connecting the ends of the blades *c* with the rim of the plate C, the links *d'*, connecting the blades *d* with the center of the plate L, the inverted funnel-shaped plate K on the under side of the plate C, said plate being provided with slots K' for guiding the links *c'*, and the inverted funnel-shaped plate M on the plate L, and provided with slots M' for guiding the links *d'*, substantially as shown and described.

386,933. PROCESS OF PREPARING A SOLUTION OF INDIGO FOR DYEING PURPOSES. FRIEDRICH R. GRUNZWEIG, Pritzwalk, Prussia, Germany. Filed May 26, 1887. Serial No. 239,097. (No specimens.) Patented in England May 19, 1887, No. 7,326; in Belgium May 31, 1887, No. 77,476; in Luxemburg Sept. 9, 1887, No. 699; in Germany Oct. 11, 1887, No. 42,602, and in Sweden Nov. 18, 1887, No. 1,143.

Claim.—The method, substantially as herein described, of preparing a vessel-bath for dyeing with indigo, consisting in mixing guano salts with water, and then adding zinc-dust and indigo or other bodies having an affinity for oxygen, and then heating the mixture, the ingredients being mixed about in the proportions given.

386,934. GRAIN-SHIPPING DEVICE. JAMES P. BEVINS and JOHN H. BEVINS, Ogd. Ills. Filed Aug. 17, 1887. Serial No. 247,170. (No model.)

Claim.—1. In a grain-elevator and carrier, the combination, with the frame-work, of a horizontally-turning frame within said frame-work, a grain-elevator suspended from and below said frame, and a cam in the horizontal path of the frame to cause it to assume an inclined position, substantially as set forth.

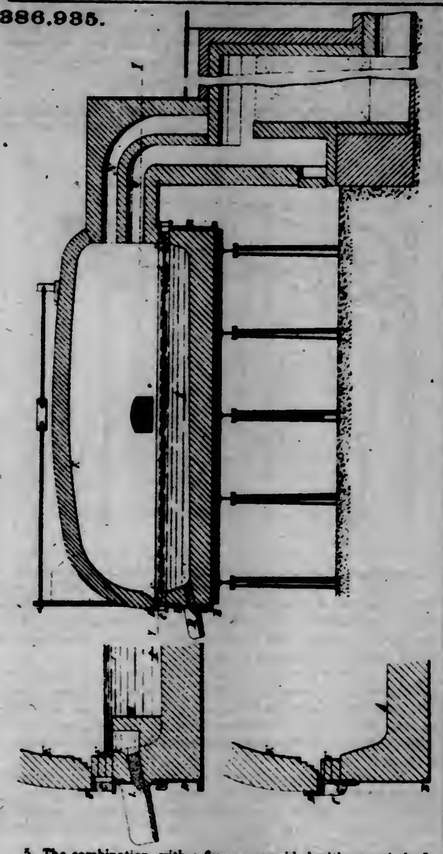
2. In a grain-elevator, the combination of an upright frame-work, a horizontal frame supported thereby, pivoted to turn laterally and to tilt, a grain-box suspended from the pivotal frame, and an inclined cam-way in the path of the frame when turning, and on the frame when so turned to tilt the same together with the grain-box, substantially as described.

3. In a grain-elevator, the combination of a horizontal frame, shafts journaled transversely in both ends of the same, drums and cranks on both ends of each shaft, pitmen connecting corresponding cranks on the shafts, and ropes winding on the drums and supporting a grain-box, substantially as described.

4. In a grain-elevator, the combination of a horizontal frame pivoted to turn horizontally and vertically, a shaft journaled therein carrying winding-drums, grain-box-suspending ropes winding on the drums, a gear-wheel on the shaft, a pawl for dogging the gear-wheel and adapted to be disengaged therefrom, a pinion engaging the gear-wheel, a rope-wheel for turning the pinion, and a hand-rope running over the rope-wheel, substantially as described.

5. In a grain-elevator, the combination of a frame-work, a grain-box-supporting frame pivoted to turn laterally and to tilt automatically on the frame-work, guides on the frame-work, a rope passing through the guides and attached to the frame for turning the same laterally in one direction, and another attached rope passing through other guides for turning the frame in the opposite direction, substantially as described.

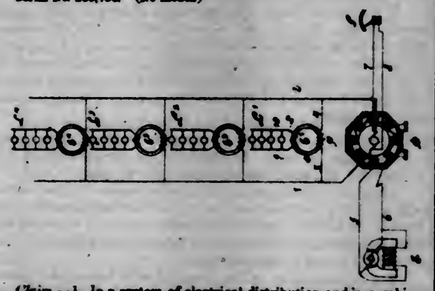
386,935. OPEN-HEARTH FURNACE. FRIEDRICH SIEMENS, Dresden, Saxony, Germany. Filed Sept. 29, 1883. Serial No. 314,764. (No model.) Patented in England June 1, 1883, No. 6,022.



Claim.—1. In an open hearth or tank furnace, the combination, with a stationary furnace-bed, of a roof carried independently of the lining of the bed on supports so arranged as to give free access between them for removing and replacing the lining of the upper layer of the bed, as and for the purpose described.

2. The combination of the furnace-bed A, inclosed in a metal casing, B, the struts C, and the ring D, on which is built the furnace-roof E, as and for the purpose described.

3. The combination of the furnace-bed A, inclosed in a metal casing, B, the struts C, the ring D, on which is built the furnace-roof E, and the removable zone of bricks F, substantially as and for the purpose described.



4. The combination of the furnace-bed A, inclosed in a metal casing, B, the struts C, the ring D, on which is built the furnace-roof E, the removable zone of bricks F, the brackets C', and the keys G, as and for the purpose described.

386,935.

5. The combination, with a furnace provided with a tap-hole, L, of the partition M, separating the tap-hole from the bed of the furnace, as and for the purpose described.

386,936. SYSTEM OF ELECTRICAL DISTRIBUTION. MARMADUKE M. M. STAFFORD, Fort Wayne, Ind., assignor of one-half to the Fort Wayne Electric Light Company, same place. Filed Apr. 8, 1886. Serial No. 198,730. (No model.)

Claim.—1. In a system of electrical distribution and in combination, an alternating-current dynamo, and converters electrically connected with the main-line conductors in multiple arc and organized to transform the current in the main conductors into currents of less potential and greater quantity in the secondaries, each converter made with a primary coil containing such length of wire exposed to magneto-electric induction that when operated by the dynamo with which it is to be used with its secondary circuit open the electrical pressure and counter-pressure in its primary circuit shall be equal, with incandescent lamps or other translating devices in the secondary circuits substantially as and for the purposes set forth.

2. In a system of electrical distribution and in combination, an alternating-current dynamo, and converters organized to transform the current in the main conductors into currents of less potential and greater quantity in the secondaries electrically connected with the main conductors in multiple arc, the dynamo and the converters of the system so adjusted to each other by mutual adaptation of their magnetic fields and the lengths of wire upon the armature of the dynamo and the primary coils of the converters, respectively, that when supplied with the full normal current of the dynamo, the secondary circuits of the converters being open, the electrical pressure and counter-pressure in their primary circuits shall be equal, with incandescent lamps or other translating devices in the secondary circuits, substantially as and for the purposes set forth.

3. In a system of electrical distribution and in combination, an alternating-current dynamo, and converters organized to transform the current in the main-line conductors into currents of less potential and greater quantity in their secondaries and electrically connected with the main conductors in multiple arc, each converter containing in its primary coil a length of wire exposed to effective magnetic induction substantially equal to the electrical or circuit length of wire exposed to like effective magnetic induction upon the armature of the dynamo operating the system, with incandescent lamps or other translating devices in the secondary circuits, substantially as and for the purposes set forth.

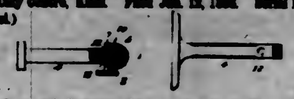
4. In a system of electrical distribution and in combination, an alternating-current dynamo, and converters organized to transform the current generated by the dynamo into currents of less potential and greater quantity at or near the points of consumption, electrically connected with the main-line conductors in multiple arc and having their primary circuits constantly closed, each converter adapted to the dynamo operating the system by making its primary coil of such length that when supplied with its full proportionate share of the entire normal current of the machine, its secondary circuit being open, the electrical pressure and counter-pressure in its primary circuit shall be equal, with translating devices in the secondary circuits of the converters to be cut out of the circuit when not in use without the introduction of any resistance in the place of them, substantially as and for the purposes set forth.

5. In a system of electrical distribution and in combination, an alternating-current dynamo, and converters organized to transform the current generated by the dynamo into currents of less potential and greater quantity at or near the points of consumption, electrically connected with the main-line conductors in multiple arc and having their primary circuits constantly closed and their secondary circuits constantly open, except when and as closed through translating devices at work, each converter containing a soft-iron core weighing substantially two pounds for each ampère or current normally produced in its secondary circuit, and adapted to the dynamo operating the system by making its primary coil of such length that when supplied with its full proportionate share of the entire normal current of the machine, its secondary circuit being open, the electrical pressure and counter-pressure in its primary circuit shall be equal, with incandescent lamps or other translating devices in the secondary circuits, substantially as and for the purposes set forth.

6. In a system of electrical distribution and in combination, an alternating-current dynamo, and converters organized to transform the current generated by the dynamo into currents of less potential and greater quantity at or near the points of consumption, electrically connected with the main-line conductors in multiple arc and having their primary circuits constantly closed and their secondary circuits constantly open, except when and as closed through translating devices at work, each converter containing a soft-iron core weighing substantially two pounds for each ampère of current normally produced in its secondary circuit, and containing in its primary coil a length of wire exposed to effective magnetic induction substantially equal to the electrical or circuit length of wire exposed to like effective magnetic induction on the armature of the dynamo operating the system, with incandescent lamps or other translating devices in the secondary circuits, substantially as and for the purposes set forth.

386,937. CARRIAGE-SPRING. ELEAZER G. SMITH, New York, N. Y. Filed Jan. 3, 1888. Serial No. 259,697. (No model.)

Claim.—1. The combination, with the carriage-body and running-gear, of springs, each of which is composed of two parts or leaves occupying the same vertical plane, one end of one part being attached to the body and the other end of the other part being attached to the running-gear, lap upon the edges of the respective leaves near the ends that lap upon each other to preserve the springs in their proper relative positions laterally, and an adjustable clamp for holding the two lapping parts of the spring together, substantially as specified.



2. The combination, with the carriage-body and running-gear, of springs, each of which is composed of two parts or leaves occupying the same vertical plane, one end of one part being attached to the body and the other end of the other part being attached to the running-gear, a connection between the adjacent ends of the respective leaves, and a movable clamp for varying the stiffness of the two-part spring by varying the distance of the clamp from the adjacent ends of the spring, substantially as specified.

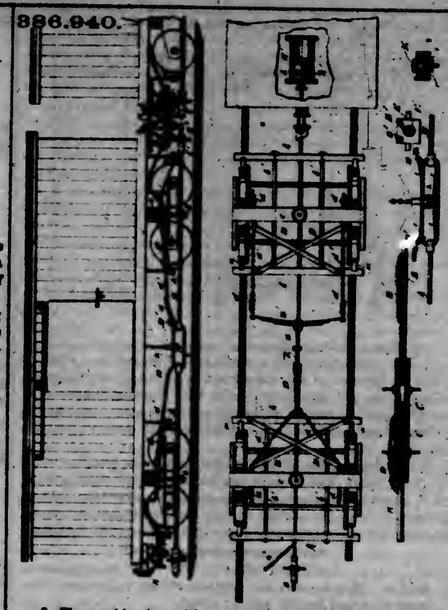
386,937.

3. The combination, with the body and running-gear, of a spring made of two parts, one of which is attached at its lower end to the running-gear and rises above the same and is convoluted, and the second part is attached at its upper end to the body and passes downwardly below the upper end of the lower part and is convoluted, and a connection between the two parts of the springs at or near their adjacent ends, substantially as set forth.

386,938. SASH-FASTENER. GEORGE E. SUTTON and CONSTANTINE P. PIERCE, Clay Center, Kans. Filed Jan. 19, 1888. Serial No. 260,945. (No model.)

Claim.—In a sash-fastener, the combination, with a rod, of the bracket 4, provided with the recess 5 and the opening 12, the pin 7, having the cut-away portion 9, and the block 10, substantially as described.

386,939. TOILET-RACK. MARY C. STERLING, Detroit, Mich. Filed Jan. 10, 1888. Serial No. 260,204. (No model.)



Claim.—The combination, with two brackets, of rods or stems B, spanning the space between them and provided with rings B² for the reception of towels, substantially as and for the purpose described.

386,940. CAR-BRAKE. PRESIDENT G. TAYLOR, Granton, R. I. Filed Sept. 22, 1887. Serial No. 250,693. (No model.)

Claim.—1. The combination, with a car, a brake-beam carrying shoes suspended from said car, and levers attached at one end to the brake-beam, adapted to cross each other, and having a spring-connection between the opposite end and the car-body, of a rod extending beneath the car from end to end provided with couplings at each extremity, a spring attached to the rod between each truck and connected with said levers, a cylinder provided with a steam inlet and exhaust, a piston working in said cylinder and connected with said rod, and adjustable fenders attached beneath the car projecting out beyond the draw-bars thereof, all arranged to operate substantially as shown and described.

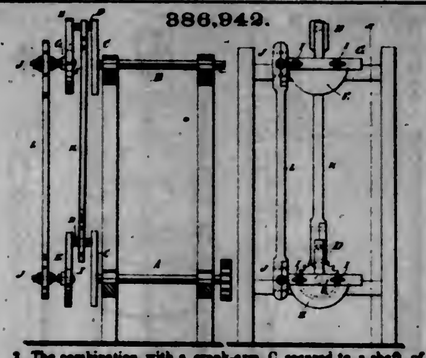
2. The combination, with a car, of a bracket attached beneath the sill, and an aperture in said bracket to hold a screw provided with a fender and adjusting-block, the said fender being adapted to project beyond the draw-heads, substantially as shown and described, whereby opposing cars are retained at a given distance apart when coupled, as set forth.

386,940.

3. The combination, with a car and a brake-beam carrying shoes suspended from said car, and spring-actuated cross-levers attached at one end to the brake-beam, of a rod extending beneath the car from end to end provided with couplings at its extremities, springs attached to said rod beneath the center of the car, chain attached to said spring and to the respective sets of levers, a cylinder provided with a steam inlet and exhaust, and a piston working in said cylinder connected with said brake-rod, substantially as shown and described.

4. The combination, with a car and a brake-beam carrying shoes suspended from said car, and spring actuated cross-levers having one end attached to the brake-beam, of rods extending longitudinally beneath the car provided with couplings at their outer extremities, a link uniting the inner ends of the rod, a chain and pulley secured to the car-body engaging said link, a spring attached to said rods near the link and to the several cross-levers, a cylinder provided with a steam inlet and exhaust, and a piston working in said cylinder connected with the longitudinal brake-rods, substantially as shown and described.

386,941. PROCESS OF CASTING. SAMUEL R. THOMAS, Brooklyn, assignor to Fred. Ades & Co., New York, N. Y. Filed May 16, 1887. Serial No. 238,260. (No model.)



Claim.—The process herein shown and described of uniting the end of a wrought-lead pipe to cast metal, which process consists in first dipping the end of the lead pipe into molten tin and in then inserting the tinned end of the pipe in the mold in which the casting is to be made, the said pipe forming part of the wall of the mold-cavity, and in then casting the metal against the end of the lead pipe, as set forth.

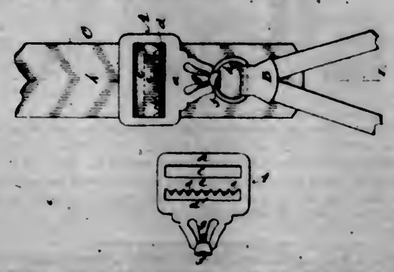
386,942. ANTI-DEAD-CENTER CRANK. THOMAS C. THOMAS, Salt Lake City, Utah, assignor of one-half to George Stringfellow, same place. Filed Sept. 7, 1887. Serial No. 249,032. (No model.)

Claim.—1. The combination, with a crank-arm, C, carrying a crank-pin, of an arm, E, secured to the said crank-pin and extending parallel with the said crank-arm, a crank-plate held on the said arm, and the crank-pin secured to the said crank-plate, substantially as shown and described.

386,942.

2. The combination, with a crank-arm, C, secured to a shaft, of a crank-pin fastened on the said crank-arm, an arm, E, secured to the said crank-pin and extending parallel with the said crank-arm, a crank-plate held universally adjustable on the said arm E, and a crank-pin fastened on the said crank-plate, substantially as shown and described.

3. The combination, with two shafts, of a crank-arm, C, secured to the end of each shaft, a crank-pin fastened to each crank-arm, an arm, E, secured to each crank-pin, an adjustable crank-plate held on each arm, a crank-pin secured to each crank-plate, and pitmen for connecting the said crank-pins, substantially as shown and described.

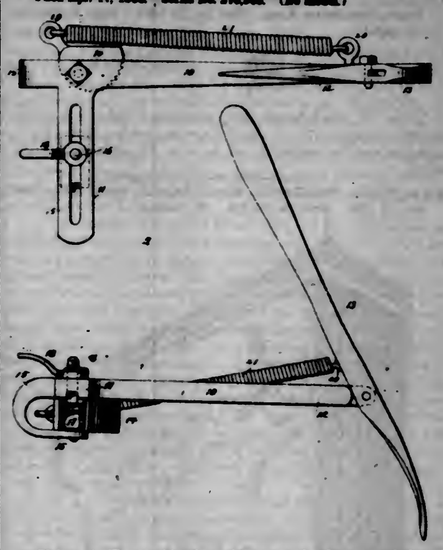


386,943. MANUFACTURE OF GLOVES. JOHN UNDERHILL, London, England. Filed Apr. 20, 1888. Serial No. 271,043. (No model.) Patented in England Dec. 20, 1887, No. 17,202.

Claim.—1. The hereinbefore-described process for the manufacture of gloves, consisting in first forming a warp fabric with alternate broad bands of ordinary warp fabric and narrow bands of thicker work, then cutting from such fabric glove-blanks with the tip ends of the fingers cut from the thickened band and the remainder from the broad band, and then finishing the gloves in the usual way.

2. The hereinbefore-described process for the manufacture of gloves, consisting in first forming a warp fabric with alternate broad bands of plain warp fabric and narrow bands of warp fabric, made thicker by the threads of which the fabric is composed, having a greater to-and-fro traverse given to them than in the work composing the broad bands, then cutting from such fabric glove pieces or blanks with the tip ends of the fingers cut from the thickened band and the remainder from the thinner band, and then finishing the gloves in the usual way.

386,944. BUCKLE. LUTHER C. VOORHEES, New York, N. Y. Filed Dec. 12, 1887. Serial No. 257,627. (No model.)



Claim.—A sheet-metal suspender or other like buckle, A, having upper and lower slots, *c d*, a bar or portion, *e*, separating said slots, integral with the frame or body of the buckle and of plain or disengaging construction on its upper margin, but serrated on its lower margin, forming teeth *e*, and a lever hook, *f*, and closing spring or tongue *g*, both also integral with the frame or body of the buckle, substantially as specified.

386,945. GUN-HOLDER. BENJAMIN F. WALKER, Weston, Pa. Filed Jan. 7, 1888. Serial No. 259,974. (No model.)

Claim.—In a combined spring-clamp and safety-pin gun-holder, the combination of the jaws A B, having dentated head or gripper end portions *f f*, arranged to project laterally from one side of the rear ends of the jaws, and the one jaw A, having a bent-over lip or push-ot *g* at its forward end, the pivot *c*, uniting the jaws intermediately of their length, the spring *d*, adapted to control the jaws, as set forth, and the single spring fastening-pin D, hinged, as at A, to the rear or clamping end of the jaw A and arranged to lie in the same longitudinal direction as the jaws A B and to cross their pivot *c*, substantially as shown and described.

386,946. DRAFT-LEVER. FREDERICK S. WESTON, Hudson, N. H. Filed Apr. 17, 1888. Serial No. 270,902. (No model.)

Claim.—1. The combination, with an angular frame consisting of a long and short member and a lever pivoted at the extremity of the longer member, of a cam pivoted beneath the frame at the angle thereof, a jaw sliding in the shorter member, and a spring connecting the said cam and lever, as and for the purpose specified.

2. The combination, with an angular frame consisting of a long and short member, the short member whereof is slotted, and a lever pivoted at one end of the longer member, of a cam pivoted beneath the frame at the angle thereof, provided with a roughened face, a jaw sliding in the slotted member, a spring connecting the lever and cam, and a means, substantially as shown and described, for securing the jaw in a fixed position, as and for the purpose specified.

3. The combination, with an angular frame consisting of a long and short member, the short member whereof is slotted, and a lever pivoted to one extremity of the longer member, of a segmental cam pivoted beneath the frame at the angle thereof, having its cylindrical face corrated, a jaw sliding in the short slotted member provided with a lock-nut, and a spring connecting the said cam and lever, as and for the purpose specified.

386,947. FRICTION-CLUTCH. JOSEPH D. WHITCOMB, Worcester, Mass., assignee of two-thirds to Arguilla Pease Butler, same place, and Elisha Young Butler, Boston, Mass. Filed May 12, 1887. Serial No. 237,933. (No model.)

Claim.—1. In a clutch, the combination of a shaft, a disk attached to said shaft and having a flange provided with teeth, a pulley running

386,947.

loosely around said shaft, a friction-strap provided with a tenon or spur, and an oblique mark acted on by said pulley to carry said tenon or spur into engagement with the teeth on said flange, substantially as described.

2. In a clutch, the combination, with frictional clutching devices, substantially as described, and a sliding cone, of the secondary lever J, as and for the purpose set forth.

3. In a clutch, the combination, with a shaft, and a pulley running loosely on said shaft, of a disk attached to said shaft, and having a friction-flange, a friction-strap surrounding said flange and having one end connected with said pulley, and a yoke integral with the opposite end of said strap, and by which it is connected with an operating-lever, and said operating-lever, substantially as described.

4. In a clutch, the combination, with a shaft, and a pulley running loosely around said shaft, and provided with a flange, E, of a disk attached to said shaft, and having a flange, E', a friction-strap, F, having parts F' F² F³ *e*, a spring, G, and connected operating-lever H, substantially as described.

5. In a clutch, the combination, with a shaft, and a pulley running loosely on said shaft, and frictional clutching devices by which said pulley and shaft are united, substantially as described, and a cone sliding on said shaft, of a secondary lever, J, with its shorter arm fulcrumed on said shaft and its longer arm having a roll, J', as and for the purpose set forth.

386,948. CLUTCH. JOSEPH D. WHITCOMB, Worcester, Mass., assignee of one-half to Arguilla P. Butler, same place. Filed Dec. 5, 1887. Serial No. 256,503. (No model.)

Claim.—1. In a clutch, the combination, with a shaft, and a friction-drum provided with notches and attached to said shaft, of a revolving pulley provided with a slotted flange and having a concentric motion around the axis of said shaft, a friction-strap having connected operative mechanism, substantially as described, by which it is compressed around the outer surface of said friction-drum, an elastic arm integrally attached at one end to said friction-strap, and having at its free end a tooth adapted to engage the notches on said friction-drum, and an oblique mark held in the slotted flange of said pulley, substantially as described.

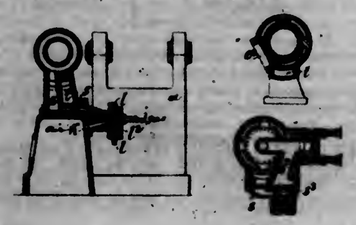
2. In a clutch, the combination, with a shaft, of a drum attached to said shaft, a friction-strap capable of being compressed on said drum, an elastic strap with one end integrally attached to said friction-strap, and the other end connected with the revolving pulley, and a revolving pulley whose motion is imparted to said drum through said elastic strap and said friction-strap, substantially as described.

3. In a clutch, the combination, with a shaft, of a drum attached to said shaft, a friction-strap inclosing said drum and provided with overlapping ends and lugs presenting opposing surfaces, a bar inclosed in and held by said overlapping ends and lugs, a lever attached to said bar and placed at an angle therewith, and a sliding cone, all arranged and operating substantially as described.

4. In a clutch, the combination, with an elastic friction-strap having connected actuating mechanism, substantially as described, and embodying a lever extending over the shaft, of an eccentric rotated by the shaft and capable of sliding thereon, substantially as described.

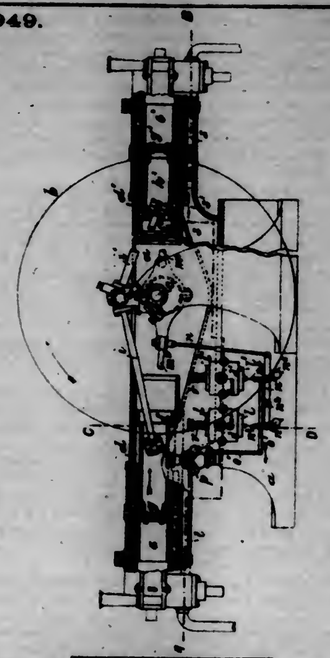
5. In a clutch, the combination, with a lever extending over the shaft and having connected clutching devices, substantially as described, whereby the rotary motion of the pulley is imparted to the shaft, or vice versa, of an eccentric capable of sliding on the shaft but held from rotating thereon, by which said lever is raised radially from the shaft and the clutching devices operated thereby, substantially as described.

6. In a clutch, the combination, with clutching devices, substantially as described, whereby the rotation of a pulley is imparted to a shaft, or vice versa, of a lever extending over the shaft and operatively connected with said clutching devices, mechanism by which said lever is actuated through a sliding motion on the shaft, and a spring applied to said actuating mechanism, whereby it is moved along the shaft and beneath said lever, substantially as described.



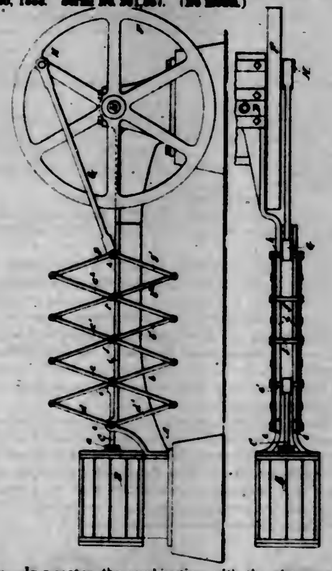
7. In a clutch, the combination, with mechanism by which a rotating pulley is made to engage its shaft, or vice versa, of an eccentric capable of sliding on the shaft but held from turning thereon, said eccentric having a beveled edge and connected devices, substantially as described, whereby it is moved on the shaft, substantially as described.

8. The combination, with a friction-strap and an operating-lever by which said strap is operated, of the eccentric L, provided with a beveled edge, L², spring M, collar M², and connected devices, substantially as described, by which said eccentric is moved against said spring, substantially as described.



386,949. GAS-MOTOR ENGINE. HUGH WILLIAMS, Stockport County of Chester, England. Filed Jan. 26, 1888. Serial No. 261,883. (No model.)

Claim.—1. The charging-cylinders *d d'*, their pistons *f f'*, the power-cylinders *e e'* and their pistons *g g'*, the piston-connecting rods *i i'*, and crank-shaft *c*, in combination with the valves *l l'*, controlling-passages *s* and *t*, communicating at one end with the gas and air inlets and at the other end with their respective charging and power cylinders, said valves being operated by suitable connections from one of the connecting-rods of the two slide ignition-valves *m m'* and regulated by connections from the governor *p*, all substantially as and for the purposes herein described.



2. The combination, with the two compound cylinders *d e d' e'*, their respective pistons connected to the crank-shaft *c*, to which are also connected the slide ignition-valves *m m'*, of ports and passages leading from the gas and air inlets to the cylinder, and the valves *l l'*, the fingers *n⁶ n⁷*, operated by connections from the connecting-rod *m²*, the springs *r r'*, and the connections to the governor, all substantially as herein set forth, for the purposes specified.

386,949.

386,950. MOTOR. GEORGE W. WHITE, Summerville, Ga. Filed Jan. 26, 1888. Serial No. 261,857. (No model.)

Claim.—In a motor, the combination, with the piston-rod C, the crank H of the steam-engine, and the connecting-rod G, of the crossed levers $b\ c\ b'\ c'\ b^2\ c^2$, connected together by cross-bars $d\ f\ f'$, the links $d\ d'$, pivoted to the levers $b\ c$ and to a fixed support, the links $g\ g'$, pivoted to the levers $b^2\ c^2$ and to the connecting-rod G, and the guides i, substantially as herein shown and described.

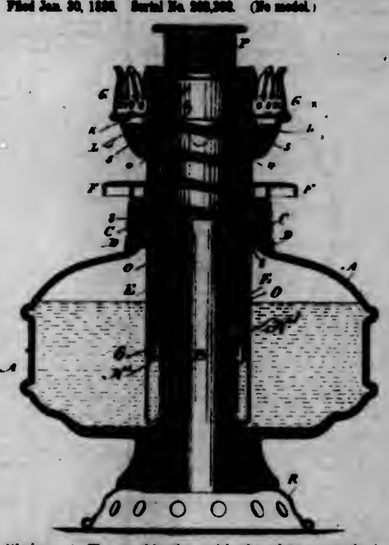
386,951. ART OF PREPARING SAND MOLDS. S. JARVIS ADAMS, Pittsburg, Pa. Filed Mar. 27, 1888. Serial No. 268,698. (No model.)

Claim.—The improvement in the art of preparing sand molds, which consists in jarring the sand into position around the pattern

386,951.

until the lower part of the mold has attained a desired degree of density, and then compressing the sand through the upper part of the flask to complete the same, substantially as and for the purpose set forth.

386,952. FILE-CASE. WILLIAM F. ALSTATTER, Weatherford, Tex. Filed Feb. 13, 1888. Serial No. 263,771. (No model.)

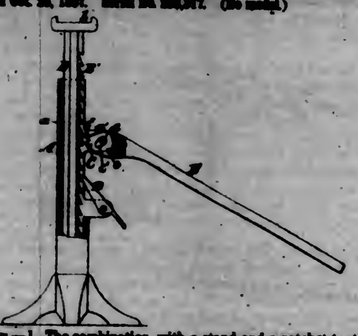


Claim.—1. The combination, with a case, of the pockets B, constructed in series of a single piece of material having partitions formed by long folds f, connected at the bottom by short folds f', substantially as and for the purpose described.

2. The pockets B, made in series of a single piece of material, having long folds f and short folds f' at the bottom, substantially as described.

3. The combination, with the folded pockets B, of the file-case having its sides constructed to overlap a part of the ends of the pockets, and an elastic follower, C, with thumb-pieces $o\ o$, arranged to bind with the sides of the case by straightening, as described.

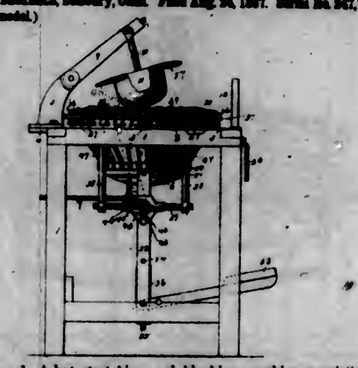
386,958. ARGAND LAMP. LEWIS J. ATWOOD, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Jan. 30, 1888. Serial No. 262,302. (No model.)



Claim.—1. The combination, with the glass reservoir A and central glass air-tube, B, in one piece, of the sheet-metal tube N, surrounding the glass tube B and parallel to and concentric therewith, and having a helical rib or corrugation, the said tube N being permanently attached to the glass tube B and forming an extension to the same, and the sleeve or nut N' around the said ribbed or corrugated tube N, and having a like rib or corrugation, and the wick-tube E, for operating the sleeve or nut N', substantially as set forth.

2. The glass reservoir and glass air-tube B in one piece, in combination with the collar D, having a cylindrical interior portion and secured to the exterior flange of the reservoir, the wick-tube E within the cylindrical portion of the collar D, the gallery F, attached to the

wick-tube E, and the sheet-metal air-tube N, having a helical rib herein and forming the wick-raiser, and surrounding the glass air-tube B, and plaster or other cement between the sheet-metal cylinder N and glass air-tube B, for permanently securing the former to the latter, substantially as set forth.



386,954. LIFTING-JACK. JAMES BROWN, New York, N. Y. Filed Oct. 25, 1887. Serial No. 253,317. (No model.)

Claim.—1. The combination, with a stand and a ratchet-toothed lifting-bar sliding therein, of a lever pivoted in the stand and a pawl pivoted to the lever in rear of the pivot on which the lever swings, and having a bearing on the lever-pivot when operated by the downward movement of said lever, and a stop-pawl pivoted in the stand independent of said lever and engaging said bar, substantially as herein described.

2. The combination, with the stand A and the toothed lifting-bar B, of the lever E, pivoted at e, the lifting-pawl C, slotted at c', to receive the lever-pivot through it and pivoted to the lever behind the lever-pivot, and the stop-pawl D, substantially as herein described.

386,955. HAT STRETCHING AND BLOCKING MACHINE. WILLIAM BERGHELS, Danbury, Conn. Filed Aug. 24, 1887. Serial No. 247,707. (No model.)

Claim.—1. A hat stretching and blocking machine, consisting, essentially, of a bed, a steam-box, a pivoted carrying-arm, a block for receiving a hat suspended from said arm, bands for clamping the hat upon the block, and radial slides by which the bands are carried and which act to compress them about the body of the hat.

2. The bed, the steam-box, standard 8, and carrying-arm 9, pivoted thereto, in combination with block 11, pivoted rod 10, by which it is suspended from the carrying-arm, rest 12 for limiting the downward movement of the carrying-arm, and semicircular bands 15, by which the hat-body is clamped upon the block.

3. The bed, the steam-box, the carrying-arm, and the block suspended therefrom, in combination with semicircular bands which clamp the hat upon the block when in the lowered position, radial slides by which said bands are carried and which are provided with pins 16 and ring 19, having diagonal slots to receive said pins whereby said slides are moved in or out when the ring is turned.

4. In a machine for blocking and stretching hats, the combination, with a block and semicircular bands for clamping a hat thereon, of radial slides by which said bands are carried, whereby the hat may be grasped or released as the slides are moved in or out.

5. The block, bands 15, and slides 13, by which said bands are carried and which are provided with pins 16, in combination with ring 19, having diagonal slots engaged by said pins, and a rack and pinion for turning said ring, whereby the slides are moved in or out to clamp or release the hat.

6. The bed having ways 14, slides 13, adapted to move in said ways, and bands 15, carried thereby, in combination with a carrying-arm and a hat-block suspended therefrom, substantially as and for the purpose set forth.

7. The bed having ways 14 and slots 17, slides 13, moving in said ways, and bands 15, carried by said slides, in combination with ring 19, having diagonal slots engaged by said pins, and a rack, 20, and a pinion engaging said rack, whereby the ring may be turned in either direction to move the slides in or out, as and for the purpose set forth.

8. The bed, steam-box, and slides having bands 15 and pins 16, in combination with ring 19, having diagonal slots engaged by said pins, a rack and pinion for imparting movement to said ring, and brackets 20, whereby said ring is held in operative position.

9. The bed having ways 26, a block and bands for clamping a hat thereon, in combination with slides 27, moving in said ways, and plates 28, carried by said slides for clamping the brim of the hat.

10. A block, bands for clamping a hat thereon, and slides 27, in combination with levers 30, carried by said slides, clamping-plates upon said levers, and means whereby said plates are caused to engage the hat-brim.

11. In a machine for stretching and blocking hats, a bed having ways 26, and radial slides 27, adapted to move in said ways, in combination with levers 30, pivoted to said slides, clamping-plates 32 at the inner ends of said levers, and a vertically-movable ring adapted to engage the outer ends of said levers, whereby the plates are clamped upon a hat-brim.

12. The bed, steam-box, and plates 32, secured to the bed, in combination with radial slides carrying pivoted levers, plates at the inner end of said levers, and a vertically-movable ring adapted to engage the outer ends of said levers, as and for the purpose set forth.

13. The block and bands 15, in combination with the bed, radial slides, and pivoted levers, carried by said slides and provided with clamping-plates.

14. In a machine for stretching and blocking hats, the combination, with the bed, of radial slides 27, having standards, levers pivoted in said standards and provided at their inner ends with clamping-plates and at their outer ends with rollers, and a vertically-movable ring adapted to engage said rollers to clamp said plates upon a hat-brim.

15. In a machine for stretching and blocking hats, a bed and radial slides adapted to move therein, said slides carrying pivoted levers having at their inner ends plates 32, carried by threaded rods, nuts for adjusting said plates vertically, and set-screws 36, whereby they may be tilted in either direction.

16. The combination, with the bed, block, and bands 15, of radial slides 27, carrying brim-clamps consisting of pivoted levers having at their inner ends adjustable plates 32.

17. The bed, block, and bands 15, in combination with radial slides 27, pivoted levers 30, carried thereby, plates at the inner ends of said levers, nuts for adjusting said plates, set-screws for tilting them in either direction, and a vertically-movable ring adapted to engage the outer ends of said levers, whereby said plates are clamped upon a hat-brim.

18. The combination, with a block to receive a hat, of a bed, radial slides 13, adapted to move therein and carrying bands which clamp the hat upon the block, and radial slides 27, moving in said block and carrying pivoted levers with plates adapted to clamp the brim.

19. The combination, with a block to receive a hat, of a bed, slides 13, carrying bands 15, to clamp the hat to the block, and having pins 16, ring 19, having diagonal slots engaged by said pins to operate said slides, slides 27, carrying levers with plates to clamp the brim, and a vertically-movable ring to operate said clamps.

20. The combination, with slides 27 and levers 30, pivoted thereto and carrying plates 32, of ring 37, rods carrying said ring, cross-pieces connecting said rods having plates with angle slots, and a shaft carrying cranks, and pins to engage said slots, whereby the ring is raised or lowered when said shaft is turned.

21. In a machine for stretching and blocking hats, radial slides 27, brim-clamps carried thereby, and pins on the under side of said slides, in combination with links 47, pivoted to said bands and to vertically-movable ring 50, whereby said slides are moved outward to stretch the brim.

22. The bed, radial slides 27, carrying levers 30, clamping-plates 32 upon said levers, in combination with vertically-movable ring 37, to operate said clamps, vertically-movable ring 50, and links 47, pivoted to the slides and to ring 50, whereby the slides are moved outward, as and for the purpose set forth.

23. The bed having ways 26 and slots 49, and slides 27, moving in said ways, and having pins 48 passing through said slots, in combination with vertically-movable ring 50, and links 47, pivoted to said ring and said pins.

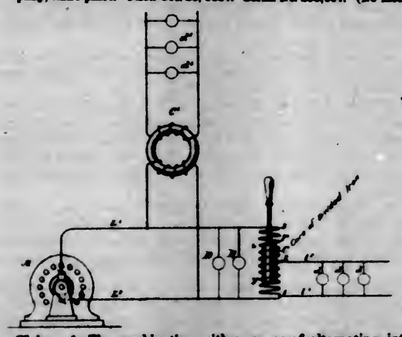
24. Slides 27, having pins 49, ring 50, and links pivoted to said

ring and said pins, in combination with rods 52, treadle 53, whereby said ring is moved upward, and springs 56, acting to hold said ring at its normal position.

25. The combination, with a block to receive a hat, bands 15, to clamp the hat thereon, and radial slides 13, carrying said bands, of radial slides 27, clamps for the brim carried thereby, and mechanism, substantially as described, for operating said clamps.

26. The combination, with a block to receive a hat, bands 15, to clamp the hat thereon, and radial slides 13, carrying said bands, of radial slides 27, clamps for the brim carried thereby, a vertically-movable ring for operating said clamps, and mechanism, substantially as described, whereby slides 27 are caused to move outward to stretch the brim.

27. The block, the bed having ways 14 and 28, radial slides 13 and 27, and body-clamps and brim-clamps carried by said slides, in combination with diagonally-slotted ring 19, vertically-movable rings 37 and 50, and operating mechanism, substantially as described, whereby a hat is clamped upon the block and the brim clamped and then stretched.



28. The block, steam-box, bed, and plates 22, in combination with slides 13, carrying bands 15, and slides 27, carrying levers 30, and clamping-plates 32.

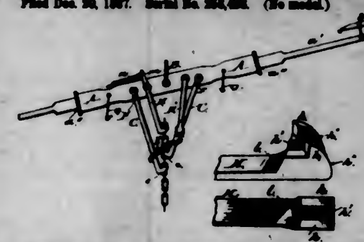
29. In a machine for stretching and blocking hats, a block to receive the hat, radial slides carrying bands to clamp a hat thereon, and having pins 16, in combination with ring 19, having radial slots engaged by said pins, a rack, 23, and a pinion engaging therewith, whereby the ring is turned to operate the slides.

30. In a machine for stretching and blocking hats, the combination, with a block to receive a hat, and slides 27, having standards 29, levers 30, pivoted in said standards, and plates 32, to clamp the brim, of vertically-movable ring 37, for operating said clamps, rods by which it is carried, cross-pieces having plates with angle-slots, and shaft 40, having cranks with pins engaging said slots, whereby the ring is moved up or down.

31. In a machine for stretching and blocking hats, the combination, with a block to receive a hat, slides 27, carrying levers with plates to clamp the brim, vertically-movable ring 50, links pivoted to said slides and to said ring, and a treadle and rods for operating said ring, whereby the slides are moved outward to stretch the brim.

386,956. REGULATOR FOR ELECTRIC CIRCUITS. REGINALD BELFIELD, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 20, 1887. Serial No. 253,097. (No model.)

Claim.—1. The combination, with a source of alternating, intermittent, or pulsatory electric currents, of a single coil of insulated wire included in circuit with said source, translating devices, a circuit including the latter in series with a portion only of said coil, and a single core at all times entirely within the inductive influence of said coil, but movable therein with reference to the last-named circuit, whereby the brilliancy of the lights may be regulated.



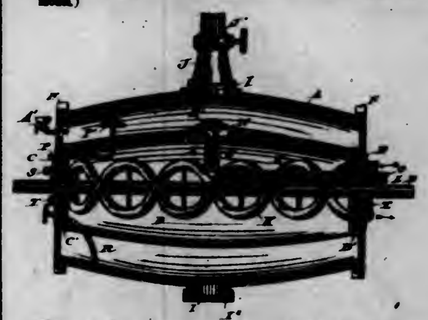
2. The combination of a source of alternating, intermittent, or pulsatory electric currents, a coil of insulated wire included in the circuit derived therefrom, a circuit including a portion of said coil, translating devices included in the last-named circuit, and a core movable with reference to said coil, whereby it may be placed within said portion of the coil or withdrawn therefrom to a greater or less extent into another portion of the same coil at will.

3. A regulator for electric circuits, consisting of a continuous coil of insulated wire and a core movable with reference thereto, whereby it may be caused to occupy different positions therein without being removed therefrom.

4. The combination of a source of electric currents, a coil of insulated wire included in its circuit, translating devices included in series with a portion of the coil and in multiple arc with another portion of the coil, and a core movable within said coil.

5. The combination of a source of electric currents, one more translating devices included in its circuit, a coil of wire one portion of which is in series with the translating devices and the other in direct shunt upon the translating devices, and a core movable in the coil.

386,957. STUMP-EXTRACTOR. HENRY C. HALL, Union City, Tenn. Filed Dec. 20, 1887. Serial No. 258,493. (No model.)



Claim.—1. The combination of a centrally-pivoted oscillating head or bar, oppositely-moving pawls H H', the latter having a downwardly-extending hook-shaped head or end at right angles to the head or end of the opposite pawl, a spring attached to said pawl H, and a chain or cable with which said pawls engage, substantially as described.

2. A stump-extractor comprising a centrally-pivoted head or bar, a pleral series of pawls connected therewith, so that one member of each series will move in a direction opposite to that of the remaining pawl of the same series, a chain or cable engaged by said pawls, springs for holding the pawls against said chain or cable, and hooks for holding the pawls of one series away from those of the other series, substantially as described.

3. The combination, with an oscillating head or bar, of oppositely-moving pawls having hook-shaped ends and curved faces, said pawls having also inclined projections upon which the curved faces ride, substantially as herein described.

386,958. VACUUM EVAPORATING APPARATUS. OTTO REINHARDT, Jersey City, N. J. Filed Sept. 30, 1887. Serial No. 251,128. (No model.)

Claim.—1. In an apparatus for the manufacture of sugar, a rotary vacuum-pan having relatively stationary heads closing its ends and upon which it rotates, substantially as set forth.

2. In an apparatus for the manufacture of sugar, a rotary vacuum-pan having a tapering shell of polygonal form in cross-section, in combination with a steam-coil held in a fixed position in the middle of said pan, substantially as shown and described.

3. In an apparatus for the manufacture of sugar, the combination, with fixed heads supported on a shaft or spindle, of a vacuum-pan adapted to rotate on said heads, a steam-coil supported in the middle of said pan by said spindle and one of the heads, and a fixed vacuum-pipe extending through one of said heads into said pan, substantially as shown and described.

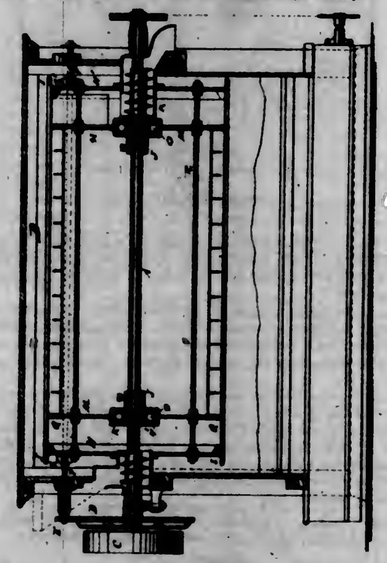
4. In an apparatus for the manufacture of sugar, the combination, with fixed heads supported on a shaft or spindle, of a vacuum-pan adapted to rotate on said heads, a steam-coil supported in the middle of the said pan by said spindle and one of the heads, a fixed vacuum-pipe extending through one of said heads into said pan, and a cone-shaped hood formed at the inner perforated end of said vacuum-pipe, substantially as shown and described.

5. In an apparatus for the manufacture of sugar, the combination with fixed heads supported on a shaft or spindle, of a vacuum-pan adapted to rotate on said heads, a steam-coil supported in the middle of the said pan by said spindle and one of the heads, a fixed vacuum-pipe extending through one of said heads in the said pan, a cone-

shaped head formed at the inner perforated end of said vacuum-pipe, and a steam-pipe passing through one of said heads and exhausting under said head in the perforated end of said vacuum-pipe, as set forth.

6. In an apparatus for the manufacture of sugar, a vacuum-pan provided with inlet and outlet openings in its shell, heads on which said pan rotates, a vacuum-pipe extending through one of said fixed heads into said pan, and a hood held on the inner perforated end of said vacuum-pipe directly in line with said openings in the shell of the pan, substantially as shown and described.

7. In an apparatus for the manufacture of sugar, the combination, with a rotating vacuum-pan, of fixed heads on which said pan rotates, and caps fitting over the inside joint of said heads and the ends of the pan, substantially as shown and described.



8. In the apparatus for the manufacture of sugar, the combination, with a vacuum-pan provided in its shell with inlet and outlet openings, of fixed heads on which said pan rotates, an inlet-pipe held in one of said heads for introducing the sugar solution, and an inlet-pipe provided with a valve and adapted to fit over one of the openings in the shell of the pan for introducing crystallized sugar, substantially as shown and described.

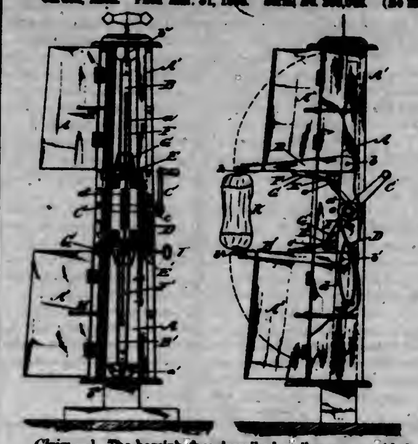
9. In an apparatus for the manufacture of sugar, a vacuum-pan formed of a longitudinally-divided shell and relatively-stationary heads closing the ends of the shell and forming bearings on which the pan rotates, substantially as set forth.

10. The combination, with a rotary vacuum-pan, of a vacuum-pipe extending into said pan and having perforations at its upper end, and a hood overhanging said perforations, substantially as set forth.

11. The combination, with a rotary vacuum-pan, of a vacuum-pipe entering the same and having perforations and an overhanging hood at its upper end, and a steam-pipe entering said pan and discharging under said hood, substantially as set forth.

386,959. FLOUR-BOLTING MACHINE. CARL BAUER, Cleveland, Ohio. Filed May 28, 1887. Serial No. 239,261. (No model.)

Claim.—1. In a four-bolting machine, the combination, with a revolving four-bolt, of cams for throwing the bolt forward suddenly in the direction of its rotation and springs for throwing the bolt in the direction opposite to that of its rotation, substantially as herein shown and described.



2. The combination, with a revolving bolt, of end frames mounted loosely upon hubs on a shaft, springs contained in the center parts of said end frames, which springs rest against the hubs and parts of the end frames, pins on the ends of the bolt, and rotating cams acting on said pins, substantially as herein shown and described.

3. In a four-bolting machine, the combination, with a shaft, of hubs on the same, end frames mounted loosely on the hubs and having enlargements, springs in said enlargements, which springs surround the hubs, said springs resting against projecting parts of the hubs and end frames, a bolt-frame formed on said end frames, and cams for throwing the bolt forward, substantially as herein shown and described.

4. In a four-bolting machine, the combination, with a shaft, of hubs on the same, lugs on the hubs, frames or plates mounted loosely on the hubs and provided at their openings with offsets, springs surrounding the hubs and resting against the lugs on the hubs and against the lugs in the offsets, a bolt-frame on said end frames, and cams for throwing the bolt forward, said bolt being mounted to rotate with the shaft carrying the hubs, substantially as herein shown and described.

5. In a four-bolting machine, the combination, with a shaft, of hubs mounted on the shaft and provided with offsets, end frames mounted loosely on the hubs and provided with offsets having lugs, springs surrounding the hubs within said offsets, the ends of the springs resting against the lugs of the offsets and the lugs of the hubs, pins on the end of the bolt, a cog-wheel on the above-mentioned shaft, a pinion engaging with said cog-wheel, a shaft on which the pinion is mounted, and cams on said shaft, which cams can act on the end pins of the bolt, substantially as herein shown and described.

386,960. MAIL-CRANE. HENRY BOYD and GASPARD CLEMENT, Garden, Mich. Filed Mar. 31, 1888. Serial No. 269,062. (No model.)

Claim.—1. The hereinbefore-described mail-crane, provided with two hinged arms and inclosed in a casing having doors arranged in the line of movement of said arms, and provided with means for closing them automatically when the arms are received within the casing, substantially as set forth.

2. The hereinbefore-described mail-crane, having two spring-actuated arms and inclosed within a casing provided with spring-actuated doors arranged in the line of movement of said arms, and adapted to be pushed open by the arms when they are swung outward and to close automatically when the arms are received within the casing, substantially as described.

3. A mail-crane having two hinged arms, springs for holding them normally in a vertical position, and mechanism for bringing them simultaneously to an approximately horizontal position against the tension of the springs, substantially as described.

4. The combination, with the post A, of the arms B B' hinged thereto, the springs G G', bearing against the arms, the shaft C, arranged between the hinged arms, and the cords F F', attached to the arms and to the shaft, substantially as described.

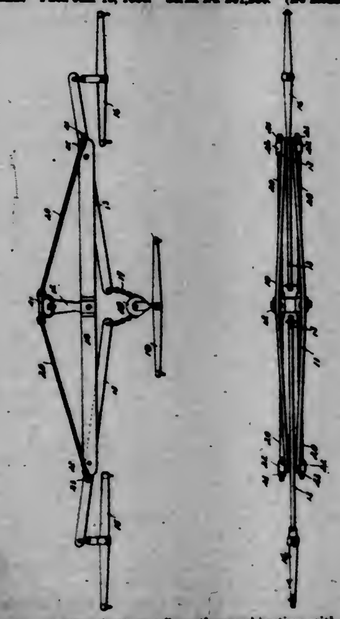
5. The combination, with the post A, of the arms B B' hinged thereto, the U-shaped springs G G', bearing against the arms, the shaft C, between the hinged arms and carrying the ratchet-wheel *e*, the spring-pawl D, engaging with the ratchet-wheel, the pulleys E E', and the cords F F', attached to the arms and to the shaft and running over the pulleys E E', and means for disengaging the pawl from the ratchet-wheel, substantially as described.

6. The combination, with the post A, having the recesses *a a'* and slot a^2, of the casing A', having the spring-actuated doors A^2 A^3, the arms B B', hinged in the recesses and provided with the pivoted fingers b^2 b^3, the shaft C, passing through post A and casing A' and across slot a^2, and provided with the ratchet-wheel *e*, the pawl D and its spring *d*, the crank C', outside the casing, the cords E E', attached to the arms B B' and to the shaft, the U-shaped springs G G' bearing against the arms B B' and the key I, substantially as described.

386,961. WINDOW-SHADE. GEORGE I. GARDNER, Memphis, Tenn. Filed Aug. 30, 1887. Serial No. 248,227. (No model.)

386,961.

Claim.—1. A window-shade formed in sections, of opaque material, suspended from one another and having their adjacent edges connected together by tapes or open-work material to form openings between them, and the uppermost section suspended by its upper edge from the top of the window, with a raising and lowering device for moving the entire shade at one operation, substantially as described.



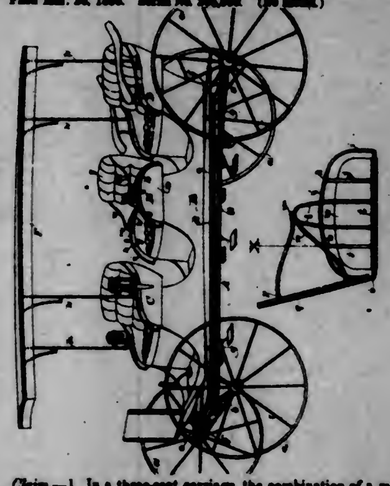
2. The combination, with a window-casing having slotted strips F, with adjustable hooks C, and the spring-roller b, of a window-shade consisting of sections E, having their adjacent edges connected by tapes f, and the upper edge of the lower section having a bar with projecting ends e adapted to engage hooks C, substantially as described.

3. A window-shade constructed in sections, of opaque material, having their adjacent edges connected together by tapes, and the upper section suspended from a spring-roller by means of tapes, substantially as described.

4. A window-shade constructed in sections connected together, substantially as described, by tapes or open-work material to form openings, and having a bar with projecting ends on the lower section or sections, in combination with open hooks or rests on the window-casing, whereby the lower section or sections are suspended independently of the upper section or sections, substantially as described.

5. A window-shade constructed in sections connected together by strips or tapes, the upper section mounted on a spring-roller and the lower section or sections having a bar with projecting ends, in combination with upwardly-opening hooks or rests on the window-casing, whereby the lower section or sections are suspended independently of the upper section or sections, substantially as described.

386,962. DRAFT-EQUALIZER. WILLIAM GAMER, Waverland, Kans. Filed Jan. 19, 1888. Serial No. 261,208. (No model.)

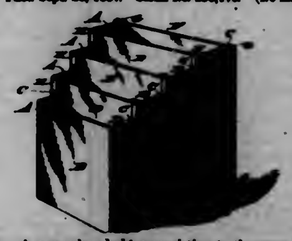


Claim.—1. In a draft-equalizer, the combination, with a support ing-frame, of doubletrees pivoted to the ends of the said frame at points about one-third of their length inward from the outer ends, singletrees connected to the outer ends of the doubletrees, a chain connected to the inner ends of the said doubletrees, and a central singletree provided with a sheave, around which passes the said chain, substantially as described.

2. In a draft-equalizer, the combination, with the spaced bars 10 and 11, of the doubletrees 13, pivoted between the ends of the said bars, the singletrees 16, connected to the outer ends of the doubletrees, the chain 17, connected to the inner ends of the said doubletrees, and the central singletree, 19, provided with the sheave 18, around which the chain 17 passes, substantially as herein shown and described.

3. In a draft-equalizer, the combination, with a frame consisting of upper and lower bars, as 10 and 11, and braces, as 20, of doubletrees 13, pivotally connected to said frame, singletrees connected to the outer ends of the doubletrees, a chain connected to the approaching ends of the doubletrees, a sheave, 18, about which the chain passes, and a singletree connected to the sheave, substantially as described.

386,963. CARRIAGE. JOSEPH T. GARDNER, Amesbury, Mass. Filed Mar. 26, 1888. Serial No. 268,668. (No model.)



Claim.—1. In a three-seat carriage, the combination of a middle seat having a bottom and ends fixed in place and a reversible back, and a front and rear seat fixed in place in all said parts, substantially as specified.

2. In a three-seat carriage, the combination, with a middle seat having a fixed bottom and ends and a reversible back, and a front and rear seat fixed in position in all said parts, of a canopy-top supported by pillars rising from the front and rear seats, substantially as specified.

3. The combination, with bottom *t*, ends *u*, and back *g*, of arm-rail *i*, having standards *j*, with offsets *k*, standard *l*, and forked arm *n*, pivoted to said standard, rigidly secured to said back and formed to rest upon said offsets, all said parts being so constructed and arranged that when said arm rests upon either of said offsets the back *g* will be thereby supported at the proper angle to bottom *t*, substantially as specified.

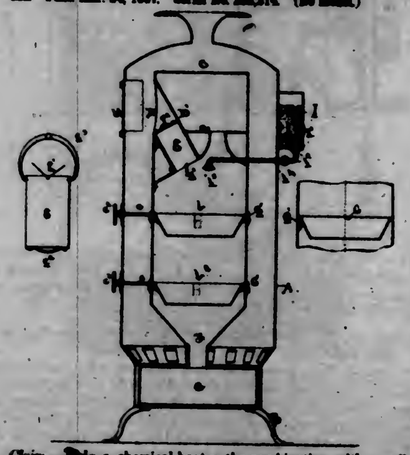
386,964. PAPER-BAG HOLDER. JAMES GORMAN, Custer City, Dak. Filed Sept. 20, 1887. Serial No. 250,173. (No model.)

Claim.—A paper-bag holder consisting in the open end sections, A, of increasing size, each formed of a single plate, having sides B B,

flanges C at the outer edges thereof, and grooves D D at the opposite sides of the back and within the plane of the outer surface thereof, the flanges of one section entering the grooves C at its sides, receiving the flanges of the rear or inner section, substantially as set forth.

386,965. TELEPHONE-TRANSMITTER. WILLIAM R. GILE, Detroit, Mich., assignor to himself, FRANK G. SMITH, and GEORGE W. HOUSE, trustees, same place. Filed May 10, 1886. Serial No. 201,643. (No model.)

Claim.—In a microphone-transmitter, the following elements: a base having a central orifice, a diaphragm (having a flange-ring secured to its periphery and an electrode centrally secured to its rear face) hinged at its lower edge to the base by means of a bracket, a bar (carrying an electrode) hinged at its upper end, and an insulated set-screw, the parts being constructed, combined, and arranged relatively to each other substantially as set forth.



386,966. SCREW-PROPELLER. ALFRED GUELLE, Pittsburgh, N. Y., assignor to himself and Seaford Works, same place. Filed Nov. 21, 1887. Serial No. 255,703. (Model.)

Claim.—1. As a new article of manufacture, a screw-propeller having an elongated tapering hub axially bored throughout its length to fit a screw-shaft, and a single continuous perpendicular helical flange integral with said hub, said flange gradually increasing in diameter from the smaller to the larger end of said hub, substantially as shown and described.

2. The combination, with the screw-shaft of a steam-vessel, of a screw-propeller having an elongated tapering hub fitted by its axial bore upon said shaft, and a single continuous perpendicular helical flange integral with said hub, which flange gradually increases in diameter from the smaller to the larger end of said hub, substantially as shown and described.

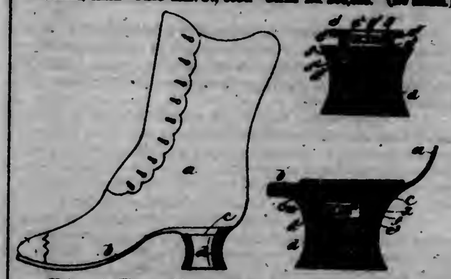
386,967. CHEMICAL STOVE. WILLIAM H. GETWAY, Baltimore, Md. Filed Mar. 24, 1887. Serial No. 232,214. (No model.)

Claim.—Into a chemical heater, the combination, with a cylinder, of one or more pans arranged within it, a chemical fuel-charger and a water-tank, arranged above the said pans to deliver their respective charges into the same, substantially as described.

2. In a chemical heater, the combination, with a cylinder, of a reversible pan pivoted within it, a fuel-charger and a water-tank arranged above the said pan and adapted to discharge their respective contents, as and for the purpose specified.

3. In a chemical heater, the combination of a cylinder and one or more reversible pans suitably mounted within said cylinder with a chemical fuel-charger and water-tank which is divided into sections, substantially as shown, both said fuel-charger and water-tank being suitably located to deliver their charges in said pan or pans.

4. In a chemical heater, the combination, with a cylinder in which the heat-generating chemical is retained while being shaked, of a water-tank having a discharge-pipe whose nozzle is within the cylinder, and having a partition which is perforated and arranged as shown, whereby it divides the tank into communicating compartments, one of which is supplied from the other and has the required capacity for a charge of water for shaking the chemical charge, as shown and described.

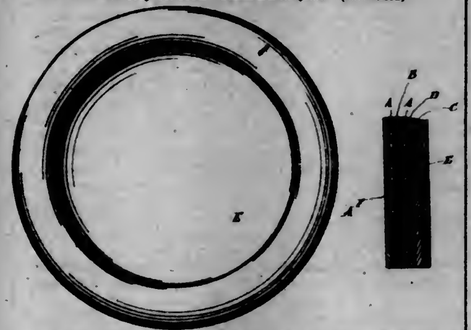


5. In a chemical heater, the fuel-charger open at one end and provided with a centrally-jointed lid, in combination with the stove-cylinder and pan for receiving the heat-generating chemical.

386,968. DEVICE FOR MOVING BEES. WILLIAM J. BARNES, Jeffersonville, Ky. Filed Oct. 28, 1887. Serial No. 253,422. (No model.)

Claim.—The standard A, provided with the series of holes *a a* at its lower end and provided with the loop B at its upper end, in combination with the sliding section C, box G, loop H, hinged extension or handle F, and supporting-pin *b*, substantially as and for the purpose set forth.

386,969. BEEL FOR BOOTS OR SHOES. SAMUEL B. BARNARD, Boston, Mass. Filed Mar. 27, 1888. Serial No. 268,693. (No model.)



Claim.—1. The combination of the heel and heel-seat with a projection provided with a threaded ring loosely connected with said projection and a pawl or dog that prevents rotation of the said ring in one direction, and a correspondingly-threaded fastening on the heel co-operating with said threaded ring, substantially as described.

2. The combination of the heel-seat stationary with relation to the shoe and provided with such member of a rotating screw-fastening.

with the movable heel having the other member of said fastening connected with it, the said heel having its bottom lift that is in contact with the heel-cast concave, and having a beveled strip, *d*, between its lifts, substantially as described.

886,970. PLAQUE OR PANEL. EDWARD DE PLANTE, Rahwan, N. J. Filed May 16, 1888. Serial No. 274,093. (No model.)

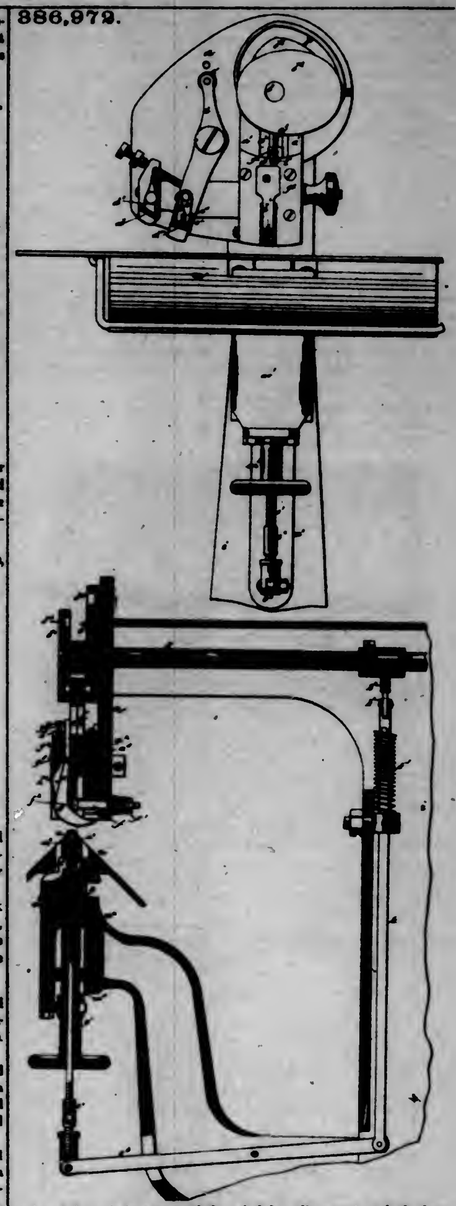
Claim.—A plaque or panel formed of two sheets of canvas or duck united by a mixture of glue, whiting, and pulverized wood, and a sheet of paper fastened to one of the sheets of canvas or duck, the sheet of paper being provided with a coating of whiting and glue, substantially as shown and described.

886,971. NATURAL-GAS BURNER. GEORGE K. DETWILER, Toledo, Ohio. Filed Dec. 16, 1887. Serial No. 258,091. (No model.)

Claim.—1. A burner for natural gas having a chamber provided with a peripheral slot, a diaphragm dividing said chamber and extending into the slot, and supply-pipes communicating with the burner on each side of the diaphragm, as and for the purpose set forth.

2. In a burner for natural gas, an upper and lower section, a disk having corrugations around the edge interposed between the sections, a gas-supply pipe communicating with the upper section, and a like pipe communicating with the lower section, as and for the purpose set forth.

886,972. BOOK-STAPLING MACHINE. EDWARD P. DONNELL and SAMUEL MCAMLIFFE, Chicago, Ill., assignors to the E. P. Donnell Manufacturing Company, same place. Filed Dec. 30, 1886. Serial No. 223,005. (No model.)



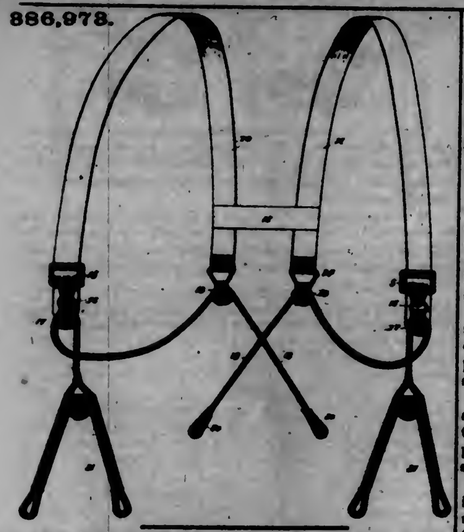
Claim.—1. In a book-stapling machine, a feeding-lever provided with a bearing or ledge to receive the wire, in combination with a slotted pawl-arm pivoted thereon, and provided with a roughened disk held in said slot to bear upon the wire ledge, substantially as and for the purpose set forth.

2. In a book-stapling machine, the combination, with the forked staple-former and the driver working in a groove in its face, of a spring-actuated toe or foot having an inclined upper edge lying normally between the legs of the former, a slide to which this toe is hinged, and a spring for supporting the slide and toe and lifting them after being depressed, substantially as and for the purpose set forth.

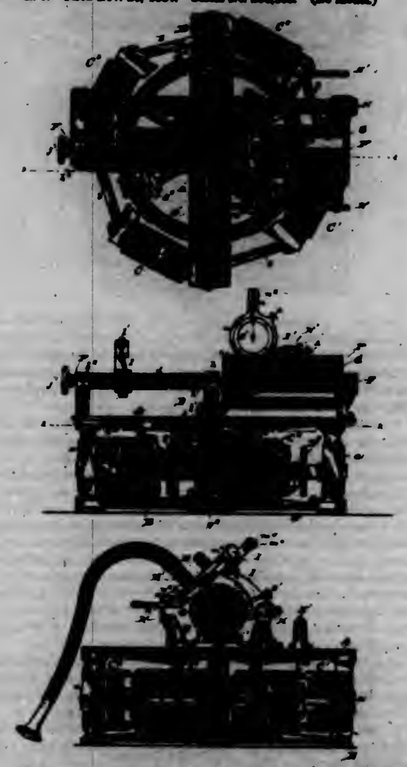
3. In a book-stapling machine, the combination, with the work-supporting table, adjustable to suit the work under operation, of a pair of clinching-dogs therein, an operating-rod for the same, shouldered to rest upon but free to slide through the table-frame, and made in two parts adjustable as to length, whereby the clinching devices are carried upon the adjustable table, yet are adjustable independently of the same, substantially as and for the purpose set forth.

4. The combination, with the main frame and its work-supporting table *m*, provided with a hollow screw, m^2, for adjusting it, and also with an anvil, m^4, of the dogs *n n*, pivoted in the anvil and formed with the notches *n'*, the slide n^2, connected to said dogs, the actuating-

886,972.



rod *o o' o²*, made in parts and threaded for adjustment, and the lever o^3, spring-actuated rod *k*, and cam L^2 on the main shaft, by which the dogs are actuated, all constructed and arranged for operation substantially as and for the purpose set forth.



886,973. SUSPENDERS. VICTOR DUMESNIL, New York, N. Y. Filed May 1, 1888. Serial No. 272,661. (No model.)

Claim.—The improved suspenders, consisting of the shoulder-straps 10 and 11, connected at the rear near the ends by the short transverse strap 12, and each provided with a pulley, 13 and 17, at the rear and front ends, respectively, and the cords 18 and 19, passing over the said pulleys, and each provided with a loop, 20, at the rear and with the forked suspender-end 21 at the forward end, the rear ends of the cords being crossed when in use, substantially as herein shown and described.

886,973.

886,974. PHONOGRAPH. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Nov. 24, 1887. Serial No. 256,193. (No model.)

Claim.—1. In a phonograph, the combination, with the revolving phonogram-carrying shaft and phonogram-cylinder adapted to carry a removable phonogram-blank, of an electric motor having a heavy fly-wheel, armatures carried by such fly-wheel, electro-magnets attracting such armatures, and a commutator, substantially as set forth.

2. In a phonograph, the combination, with the horizontal shaft carrying the phonogram, of a vertical shaft, an electro-magnetic motor mounted upon such vertical shaft, and a beveled friction-gearing transmitting the motion from the vertical shaft to the horizontal shaft, substantially as set forth.

3. In a phonograph, the combination, with the vertical shaft carrying the balance-wheel, electro-magnetic motor, and stepped in a jewel-bearing, of the horizontal phonogram-carrying shaft, and the beveled friction-gearing having one wheel of soft material, substantially as set forth.

4. In a phonograph, the combination of the electro-magnetic motor, consisting of a heavy fly-wheel carrying armatures on its periphery, magnets attracting such armatures, and a commutator with a centrifugal governor controlling the electric circuit of the motor and maintaining a uniform speed of such motor, and a phonogram-carrying shaft connected with the motor by friction-gearing, substantially as set forth.

5. The combination, with the vertical motor-shaft, of the horizontal phonogram-shaft carrying a beveled friction-wheel, and a beveled friction-pinion of soft material mounted on the motor-shaft and pressed against the wheel on the phonogram-shaft by a spring, substantially as set forth.

6. In a phonograph, the combination, with a phonogram-cylinder and advancing screw-thread, of a swinging frame carrying together the separate recorder and reproducer and adapted to bring either into position for operation by the swinging of the frame, substantially as set forth.

7. In a phonograph, the combination, with the revolving recording-surface, of a swinging spectacle-frame carrying the recorder and reproducer and adapted to be swung so as to bring either into operative relation with the surface, substantially as set forth.

8. In a phonograph, the combination, with a revolving recording-surface, of a swinging frame carrying the recorder and reproducer, and a stationary plate carrying the single speaking or listening tube, the swinging of the frame bringing either the recorder or reproducer into operative relation with the surface and with the speaking or listening tube, substantially as set forth.

9. In a phonograph, the combination, with a revolving phonogram-cylinder, an arm having a movement parallel with the axis of said cylinder, and the reproducer carried by a frame mounted on such arm and adjustable laterally thereon, whereby the reproducer can be readily adjusted to the record, substantially as set forth.

10. In a phonograph, the reproducer carried by a pivoted frame swinging across the lines of record, and an adjusting-screw for determining the lateral position of the reproducer, substantially as set forth.

11. In a phonograph, the combination, with the revolving phonogram-cylinder, of the holding-arm mounted to swing toward and away from the surface of said cylinder, and the reproducer mounted on such arm and laterally adjustable thereon, substantially as set forth.

12. In a phonograph, the combination, with the revolving phonogram-cylinder, of the holding-arm mounted to swing toward and away from the surface of such cylinder, the reproducer mounted on such arm and laterally adjustable thereon, an adjusting-screw for determining the position of the holding-arm relative to the phonogram-cylinder, and an adjusting-screw for determining the lateral position of the reproducer, substantially as set forth.

13. In a phonograph, the combination, with the revolving phonogram-cylinder, of the advancing holding-arm carrying the recorder or reproducer, and a stationary guide-rest for supporting the holding-arm in proper relation with the phonogram-cylinder, substantially as set forth.

14. In a phonograph, the combination, with the revolving phonogram-cylinder, of the advancing holding-arm carrying the recorder or reproducer, a stationary guide-rest for supporting the holding-arm in proper relation with the phonogram-cylinder, and an adjusting-screw for adjusting the height of the holding-arm above the guide-rest, substantially as set forth.

15. In a phonograph, the combination, with the phonogram-cylinder and the lead-screw, an arm carrying the recorder or reproducer, a guide-arm connected with the carrying-arm, a yielding guide-block engaging with the lead-screw, a guide-rest, and an adjusting-screw for adjusting the height of the carrying-arm upon the guide-rest, substantially as set forth.

16. In a phonograph, the combination with the swinging arm and the recorder or reproducer carried thereby, of the springy back-rest upon which such carrying-arm is thrown, substantially as set forth.

17. In a phonograph, the combination, with the revolving phonogram-cylinder, of the advancing recorder or reproducer, and the scale for determining the position of the recording or reproducing point upon the phonogram or blank, substantially as set forth.

18. In a phonograph, the combination, with the revolving phono-

gram-cylinder, and recorder and reproducer mounted upon an advancing holding-arm and adjustable toward and away from the phonogram-cylinder, of a cutting-tool movable with such holding-arm and independently adjustable toward and away from the phonogram-cylinder, whereby the recorder and reproducer can be adjusted out of operative engagement with the phonogram-blank, and the cutting-tool can be adjusted forward into engagement with such blank, substantially as set forth.

19. In a phonograph, the combination, with the revolving phonogram-cylinder and the lead-screw, of the arm carrying the recorder or reproducer, a cutting-tool on such arm for reducing the surface of the phonogram or blank, and a guide-arm engaging the lead-screw and advancing the carrying-arm, substantially as set forth.

20. In a phonograph, the combination, with the revolving phonogram-cylinder, of the swinging arm carrying the recorder or reproducer, a cutting-tool also carried by said arm, a guide-rest, a screw for adjusting the position of the recorder or reproducer and said cutting-tool with relation to the phonogram or blank surface, and a yielding guide-block engaging with the lead-screw and advancing said carrying-arm, substantially as set forth.

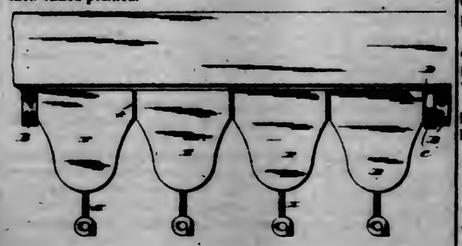
21. In a phonograph, the combination, with the cylinder-shaft having a fine screw-thread, the phonogram-cylinder mounted on such shaft, a stationary guide-rod, a sleeve mounted on such guide-rod and capable of sliding and turning movements thereon, a guide-arm secured to said sleeve and having a screw-threaded guide-block engaging the screw-thread, and the holding-arm for the recorder or reproducer, also secured to said sleeve, substantially as set forth.

22. In a phonograph, the combination, with the cylinder-shaft having a fine screw-thread, the phonogram-cylinder mounted on such shaft, a stationary guide-rod, a sleeve mounted on such guide-rod and capable of sliding and turning movements thereon, a guide-arm secured to said sleeve and having a screw-threaded guide-block engaging the screw-thread, the holding-arm for the recorder or reproducer, also secured to said sleeve, and a guide-rest for determining the rotary position of the guide-sleeve, substantially as set forth.

23. In a phonograph, the combination, with the cylinder-shaft having a fine screw-thread, the phonogram-cylinder mounted on such shaft, a guide-rod and sleeve, a guide-arm secured to said sleeve and having a screw-threaded yielding guide-block engaging the screw-thread, the holding-arm for the recorder or reproducer, also secured to said sleeve, and a guide-rest for determining the rotary position of the guide-sleeve, substantially as set forth.

24. In a phonograph, the phonogram-cylinder tapering throughout its length, substantially as set forth.

25. In a phonograph, the combination, with the cylinder-shaft mounted in bearings and projecting at one end beyond such bearings, of a smooth-surface phonogram-cylinder tapering throughout its length and carried by the shaft outside of its bearings, substantially as set forth.



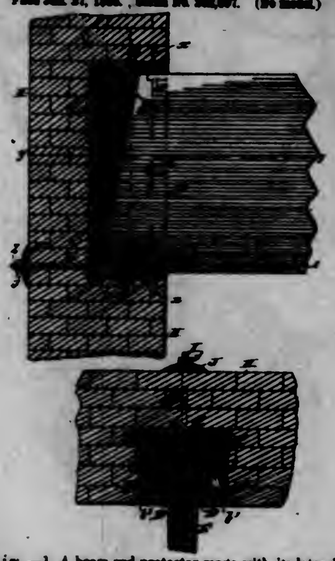
26. In a phonograph, the combination, with a tapering phonogram-cylinder, of two or more phonogram-blanks of different lengths having tapering bores adapted to fit said phonogram-cylinder and provided with cylindrical recording-surfaces, substantially as set forth.

27. In a phonograph, the combination, with a tapering phonogram-cylinder, of a phonogram having a tapering bore and a cylindrical outer surface held upon said cylinder by friction, substantially as set forth.

28. In a phonograph, the combination, with a holding-frame, of the recording and reproducing devices constructed each as a complete self-contained body removably attached to said holding-frame, substantially as set forth.

386,975. YARN-GUIDING DEVICE FOR SPINNING-MACHINES. JOHN F. PULLEN, Central Falls, R. I. Filed Dec. 7, 1887. Serial No. 257,269. (No model.)

Brief.—The object of the invention is to provide guide-plates which may be independently adjusted with rapidity and ease, and to mount the same on a rocking shaft in such way as to be simultaneously raised or lowered, and to provide a means for retaining them in their raised position.



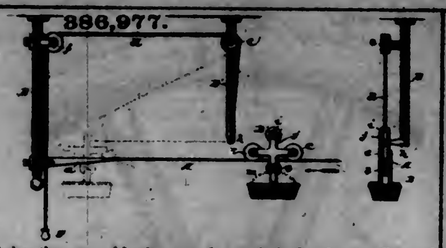
Claim.—1. A guide-plate provided with the clamp H, having the groove F, the shoulder E, the clamping-jaw S, provided with the extension U, adapted to impinge upon a shaft fitted in the groove F, and the screw T, passing through a perforation in the shoulder E, substantially as described.

2. The combination of the shaft A, the handle C, provided with the cam D and the bearing E, with the clamps H, engaging rigidly the said shaft, and the guide-plates E, pivotally connected to the said clamp and provided with the guide-rod I, extending out from the same, substantially as described.

386,976. BEAM-END PROTECTOR. HENRY A. GOSS, New Albany, Ind. Filed Jan. 27, 1888. Serial No. 262,697. (No model.)

Claim.—1. A beam-end protector made with its lateral side or sides dovetailed exteriorly in horizontal plane, whereby it is adapted to interlock with a wall into which it may be built, to prevent pulling of it from the wall, said protector also having an upwardly-extending lug at its bottom adapted to interlock with a notched beam end, substantially as herein set forth.

2. A beam-end protector made with a dovetailed exterior adapted to interlock with a wall into which it may be built, to prevent pulling of the protector from the wall, an upwardly-extending lug at its bottom adapted to interlock with a notched beam end, and interior plates, as D D, adapted to receive the beam end between them and provide an air-space at the end of the beam, substantially as herein set forth.



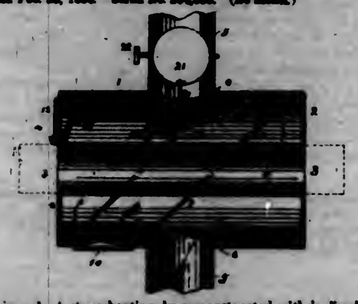
3. Beam-end protectors made with a lateral side or sides dovetailed exteriorly in horizontal plane, whereby they are adapted to interlock with opposite walls into which they are built, to prevent pulling of them from the walls, said said protectors also having upwardly-extending lugs at their bottoms, in combination with a beam set into two opposite protectors, and having notched ends interlocking with the bottom lugs of the protectors, substantially as described, for the purposes set forth.

4. A beam-end protector made with side walls, B, having double dovetailed form horizontally, or with reversely-inclined faces *b' b'*, to prevent pulling of the protector from the wall or pushing it into the wall into which it is built, substantially as herein set forth.

5. The combination, with a beam-end protector, of a bolt, I, fitted into the lower part of the protector and into a wall, substantially as herein set forth.

386,977. SHORE-SERVICE APPARATUS. JOHN H. GOODFELLOW, Troy, N. Y., assignor to the Lamson Store Service Company, Boston, Mass. Filed Feb. 8, 1888. Serial No. 263,578. (No model.)

Claim.—1. The combination, in a store-service apparatus, of a way, a carrier moving upon said way, provided with wheels above and



below the way and having a supplemental wheel, and a propeller-cord fixed at one end at a point adjacent to the way and arranged in the path of the supplemental wheel, substantially as set forth.

2. The combination, with the way, carrier traveling thereon, with wheels above and below the way and provided with a supplemental wheel, and retainer at the end of the way, of a propeller-cord supported by a fixed support at one end to extend across the path of said wheel and extending downward to the salesman's station, substantially as set forth.

3. The combination of the way, carrier traveling thereon, provided with a supplemental wheel, propeller-cord, and a lateral support, to which one end of said cord is attached, arranged adjacent to the way and to the path of the supplemental wheel, substantially as set forth.

4. The combination, with the way, of a carrier provided with a supplemental wheel, *i*, at one side of a support, a propeller-cord passing over a guide-roller, *c*, at a distance from the station, and supported at the end in position to contact with the said wheel *i*, substantially as set forth.

386,978. HEATING-DRUM. EDWARD C. GRAY, Jordan, Minn. Filed Feb. 20, 1888. Serial No. 264,933. (No model.)

Claim.—1. A stove heating-drum counterpoised with inclined partitions alternately extending across the drum from the bottom nearly to the top and from the top nearly to the bottom, and located between the bottom and top openings of the drum, and a discharge-opening with a door located in the lower portion of the drum between the said partitions, substantially as described.

2. A stove heating-drum constructed with inclined partitions extending alternately from the bottom and top of the drum nearly to its opposite side and located between the bottom and top openings thereof, and having a ventilating opening and valve connected by mechanism, substantially as described, with a damper located on the drum, the said mechanism operating to close the valve on closing the damper, substantially as described.

3. A stove heating-drum constructed with inclined partitions extending alternately from the bottom and top of the drum nearly to its opposite side, and located between the bottom and top openings thereof, and having a ventilating-opening, substantially as described.

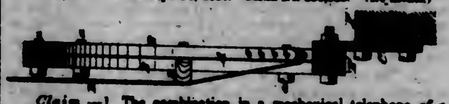
4. A stove heating-drum, 1, constructed with open horizontal pipes, 4, thimbles 5 5 in its top and bottom, inclined partitions 7 8, opening 9, with slide 10, and opening 11, provided with the valve 15, connecting-rod 16, bell-crank lever 17, connecting-rod 20, and damper 21, all constructed and arranged substantially as described.

386,979. CEMENT-PIPE MOLD. LEE G. HAAKE, Oak Park, Ill. Filed Aug. 10, 1887. Serial No. 247,024. (No model.)

Claim.—1. In a mold for making cement pipe, the combination of a collapsible hollow core and a removable collapsible cover on the upper end of the core, substantially as and for the purpose set forth.

2. In a mold for making cement pipe, the combination of a collapsible core and a collapsible cover, G, having two semicircular disks, *g* and *g'*, hinged in opposite directions toward corresponding ends and hinged together, and a wedge, G', substantially as described.

3. In a mold for making cement pipe, a collapsible core and a collapsible cover, G, having two semicircular disks, *g* and *g'*, hinged in opposite directions toward corresponding ends and hinged together, and a wedge, G', hinged to the edge of one of the semicircular disks, substantially as described.

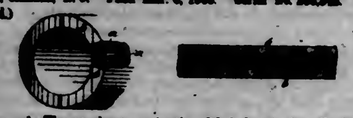


4. In a mold for making cement pipe, the combination of a collapsible cover, G, comprising two semicircular disks, *g* and *g'*, hinged in opposite directions toward corresponding ends and hinged together, a wedge, G', rounded on its under side and hinged to one of the semicircular disks, a guide-strap, *c*, and a tongue, *c'*, substantially as described.

5. In a mold for making cement pipe, a collapsible core, A, comprising a hollow cylinder or approximate cylinder split longitudinally, and having a thickened edge, *r*, and a thickened beveled edge, *r'*, a door, D, hinged to the edge *r* and beveled at its opposite edge, a yoke, E, pivoted at opposite ends, respectively, to the door and edge *r'*, and a suitable locking device, *o o'*, substantially as described.

6. In a mold for making cement pipe, a collapsible core, A, comprising a hollow cylinder or approximate cylinder split longitudinally, and having a thickened edge, *r*, and a thickened beveled egde, *r'*, a door, D, hinged to the edge *r* and beveled at its opposite edge, a yoke, E, pivoted at opposite ends, respectively, to the door and edge *r'*, a suitable locking device, *o o'*, a brace, *p*, and a cam-block, *p'*, substantially as described.

7. In a mold for making cement pipe, the combination of a collapsible jacket in the form, substantially, of a hollow cylinder split longitudinally, and provided with means for holding the separate edges together and for releasing them to collapse the jacket, and a collapsible core, A, within the jacket, and comprising a hollow cylinder or approximate cylinder split longitudinally, and having a thickened edge, *r*, and a thickened beveled edge, *r'*, a door, D, hinged to the edge *r* and beveled at its opposite edge, a yoke, E, pivoted at opposite ends, respectively, to the door and edge *r'*, a suitable locking device, *o o'*, a brace, *p*, and a cam-block, *p'*, substantially as described.

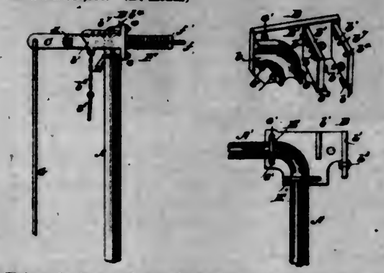


386,980. MECHANICAL TELEPHONE. A. WILFRED HALL, New York, N. Y. Filed Sept. 26, 1887. Serial No. 250,553. (No model.)

Claim.—1. The combination, in a mechanical telephone, of a diaphragm, a wire or string placed in front of and across the diaphragm, and a bearing or support for the said wire or string upon the diaphragm at or near the center of the latter, substantially as and for the purpose herein set forth.

2. The combination, with the diaphragm and the wire or string attached thereto at a point distant from the center thereof and the support for the wire or string at or near the center of the diaphragm, of means, substantially as herein described, of adjusting or varying the said point of attachment, for the purpose herein set forth.

386,981. NON-HEAT-CONDUCTING FABRIC. HIRAM M. HASTINGS, Canton, N. Y. Filed Mar. 6, 1888. Serial No. 266,542. (No model.)



Claim.—1. The non-heat-conducting fabric herein described, consisting of tale-gram and a plastic mineral substance in which the spires

of the said grass are embedded and enveloped, and which fills the interstices between them and unites them, substantially as herein set forth.

2. The non-heat-conducting fabric herein described, consisting of a woven fabric of tale-grass and a plastic mineral substance in which said woven fabric is embedded and enveloped, substantially as herein set forth.

886,982. SPRING ATTACHMENT FOR AGRICULTURAL IMPLEMENTS. CHARLES B. HERTMAN, Vincennes, Ind. Filed Sept. 1, 1887. Serial No. 248,530. (No model.)

Claim.—1. An attachment for implements of the class specified, comprising the bracket B, having cheek-plates *b'*, a forked lifting-lever, C, supporting the shovels and pivoted at one end to the cheek-plates, link D, pivoted between the forked arms of said lifting-lever, and a spring-rod connected with the forward end of said link, to operate substantially as and for the purpose specified.

2. The combination, with an implement of the class specified, of the bracket B, having cheek-plates *b'* projecting therefrom, and having a step cheek or cheeks at the rear or outer end, a forked lifting-lever, C, supporting the shovels and pivoted at one end to the legs upon the cheek-plate, link D, pivoted between the forked arms of the said lifting-lever, and a spring-rod connected with said link, substantially as described, for the purpose described.

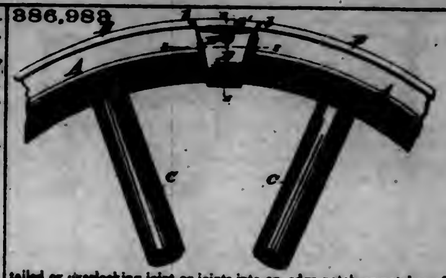
3. An implement of the class specified, comprising a bracket, B, having projecting cheek-plates, one of which is provided with an adjustable step-cheek, the lifting-lever C, pivoted thereto, a link, D, and an notching-spring, substantially as and for the purpose described.

4. The combination, with the implement of the class specified, of a bracket secured to the frame, having projecting cheek-plates, a forked lifting-lever pivoted to the said cheek-plates, a link, D, pivoted at one end to said lifting-lever intermediately of the length of such lever and connected with the notching-spring, the said connections being held substantially in line with each other when the shovels are at work, substantially as described, and for the purpose specified.

5. The combination, with the implement of the class specified, of a bracket, B, secured to the frame, having projecting cheek-plates *b'* and a cheek step or stops, *b²*, at the end thereof, a lifting-lever, C, link D, spring-actuated rod *f*, and shovel-gang suspension-rod G, combined to operate substantially as described, for the purpose specified.

6. The combination, with the implement of the class specified, of a bracket, B, secured to the frame, having projecting cheek-plates *b'* and cheek-holes *b³* at the ends of said plates, lifting-lever C, link D, spring-actuated rod *f*, shovel-gang suspension-rod G, and a cotter secured to the bracket and adapted to support the said lifting mechanism in their raised position, substantially as described.

7. The combination, with the implement of the class specified, of a bracket, B, secured to the frame, having projecting cheek-plates *b'* and cheek-holes *b³*, lifting-lever C, link D, spring-actuated rod *f*, shovel-gang suspension-rod G, and a cotter adapted to the cheek-holes *b³* to limit the movement of the plow-gang, substantially as described.

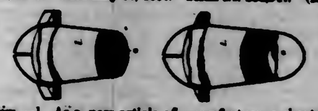


8. The combination, with the implement of the class specified, of a bracket, B, secured to the frame and having a check step or stops, *b²*, cheek-holes *b³*, cheek-holes *b³*, a cotter to fit said check-holes, a lever, C, link D, spring-actuated rod *f*, and gang-suspension rod G, substantially as and for the purposes described.

9. In an attachment substantially as described, a bracket having a main or front plate adapted for connection with the machine-frame, and the cheek-plates extended from the main plate and provided with bearings for the pivots of the lever and link and with a check step or stops, substantially as and for the purposes specified.

886,988. FELLY-CLIP. JAMES HUGHES and JOHN SULLIVAN, Grand Rapids, Mich. Filed Mar. 17, 1888. Serial No. 267,982. (No model.)

Claim.—1. A felly and tire clip fixed to the felly and entering an edge notch or notches of the wheel-tire, substantially as herein set forth.



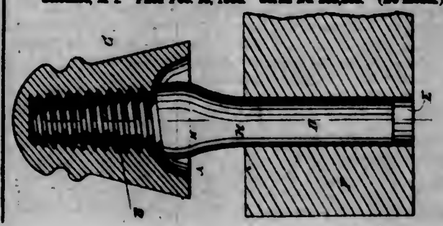
2. A felly and tire clip fixed to the felly and fitting by a dovetailed or overlocking joint or joints into an edge notch or notches of the wheel-tire, substantially as herein set forth.

3. A felly and tire clip consisting of a plate fitted around the inner edge and opposite faces of the felly and fixed thereto and entering opposite edge notches of the wheel-tire, substantially as herein set forth.

4. A felly and tire clip consisting of a plate fitted around the inner edge and opposite faces of the felly and fixed thereto, and having opposite dovetailed extremities which enter recesses in opposite edges of the wheel-tire and overlock the tire at said recesses, substantially as herein set forth.

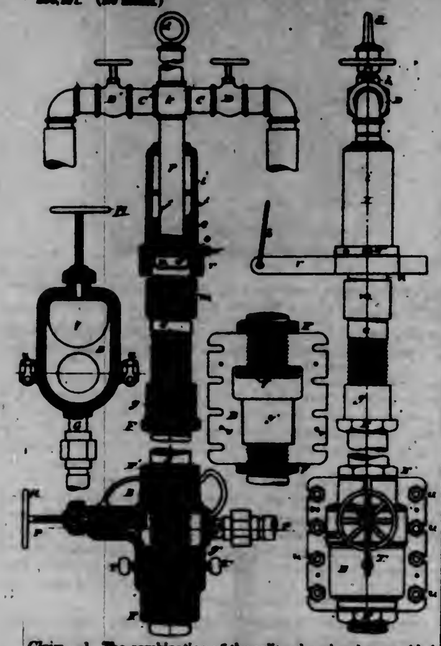
886,984. TIP FOR GAS-BURNERS. WALTER M. JAMESON, New York, N. Y. Filed May 17, 1887. Serial No. 238,547. (No model.)

Claim.—1. As a new article of manufacture, a sheet-metal gas-burner tip, consisting, essentially, of a tapering body or shank, a head secured in the larger end of the shank, and a cup-shaped screen, the side edges of which are shaped to conform to the inner surface of the shank, substantially as set forth.



2. As a new article of manufacture, a sheet-metal gas-burner tip, consisting, essentially, of a tapering shank having its lower or smaller end perforated, a head secured to the larger end of said shank, and a cup-shaped screen located within the tip, the sides of said screen conforming in shape to the inner surface of the tip, substantially as set forth.

886,985. APPARATUS FOR DYEING. GUSTAV JAMESSON, Rydboholm, Sweden. Filed Oct. 20, 1887. Serial No. 252,570. (No model.) Patented in Germany Jan. 6, 1887, No. 42,688; in Sweden Feb. 4, 1887, No. 916, and in Italy Apr. 16, 1887, No. 21,331

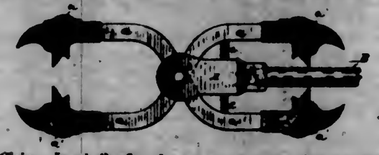


Claim.—In an apparatus for dyeing loose cotton or like material, the combination, with a vat, of a suction-pipe for drawing the liquid from the vat, a pump connected with said suction-pipe, a discharge-pipe connected with the pump and terminating in the vat, and a receptacle for receiving the concentrated dye-solution, located above the level of the dye-liquor in the vat and connected outside of the vat with the suction or discharge pipe, so that said solution is intimately mixed with the dye-liquor, substantially as herein shown and described.

886,986. ELECTRIC INSULATOR-PIN. WILLIAM B. JOSLIN, South Setauket, N. Y. Filed Feb. 13, 1888. Serial No. 263,833. (No model.)

Claim.—As an improved article of manufacture, a wooden insulator-pin, A, formed with a threaded head, B, the neck E, which is tapered downward, and the shank D, forming a smooth non-shouldered continuation of said neck, adapting it to be driven into a socket of cross-arm F, substantially as described, and for the purposes specified.

886,987. APPARATUS FOR THE FORMATION OF DEEP WELLS. CHARLES B. KNOX, New Orleans, La. Filed Sept. 16, 1887. Serial No. 250,161. (No model.)



Claim.—1. The combination of the split-valve chamber provided with the induction-passage and having the internal screw-threads at its opposite ends to engage the adjacent threaded ends of the two pipes, its valve, and the clamping-bolts to secure in parts about the pipe ends with its threads fitting the threads on the pipe ends, substantially as and for the purpose set forth.

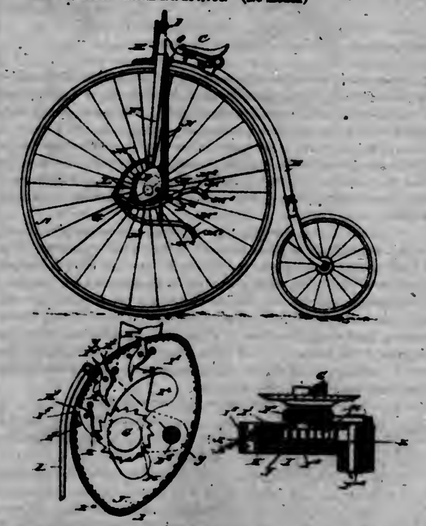
2. The combination of the split-valve chamber provided with the induction-passage and having the internal screw-threads at the opposite ends, the valve sliding grooves of the valve-chamber, the clamping-bolts, the threaded coupling within the valve-chamber, and the pipe-sections having threads for engaging the threads of the coupling and those at the ends of the valve-chamber, substantially as and for the purpose set forth.

3. The combination of the swivel apparatus provided with the pipe *p*, the induction-passage (or passages) connecting therewith, the threaded nipple or pipe *c*, having connection with the lower end of the pipe *p*, the coupling connected with the lower end of the nipple or pipe *c*, the pipe-section connected with the coupling, the split-valve chamber provided with the induction-passage and having the internal end threads for engaging the nipple or pipe *c* and pipe-section threads, the slide-valve, the induction-passage G, the means for clamping the sections of the valve-chamber together, and a set screw or screws engaging the valve-chamber with the coupling, substantially as and for the purpose set forth.

886,988. BOILER-TUBE CLEANER. GREGORY B. KENDALL, Buffalo, N. Y. Filed Apr. 30, 1887. Serial No. 236,033. (No model.)

Claim.—In a boiler-flue cleaner, arms *a a*, crossed at or near their center and pivoted there in or to a holder, A, the ends of said arms being provided with scraping-edges, and a suitable spring, *c*, working in connection with said arms, all substantially as and for the purpose specified.

886,989. NUT-LOCK. WILEY S. KNUE, Verona, Miss. Filed June 30, 1887. Serial No. 243,054. (No model.)



Claim.—1. A bolt having its threaded portion formed with a flat side or sides, the threads on such portion being continuous or intact at their bases, whereby a bearing face or faces will be provided for the locking-key without materially affecting or diminishing the strength of the threads, substantially as and for the purposes specified.

2. As an improved article of manufacture, the bolt herein described, having the head 1, the angular portion 2 next to said head, the unthreaded polygonal portion, and the threaded polygonal portion, the threads of the latter portion being intact and continuous at their bases, whereby a bearing is provided for the nut-locking key without diminishing the strength of the threads, substantially as and for the purposes specified.

3. A bolt consisting of a bar or body having one or more flat sides and provided with a spiral circumferential groove forming threads on the said flattened sides, such groove being unbroken from end to end, forming a continuous unbroken thread, substantially as and for the purposes specified.

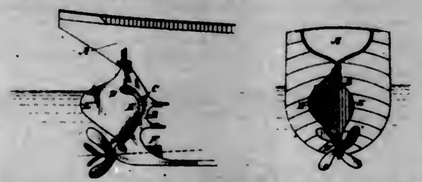
4. The combination of a bolt having its threaded portion formed with a flat side or sides, the threads on such portion being continuous or intact at their bases, whereby a bearing face or faces will be provided for the locking-key without materially affecting or diminishing the strength of the threads, the nut turned on the said bolt and having a groove or keyway, *b*, and the key driven in said keyway and bearing on one of the flat sides of the bolt, substantially as and for the purposes specified.

886,990. VELOCIPEDE. GERRIT KNOX, Amsterdam, N. Y. Filed Dec. 12, 1887. Serial No. 257,731. (No model.)

Claim.—1. In a velocipede, the combination, with a drive-axle and its bearing, of a ratchet-wheel on the axle, a rocking cone pivoted to the frame eccentrically to the axle, a pawl carried thereby and arranged to engage the ratchet-wheel, a pedal-lever, and connections for operating the rocking cone thereby, substantially as described.

2. In a velocipede, the combination, with a drive-axle and its bearing, of a ratchet-wheel on the axle, a rocking cone pivoted to the frame eccentrically to the axle, a pivotal plate on the axle of and adapted to play within the cone, and tailed pawls pivoted to said plate, the cone having shoulders arranged to bear upon the tails of the pawls

and throw the same into engagement with the ratchet-wheel on the axle, substantially as described.



3. In a velocipede, the combination, with a drive-axle and its bearing, of a ratchet-wheel on the axle, a rocking case pivoted eccentrically to the axle, a series of pivotal pawls carried by the case and arranged in a segmental row having the pivot of the case as the center, a pedal-lever, and connections for operating the rocking case thereby, substantially as described.

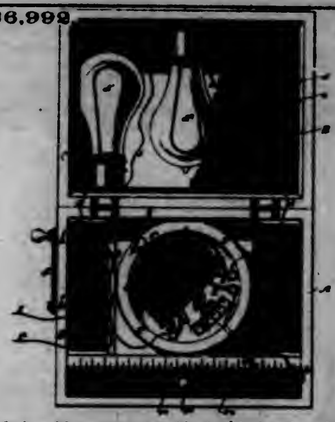
4. The pedal-lever having a vertical curve or incline at its rear end and laterally-projecting pedals at both the head and the foot of said curve or incline at different distances from the pivotal point of the lever, as and for the purpose specified.

5. The combination, with the frame, the axle, the ratchets thereon, the transverse walking-beam O, the treadle-levers pivoted to the frame, and rods N N, pivoted to the ends of the said beam and to the treadle-levers, of the pins F^3, secured to the opposite sides of the frame in rear of the axle, the case I, mounted to rock on the said pins and having side slots, I^3, to receive the axle and peripheral slots I^2, the plates mounted on the pins F^3, to rock within the case I, and provided with segmental series of spring-pawls, having tails projecting into the slots I^2, and the links L, connecting the rocking cases with the treadle-levers, substantially as set forth.

6. In a velocipede, the combination, with the steering-head N, having a transverse groove, O', extending across the vertical face of its back, and two apertures extending through it at opposite sides of a central vertical line, of the clamp Q, having a groove on its inner face to register with groove O', and two integral bolts projecting from one edge and extending through the said apertures and provided with nuts, the opposite edge of the clamp resting against the back or face of said head, and the handle-bar held in place by said clamp, substantially as set forth.

386,991. PROPULSION AND STEERING OF STEAM-VESSELS. CARLOS B. LAMBERT, San Francisco, Cal. Filed Dec. 8, 1887. Serial No. 257,266. (No model.)

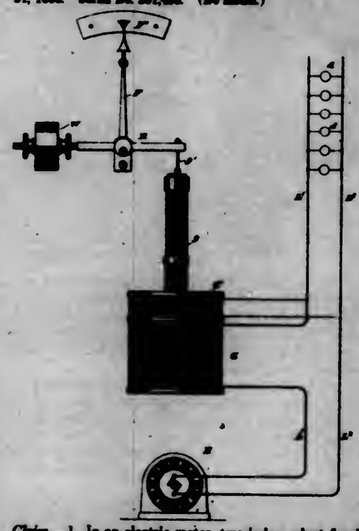
Claim.—1. A conoidally-shaped propeller secured to a shaft which passes through the stern-post below the rudder-pintles, in combination with a triangular-shaped rudder with curved outline, having the broadest portion near the top and tapering toward the point at the lower pintle, and a stern-post made concave in front of the pintle attachments of the rudder to admit the forward curved edge of the latter turning within the concavity, while the rear portion of the rudder and the propeller project entirely behind the stern-post, substantially as herein described.



2. A vessel having the rear edge of the stern-post made concave, with pintle attachments above and below the concave portion, a rudder hung to said attachments and having its forward portion curved approximately to fit the concavity of the stern-post, and its rear portion increasing in horizontal diameter from the lower pintle upward toward the water-line, in combination with a propeller having blades extending backwardly from the hub and approximately following the rear edge of the rudder, and a shaft to which the hub of the propeller is fixed, extending from the stern-post below the lower pintle of the rudder, substantially as herein described.

386,992. GALVANOMETER. PHILIP LAMB, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct 29, 1887. Serial No. 253,722. (No model.)

Claim.—A portable electric meter consisting of the combination of a divided circuit, one branch containing carbon resistances and the other a metallic resistance, an indicating-needle operated by the current traversing the two branches, a containing-box having a lid in which the carbon-resistances are placed while the metallic resistance is in the other portion of the box, an adjustable resistance in series with said metallic resistance placed in the front of the box, consisting of a



386,992

coil of wire with a contact movable along its length, and a guard-protection for the carbon resistances, substantially as described.

386,993. GALVANOMETER. PHILIP LAMB, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Jan. 21, 1888. Serial No. 261,602. (No model.)

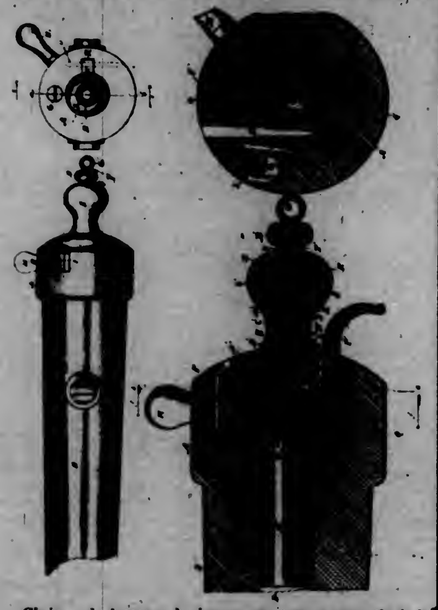
Claim.—1. In an electric motor, two independent fixed energizing-coils, one adapted to be connected in series with the work-circuit and the other in shunt therefrom, and a core movable with reference to both coils, substantially as described.

2. The combination, in an electric motor, of a movable core, a solenoid for actuating the same, designed to be connected in series with the work-circuit, and a second solenoid applied to said core and designed to be connected in shunt upon the work-circuit, said second solenoid having a fixed position with reference to the series-coil.

3. In an electric motor, the combination, with a coil connected in series with the work-circuit and a core acted upon thereby and movable into and out of the coil, of a second solenoid connected in shunt upon the work-circuit and fixed upon the end of the first-named solenoid at which the core enters.

4. In an electric motor, two independent fixed solenoids acting in the same magnetic sense upon a core common to both and movable with reference thereto, one of which solenoids is traversed by a current dependent upon the consumption in the work-circuit, and the other by a current approximately constant under all conditions.

386,994. GAS-HEATER. ARMIN LANDAU, Chicago, Ill. Filed Feb. 13, 1888. Serial No. 263,894. (No model.)



Claim.—1. In a gas-meter constructed as shown, the combination, with the cups *d* of the expansible chamber, of the inner cups, *e*, provided with a cover, *e'*, having an opening in the center provided with a neck, e^2, and flange e^3, as and for the purpose specified.

2. In a gas-meter of the construction shown, the cup *d* of the expansible chamber provided with a stud, d^7, in combination with the rods L and d^9, said rods being hinged to opposite ends of said stud, so as to be flexible through intervening pieces coincident with said stud, and weighted lever d^8, as and for the purpose specified.

3. In a gas-meter constructed as shown and described, the cups *d* of the expansible chamber provided with a rod, F, rigidly attached at *f* and extended in opposite direction from said point, in combination with an arm, *f'*, and the cover d^4 and its flange provided with openings in which said rod can move to guide the movement of the cups, as specified.

4. In a gas-meter constructed as shown and described, the cups *d* of the expansible chamber balanced by a weight-pressed rod connected in the center and guided by a single rod rigidly attached to the top plate and sliding in openings above and below its point of attachment to the cup, in combination with links L, bell-crank shown K, provided with arms *k k'*, links L', and cams *l* of the shafts I, as and for the purpose specified.

386,995. BREECH-LOADING ORDNANCE. JOSEPH P. LAVERTY, New Haven, Conn. Filed Jan. 30, 1888. Serial No. 262,260. (No model.)

Claim.—1. A cannon having an open transverse mortise in its breech and a breech-block fulcrumed therein on a pivot situated in the vertical line through the axis of the bore and thereby virtually balanced, substantially as set forth.

2. A cannon having an open transverse mortise in its breech, a breech-block located therein, and a pivot for such block located directly above the bore of the gun, whereby lateral throw of the block is prevented on discharging the gun, substantially as set forth.

3. A cannon having a transverse mortise in its breech, and an elongated breech-block located in such mortise and pivoted about midway between the ends of its longer axis and directly above the bore of the gun, whereby lateral throw of the block is prevented on discharging the gun, substantially as set forth.

4. A cannon having an open transverse mortise in its breech, and an elliptical breech-block located in such mortise and fulcrumed about midway between the ends of its longer axis, whereby lateral throw of the block is prevented on discharging the gun, substantially as set forth.

5. A cannon having an open transverse mortise in its breech, and an elliptical breech-block located in such mortise having its inner and outer edges respectively conformed to the curved wall of the mortise and the exterior curve of the breech, and fulcrumed about midway between its ends above the bore of the gun, whereby the block is balanced against lateral throw on discharging the gun, substantially as set forth.

6. A cannon having an open transverse mortise in its breech, and a breech-block pivoted about midway between its ends and provided in its outer edge and near one of its ends with an open curved slot arranged to be registered with the bore of the gun when the block is lifted, whereby lateral throw of the block is prevented on discharging the gun, substantially as set forth.

7. A cannon having a transverse mortise in its breech, a breech-block pivoted in such mortise, and a knob made independent of the block and carrying hammer mechanism for actuating the firing mechanism which is carried by the block, substantially as set forth.

8. A cannon having a transverse mortise formed in its breech, a breech-block pivoted in such mortise, and a knob pivoted to the breech at one side of the bore of the gun and carrying hammer mechanism actuating the firing mechanism carried by the said block, substantially as set forth.

9. A cannon having a transverse mortise in its breech, a breech-block located in such mortise, and a knob made movable independent of the block, by which it is locked in its normal or firing position, in which it closes the bore which extends through the breech, substantially as set forth.

10. A cannon having a transverse mortise in its breech, a breech-block located in such mortise and having a slot in its rear face, and a knob closing the rear end of the bore and having an arm pivoted in a slot in the breech, normally engaging with the rear face of the breech-block to lock the knob, which is movable only when the slot in the block is registered with its arm, substantially as set forth.

11. A cannon having a transverse mortise in its breech, a breech-block pivoted in such mortise and carrying a firing-pin, and an independent knob carrying a hammer and pull-pin located behind the block in position for the engagement of the hammer with the firing-pin when such block and knob are in closed position, substantially as set forth.

12. A cannon having a transverse mortise in its breech, a breech-block located in such mortise, carrying a firing-pin and having its rear face depressed around such pin, and an independent knob carrying a hammer and a pull-pin, the hammer being adapted to enter the depression in the block in striking the pin, substantially as set forth.

13. In the firing mechanism of a cannon, the combination, with a firing-knob, of a longitudinally-movable firing-hammer, a pull-pin located in such hammer, longitudinally movable therein and normally coupled therewith, and a trip carried by the knob for disengaging the hammer and pull-pin, substantially as set forth.

14. A cannon having a chambered firing-knob, a chambered firing-hammer located therein and provided with a longitudinal slot bridged at its forward end by a lug, a pull-pin located within the hammer and provided with an elastic finger having a lug and a beveled face, a trip carried by the knob and engaging such beveled face for disengaging the lug of the finger from that of the hammer, and a spring for throwing the hammer forward and taking its recoil.

15. A cannon having a chambered firing-knob, a longitudinally-movable chambered firing-hammer located therein and shouldered at its forward end, a pull-pin located in the said hammer, a washer interposed between the forward end of the spring, which is on one side of it, and the forward end wall of the knob-chamber and the shoulder of the hammer, which are on the other side of it, and an independent spring-recovered firing-pin, substantially as set forth.

386,996. PHOTOGRAPHIC CAMERA. WILLIAM H. LEWIS, Brooklyn, assignor to H. & H. T. Anthony & Company, New York, N. Y. Filed Jan. 6, 1888. Serial No. 259,980. (No model.)

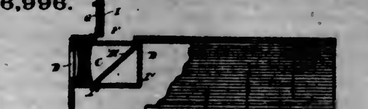
Claim.—1. The combination, with a photographic camera, of a

386,996.

finder consisting of a concave lens and a reflecting-surface placed behind the lens and at an angle thereto, and apertures in the camera in front of the lens and above the reflecting-surface, the latter provided with a cover having a mirror on its under side, substantially as set forth.

2. The combination, with a photographic camera, of a finder consisting of a concave lens, a diaphragm covering a portion of the lens having a square aperture therein, and a reflecting-surface placed behind the lens and at an angle thereto, and apertures in the camera in front of the lens and above the reflecting-surface, substantially as set forth.

3. The combination, with a photographic camera, of a finder consisting of a concave lens, diaphragms applied over a portion of the lens, a reflecting-surface placed behind the lens and at an angle thereto, and apertures in the camera, one in front of the lens and another above the reflecting-surface, the latter being provided with a cover having a mirror on its under side, substantially as set forth.



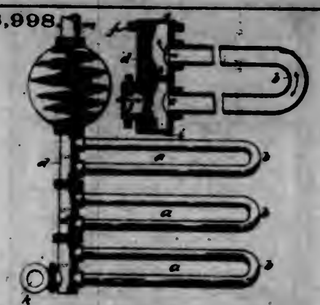
4. The combination, in a finder for photographic cameras, of a concave lens, a mirror placed behind the lens and at an angle thereto, and hair-lines or their equivalent to determine the center of the picture, substantially as set forth.

5. The combination, in a finder for photographic cameras, of a lens, a diaphragm covering portions of the lens, hair-lines or their equivalent which intersect at or near the center of the lens, a mirror placed behind the lens and at an angle thereto, an aperture in the camera in front of the lens and another over the mirror, and a cover for said last-named aperture provided with a mirror on its under side, substantially as and for the purpose set forth.

6. A finder for photographic cameras, comprising a finder-box complete in itself when separate from the camera, made substantially as described and shown, and having an opening at one end and another at the top provided with a cover, a concave lens, a reflecting-surface behind the lens set at an angle thereto, and another reflecting-surface arranged on the under side of the cover, substantially as set forth.

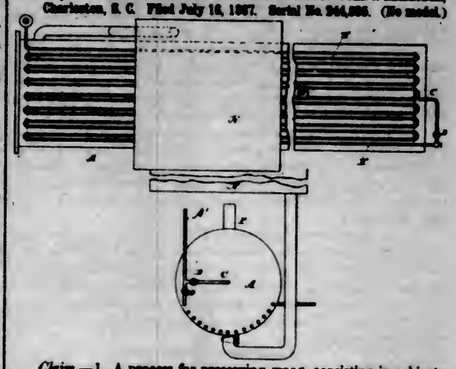
7. A finder for photographic cameras, comprising a finder-box complete in itself when separate from the camera, made substantially as shown and described, and having an opening at one end provided with a lens and another at the top, and two reflecting-surfaces, the first arranged to receive the image from the lens and the other to receive it from the first by reflection, substantially as set forth.

386,997. DRAIN FOR STALLS. MARTIN LOGAN, New York, N. Y. Filed May 22, 1888. Serial No. 274,691. (No model.)



Claim.—1. A drain for stalls, consisting of a metal body having the projections *b'* on its under face, essentially U-shaped gutters and dovetail grooves produced alternately in its upper face, and lugs *b*, formed at the outer ends of said dovetail grooves, and slats of a softer material held in said dovetail grooves, substantially as shown and described.

2. In a drain for stalls, the combination, with a metal body having projections upon the under face and longitudinal essentially U-shaped gutters and dovetail grooves alternately produced in its upper face, of slats of a softer material detachably held in said dovetail grooves, substantially as and for the purpose specified.



3. In a drain for stalls, the combination, with a metal body having projections on its under face, longitudinal essentially U-shaped gutters and dovetail grooves alternately produced in its upper face, and a flange at one extremity of said gutters, of slats of a softer material detachably held in said dovetail grooves, substantially as and for the purpose specified.

386,998. BOILER. WILLIAM B. MACK, Boston, Mass. Filed Aug. 20, 1887. Serial No. 247,492. (No model.)

Claim.—The combination, with a pair of return-tubes, of a connecting-section, *d*, to which said tubes are attached, said connecting-section being provided with a partition, *e*, at a central point, and on one end with a rib, *g*, and on the other end with a groove or depressed seat, *h*, as set forth.

386,999. PROCESS OF PRESERVING WOOD. JOHN C. MALLORY, Charleston, S. C. Filed July 16, 1887. Serial No. 244,186. (No model.)

Claim.—1. A process for preserving wood, consisting in subjecting the wood to the action of steam to open the cells of the wood, then drying the wood, and then filling a chamber containing the wood with the preservative liquid and expanding the latter by heat and forcing it into the cells of the wood, substantially as set forth.

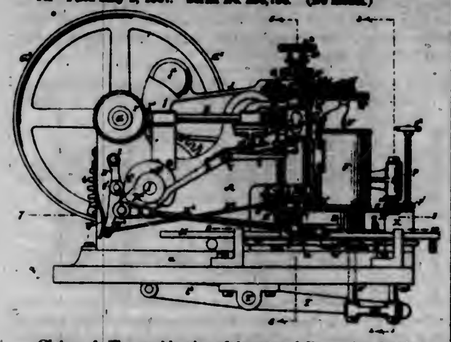
2. In a process for preserving wood, consisting in first subjecting the wood to the direct action of steam to open and expand the cells, then drying the wood by the radiant heat of high-pressure steam, and then filling the chamber containing the wood with a liquid preservative and applying heat to the latter and expanding its mass and forcing a portion thereof into the cells of the wood, substantially as set forth.

387,000. REMOVABLE CALK FOR HORSESHOES. THOMAS R. MASON, Trenton, N. J. Filed Feb. 25, 1888. Serial No. 265,260. (No model.)

Claim.—1. A detachable calk for horseshoes, composed of a clamp to be attached to the shoe, consisting of rocking portions formed with suitable clips and connected together, and a removable calk having a wedge-shaped portion engaging corresponding recesses in the edges of the rocker portions, and a screw-threaded end engaging a nut located within the rocker portions, substantially as described.

2. A detachable calk for horseshoes, composed of a clamp consisting of rocker portions connected by straps and bolts, and formed with a hooked clip and a straight clip, and having beveled semicircular recesses in their edges, and an internal recess containing a nut, in combination with a removable calk having a tapered shoulder engaging the beveled semicircular recesses, and a screw-threaded end engaging the nut within the rocker portions, substantially as described.

3. The combination, with the toe-clamp, consisting of rocker portion 2, having straight clip 7, and rocker portions 1, having clips 6, of calks 8, having a tapering shoulder, 9, engaging the semicircular recesses 5 in the portions 2 and 1 1, and a screw-threaded end, 10, engaging a nut, 11, located in the recess 12 in the rocker portions 2 1 1, substantially as described.



387,001. GRAIN-MEASURING SPOUT. JOHN B. HOFFMASTER, Battle Creek, Mich. Filed Apr. 2, 1888. Serial No. 269,358. (No model.)

Claim.—1. The spout A and its inner frame, B, having a curved open bottom, and a curved cut-off or valve controlling said opening, in combination with a lever for operating the cut-off, a cam carried by said cut-off, a second valve adjustably secured to the spout, and a pivoted adjustable rod between said valve and cut-off, whereby the cut-off and lower valve operate in unison, substantially as described.

2. The spout A, the inner frame, B, having an open bottom, the curved valve having side arms provided with short shafts, a pinion on one of said shafts and a cam on the other, a lever having a toothed segment for operating the pinion and valve, a pivoted rod, *g*, actuated by the cam, a second rod, *f*, adjustably attached to the rod *g*, and a valve adjustably attached to the spout, and having a crank-shaft attached to said rod *f*, whereby said valve is operated during the movement of the curved valve, substantially as described.

387,002. PILL-MACHINE. JOSEPH A. HOFFMAN, Philadelphia, Pa. Filed May 2, 1887. Serial No. 236,703. (No model.)

Claim.—1. The combination of the rotated die-carrier, the ejector, a platform therefor, and a pin for depressing the ejector, said pin and platform being geared together, so as to be adjusted simultaneously, but the pin having a vertical movement independent of the platform, substantially as described.

2. The combination of the rotated die-carrier, the ejector, a platform therefor carried by a rod, a depressing-pin, also carried by a rod, gearing for connecting said rods, and mechanism for reciprocating the rod of the depressing-pin, substantially as and for the purpose set forth.

3. The combination of the threaded rod *x*², carrying the ejector-platform and, provided with a toothed nut, X', the threaded rod *s*, carrying the depressing-pin and geared to the rod *x*², an operating-lever having a threaded block adapted to the rod *s*, and an operating-shaft having a pinion for operating the nuts of the two rods, so as to simultaneously adjust the platform and depressing-pin, all substantially as specified.

4. The combination of the frame of the machine, a rod, *s*, adapted to slide in said frame, a lever, T, connected to said rod and to operating mechanism, whereby the raising and lowering of the rod is effected, a head, S, on said rod, and a depressing-pin carried thereby, all substantially as and for the purpose specified.

5. The combination of the die-carrier with a rod guided in the frame of the machine, and having a head, S, with two arms, one carrying a depressing-pin and the other having a steady-pin, all substantially as specified.

6. The combination of the die-carrier of a pill-machine, provided with a series of dies, and a rotating brush having its cleaning-surface at right angles to the axis of rotation, whereby the end of the brush acts upon the face of the die, substantially as specified.

7. The combination of the hopper and a shaft carrying a retarding-flange and agitators near the bottom of the hopper, as and for the purpose specified.

8. The combination of the hopper, having an outlet at or near the bottom and an internal flange above the same, with a vertical shaft provided with agitators below said flange, all substantially as specified.

9. The combination of the rotated die-holder carrying ejectors, a lever having a lifter-arm, a guided block acted on by said arm, and an adjusting device for raising and lowering the block, all substantially as specified.

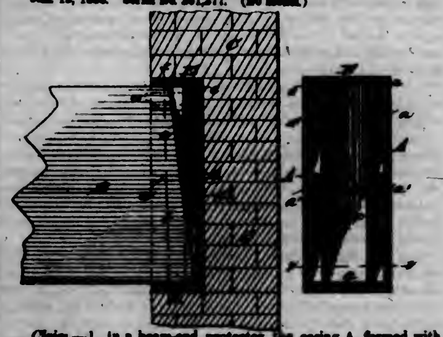
10. The combination of the upper die of a pill-machine with a revolving die-cleaner having its cleaning-surface at right angles to its axis of rotation, and carried by an arm movable into and out of the path of the die, and means for positively rotating said die-cleaner, substantially as and for the purpose specified.

11. The combination of the upper die of a pill-machine with a revolving die-cleaner having its cleaning-surface at right angles to its axis of rotation, and movable into and out of the path of the die, and free to move vertically, so as to press the cleaner against the face of the die, all substantially as specified.

12. The combination of the upper die of a pill-machine with an arm carried by a spindle having its bearings in the frame of the machine, a shaft, Q, carrying a driving-pulley, a cleaner-receptacle free to turn in the arm, and a belt, whereby the die-cleaner is rotated from the pulley on the shaft Q, all substantially as specified.

13. The combination of the upper die of the machine, and an arm carried by a spindle and provided at its outer end with a die-cleaner, with a lever and cam for raising the die-cleaner and pressing it against the face of the upper die while the latter is in the raised position, all substantially as specified.

14. The combination of the upper die of the machine, and an arm carried by a spindle and having at its end a die-cleaner, with a lever, cam, and connecting devices, whereby said arm is swung so as to carry the cleaner into and out of the path of the die, all substantially as specified.



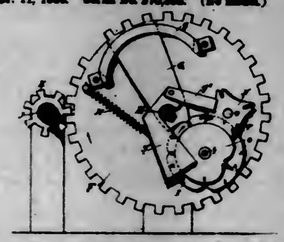
15. The combination of the upper die of the machine, the arm carried by a spindle and provided at its outer end with a die-cleaner, a lever for lifting the spindle, and means for adjusting the latter, so as to govern the pressure of the cleaner against the die, all substantially as specified.

387,003. PLOW. REUBEN HOFFMASTER, Hickory, N. C. Filed May 5, 1888. Serial No. 272,942. (No model.)

Claim.—The combination of the plow having the rearward-extending landside-plate D, provided with the longitudinal recess E and the transverse openings N, the share or point arranged on the bottom of the plow and having the longitudinal depending flange G and the openings H, the bolts engaging said openings and securing the share to the mold-board, the plate or block L, having the flange arranged in the recess E, said plate or block engaging the rear end of the flange G, and the bolt extending through the flange of said block and one of the openings N, for the purpose set forth, substantially as described.

387,004. BEAM-END PROTECTOR. MARSH. W. HITCHELL, New Albany, Ind., assignor of one-half to Henry A. Gentz, same place. Filed Jan. 19, 1888. Serial No. 261,277. (No model.)

Claim.—1. In a beam-end protector, the casing A, formed with interior side guides, *a a*, and provided with a floor-recess, *d*, forming a continuous air-space at the sides and bottom of the beam end, substantially as herein set forth.



2. In a beam-end protector, the casing A, formed with interior

side guides, *a a*, which do not reach the back wall of the casing, and provide a continuous air-space at the sides and end of the beam, substantially as herein set forth.

3. In a beam-end protector, the casing A, formed with interior side guides, *a a*, which do not reach the back wall of the casing, and said casing formed, also, with a floor-recess, *d*, thereby providing an air-space entirely around the end of the beam, substantially as herein set forth.

387,005. CALENDAR-CLOCK. PETER F. HERBR, Phœnix, Ariz.

Filed Apr. 11, 1888. Serial No. 270,202. (No model.)

Claim.—1. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth movable and arranged to align beside one or more of the fixed teeth, whereby the number of acting teeth in the wheel may be varied, substantially as herein described.

2. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth movable and arranged to align beside one or more of the fixed teeth, whereby the number of acting teeth in the wheel may be varied, said wheel having a monthly period of revolution, in combination with a shaft on which the wheel is mounted and a hand carried by the shaft and moving over a dial to indicate the day of the month, substantially as herein described.

3. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by a pivoted slide or arm occupying a radial plane on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, substantially as herein described.

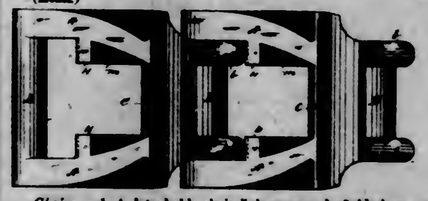
4. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by a pivoted slide or arm on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with a cam-disk acting on said slide or arm to regulate its movement to present the required number of acting teeth for each month, substantially as herein described.

5. In a calendar clock, a thirty-one-tooth wheel having a portion of its teeth carried by a pivoted slide or arm on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with a cam-disk acting on said slide or arm to regulate its movement to present the required number of acting teeth for each month, and a spring secured to the slide or arm for moving it, substantially as herein described.

6. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by a pivoted slide or arm on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with the rotary cam-disk carried by the wheel and having its rim composed of a series of cam-surfaces successively acting against the butt of the slide or arm to regulate its movement to present the required number of acting teeth for each month, substantially as herein described.

7. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by a pivoted slide or arm on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with a rotary cam-disk carried by the wheel, and having its rim composed of a series of cam-surfaces successively acting against the butt of the slide or arm to regulate its movement to present the required number of acting teeth for each month, and a spring secured to the wheel and to the slide or arm, whereby said slide or arm is moved to position, substantially as herein described.

8. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by a pivoted slide or arm on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with the cam-disk I, carried by the wheel, and having its rim composed of a series of cam-surfaces successively acting against the slide or arm to regulate and control its movement, as described, and the mechanism for imparting to said cam-disk its rotary motion, consisting of the shaft on which it is mounted, the notched wheel on said shaft, and the fixed teeth engaging said wheel, substantially as herein described.



9. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by spring-actuated pivoted slide or arm on the side of the wheel, whereby one or more of its teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with the rotary cam-disk carried by the wheel, and having its rim composed of a series of cam-surfaces for regulating and controlling the movement of the slide or arm, as described, the toothed flange on said cam-disk, the notched wheel engaging said flange and having a pin, and the lug on the slide or arm for coming in contact with the pin, whereby for February in leap-year the movement of the slide or arm is limited, substantially as herein described.

10. In a calendar-clock, a thirty-one-tooth wheel having a portion of its teeth carried by a spring-actuated pivoted slide or arm on the side of the wheel, whereby one or more of its teeth can be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, and the guide-bracket on the wheel in which the slide or arm works and by which its movement at each end is limited, in combination with the cam-disk acting on the butt of the slide or arm, as described, the shaft, notched wheel, and fixed teeth, whereby the cam-disk is rotated, the toothed flange on said disk, the notched wheel engaging said flange and having a pin, and the contact-lug on the slide or arm, all arranged and adapted to operate as described.

11. In a calendar-clock, the thirty-one-tooth wheel having the movable slide or arm with three teeth, whereby one or more of said teeth may be aligned beside one or more of the fixed teeth to vary the number of acting teeth in the wheel, in combination with the seven-tooth pinion of the week-day-indicating mechanism engaging said wheel, substantially as herein described.

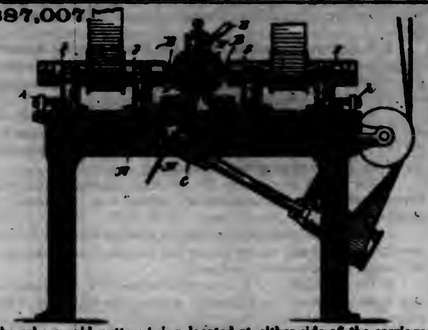
387,006. DRIVE-CHAIN. BENJAMIN F. CREVE, Philadelphia, Pa.

Filed Apr. 16, 1887. Renewed June 30, 1888. Serial No. 278,703. (Model.)

Claim.—1. A detachable chain-link composed of side bars, end bars, and coupling-hook, all of substantially uniform size, the coupling-hook being centrally located upon one of the end bars and the side bars being provided with retaining-lugs located at a distance from the junction of the side bars and end bars equal to the thickness of the ribs on the coupling-hook.

2. A detachable chain-link composed of side bars, end bars, and coupling-hook, all of substantially uniform size, the coupling-hook being centrally located upon one of the end bars and having the outer periphery of its ribs formed on the circumference of a circle, the side bars being provided with retaining-lugs whose faces are correspondingly rounded.

3. A detachable chain-link composed of side bars, end bars, and coupling-hook, all of substantially uniform size, the coupling-hook being centrally located upon one of the end bars, the side bars being provided with retaining-lugs located at some distance from the junction of the side bars and end bars, and whose working-faces are perpendicular to said bars.

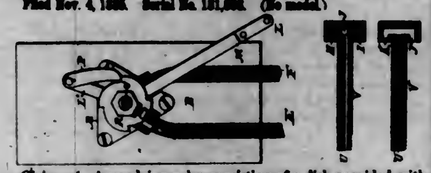


4. A detachable chain-link composed of side bars, end bars, and coupling-hook, all of substantially uniform size, the side bars being provided with retaining-lugs adapted to engage the outer periphery of the coupling-hook of a corresponding link, and internal strengthening-webs for said retaining-lugs, as and for the purpose described.

387,007. STEREOTYPE-PLATE-FINISHING MACHINE. CHARLES S. PALMERSON, Chicago, Ill., assignor to the A. N. Kellogg Newspaper Company, same place. Filed May 10, 1888. Serial No. 273,694. (No model.)

Claim.—1. The combination, in a stereotype-plate-finishing machine, of the carriage for carrying the plate, with disk-cutters having cup-shaped centers and peripheral teeth standing at right angles to

387,007



the arbors, said cutters being located at either side of the carriage-path and mounted upon independent arbors, substantially as specified.

2. The combination, with the carriage of a plate trimming or finishing machine, of one or more rotary cutters armed with shaving-teeth, substantially as set forth.

387,008. REVOLVING VALVE. THOMAS O. PERRY, Chicago, Ill.

Filed Nov. 4, 1886. Serial No. 181,892. (No model.)

Claim.—1. A revolving valve consisting of a disk provided with a hollow stem or opening at the center, and having an even number of holes arranged equidistantly in a circle concentric with the valve-axis, alternate holes communicating with the hollow stem or center, and alternate holes passing through the disk, in combination with a valve-seat having two apertures so placed that they may come opposite to and match any two consecutive holes in the valve, substantially as and for the purpose herein described and illustrated.

2. A revolving valve consisting of a disk provided with a hollow stem or opening at its center, and having an even number of holes arranged equidistantly in a circle concentric with the valve-axis, alternate holes communicating with the hollow stem or center, and alternate holes passing through the disk, in combination with a valve-seat having two apertures so placed that they may come opposite to and match any two consecutive holes in the valve, and a cap attached to the valve-seat so as to inclose the disk of the valve and form a convenient pipe terminal or receptacle for fluid flowing into the valve, substantially as herein set forth.

3. In combination with a revolving valve consisting of a disk provided with a hollow stem or opening at its center, and having an even number of holes arranged equidistantly in a circle concentric with the valve-axis, alternate holes communicating with the hollow stem or center and alternate holes passing through the disk, and a valve-seat having two apertures so placed that they may come opposite to and match any two consecutive holes in the valve, a ratchet-wheel having teeth corresponding in number with the holes in the face of the valve secured to the valve-stem, and a pawl pivoted to an oscillating arm so as to engage successively the teeth of the ratchet-wheel, and thus give to the valve a succession of partial revolutions, substantially as and for the purpose herein specified.

4. The combination of the revolving valve V, having ratchet-wheel R rigidly attached thereto or forming a part thereof, with the pawl P, lever L L′ L″, and stop M, for the purpose of rotating the valve always in the same direction about its axis and arresting each successive movement, substantially as herein specified.

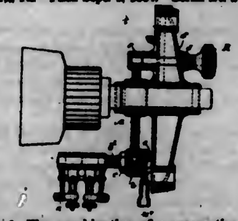
5. The revolving valve V, having ratchet-wheel R rigidly attached thereto, in combination with the pawl P, weighted lever L L′ L″, stop M, and wheel Q, having spur or pin S, for the purpose of imparting to the valve at intervals limited partial revolutions always in the same direction about its axis, substantially as herein set forth.

6. The valve-seat A, provided with cap C, in combination with the valve V, having equidistant holes H I J K, and hollow stem U, the ratchet-wheel R, attached to or forming part of the hollow stem, the pawl P, and oscillating lever L L′ L″, substantially as and for the purpose specified.

7. The combination embracing the valve-seat A, cap C, valve V, ratchet-wheel R, pawl P, lever L L′ L″, and stop M, as and for the purpose herein set forth.

8. The combination embracing the valve-seat A, cap C, valve V, with stem U, ratchet-wheel R, pawl P, lever L L′ L″, spring D, nut N, support E, and stop M, as herein set forth.

9. The combination embracing the valve-seat A, valve V, ratchet-wheel R, pawl P, lever L L′ L″, with heavy or weighted arm L, stop M, and wheel Q, with spur or pin S, substantially as herein set forth.



10. The combination embracing the valve-seat A, having cap C, valve V, having hollow stem U, ratchet-wheel R, pawl P, lever L L′ L″, with heavy or weighted arm L, support E, stop M, and wheel Q, having spur or pin S, substantially as herein set forth.

387,009. FASTENING FOR GLOVES OR CORSETS. ALBERT RAUTENSTRAUCH, Berlin, Germany. Filed Aug. 6, 1887. Serial No. 246,476. (No model.) Patented in England May 27, 1887, No. 7,760, and in Belgium June 28, 1887, No. 77,065.

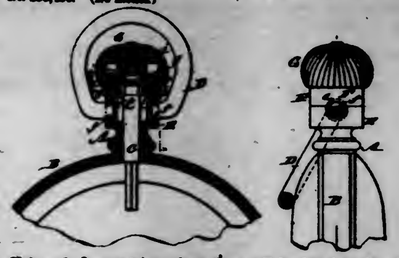
Claim.—The improved construction of fastenings for gloves, trunks, corsets, and other like purposes, consisting of the part *a*, turning on the pin or axis *f*, with the hook *b* thereon, which, by means of the spring *i*, is kept closed across the forks *d d*, and catches and retains the stud *g*, all substantially in the manner and for the purposes hereinbefore described.

387,010. BRUSH-HOLDER FOR ELECTRIC MACHINES. ALBERT SCHMID, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,488. (No model.)

Claim.—1. The combination of a supporting-frame for commutator or collector brushes, an insulated bar carried thereby, two brush-clamps, a symmetrically-formed straight sleeve surrounding the rod upon which the clamps are carried and from either end of which they may be removed, a tension device for each clamp normally pressing the corresponding brush against its commutator, and detachable holding devices for permitting the removal of said sleeve from said bar for reversing its position thereon, thereby bringing the brushes upon the opposite sides of the commutator, substantially as described.

2. The combination of a supporting-frame for commutator or collector brushes, an insulated rod carried thereby, two brush-clamps, a sleeve carrying the same supported upon said rod, a tension device for each clamp normally pressing the corresponding brush against its commutator, and a spring pressing the brush toward or from the ring, accordingly as it is moved to one side or the other of the center of support of the brush.

3. A brush-holding clamp for electric machines, consisting of two movable boxes, an arm extending therefrom, a pivoted yielding rod, to which said arm is pivoted, permitting the turning of said rod upon one side or the other of the line joining the centers of the support of the clamp and of said pivoted rod, and a spring pressing said rod against said arm.



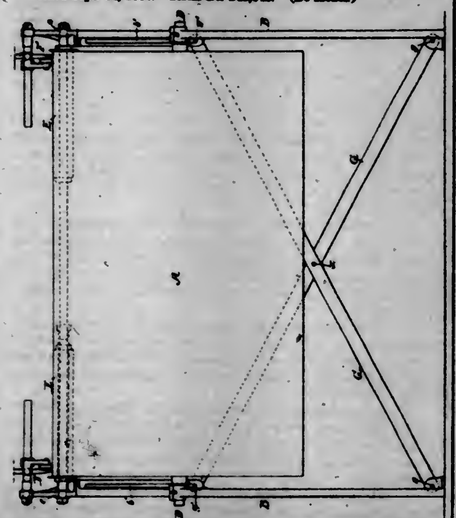
4. The combination of the clamps E′ and E″, the bush H, carrying the same, the rod *e′*, carried upon the bush and connected therewith, the pivoted bar *n′*, and the extension *K′*, coupled therewith, and the yielding spring *e″*, surrounding the bar *n′*, substantially as and for the purpose described.

5. The combination, with a brush-holder for electric machines, of a spring compressed between the clamp and its support and exerting its force in a direction oblique to the support of the clamp, and means for carrying the spring into a second position upon the opposite side of the support.

6. The combination, with an electric generator or motor and its revolving commutator or collector, of a movable brush-holder, and an eccentric-spring exerting stress upon the brush-holder in one direction or the opposite accordingly as the spring is moved from one side to the other of the center of support of the brush-holder.

7. In a brush-holder for electric machines, the combination of a brush-holding clamp, an axis upon which it is movable, an arm extending from the clamp, an arm extending from the axis, and a yielding knee-joint between the clamp and said arm, whereby the position of the clamp may be controlled.

387,011. WATCH-CASE PENDANT. FREDERIC W. SARGENT, Harvey, Idaho. Filed Sept. 20, 1886. Renewed Oct. 27, 1887. Serial No. 253,693. (No model.)



Claim.—1. In a watch-pendant, the cap F, having the collar *d*, a recess, *g*, and a washer, *j*, in the upper part of said recess, in combination with the push-pin C, extending through the collar, recess, and washer, and formed with an annular groove, *i*, and a beveled collar, *l*, and the split ring A, carried by the push-pin in the groove *i* and bearing against the under face of the washer when the push-pin is moved upward and against the base of the recess when moved downward, substantially as set forth.

2. The combination, with the pendant A, having an aperture, *a*, in one side, and a recess, *b*, in the opposite side, of the pendant-bow D, having flanged ends, the sleeve E, and the cap F, substantially as described.

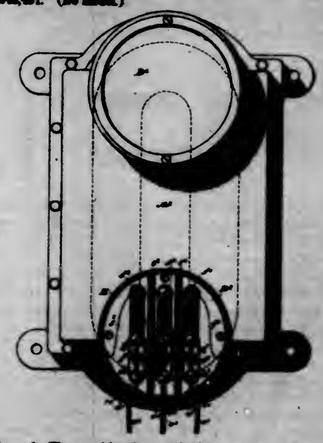
3. The combination, with the pendant A, provided with the aperture *a* and recess *b*, of the pendant-bow D, having flanged and notched ends, the notched sleeve E, the notched cap F, provided with the recess *g*, the push-pin C, carrying the washer A, the bushing *j*, adapted to retain the washer *h* in the recess *g*, and the milled head G, substantially as described.

4. The combination, with the pendant A, provided with the aperture *a* and recess *b*, of the pendant-bow D, having flanged and notched ends, the notched sleeve E, the notched cap F, provided with the recess *g*, the push-pin C, carrying the washer A, the bushing *j*, adapted to retain the washer *h* in the recess *g*, the milled head G, and the pin *k*, for limiting the movement of the sleeve E, substantially as described.

387,012. RULING-MACHINE. JAMES SHERRARDEN, Camden, N. J. Filed Sept. 14, 1887. Serial No. 249,669. (No model.)

Claim.—1. A paper-ruling machine comprising marking-instruments, a spindle for the roll of paper, a roller for the paper to travel over, and side frames, the latter being adjustable toward and from each other for ruling different widths of paper, substantially as set forth.

2. A paper-ruling machine having side frames carrying the marking-instruments and adjustable toward and from each other, an extensible spindle for the roll of paper, and an extensible roller for the paper to travel over, all substantially as described.

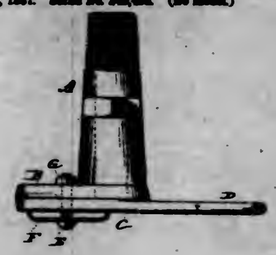


3. The combination of the extensible spindle and roller with the side frames carrying marking-instruments, diagonal braces connecting the side frames, and each brace having a bolt-and-slot connection with one of the frames, substantially as described.

4. The spindle for carrying the roll of paper, said spindle being provided with expanding mandrels at opposite ends, substantially as specified.

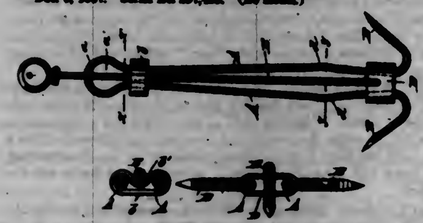
5. The spindle having at each end a wedge-collar, and a collar movable longitudinally on the spindle and carrying arms bearing on the wedge, all substantially as described.

6. The combination of a marking-instrument of a ruling-machine and a lever to press the instrument down on the paper with a centrifugal governor driven by some moving part of the machine and acting on the said lever, all substantially as set forth.



387,013. ELECTRIC CONVERTER. OLIVER B. SHALLENBERGER, Rochester, and ROBERT H. BULLERY, Pittsburg, assignors to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,431. (No model.)

Claim.—1. The combination, with a box for receiving an electric converter, of a compartment receiving the terminals of a coil thereof, a non-conducting plate within such compartment, three binding-posts for receiving conductors leading respectively from the terminals and an intermediate point in the length of a coil of the converter, binding-posts for receiving the terminals of the outside conductors, fusible strips and circuit-controlling devices applied thereto, and lugs of non-conducting material formed upon said plate, separating the different sets of binding-posts, substantially as described.



2. In a converter-box, a plate for receiving the terminals of the converter-coil, formed of vitreous material, three binding-posts carried thereby, fusible strips respectively connected at one end with said binding-posts, switch-plugs receiving the remaining ends, respectively, means for placing electric conductors in connection with said switch-plugs, and lugs upon the plate integral therewith intervening between the fusible strips and their respective binding-posts and switch-plugs, substantially as described.

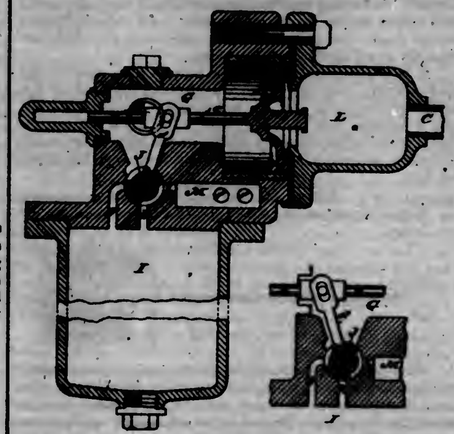
387,014. FAUCET. CHARLES F. SMITH, New Britain, Conn. Filed Sept. 13, 1887. Serial No. 249,602. (No model.)

Claim.—The herein-described faucet, consisting of a tube having its discharge end open and constructed with a projection radially from the said open end, a lever forming a gate for the open end of the tube, the said lever terminating at one end in a handle, the other end extending over said projection on the faucet-tube, and a pivot for said lever midway between the outer end of said projection and the open end of the faucet-tube, combined with a clamp upon which said pivot bears, the said clamp extending to the right and left and so as to take a bearing upon the gate portion of the lever on one side of the pivot, and upon the extension of the lever upon the other side of the pivot, substantially as described.

387,015. FISH-HOOK. GEORGE SMITH, Brooklyn, N. Y. Filed Dec. 8, 1887. Serial No. 257,626. (No model.)

Claim.—In an expansible fish-hook, the combination, with the shanks A A, formed in one piece and having the eye *a*, bent at an angle to the general direction of the shanks, the collar *b*, inclosing said shanks, a rod, E, passing through the eye *a*, which, in connection with said collar *b*, forms a guide for said rod, and a collar, D, secured to the lower end of said rod and sliding on said shanks, substantially as described, and for the purposes set forth.

387,016. BREECH-LOADING ORDNANCE. LEVI Z. SNOW, New Haven, Conn. Filed Apr. 23, 1888. Serial No. 271,888. (No model.)

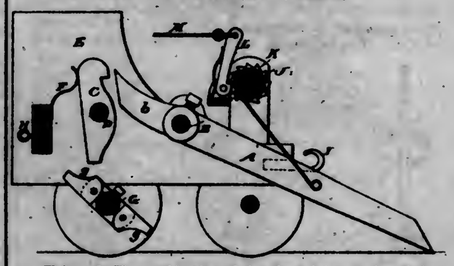


Claim.—1. The combination of the piece A, provided with a segmental recess for the reception of the breech-block B, and a longitudinal recess in the rear of that breech-block for the reception of the conchoi C, the breech-block B, adjusted to that segmental recess and provided with the opening G, and the conchoi C, adjusted to that longitudinal recess and provided with the firing-pin D, the point of which is adapted to penetrate through the opening G in the breech-block B and to be driven into the rear end of a cartridge forward of that breech-block, all substantially as described.

2. The combination of the conchoi C, and the rod I, provided with the angular groove J and resting on the stud K in a longitudinal recess in the piece A, all substantially as described.

387,017. PUTTY FOR MAKING ORNAMENTAL MOLDINGS. WILLIAM A. SNYDER, Chicago, Ill. Filed Jan. 9, 1888. Serial No. 260,240. (No specimens.)

Claim.—A putty for making ornamental moldings, consisting of dissolved glue, resin, and whiting, combined with paraffine-oil and spirits of turpentine, as specified.



387,018. AUTOMATIC AIR-BRAKE. EDWARD SPAHN, Brooklyn, N. Y., assignor of two-thirds to John W. Howard and David B. Hoyt, both of same place. Filed Feb. 14, 1888. Serial No. 263,993. (No model.)

Claim.—1. In an automatic fluid-brake apparatus, wherein stored pressure is rendered active to offset the brake-stroke automatically by the reduction of train-pipe pressure, the combination, with the train-pipe, car, reservoir, and brake-cylinder, having pipe-connections and cylinder-valves adapted to operate as set forth, of the expanding-chamber and piston-actuated relief-valve located in the line of train-pipe proximate to but independent of the brake-cylinder valves, and adapted to open or close automatically by predominant reservoir or train-pipe pressure, respectively, on opposite sides of its actuating-piston, as and for the purposes specified.

2. The herein-described piston-actuated oscillating relief-valve, the piston whereof is exposed on the one side to pressure in the line of train-pipe and on its opposite side to the stored pressure from the car-reservoir, and the valve adapted to connect the train-pipe with an expanding-chamber in the one position or disconnect said chamber from the train-pipe and exhaust the same to the atmosphere in the reverse position, as set forth.

387,019. AUTOMATIC CAR-BRAKE. THOMAS TAIT, Dubois, Pa. Filed Dec. 13, 1887. Serial No. 257,816. (No model.)

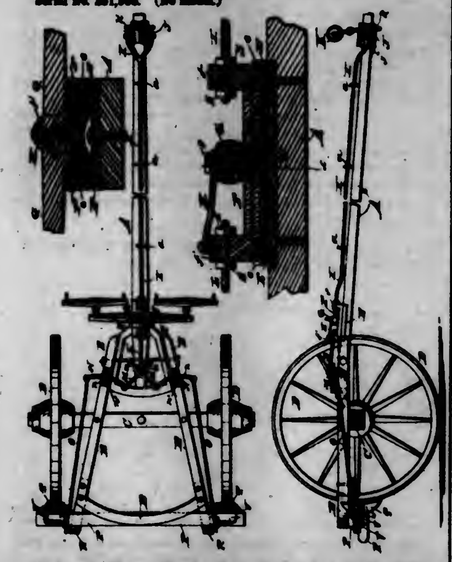
Claim.—1. The combination of the pivoted bars A A and shaft B, having arm A, with a trigger and axle-arms, as set forth.

2. The combination, with the trigger, of axle-arms adapted by means of a joint to pull the trigger only when the loaded car takes a backward movement.

3. The combination of the pivoted bars A A, having spacer *a*, the rope or chain, the pinion, the ratchet, and the detent, as and for the purpose specified.

387,020. FLOOD-GATE. GEORGE R. THEARDEN, St. Paul's, Ohio. Filed May 4, 1888. Serial No. 272,769. (No model.)

Claim.—1. In a flood-gate, the combination, with the stakes provided with elongated guide-loops, of the horizontal bar having its ends inserted in and resting upon the bottom of the said loops and provided with pickets, and the flexible rope secured to said stakes and passing around the said bar, so that the gate is operated by the stream, substantially as and for the purpose set forth.

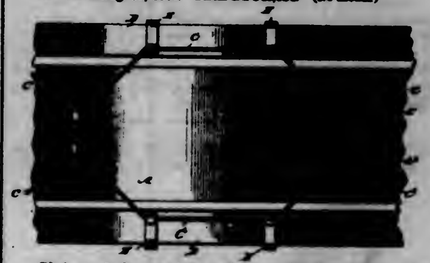


2. In a flood-gate, the combination, with the stakes provided with elongated guide-loops and with notches F, of the horizontal bar having its ends inserted in said loops and provided with pickets, and with pins E engaging with the said notches in the stakes, and the wire rope secured to the stakes and passing around the said bar, so that the gate is operated by the stream, substantially as and for the purpose set forth.

387,021. POKING-BAR FOR GAS-PRODUCERS, &c. JACOB R. THOMAS, Philadelphia, Pa. Filed Aug. 4, 1887. Serial No. 246,116. (No model.)

Claim.—A poker-bar having the handle portion open or divided, the flat working end A', having the shoulder E, said end being wider at the shoulder than at the shank, and the shield D, loosely mounted on said shank, said parts being combined substantially as and for the purpose described.

387,022. AUTOMATIC VEHICLE-BRAKE. LEONARD B. VAN ANTWERP and MORGAN L. ROBBINS, Susquehanna, Pa. Filed Oct. 11, 1887. Serial No. 251,993. (No model.)



Claim.—1. The combination, in a vehicle-brake, with the running-gear, of the sliding brake-beam P, the stirrups U, pivotally connected with said beam, the brake-shoes T, supported by said stirrups, and the spring W, suitably supported and arranged to bear against and actuate the stirrups, all operating substantially as described, whereby the brake-shoes are forced against the wheels with a yielding pressure, as herein set forth.

2. The combination, in a vehicle-brake, of a plate, F, fitted to slide on the pole or shafts, a double or single tree or draft device held to the plate, a rod, I, connected to the plate and adapted to a hooking device of the harness, a rod, L, also connected to the plate F, toggle-levers M, connected to the rod L, levers N, fulcrumed on the running-gear and connected to the levers M, a brake-beam, P, carrying shoes adapted to the wheels and fitted to slide on the running-gear, and rods O, connecting the beam P and levers N, substantially as described, for the purposes set forth.

3. In a vehicle-brake, the combination, with the running-gear, of a plate, F, fitted to slide on the pole, a doubletree or draft device held to the plate, a rod, I, connected to the plate, a sleeve, J, on the pole and to which the rod I is attached, a hooking-lug, *j*, on the pole, a rod, L, connected to the plate F, toggle-levers M, connected to the rod L, levers N, fulcrumed on the running-gear and connected to the levers M, a brake-beam, P, brake-shoes T, held to the beam by yielding stirrups U, and rods O, connecting the beam P and levers N, all arranged for operation substantially as herein set forth.

4. In a vehicle-brake, the combination, with rods I L, leading to the holdback and brake-applying devices, of a plate, E, on the pole or shafts, a plate, F, fitted to slide on the plate E and provided with lugs *f f'*, to which the rods I L are connected, a draft-tree held by a pin, *g*, to the plate F, and a hammer-strap or tie-bar, H, connecting the pin *g* with a lug of the plate F, substantially as shown and described.

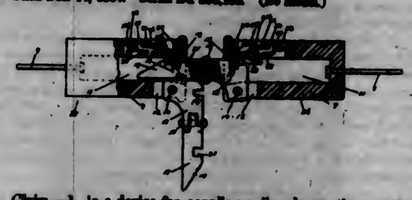
387,023. DRUM-HEAD STRAINER. GEORGE VAN HAGEN, Chicago, Ill. Filed Aug. 13, 1887. Serial No. 246,921. (No model.)

Claim.—1. In a strainer or tightener for drum-heads, a set of loops each comprising a pair of wires, C and C', and all connected in continuous series by intervening adjustable tension devices to which the terminals of said wires are secured, substantially as and for the purpose set forth.

2. In a strainer or tightener for drum-heads, an adjustable tension device consisting of a collar, *d'*, and a nut, *d''*, both applied upon a bolt, *d*, combined with two straining-wires, C, connected with one hoop and having their terminals permanently and rigidly attached to the collar, respectively, at opposite sides of the bolt, and two straining-wires, C', connected with the other hoop and having their terminals permanently and rigidly attached to the nut likewise at opposite sides of the bolt, substantially in the manner and for the purpose described.

3. In a strainer or tightener for drum-heads, a set of loops each comprising a pair of wires, C and C', and all connected in continuous series by intervening adjustable tension devices, combined with two sets of hangers engaging both the hoops and the wires, and arranged, substantially as described, with two hangers for each wire, for the purpose specified.

4. In a strainer or tightener for drum-heads, a set of wire loops connected in continuous series, combined with hangers R, attached to the hoops and permanently clamping the wires of the loops, substantially as described.



387,024. DRUM FOR CABLE RAILWAYS. JOHN WALKER, Cleveland, Ohio. Filed Apr. 4, 1888. Serial No. 269,611. (No model.)

Claim.—1. A grooved driving-drum for a cable railway having the first of the series of grooves formed in a stationary or fixed part of the drum and the remaining ones in rings adapted to turn on and independently of the said drum, combined with a second grooved drum, all the grooves of the two drums being of a practically common diameter, and a cable rove around so as to connect the said drums, substantially as and for the purpose specified.

2. A driving-drum having a series of grooved peripheral rings in contact with each other and adapted to turn on the surface of the drum, and a removably-covered flange, substantially as and for the purpose specified.

387,025. CAR-COUPLING. HENRY W. WARNER, Baltimore, Md. Filed Dec. 17, 1887. Serial No. 258,163. (No model.)

Claim.—1. In a device for coupling railroad-cars, the combination of a ball-nose, a tongue, 13, pivoted to the said ball-nose and provided with the slots 19 and 21 thereon, a lock-plate, 20, a lever, 22, and the shaft or pin 21½, for the purpose set forth.

2. In a device for coupling railroad-cars, the combination of a ball-nose, a tongue, 13, pivoted to the said ball-nose and provided with the slots 19 and 21 thereon, the said tongue 13, provided with the hinged joint 15, a lock-plate, 20, a lever, 22, a lever, 27, a shaft, 28, and the hand-lever 29, secured to the said shaft 28, for the purpose set forth.

3. In a device for coupling railroad-cars, the combination of a ball-nose, a tongue, 13, pivoted to the said ball-nose and provided with the slots 19 and 21 thereon, the said tongue provided with the hinged joint 15, a lock-plate, 20, a lever, 22, a forked lever, 27, a shaft, 28, the hand-lever 29, the stop-lever 30, and the stop-plate 31, for the purpose set forth.

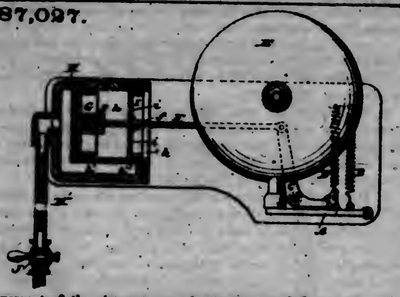
4. In a device for coupling railroad-cars, the combination of a ball-nose, a tongue, 13, pivoted to the said ball-nose and provided with the slots 19 and 21 therein, the said tongue 13 provided with the hinged joint 15, a lock-plate, 20, a lever, 22, a fork-ed lever, 27, a shaft, 28, the hand-lever 29, the stop-lever 30, the stop-plate 31, the shaft 14, to which is fixed the tongue 13, extended and provided with the hand-lever 18½ thereon, substantially as shown, and for the purpose set forth.

387,026. TRAIN-SIGNALING APPARATUS. CHARLES F. WEBB, Concord, N. H. Filed Feb. 20, 1888. Serial No. 264,804. (No model.)

Claim.—1. In a gong-bell-sounding mechanism, a steam-actuated piston, a compressed-air-actuated valve for controlling its steam-supply, suitable pipes, and a valve or valves for conducting compressed air from a storage-reservoir located on the several cars of a train, substantially for the purpose set forth.

2. In an apparatus for ringing the signal-gong in a locomotive-engine, a cylinder, and piston, having its piston-rod in direct connection with a bell-crank which operates the bell-hammer, a valve for controlling the movement of said piston, and means for actuating said valve from the several cars of a train, comprising pipes having suitable couplings, as shown, and branch pipes connecting with the compressed-air reservoirs of the air-brake system, provided with valves, and operating-cords entering the several cars, all substantially for the purpose set forth.

3. The combination of a locomotive signal-gong, a steam-actuated piston for ringing the same; a valve for admitting steam to said piston, and means, comprising air-conducting pipes with suitable couplings and valves, for actuating said valve B from the interior of any of the several cars of a train by compressed air from the air-brake system, substantially in the manner and for the purpose set forth.



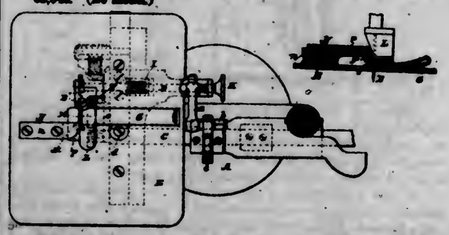
387,027. GONG-SOUNDING MECHANISM. CHARLES F. WEBB, Concord, N. H. Filed Mar. 22, 1888. Serial No. 268,251. (No model.)

Claim.—1. In a signal-sounding mechanism for railway-trains, the combination, with the signaling device, of the compressed-air cylinder, the piston therein, the piston-rod connected with the signaling device to operate the latter, an automatic relief-valve operated by the movement of the piston to permit the escape of the compressed air from the cylinder, and means, substantially as described, for forcing back and returning the piston when the pressure is relieved, the air-supply pipe, and a combined cut-off and relief cock in the latter, which co-operates with said relief-valve to permit the escape of air at each end of said pipe and allow of the rapid sounding of the signal, substantially as set forth.

2. In a signal-sounding mechanism for railway-trains, the combination, with the signaling device, of the compressed-air cylinder, the piston therein, the piston-rod connected with the signaling device to operate the latter, an automatic relief-valve mounted loosely on said piston-rod in advance of the piston, a relief-opening, *h*, in said cylinder at its forward or open end, an escape-duct extending from said opening to the rear or supply end of the cylinder, and means, substantially as described, for forcing back and returning the piston when the pressure is relieved, substantially as set forth.

3. In a signal-sounding mechanism for railway-trains, the combination, with the signaling device, of the compressed-air cylinder, the piston therein, the piston-rod connected with the signaling device to operate the latter, an automatic relief-valve mounted loosely on said piston-rod in advance of the piston and having an opening, *i*, a relief-opening, *h*, in said cylinder at its forward or open end, an escape-duct extending from said opening to the rear or supply end of the cylinder, and means, substantially as described, for forcing back and returning the piston when the pressure is relieved, substantially as set forth.

387,027.



387,028. VEHICLE-AXLE. LA FAYETTE T. WEVER, Sophomy, Fla. Filed Sept. 12, 1887. Serial No. 249,474. (No model.)

Claim.—The combination, with an axle having an enlargement at its ends provided with an exterior thread, and a longitudinal aperture having a thread of coarser pitch than the exterior thread, of a spindle provided with an exteriorly-threaded extremity adapted to enter the aperture of the axle and a plain collar in front of said thread, and an interiorly-threaded flanged sleeve adapted to slide upon the spindle and engage the exteriorly-threaded surface of the axle and lock the spindle and axle, substantially as set forth.

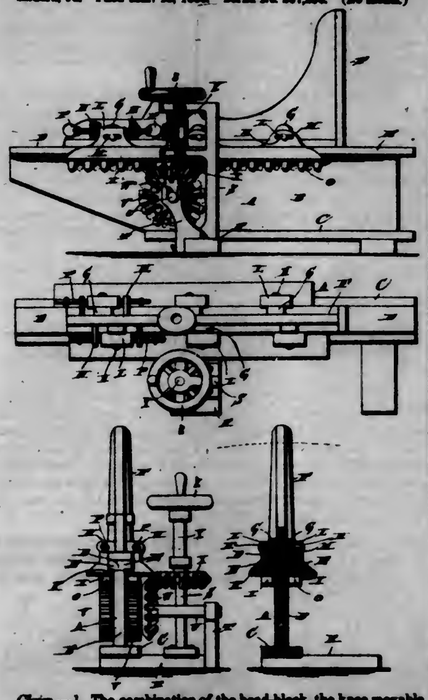
387,029. TRIMMING ATTACHMENT FOR SEWING-MACHINES. CHARLES H. WILLCOX, New York, N. Y., assignor to the Wilcox & Gibbs Sewing Machine Company, same place. Filed June 2, 1888. Serial No. 275,045. (No model.)

Claim.—1. The combination, with the sewing-machine and trimming attachment, of the diverting-guide secured to the cloth-plate and having a finger projecting in front of the cutters close to the presser-foot, said finger being raised above the cloth-plate to permit the passage of one or more layers of fabric to said cutters, substantially as described.

2. The combination of a trimming attachment, a diverting-guide,

and a device for uncovering or fastening the margin to be trimmed off, substantially as described.

3. In a sewing-machine with trimmer attachment, the feed-surface divided transversely, to the direction of the feed movement and arranged to take hold of the fabric both in front and rear of the cutters, substantially as described.



4. The combination, with a sewing-machine having a needle and presser-foot, of a stationary cutter bar or plate arranged to extend under the presser-foot past the needle, and an auxiliary cutter arranged alongside of the said presser-foot and forming with said cutter bar or plate a pair of shears, substantially as described.

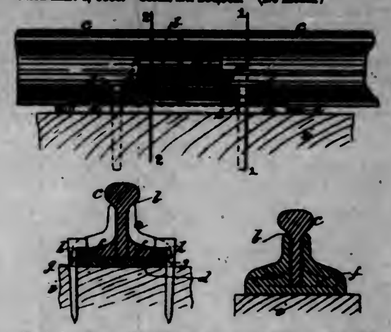
5. The combination, with a sewing-machine, of a trimming attachment having the cutting portion arranged on the side of the needle away from the goose-neck, and a diverting-guide arranged on the same side of the needle in front of said cutting portion, and having a projecting finger raised above the cloth-plate to permit the passage of a layer or layers of fabric to the cutters, substantially as described.

6. The combination, in a sewing-machine with trimmer attachment, of the vibratory and stationary cutters, the diverting-guide, and the uncovering device arranged on the side of the needle opposite from the goose-neck of the machine, substantially as described.

7. The combination, with the stitch-forming mechanism and presser-foot of a sewing-machine, of a feed-bar having a divided feed-surface, and trimming devices located below said presser-foot and crossing said feed-bar, said trimming devices having means for operating them, substantially as described.

887,080. HEAD-BLOCK FOR SAW-MILLS. FRANKLIN P. SHELDEN, Abilene, Pa. Filed Mar. 15, 1888. Serial No. 267,262. (No model.)

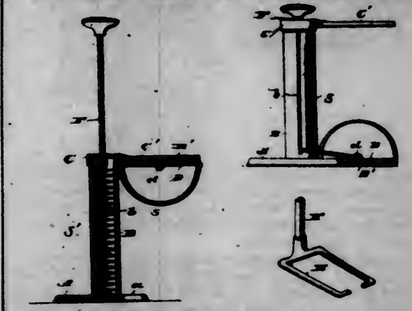
Claim.—1. The combination of the head-block, the knee movable longitudinally thereon and having the rack-bars on opposite sides bearing against the sides of the head-block and forming guides for the knee, and the shaft U, having the pinions meshing with the rack-bar S, for the purpose set forth, substantially as described.



2. The combination of the head-block, the knee movable longitudinally thereon, the rack-bars secured to opposite sides of the knee and adjustable longitudinally thereon, said rack-bars bearing against opposite sides of the head-block and forming guides for the knee, and the shaft U, having the pinions V engaging the rack-bars, substantially as described.

3. The combination of the head-block, the knee, the rack-bars on opposite sides of the knee, having their teeth arranged out of line with each other, and the pinions on opposite sides of the head-block engaging the rack-bars, the teeth of said pinions being also out of line with each other, substantially as described.

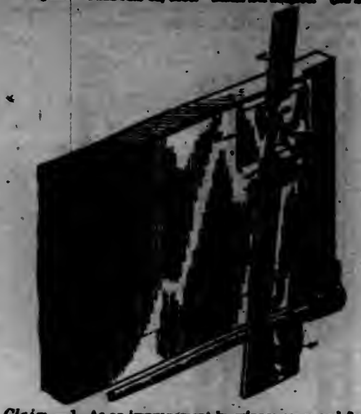
4. The combination of the head-block, the knee, the rack-bars on opposite sides of the knee and head-block, having the longitudinal slots M, and the screws N, extending through said slots and entering threaded openings in the knee, said screws clamping the rack-bars to the knee at any desired adjustment, and the pinions meshing with the rack-bars, substantially as described.



5. The combination of the head-block, pinions on opposite sides of the same, the knee movable longitudinally on the head-block and having the projecting lugs or brackets H, the rack-bars having the lugs L, provided with longitudinal slots M and bearing against opposite sides of the knee and head-block, the clamping-nuts extending through said slots and engaging the knee to secure the rack-bars to the latter, and the adjusting-screws P, engaging threaded openings in arms or brackets H and engaging the lugs or ears L of the rack-bars, for the purpose set forth, substantially as described.

887,081. RAILROAD FISH-JOINT. LEE ADAM, St. Louis, Mo. Filed Mar. 8, 1888. Serial No. 266,962. (No model.)

Claim.—In a railway-joint, the combination of the rails having portions of their bottom flanges cut away, and a slotted chair having a base extending beyond the ends of the slotted chair, said base having vertical flanges for the lateral support of the rail, substantially as and for the purposes specified.



887,082. SELF-INKING HAND-STAMP. LEMUEL G. ARNOLD, Rock Island, Ill. Filed Dec. 22, 1887. Serial No. 258,256. (No model.)

Claim.—1. The combination, with a cylinder mounted upon a base, as set forth, and having a coiled spring mounted therein, of the plunger secured to a suitable yoke, whose inner ends pass through the slots formed in the cylinder, the type-plate adapted to revolve when the plunger is depressed, and stationarily mounted inking-pad integrally formed with the cap of said cylinder, substantially as described.

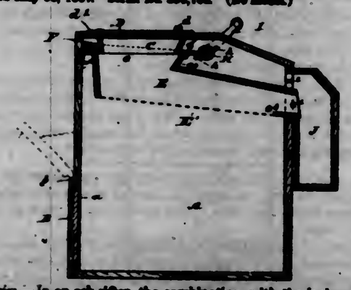
2. The combination of the base A, recessed as set forth, the cylinder mounted thereon having vertical slots, and a coiled spring, F, mounted therein, the stationarily-mounted inking-pad C, integrally formed with the cap C of the said cylinder, the hand-plunger, rectangular yoke, to which said hand-plunger is secured and which bears upon the top of the coiled spring F within the cylinder, the counterbalance yoke D, to which the outer ends of the rectangular yoke are secured, the type-plate carried by said counterbalance yoke, and the strap-spring S, secured at one end to the cylinder and at its opposite end to the outer side of the counterbalance yoke D, as set forth, substantially as described.

887,083. FEED-GAGE FOR PLAITING-MACHINES. FRANZ A. HAMEL, Cleveland, Ohio, assignor to himself and THOMAS HOLDEN, same place. Filed Jan. 11, 1888. Serial No. 260,304. (No model.)

Claim.—1. As an improvement in gripper-arms and feed-gages for plaiter-presses, the combination, with the gripper-arm, of the spring-actuated arm designed to enter a groove or recess of said gripper-arm substantially as shown and described.

2. The combination, with the gripper-arm provided with a groove or recess, of the spring-actuated arm and the curved or bent spring arm, substantially as shown and described, said arms being designed to enter said groove or recess when compressed, substantially as set forth.

3. As an improvement in gripper-arms and feed-gages, the gripper-arm having a groove or recess in its front face and a short arm or projection, in combination with a plate adjustable thereon and the arm having its spring-securing rod attached to the adjustable plate, substantially as shown and described.



4. As an improvement in feed-gages for plaiter-presses, the spring-actuated arm having an outer flanged end, and the spring-arm secured thereto, substantially as shown and described.

5. As an improvement in feed-gages, the combination, with the gripping-arm, of the adjustable plate having a circular or rounded portion, the spring-rod passed therethrough, and the arm secured to one end of said spring-rod, substantially as shown and described.

6. The combination, with the gripper-arm having the arm or projection, of the adjustable plate secured to said arm or projection, the vented bolt, the spring-rod, and the rigid arm having a spring-arm secured thereto, substantially as shown and described.

7. The herein-described combined gripper-arm and feed-gage, comprising the gripper-arm provided with a rubber facing, the short arm or projection, the adjustable plate, the spring-rod, the arm having an outer flanged end, and the spring-arm, in combination with the metallic plate secured to the plaiter, substantially as shown and described.

887,084. ASH-SIFTER. CHARLES J. RAMEY, Grant Park, Ill. Filed May 21, 1887. Serial No. 238,703. (No model.)

Claim.—In an ash-sifter, the combination, with the inclosed case A, having opening *a'*, of the hopper C, provided with a cover, the inclined sifter E, beneath the same, pivoted at one end in the casing and provided with the lip G and with the retarding and impact sill *e*' at its rear end, resting in opening *a'*, the shaft H above the sifter and having fingers for engaging said lip, and the closed receptacle J upon the side of the case having an opening at the top of its inner side for receiving the discharge of the sifter, substantially as described.

887,085. STOCKINGS AND SOCKETTES. DAVID ISAAC, New York, N. Y. Filed Dec. 15, 1887. Serial No. 258,253. (No model.)

Claim.—1. The combination, with a stocking, of an inner sole placed loosely in the stocking and an outer sole secured to the stocking, substantially as set forth.

2. The combination, with a stocking having an inner sole placed therein, of a shoe-upper and an outer sole secured to one another and to the stocking, substantially as set forth.

887,086. PROCESS OF CLEANSING GOLD AND SILVER WHERE REFRACTORILY COATED BY ORES WITH REFRACTORY SUBSTANCES. CHARLES P. SELDEN, Gloversville, N. Y. Filed Aug. 27, 1887. Serial No. 248,072. (No specimens.)

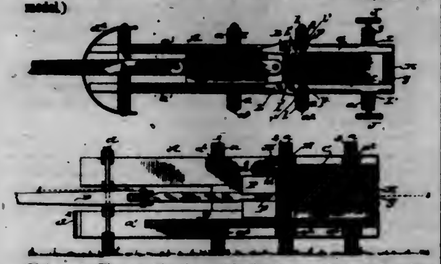
Claim.—The process of cleansing refractory ores prior to the recovery of the precious metals therefrom, which consists in immersing said ores in a solution of a sodium chloride and cuamic soda, heating said solution, and at the same time subjecting the ores to the action of the electric current, whereby the ore is rendered free-milling, substantially as described.

887,087. ICE-CAGE FOR WATER-COOLERS. BROWN P. BENNETT, Philadelphia, Pa. Filed Aug. 20, 1887. Serial No. 247,402. (No model.)

Claim.—An ice-cage for water-coolers, consisting of an open-work body with inwardly-folding handles or bails connected with opposite sides thereof, and a link coupling said handles and retaining them above the top of the ice, substantially as described.

887,088. TRIANGULAR TUBULAR LAMP. CHARLES BRESSLER, Rochester, N. Y., assignor to the C. T. Hinz Manufacturing Company, same place. Filed Jan. 6, 1887. Serial No. 223,897. (No model.)

Claim.—1. In a tubular lantern, the combination, with a suitable burner, oil-reservoir, and air-chamber, of a dome having perforations open to the air, the air-space surrounding the said dome closed at the



top and open to the air at the bottom, and having openings into the dome, and the air-tubes communicating at the base with the air-chamber and passing upward and communicating with the air-space at the dome, substantially as described.

2. The combination, in a lantern, with the casing thereof, of a top section having a dome which has perforations open to the air and extends downward within the casing, the air-space around the dome communicating therewith and open to the air at the bottom, the burner, the air-chamber, and the air-tubes communicating with the annular air-space and the chamber at the burner, substantially as described.

3. The combination, in a lantern, with the casing, of the perforated dome D, having openings *h h'* and extending downward within the casing, the annular air-space *g*, surrounding the dome and open at the bottom only, the burner and the air-chamber and the air-tubes *f f* communicating with the air-space at the openings *h* and with the air-chamber at the burner, substantially as described.

4. The combination, in a lantern, of the top section having the perforated dome, the openings *h h'*, the annular air-space surrounding the same, closed at the top and open at the bottom, the burner and air-chamber of the air-tubes communicating with the chamber at the burner and with the air-space opposite the openings *h h'*, substantially as described.

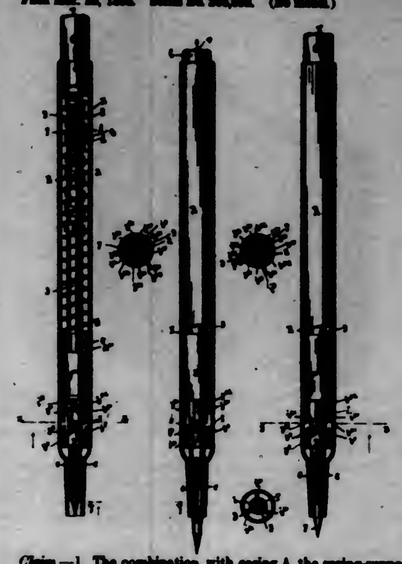
387,039. HAY-PRESS. JOSHUA R. BOHAN and ANDREW W. BOHAN, Terrell, Tex. Filed Mar. 27, 1888. Serial No. 268,704. (No model.)

Claim.—1. The combination, with the frame, of pivoted spring-actuated catches, constructed substantially as described, and provided with shoulders adapted to engage stop-pins for limiting the movement of said catches, and a spring-actuated board in the top of the frame, having a flanged free end projecting under one of the cross-beams of the frame for limiting the upward movement of said board, substantially as and for the purpose set forth.

2. The herein-described baling-press comprising the frame, a plunger located therein, a pivoted power-lever, a pitman connecting the latter and the plunger, the hinged side bars, the outer end pieces adapted to be secured between said bars by adjustable blocks, the inner end piece, spring-actuated side catches for retaining the same against backward movement and provided with shoulders, pins for limiting the movement of said catches, and the spring-actuated horizontally-disposed top-catch, substantially as and for the purpose set forth.

387,040. SEWING-MACHINE TABLE. MIMA G. BLAKE, Vicksburg, Miss. Filed Jan. 24, 1888. Serial No. 261,747. (No model.)

Claim.—In combination with a leaf adapted for application to the edge of a sewing-machine table, a clamp, C, having the prongs *a* and *b*, the former having its inner side in alignment with the top of the leaf, and its outer side beveled, as shown, and the latter provided with a thumb-screw, *c*, substantially as and for the purpose specified.



387,041. TOBACCO-PIPE BOWL. WALTER S. BLAKE, St. Louis, Mo., assignor to the Blake Pipe Company, same place. Filed Jan. 7, 1888. Serial No. 260,115. (No model.)

Claim.—1. A composition for the manufacture of pipe-bowls, consisting of ground corn-cob and silicate of soda, substantially as set forth.

2. A composition for the manufacture of pipe-bowls, consisting of ground corn-cob, earthy material, and silicate of soda, substantially as set forth.

387,042. PIPE OR LEAD HOLDER. WILLIAM BOHMER, Hoboken, N. J. Filed Mar. 10, 1888. Serial No. 266,922. (No model.)

Claim.—1. The combination, with casing A, the spring-supported head C, fitted into said casing, and the tube D, carrying a pen or lead, of a latch, I, actuated by the head C and constructed to lock the tube D in its forward and also in its retracted position, substantially as described, whereby the latch is thrown in its locking position by first depressing and then releasing the head C, and in its unlocking position allowing the tube D to recede by depressing and releasing the head a second time, as set forth.

2. The combination, in a pen or lead holder, of the tubular casing provided interiorly with upper and lower teeth, the spring-supported head, the pen or lead holding tube, and the latch mounted on the said tube and having a series of teeth and locked in a stationary position to hold the tube advanced by depressing and then releasing the head, and unlocked to permit the tube to recede by again depressing and then releasing said head, substantially as described.

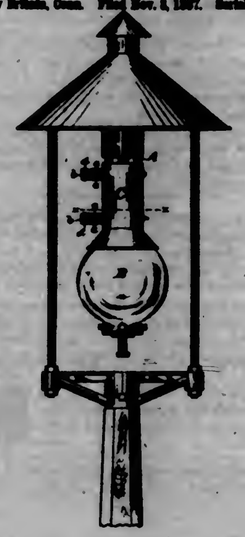
3. The combination, in a pen or lead holder, of the casing A, having the lower fixed tube B', provided with teeth *b'*, the upper tube B'', provided with teeth *b''*, and slots *b'' b'' b''*, the spring-supported head C, the pen or lead holding tube D, and the revolving toothed latch I, mounted on said holding-tube and revolved by the teeth, substantially as and for the purposes described.

4. The combination of the casing A, the non-rotating pen or lead holding tube D, the spring-supported head C, loosely connected with the tube, the spiral G, connected with the head, the sheath E, arranged in the holding-tube and having a toe, *f*, projecting through the latter and engaging the spiral, a rotating toothed latch, I, mounted on the lead-holding tube, and upper and lower teeth in the casing for turning the latch, substantially as described.

5. The combination, with the casing A and the spring-supported head C, of the tube D, the spiral G, carried by the head and made to embrace the tube D, the lead-sheath E, fitted into the tube D, and the toe *f*, made to project from the sheath E through a slot in the tube D and engaging the spiral G, substantially as described.

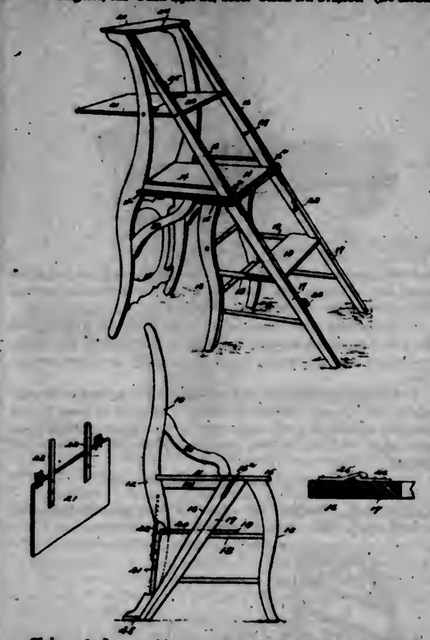
387,043. FURNACE FOR SMELTING AND REDUCING ORES. ROBERT RUSSELL, St. Louis, Mo., assignor of one-half to August M. Reinke & Co., same place. Filed June 13, 1887. Serial No. 241,703. (No model.)

Claim.—1. In a furnace for smelting and reducing minerals, the combination of the fire-boxes, smelting-chamber, the refining-chamber, the division-wall dividing said refining and smelting chambers from top to bottom, the calcining-chamber, and the flues 18, connecting the calcining-chamber with the smelting and refining chambers at points remote from the fire-boxes, whereby the products of combustion will pass from either the smelting or refining, or both the smelting and refining chambers into said calcining-chamber after having traversed the former chambers, substantially as and for the purpose set forth.



387,042.

2. In a furnace, substantially as described, the combination of two fire-boxes, a smelting-chamber communicating with one of said fire-boxes, and a refining-chamber arranged in a lower plane than the smelting-chamber and communicating with the other fire-box, a partition, 13, dividing said chambers from top to bottom and provided at its base with one or more leak-holes, a calcining-chamber, and a flue from each of the aforesaid chambers to said calcining-chamber.



3. The combination, with two fire-boxes, of a smelting and refining chamber arranged between said fire-boxes and having a perforated partition-wall dividing said chamber from top to bottom, a calcining-chamber arranged in the vicinity of the aforesaid chambers, and flues 18, leading from both the smelting and refining chambers into said calcining-chamber and adapted to convey products of combustion from either or both of the fire-boxes into the calcining-chamber.

387,044. STORM-PROTECTOR FOR ELECTRIC LAMPS. THOMAS H. BRADY, New Britain, Conn. Filed Nov. 5, 1887. Serial No. 254,502. (No model.)

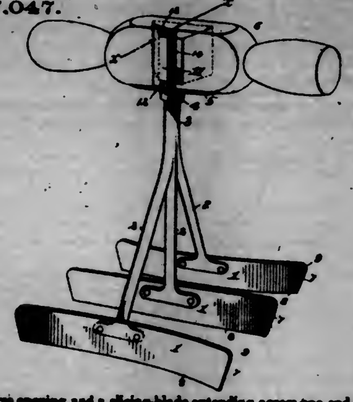
Claim.—In an electric lamp, the combination of a storm-protector having hinge-brackets, the frame A, inside the protector, the hinge-supporting brackets *b*, secured to said frame and extended outwardly from said frame to the hinge-plate on the outside of the protector, substantially as described, and for the purpose specified.

387,045. SUPPORTED SEEN-LADDER AND CHAIR. PHILIP BRAUN, Los Angeles, Cal. Filed Apr. 23, 1888. Serial No. 271,260. (No model.)

Claim.—1. In a combined step-ladder and chair, the combination, with the front and rear legs, a sectional and hinged seat secured to the said legs, and two pairs of standards secured to each section of the seat, of a step secured to one pair of standards and a platform hinged to the said step and provided with bars projecting from its hinged end and adapted to rest under the step and support the said platform in a horizontal position when used as a ladder, substantially as herein shown and described.

2. The combination, with the front and rear legs of a chair, a sectional seat secured to said front and rear legs, standards 16 and 17, attached to said seat at each side of the division and hinged together, and rounds connecting the standards 17 and the front legs, of a step or platform secured upon one of said rounds and attached to the standards 17, a second step or platform secured to the standard 16 and the rear legs, a shelf hinged to said platform or step 20, provided with stay-bars 23, and a recessed base-board secured to the under side of the rear legs, and the standard 16, adapted to serve alternately as an upper step for the ladder and a brace for the rear legs of a chair, substantially as and for the purpose specified.

387,046. PROCESS OF COATING IRON AND STEEL WITH RUST-LESS OXIDE. ADRIAN A. BRESNAN, Brooklyn, N. Y. Filed Jan. 10, 1888. Serial No. 260,502. (No specimens.)



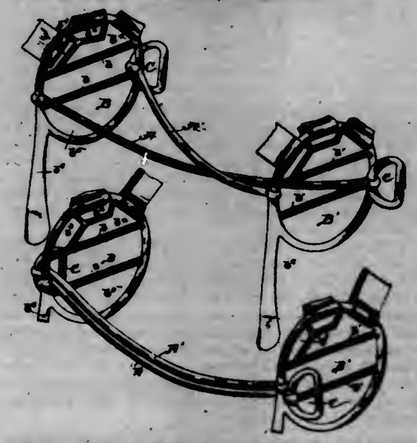
Claim.—1. The method, substantially as hereinbefore set forth, of producing a coating of magnetic oxide upon the surface of articles of iron for the purpose of rendering said articles non-corrodible, which consists in subjecting the uniformly-heated articles to the reducing action of a hydrocarbon and then to the oxidizing action of air.

2. The method, substantially as hereinbefore set forth, of producing a coating of magnetic oxide upon the surface of articles of iron for the purpose of rendering said articles non-corrodible, which consists in repeatedly subjecting the uniformly-heated articles to the alternate and successive action of a reducing agent to bring the surface to the state of metallic iron, and of an oxidizing agent to produce the final coating of magnetic oxide.

387,047. CHOPPING-KNIFE AND SLICER. HARVEY W. BRESNAN, Lyons, Kans. Filed Apr. 5, 1888. Serial No. 269,897. (No model.)

Claim.—1. A chopping-knife consisting of a handle having a

387,047.



transverse opening and a sliding-blade extending across one end of the opening, and a shank with arms on which are mounted chopping-blades, substantially as shown and described.

2. A chopping-knife consisting of a handle having a shank with arms, and chopping-blades mounted thereon, the ends of the blades being formed with converging edges, substantially as shown and described.

3. A chopping-knife consisting of handle 6, having secured thereto shank 3, with arms 2, and curved blades 1, secured to arms 2, with converging taper ends 7, the outer ends of the adjacent blades being farther apart than the central portions, substantially as shown and described.

387,048. BRIDLE-BIT. HARRY W. GARDNER, Columbia, Del. Filed Apr. 2, 1888. Serial No. 269,202. (No model.)

Claim.—1. In a bridle-bit, the combination of the curved bars A and A', the bar A having the rings B and C, and the bar A' having the rings B' and C, the rings B and B' being formed with the cross-bars *b* and *b'* and the loop-holes *b²* *b²* *b²* *b²* and the guard or projection *b³*, the bars A and A' having their alternate ends protruding through the rings B and B', and the rings B, B', and C pivoted to the ends of said bars, all substantially as described and set forth.

2. In a bridle-bit, the combination of the curved bars A and A' the bar A having the rings B and C, and the bar A' having the rings B' and C, the rings B and B' having the cross-bars *b* and *b'* and the guard or projection *b³*, the bars A and A' having their alternate ends protruding through the rings B and B', and the rings B, B', and C pivoted to the ends of said bars, substantially as described and set forth.

3. The combination of the curved bars A and A', the bar A having the rings B C, and the bar A' having the rings B' C, the bars A and A' having their alternate ends protruding through the rings B and B', the rings B, B', and C pivoted to the ends of curved bars, substantially as described, and for the purpose set forth.

387,049. BATTERY-CUP. Reuben I. Gano and Parmen Benson, Fall River, Mass. Filed Dec. 22, 1887. Serial No. 258,503. (No model.)

Claim.—1. In a battery-cup, the combination of a body composed wholly or in part of an amalgam of zinc and mercury, and a cup composed of pure or approximately pure zinc, the cup and body being united by brazing or fusing, substantially as set forth.

2. In a battery-cup, the combination of a body composed wholly or in part of an amalgam of zinc and mercury, a cup composed of pure or approximately pure zinc, and a conducting-wire for said battery-cup, the cup and body being united by brazing or fusing, substantially as described.

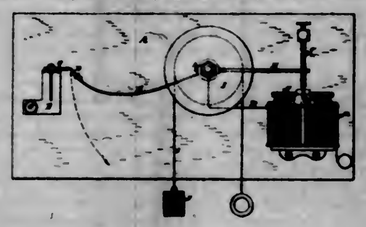
3. In a battery-cup, the combination of a body composed wholly or in part of an amalgam of zinc and mercury, a cup composed of pure or approximately pure zinc, and a conducting-wire for said battery-cup, the cup and body being united by brazing or fusing, and the wire connected with the cup by fusing or brazing, substantially as set forth.

4. The cup B, having the cone *c*, and provided with the wire *x*, said cup being composed of pure or approximately pure zinc, and said wire cast into the cone and projecting beyond the ends thereof, substantially as set forth.

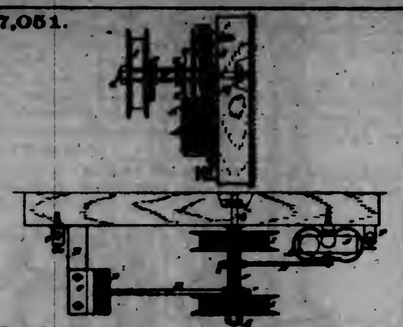
5. A battery-cup comprising the body A, having the socket *i*, the cup B, having the cone *c*, and the wire *x*, constructed, combined, and arranged to operate substantially as described.

6. In a battery-cup, the body A, composed wholly or in part of an amalgam of zinc and mercury, said body being provided with a socket for receiving a zinc cup, substantially as set forth.

387,050. CUTTER FOR MINING-MACHINES. EDWIN H. GARDNER, Knoxville, Allegheny County, assignor to John S. Scully, Pittsburg, Pa. Filed Apr. 24, 1888. Serial No. 271,668. (No model.)



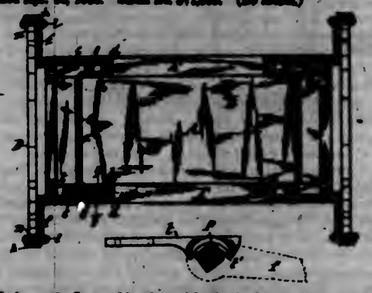
Claim.—1. A cutter having a cutting point or points for removing material at and adjoining its center and two lateral wings in a plane below said cutting-points, one of said wings being provided with transverse scoring-edges and the other with a longitudinal cutting-edge, substantially as set forth.



2. A cutter having a cutting point or points at or adjacent to its center and two lateral wings provided with cutting and scoring edges, respectively, each of said wings having a cutting-edge on its rear side, substantially as set forth.

387,051. LIGHTNING-ARRESTER FOR ELECTRIC CIRCUITS. FREDERICK A. GILMER, Elmira, N. Y. Filed May 15, 1888. Serial No. 273,788. (No model.)

Claim.—1. The combination, with the piston of a lightning-arrester, of a rotary device carrying one of said pistons, a catch or detent



387,051.

normally in the path of the rotary device, so as to restrain it against movement, and an electro-magnet in the circuit including the piston and adapted when energized to withdraw the catch or detent out of the path of the rotary device, whereby the rotary device after being released by the action of the magnet will again encounter the said detent at the end of a complete revolution, as set forth.

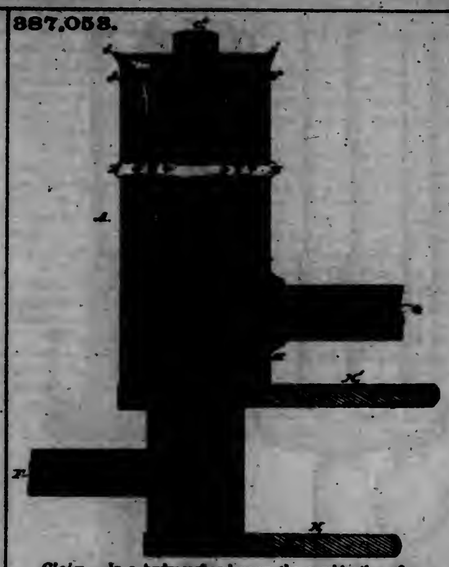
2. In a lightning-arrester, the combination, with a stationary plate, of a movable plate, a sleeve or shaft capable of complete rotation, a motor for rotating the same, an arm extending from said sleeve and carrying the movable plate, a detent or catch normally in the path of movement of an arm secured to the rotary sleeve, and an electro-magnet in the circuit including the plates and adapted when energized to withdraw the detent or catch and set the sleeve in rotation, whereby the movable plate will be carried away from the stationary plate, as set forth.

387,052. STEAM-VEHICLE. EDWARD GAY, Rochester, N. Y. Filed Apr. 16, 1888. Serial No. 271,033. (No model.)

Claim.—1. In combination with the body and its supporting-spring, a rocking bar secured to the body and provided with a V-shaped bearing on the same, and a coupling-arm connecting said rocking bar with the aforesaid spring, as set forth.

2. In combination with the body, the torsion-spring C, formed of a square bar bent into a U-shaped loop, *b*, in a plane diagonal relative to the shape of the bar, the metal shoe *d*, interposed between said loop and body and secured to the latter, and the clip *c*, outside said loop and secured to the shoe, substantially as described and shown.

3. In combination with the loop *b* of the spring C, the shoe *d*, provided with the flange *d'*, and the clip *c*, provided with the stud-pin *c'*, projecting from the clip and passing through the shoe and riveted thereon, substantially as described and shown.



4. In combination with the body A, coupling-arm *f*, and the spring D, formed with the shackle-eye *n*, the coupling-bolt *l*, passing through said eye and through the end of the coupling-arm and formed with the circumferential groove *l'*, substantially as and for the purpose set forth.

5. In combination with the body A, the coupling-arm *f*, formed with the yoke *i* and eyes *i i*, the spring D, formed with the shackle-eye *n* inserted between the eyes *i i*, the coupling-bolt *l*, formed with the shoulder *o*, and the nut *l* on the end of said bolt, substantially as described and shown.

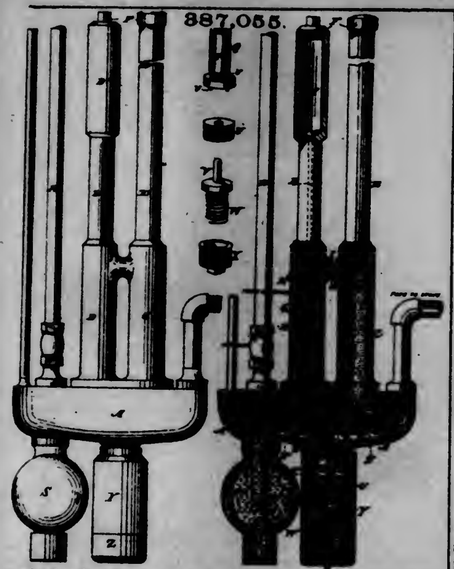
6. In combination with the body A and spring D, the torsion-spring C, provided with the V-shaped bearing *p*, and the arm *f*, rigidly attached to said torsion-spring and coupled to the spring D, substantially as described and shown.

387,053. HYDROCARBON-BURNER. CHARLES GILL and JOHN S. PARKINSON, Chicago, Ill. Filed Nov. 3, 1887. Serial No. 254,163. (No model.)

387,053.

Claim.—In a hydrocarbon-burner, the combination of a central air-tube, an intermediate tube, and an outer tube, the latter forming the casing of the burner, an oil-supply pipe secured to the said outer tube for the supply of oil, and the steam-supply pipe secured to the intermediate tube, each of said tubes provided at one end with an outwardly-extending flange, whereby the flame is spread outwardly around the outward flange, a steam-passage formed between the said air-tube and intermediate tube, an oil-passage between the outer tube and intermediate tube, and handles secured, respectively, to the air-tube and intermediate tube, by which these tubes are adjusted for the purpose of regulating or stopping the supply of oil and steam, substantially as described.

387,054. SUSPENDERS. Freeman C. Rowe, Burlington, assignor to the Willard Manufacturing Company, St. Albans, Vt. Filed June 23, 1887. Renewed May 16, 1888. Serial No. 273,553. (No model.)



Claim.—1. In a pair of suspenders, a body and a back-band made of one seamless piece of webbing or like material combined with slotted plates, substantially as specified, whereby the length of the back-band may be adjusted, and buckles and seams are dispensed with.

2. A pair of suspenders having its body portion and an adjustable back-band all made in one seamless piece, the suspenders being also made double below the back-band and combined with plates and with button-loops, substantially as specified.

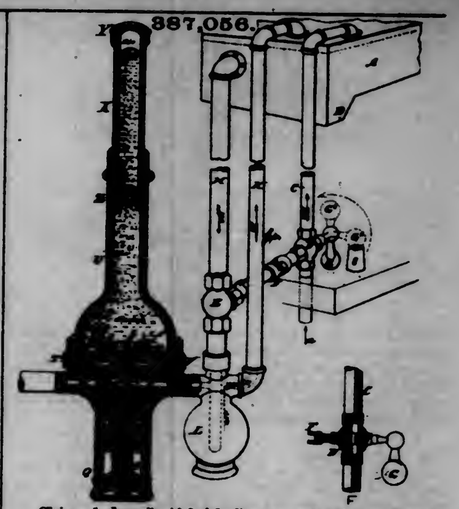
387,055. AUTOMATIC FEED-REGULATOR FOR LIQUID FUEL. WILLIAM H. RADEMAN, Boston, Mass., assignor to the Rademan Freight Car Heater Company, Portland, Me. Filed Mar. 14, 1887. Serial No. 230,958. (No model.)

Claim.—1. In an organized apparatus automatically regulating a flow of liquid fuel between the points of supply and combustion, the base A, provided with the chamber K and passage B², the chambers B and C, supported by said base A and provided with an intercom-

387,055.

municating duct, I, permitting alcohol to enter the contiguous chamber B and rest upon mercury therein contained, the mercury-tube D, thereto attached, provided with an expansion-chamber, D', and the alcohol-tube E, communicating with the chamber C, all arranged to coact with the residuum-chamber S, the tube E thereto communicating, the valve-casing Y, the valve P therein contained, provided with the conical opening Q, the diaphragms L and M, adapted to receive the pressure of the alcohol, thereby actuating said valve downward, and the spring W, compensating for the pressure of the diaphragm, substantially in the manner and for the purpose set forth.

2. In an automatic liquid-fuel regulator, the chambers B and C, the passage I, connecting said chambers, the base A, provided with the chamber K and passage R^2, the casing Y, pendantly attached to said base, the spring W therein contained, the receiving-nut X, upholding said spring, the follower V, thereby supported and actuated, and the gage-nut U, all adapted to operate in combination with a slide-valve, P, provided with an opening, Q, for the constant transmission of oil, the resisting diaphragm M, resting upon said valve, and the resilient diaphragm L, adapted to receive the pressure of the alcohol, whereby said valve is actuated to lessen or to increase the flow of oil to the stove, as in the manner set forth.



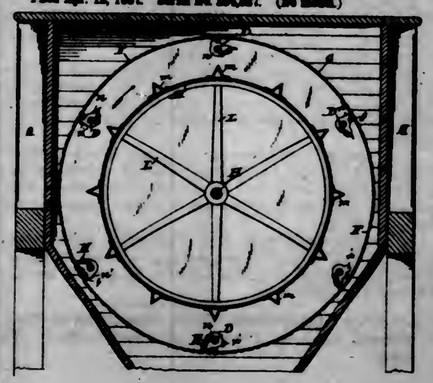
3. In an automatic liquid-fuel regulator, the combination, with the chambers B and C, provided with the duct I, and the tubes D and E, the diaphragms L and M, the base A, provided with the chamber K and oil-passage R^2, the casing Y, and the assembled devices V W X U therein contained, of a valve, P, provided with an adjusting-base having one or more projections, *v*, thereon to permit the discharge of sediment, and a transverse conical opening, Q, adjacent to its head to permit the passage of the liquid fuel, substantially as described.

4. In an automatic fuel-regulator, the combination, with the diaphragms L and M, the casing Y, the valve P, provided with the opening Q, and projections *v*, the adjusting-nut U, threaded within said casing Y, the follower V, spring W, and nut X, of the base A, provided with a chamber, K, having annular shoulders N N' to receive the peripheries of said diaphragms, a passage, R^2, for the transmission of oil, a drain-duct, *w*, permitting the escape of oil from said chamber K, a residuum-chamber, S, provided with a duct for the liberation of air, and the chambers B and C, having a duct, I, to establish communication, as herein described.

5. In an automatic liquid-fuel regulator, the base A, provided with the chamber K and passage R^2, the residuum-chamber S, the casing Y, the valve P, provided with the opening Q, the spring W, and the diaphragms L and M, all combined and adapted to co-operate with a duplex-chambered receptacle, B C, provided with an intercommunicating duct, I, and an inclined base contiguous to said diaphragms to facilitate the dislodgment of air from the chamber K, as in the manner and for the purpose specified.

387,056. LIQUID-FUEL-FEEDING APPARATUS. WILLIAM H. RANDAH, Boston, Mass., assignor to the Eastman Freight Car Heater Company, Portland, Me. Filed Apr. 13, 1887. Serial No. 234,594. (No model.)

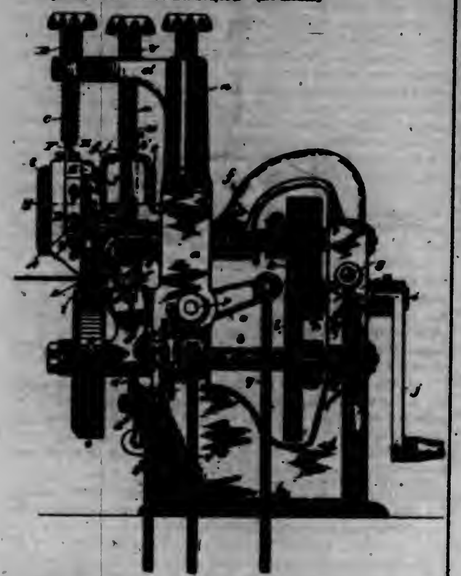
387,056.



Claim.—1. In a liquid-fuel-feeding apparatus, the combination, with the receptacle U, provided with a foraminous base or bridge, W, and an expansive chamber, X, threaded into the top thereof, the bed-piece T, provided with oil-ducts J I, the diaphragms S R, the perforated valve M, underlying said diaphragms, and the follower O, of a hermetic tank, A, provided with a deposit-chamber, B, at the bottom of one end thereof, air-pipe C K, for admission of air above the contents of said tank, and outlet-pipe H, provided with the cut-off valve E, for transmitting oil to the burner, substantially as described.

2. In a liquid-fuel-feeding apparatus, the combination, with a bed-piece, T, provided with transverse oil-ducts J I, the diaphragms R S, seated within said bed-piece, the valve-case Q, thereto attached, provided with accessories embracing a nut, P, spring-follower O, and check-nut N, the valve M, thereby actuated, and provided with the oil-passage *c*, of a receptacle, U, for the reception of alcohol, provided with a foraminous concaved bridge, W, at its bottom and a screw-plug, Z, at its top, admitting to the interior, substantially as illustrated, and for the purpose described.

3. In a liquid-fuel-feeding apparatus, the expansion-chamber X, the receptacle U, thereto united, to contain alcohol, the diaphragms R and S, adapted to receive the pressure of said alcohol, the hermetic tank A, the accessory pipes C K, conveying air thereto, the oil-pipe H, leading therefrom, the cock D, provided with an operative lever-bar, G, the loose clutch F, and the cut-off valve E, constructed and adapted to operate in combination with a bed-piece, T, provided with oil-passages, and a residuum-chamber, L, the valve-case Q, thereto attached, the spring-follower O, therein contained, and the valve M, having a reciprocating motion to control the variable flow of liquid fuel to the burner, substantially in the manner and for the purpose set forth.



387,057. CENTRIFUGAL REEL. SILAS C. HARRIS, Jackson, Mich., assignor to the George T. Smith Middlings Purifier Company, same place. Filed Apr. 12, 1887. Serial No. 234,457. (No model.)

Claim.—1. The combination, with the inner drum provided with the longitudinal blades, of the bolting-reel and the sliding elevator, substantially as set forth.

2. In a flour-bolt, the combination of an outer relatively slow-moving bolting-reel provided with internal elevators, and an inner relatively fast-moving drum adapted to receive material carried up by the elevators and discharge the same against the bolting-cloth, substantially as set forth.

387,058. MACHINE FOR SHARPENING AND FEATHERING THE BOOT OR SHOE HEELS. ANDREW BYRNE, Jr., Boston, Mass. Filed Apr. 30, 1888. Serial No. 271,951. (No model.)

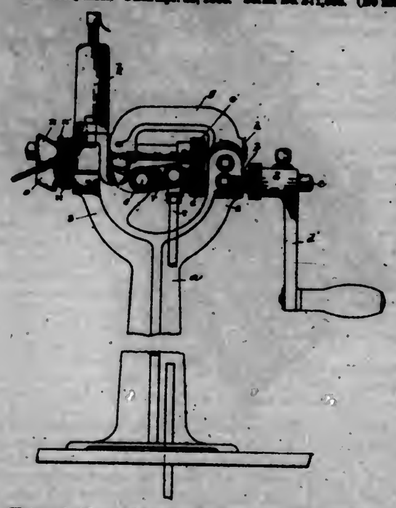
Claim.—1. The combination of the bed-rail, the feed-wheel, the vertically-movable yoke or frame *f*, supporting the feed-wheel and provided with a depressing-spring, a lever whereby said yoke may be raised to elevate the feed-wheel, the edge-beveling knife, the spring-depressed holder therefor, and means, substantially as described, for independently raising said knife, as set forth.

2. The combination of the bed-rail, the feed-wheel, the vertically-movable yoke or frame supporting the feed-wheel and provided with a depressing-spring, a lever whereby said yoke may be raised to elevate the feed-wheel, the channeling-knife and a spring-depressed holder therefor, arranged, as described, to be raised by the yoke *f*, and an adjustable stop to limit the downward movement of the channeling-knife, as set forth.

3. The combination of the bed-rail, the feed-wheel, the vertically-movable yoke or frame *f*, supporting the feed-wheel and provided with a depressing-spring, a lever whereby said yoke may be raised to elevate the feed-wheel, the edge-beveling knife, the spring-depressed holder therefor, a connection, substantially as described, between said holder and the yoke or frame *f*, whereby the holder and knife are raised by said frame, and means, substantially as described, for independently raising said knife and holder, as set forth.

4. The combination of the bed-rail, the feed-wheel, the spring-depressed vertically-movable frame supporting the shaft of the feed-wheel, means, substantially as described, for raising said frame, the edge-beveling knife, the vertically-movable holder for said knife engaged with said frame to be elevated thereby, and a vertically-adjustable stop which limits the downward movement of said holder, as set forth.

5. The combination of the bed-rail, the feed-wheel, the vertically-movable spring-depressed frame supporting the shaft of the feed-wheel, means for raising said frame, and the vertically-movable knife-holders a B, arranged to be raised by the yoke *f* and provided with depressing-springs, as set forth.



6. The combination of the supporting-frame, the bed-rail, its shaft, the yoke or frame pivoted to the fixed supporting-frame, the feed-wheel mounted on a shaft journaled in said yoke, the crank-shaft *i*, journaled in said yoke and connected, as described, by gearing with the shafts of the bed-rail and feed-wheel, whereby said rail and wheel are positively rotated in opposite directions, a spring whereby the pivoted yoke and feed-wheel are depressed, a lever whereby said yoke and feed-wheel may be raised, and vertically-movable holders a B, provided, respectively, with an edge-beveling knife and a channeling-knife and arranged to be raised by the yoke *f*, springs a C, whereby said holders are depressed, and adjustable stops whereby the depression of said holders is regulated, as set forth.

7. The combination of the supporting-frame, the bed-rail journaled therein, the yoke or frame *f*, pivoted to the supporting-frame, the feed-wheel mounted on a shaft which is journaled in said yoke, the lever *o*, pivoted to the supporting-frame and adapted to raise the yoke, the vertically-movable knife-holder *a*, having the edge-beveling knife *r*, the spring *u*, whereby said holder is depressed, and the pivoted lever *d'*, whereby said holder may be independently raised.

8. The combination, with the bed-rail, the feed-wheel, and the beveling and channeling knives, of the laterally-movable edge-guide, the pivoted lever supporting said guide, and adjustable stops for said lever, as set forth.

9. The combination, with the bed-rail, the feed-wheel, and the beveling and channeling knives, of the gages or feet *b' L*, arranged to bear on the upper surface of the sole at opposite sides of the feed-wheel and in advance of said knives, as set forth.

387,059. SOLE-EDGE-TRIMMING MACHINE. ANDREW BYRNE, Jr., Boston, Mass. Filed Apr. 30, 1888. Serial No. 271,952. (No model.)

Claim.—1. The combination of the supporting frame or standard, the longitudinally-adjustable shaft *e*, journaled therein, the vertically-movable shaft *f*, having a yielding movement, and the frusto-conical rolls *a c*, mounted on said shafts, the smaller end of one of said rolls having a flange which overlaps the larger end of the other roll, the said rolls being made adjustable by the longitudinal adjustability of the shaft *e* and by the yielding movement of the shaft *f*, as set forth.

2. The combination of the supporting frame or standard, the adjustable bearing *b* thereon, the shaft *e*, journaled in said bearing and adjustable therewith, the yoke *g*, pivoted to the supporting-frame and having a depressing-spring, the shaft *f*, journaled in said yoke, and the rolls *a c*, mounted, respectively, on the shafts *f e*, one of said rolls having a flange, *a'*, overlapping the larger end of the other roll, as set forth.

3. The combination, with the conical rolls *a c*, the former having a flange at its smaller end overlapping the larger end of the latter, and the guide *u*, formed to support the edge of a sole while it is being presented to said rolls, as set forth.

387,060. THILL-COUPLING. BENJAMIN A. FAHS, Galesburg, Ill. Filed Feb. 6, 1887. Serial No. 226,923. (No model.)

Claim.—1. In a thill-coupling, in combination, a case, C, having a cavity in its upper side, bearing-surfaces *d'*, and V-shaped grooves *d*, a thill-iron having trunnions *f'*, a rubber block, G, having groove *g*, plate D, having its forward side fitted to the V-shaped groove *d*, and binding-bolt B, substantially as and for the purpose specified.

2. In a thill-coupling, in combination, clip B, case C, having a cavity in its upper side, bearing-surfaces *d'*, side grooves, *d'*, hole *d'*, and V-shaped grooves *d*, thill-iron having trunnions *f'*, rubber block

387,060.

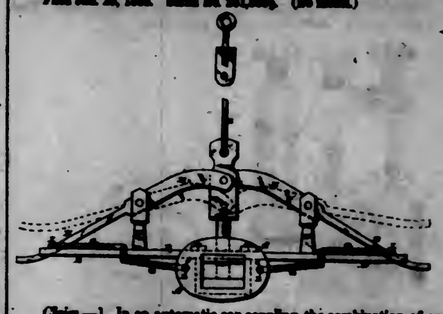
having grooves *g g' g'*, plate D, and bolt B, substantially as and for the purpose specified.

387,061. SUGAR-CANE HARVESTER. HENRY FATH, Middletown, Ind. Filed Apr. 18, 1887. Serial No. 235,272. (No model.)

Claim.—1. The combination, with the machine-frame, of the tongues secured to the forward portion thereof, the stalk-cutter consisting of the stationary circular cutter-plate formed with teeth at its forward edge and provided at its sides with upward-extending arms, the upper ends of which are formed with longitudinal slots, bolts, and nuts for securing the same to the tongues, and the circular revolving cutter-plate having knives on its periphery and means, substantially as set forth, for rotating it.

2. The combination, with the machine-frame, of the tongues secured to the forward portion thereof, the curved guide-rods secured to said tongues with one end and extending upward and rearward and secured at their other ends to the upper part of the machine-frame, a rotary stalk-cutter supported by arms depending from said tongues, a feed-belt at the top of the machine, provided with projections or teeth, the top cutters immediately in the rear of this feed-belt, and the intermeshing carrier-belts running along the top of the machine in the rear of the top-cutters, and gearing, substantially as described, for operating the several parts from the drive-wheels of the machine.

3. The combination, with the machine-frame having the parallel tongues, of the rotary stalk-cutter, the carrier-belts, and the stripper-frames mounted on the crank-shafts, and gearing, substantially as described, for operating the several parts from the machine drive-wheels.

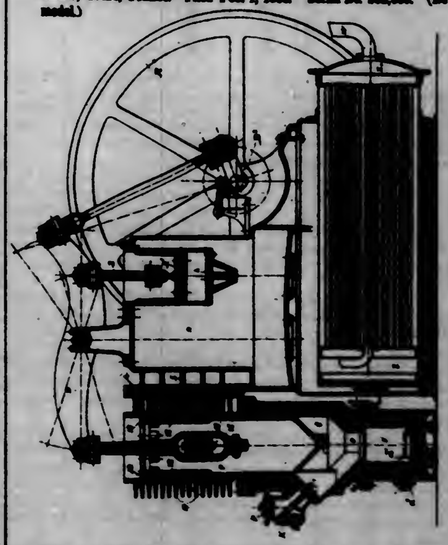


4. The combination, with the machine-frame, of the stalk-cutter, the feed-belt, the carrier-belts, and the stripper-frames mounted on the crank-shafts and pivotally connected to the centrally-pivoted walking-beam, and gearing, substantially as described, for operating the several parts from the machine drive-wheels.

5. The combination, with the machine-frame, of the stripper-frames mounted on the crank-shafts and pivotally connected to the centrally-pivoted walking-beam on the machine-frame and provided with the transverse bars formed with fingers or teeth, and means, substantially as described, for rotating the said crank-shafts.

6. The combination, with the machine-frame having parallel tongues, of the curved guides, the rotary stalk-cutter, the elevator, the feed-belt, the top-cutters, and the strippers mounted on the crank-shafts, and gearing, substantially as described, for operating the several parts from the machine drive-wheels.

7. The combination, with the machine-frame, of the rotary stalk-cutter, the elevator, the feed-belt, the top-cutters, the carrier-belts, the strippers mounted on crank-shafts, the rods, the rear platform, and the hooker, and gearing, substantially as set forth, for operating the several parts from the machine drive-wheels.



387,062. CAR-COUPLING. CHARLES E. FOX, Hendrix, Miss. Filed Jan. 28, 1888. Serial No. 261,895. (No model.)

Claim.—1. In an automatic car-coupling, the combination of one or more tripping-levers which extend horizontally across the end of the car, and which are bent at their centers so as to be pivoted upon a plate or the timbers of the car, and which have their ends turned in opposite directions with the pivoted operating-levers, the coupling-pin, and the draw-head, substantially as shown and described.

2. The combination of the plate which extends horizontally across the end of the car, the tripping-levers which extend in a line with the plate and which have their ends turned at right angles, the standards mounted upon the plate or the end of the car, the operating-levers, the coupling-pin, and the draw-head, the parts being combined and arranged to operate substantially as set forth.

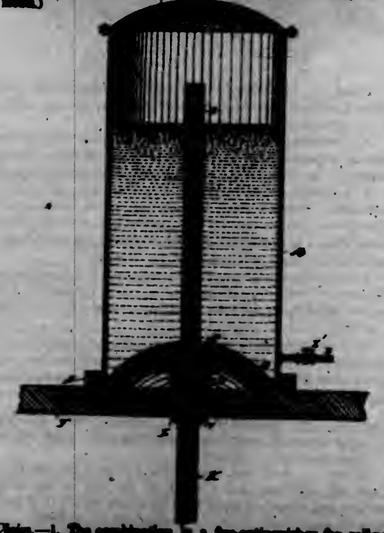
387,063. HOT-AIR ENGINE OR AEROTHERMIC MOTOR. LOUIS GIFFY, Tours, France. Filed Feb. 1, 1888. Serial No. 262,660. (No model.)

Claim.—1. The improved hot-air engine or aerothermic motor composed of the compression-chamber provided with the shaft-bearings at one end, the working-cylinder, motor-piston, and expansion-chamber at the opposite end of said chamber, the feed-pump supported by flanges in said chamber and having its cylinder in communication therewith, the beam mounted on said chamber, the crank-shaft mounted in said bearings, and the connection-rods between the said beam and the motor-piston, the pump-piston, and the crank-shaft, respectively, in combination with the combustion-chamber placed under and communicating with the expansion-chamber, and the heater interposed between the compression and the combustion chambers and heated by the waste-gases from the expansion-chamber, substantially as described.

2. The combination, with the working-cylinder and motor-piston, the combustion and expansion chambers under said working-cylinder, the heater receiving the waste gases from the said chambers, and the feed-pump for compressing the air into said heater, of the admission-valve placed in the passage leading from the said heater into said combustion-chamber and automatically operated by connections with the mechanism driven by said motor-piston, substantially as described.

3. The combination, with the machine-frame, of a working-cylinder and an expansion-chamber fastened to said frame, so as to be supported thereby independently of the combustion-chamber, and a removable combustion-chamber arranged under and detachably connected with said expansion-chamber, substantially as described.

4. In combination with the working-cylinder, the motor-piston, and the expansion-chamber, the combustion-chamber arranged under the said expansion-chamber and provided at the top with a contracted throat, through which it is in direct communication with said expansion-chamber, said combustion-chamber being, moreover, provided with passages leading one to the lower part of said chamber and the other to its upper part below the contracted portion or throat, substantially as described.



5. The combination, with the working-cylinder, the expansion-chamber, and the combustion-chamber, of the hollow motor-piston, the connection-rod, and the means inside said motor-piston for connecting the inner end of the said rod with the said motor-piston, said means consisting in a flexible blade or metal spring fastened at one end to the said rod and at the other to a cross-piece of said motor-piston, substantially as described.

6. The combination, with the combustion-chamber, the expansion-chamber, the working-cylinder, the motor-piston, the feed-pump, and the crank-shaft, of the beam and the connection-rods provided with double joints having axes at right angles to each other and to the length of the rods, substantially as described.

7. The working-cylinder provided externally with ribs or projections, in combination with a machine-frame provided with a plate to which said cylinder is bolted, said plate being connected with said frame by webs, substantially as described.

8. The combination, with the combustion-chamber, the expansion-chamber, the working-cylinder, the motor-piston, and mechanism operated by said piston, of the admission-valve, the elongated admission-cam or the crank-shaft having a helical incline for closing said valve, the lever for operating the valve from said cam, the centrifugal governor, and the regulating mechanism, whereby said governor shifts said lever lengthwise of said cam and causes it to be operated by different parts of the cam-surface, substantially as described.

387,064. FIRE-EXTINGUISHER FOR RAILWAY-CARS. GEORGE GUSS, Milwaukee, Wis. Filed Jan. 17, 1887. Serial No. 224,402. (No model.)

Claim.—1. The combination, in a fire-extinguisher for railway-cars, of the feed-tank, the hooking apparatus, and a pipe making air-connection between the hooking device and the tank, said pipe being

operable at or near the tank and having suitable valves in its two parts for closing the same and preventing exit of air, as herein set forth.

2. In a fire-extinguisher, the combination, with a pressure apparatus, an air-tube extending therefrom having a valve in its extremity, of a tank having a tube therein projecting beyond its outer surface, the end of the tank-tube being adapted to enter the air-tube and thereby depress its valve, whereby air-pressure is supplied to the tank.

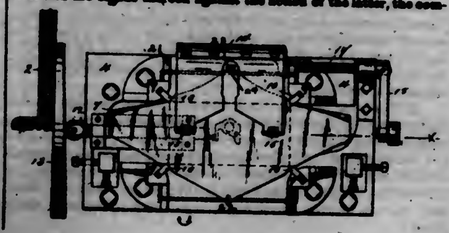
3. In a fire-extinguisher, the combination, with the pressure apparatus and an air-tube extending therefrom and having a valve at its extremity, of a tank, a tube extending from said tank, the end of the tank-tube being adapted to enter the extremity of the air-tube and thereby depress its valve and allow flow of air into the tank, and a valve in the tank-tube closing outwardly by air-pressure in the tank, whereby the air is prevented from escaping when the tank is removed from the air-tube, as herein set forth and described.

4. The combination, with the auxiliary cylinder, a removable reservoir or tank, and a valve in said reservoir or tank having its opening toward the interior of the latter, of a valve in communication with the cylinder and adapted to communicate with the other valve and opening oppositely to the former valve, substantially as set forth.

5. The combination, with the cylinder X, of a valve in communication with said cylinder and held normally closed by the air therefrom, a portable reservoir, a protuberance in said reservoir adapted to communicate with and hold open said valve, and a valve in said reservoir adapted to close by gravity when the said protuberance and valve are disconnected.

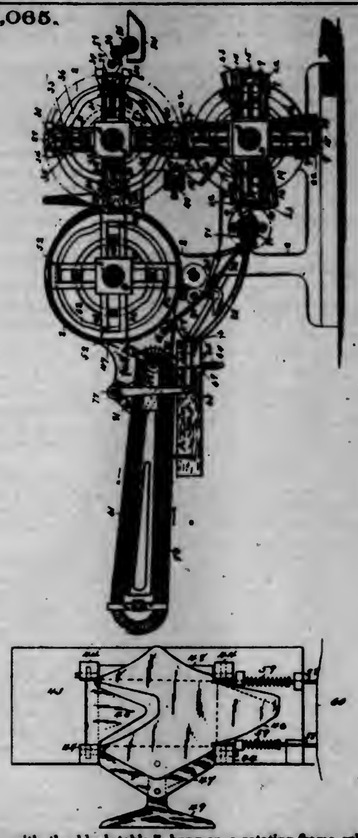
6. The combination, with the cylinder X for operating the brakes, of a valve in communication therewith, a removable tank, a protuberance adapted to communicate with said valve and with the removable tank and to hold said valve open, and a gravity-valve in said protuberance, substantially as set forth.

7. The combination, with the cylinder for supplying compressed air and the portable reservoir, of two valves, detachably connected with each other, opening in opposite directions, and one being connected with the air-tank and the other with said reservoir, whereby one is held open and the other closed by the air from said tank, and a casing in which one of said valves is located and the end of which bears upon the opposite valve to force it open.



8. The combination, with the auxiliary air-cylinder, of a pipe, K, leading therefrom, a valve in said pipe opening toward the pressure of air, a tank for containing liquid, a pipe, C, on the interior of said liquid-tank protruding beyond its outer wall and adapted to communicate with pipe K and force the valve therein open, and a valve in said pipe C opening oppositely to the other valve.

9. The combination with the auxiliary air-cylinder and a portable tank, of a tube extending upward in said tank, a hollow truncated cone on the outer wall of said tank, and communicating with said tube, a valve in said cone opening toward the upper end of said tube, a bar across the lower end of said cone, a pipe leading from said air-cylinder, an enlargement on the terminus of said pipe, a conical cavity in said enlargement for the reception of said truncated cone, a valve in said enlargement adapted to be forced open by the bar on said cone, and a spring for holding it closed when said cone is removed.



10. The combination, with the air-cylinder and air tube or passage leading therefrom having an inwardly-opening valve with a vertical stem in its extremity, of a portable tank having a tube extending out through its bottom and adapted to enter the air-tube, and a perforated fibrous disk or packing secured to the extremity of the tank-pipe, whereby the stem of the valve is depressed and a tight joint secured by pressing one pipe within the other.

387,065. ROTARY ENVELOPE-MACHINE. HENRY A. GRANT, Springfield, Mass. Filed May 24, 1888. Serial No. 275,028. (No model.) Patented in Canada Apr. 30, 1888, No. 23,254; in England Sept. 2, 1888, No. 11,339; in France Sept. 6, 1888, No. 179,488; in Germany Sept. 6, 1888, No. 50,714; in Belgium Sept. 13, 1888, No. 79,518, and in Austria-Hungary Aug. 6, 1887.

Claim.—1. In a rotary envelope-machine, as a means for feeding the blank-table outwardly toward the pickers and for holding said table and the blanks thereon against the action of the latter, the com-

387,065.

bination, with the blank-table 7, hung on a rotating frame, substantially as described, of a post, 8, connected by one end to said table and having its opposite end entering a socket in the frame 4, a spring-clamp, 11, fixed on the latter and surrounding said post, a sliding bar, 12, having an endwise movement on frame 4 against and from one side of said clamp, and a cam-strip on the frame of the machine, with which the outer end of said sliding bar engages, substantially as set forth.

2. As means for limiting the outward movement from frame 4 of the blank-table and the pile of blanks thereon, a blank-retainer, 14, and means, substantially as described, for swinging the latter over and off from the pile of blanks while the latter is being rotated opposite the picker devices, combined and operating substantially as set forth.

3. In combination, the blank-table 7, having, together with the blanks thereon, a free outward movement from frame 4, the crank-shaft 17, having arm 16 thereon, the blank-retainer 14, secured on the latter, and a suitable cam for the engagement therewith of the crank-arm on said shaft 17, whereby the blank-retainer is given a vibratory motion over the pile of blanks during the rotation of said frame, substantially as set forth.

4. In combination, the pickers 24, having a rotary motion with frame 5, opposite and in conjunction with the blank-table 7, a spring-arm, 23, secured at the edge of the latter and having a curved free end for engagement with said pickers, a spring-hook, 24, having its free end projecting through said arm, and the spring-hook 23, substantially as set forth.

5. The rotating frame 5, a picker-box located between suitable supporting-posts projecting from the side of said frame and having a partly-covered face and open ends, and having across one end thereof the curved strip 28, the vibratory arm 30, having the curved strip 29 thereon, and means, substantially as described, for swinging the end of said arm against and from the end of said box while the latter, with frame 4, is rotated, combined and operating substantially as set forth.

6. The combination, with the picker-box, of the pickers 24, bars on each side of the latter, the bars 26, to which said pickers are attached, the frame 5, having a cam-groove therein, with which the ends of said bars engage, whereby the pickers are given a reciprocating motion by the sides of said bar, substantially as set forth.

7. In combination, the picker-box, the pickers 24, and the lever 37, pivoted on the side of said box, and means, substantially as described, for imparting a vibratory motion to said lever while the frame 5 and the picker-box rotate, substantially as set forth.

8. In combination, the picker-box having the curved strip 28 across one end, the arm 30, having the curved strip 29 thereon, and the evener-shaft 40, having thereon the evener 41, to rotate in engagement with said strips 28 and 29, substantially as set forth.

9. In combination, the rotating frame 5 and 6, the picker-box, the vibratory arm 30, means, substantially as described, for swinging the latter away from the end of said box, and the folding-wing 45, swinging into the open end of the latter under the envelope-blank thereon and raising the blank, substantially as set forth.

10. In combination, the rotating frame 6, the plate 43, supported on the latter, the end-flap-folding wings 45 and 46, the back-flap-folding wing having the adjustable extension 49 thereon, the eccentric end-flap-folding shaft 48, rolling over the edge of said extension, and means, substantially as described, for imparting vibratory motions to said wings and a rocking motion to said shaft, substantially as set forth.

11. In combination, the rotating frame 6, the plate 43, the end-flap-folding wings 45 and 46, the back-flap-folding wing having the adjustable extension 49 thereon, the eccentric end-flap-folding shaft 48, rolling over the edge of said extension, the pins 50, extending over the shaft of one of the end-flap-folding wings, and means, substantially as described, for imparting a reciprocating endwise motion to said pins and vibratory motions to said wings and a rocking motion to said shaft, substantially as set forth.

12. In combination, the back-flap-folding wing 47, having the adjustable extension 49 thereon, and the eccentric end-flap-folding shaft 48, and means, substantially as described, for imparting a vibratory motion to said folding-wings and a rocking motion to said shaft, substantially as set forth.

13. In combination, in an envelope-machine, the rotary frame 4, the blank-table 7, (having convex surface,) secured to the frame, the posts 9, attached to the frame and extending opposite the edges of said table, and the spring-actuated guide-strip 10, secured in grooves in said posts, so as to bear against the edges of the table, substantially as described.

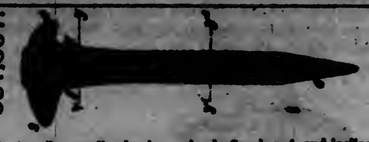
387,066. SPIKE. EDWARD GRIMM, Lake View, assignor to himself and Morris Sellers, Chicago, Ill. Filed Feb. 18, 1888. Serial No. 264,627. (No model.)

Claim.—1. In a spike-bar, the head 15, having beads 17 and 18, produced or developed along one edge of the bar exterior to the usual rib, 14, substantially as set forth.

2. A railway-rail spike having a driving-head and two claw-bar heads or projections, one on the side next the rail (when the spike is driven) and the other on the opposite side, substantially as set forth.

3. A railway-rail spike having a double head, the upper one of which has a claw-bar head or projection on the side next the rail (when driven) and another on the opposite side, and the lower head of which has a projection or lip, 4, for engaging the rail-flange, and a swell or enlargement, 6, substantially as set forth.

4. A railway-spike having a driving-head, 5, a claw-bar head or projection, 7, on the side of the head next the rail, another, 8, on the opposite side, a lip, 4, and a shank having a taper part, 9, substantially as set forth.



5. A railway-spike having a driving-head, 5, a claw-bar head or projection, 7, on the side of the head next the rail, another, 8, on the opposite side, a lip, 4, and a shank having a taper part, 10, substantially as set forth.

387,067. RAILWAY-SPIKE. EDWARD GRIMM, Lake View, assignor to himself and Morris Sellers, Chicago, Ill. Filed Feb. 18, 1888. Serial No. 264,628. (No model.)

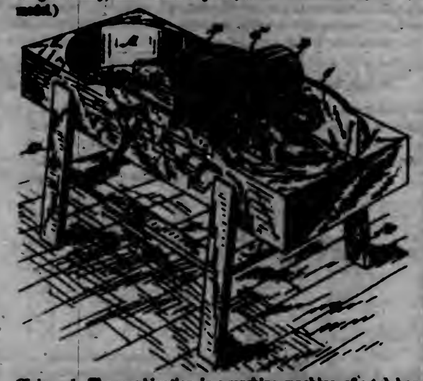
Claim.—1. A railway-spike having a hook, 3, for engaging (when driven) the rail-flange, and a lug, 4, on the rear of the spike-head, arranged and shaped to stand at its outermost end clear of and a little above the upper face of the tie, substantially as set forth.

2. In a railway-spike, a hook-lug, 4, the lower face of which is in a plane higher than and parallel, or approximately so, to the plane of the lower face of the hook 3, substantially as set forth.

387,067.

2. A railway-spike having a hook, 3, a lug, 4, and inclines 5 7, substantially as set forth.

387,068. RAILWAY-SPIKE. EDWARD GRIMM, Lake View, assignor to himself and Morris Sellers, Chicago, Ill. Filed Apr. 2, 1888. Serial No. 269,247. (No model.)



Claim.—1. A railway-spike having an L-shaped shank, upper head with beads 7 and 8, and a lower head with hook 4, substantially as set forth.

2. A railway-spike having an L-shaped shank, an upper head with beads 7 and 8, and a lower head with hook 4 and swell 6, substantially as set forth.

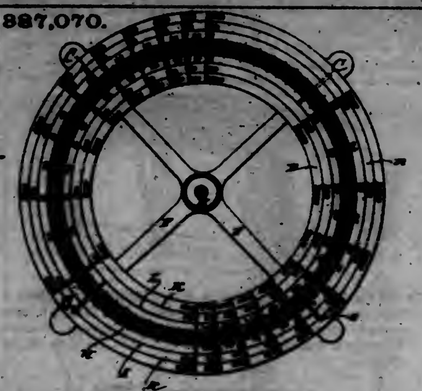
3. A railway-spike having an L-shaped shank, an upper head with beads 7 and 8, a lower head with hook 4, and an incline, 5, beneath the hook, substantially as set forth.

4. A railway-spike having an L-shaped shank, an upper head with beads 7 and 8, a lower head with hook 4, and inclines 9 and 10, substantially as set forth.

387,069. WASHING-MACHINE. HARVEY HARMAN, Judson, Hopper County, Ind. Filed Sept. 24, 1887. Serial No. 250,071. (No model.)

Claim.—1. The combination, in a washing-machine, of a tub having the rounded inner ends, two rotary rubbers mounted in said tub, one on each side thereof, and geared to revolve in opposite directions, and rubbing-boards mounted beneath said rotary rubbers, substantially as set forth.

2. In a washing-machine, the combination of a tub provided with a central partition, A^2, extending only a portion of its length, and spring-mounted rubbing-boards hinged at one end to the bottom of the tub arranged on each side of said partition, and rotary rubbers mounted on each side of said partition above said rubbing-boards and geared to run in opposite directions, substantially as set forth.



3. A washing-machine consisting of a tub, rubbing-boards, and rotary rubbers mounted above said rubbing-boards and geared to revolve in opposite directions, substantially as described, and for the purpose specified.

387,070. LOGARITHMIC SLIDING SCALE. WARREN HALE, East Orange, N. J. Filed Sept. 30, 1887. Serial No. 250,959. (No model.)

Claim.—1. In a slide-rule, the combination of two concentrically-connected and independently-movable disks arranged in the same plane, a circle on each disk being filled with a logarithmic auto-scale and one or more extensions thereof of regularly-increasing numerical value, the scales of the separate disks having the same relative divisional values, substantially as and for the purpose set forth.

2. In a slide-rule, the combination of two concentrically-connected and independently-movable disks arranged in the same plane, a circle on each disk being filled with a logarithmic auto-scale and one or more extensions thereof of regularly-increasing numerical values, and one or more circles arranged concentric to the circle of the auto-scale and its extension and distinctly divided and of proportionately-increasing values, the scales of the separate disks having the same relative divisional values, substantially as and for the purpose set forth.

387,070.

387,071. SHAVING-BRUSH. HENRY V. HAMM, Cleveland, Ohio. Filed Apr. 12, 1888. Serial No. 271,054. (No model.)

Claim.—1. A match-block constructed with a hook-strap having a vertical part formed with a slot in its lower end and a horizontal part formed with a swivel-eye, a hook at the outer end, and a link-depression, substantially as described.

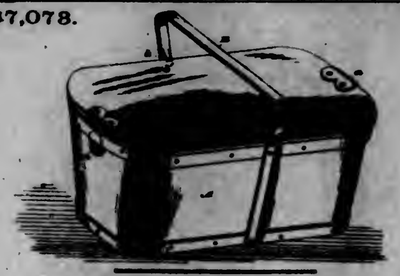
2. A match-block having a hook-strap adapted to slide, formed with a slot for the center-pin, and a link, substantially as described.

3. A match-block having a hook-strap adapted to slide, a link, and a basket for guiding and retaining the strap on the rear check-plate, substantially as described.

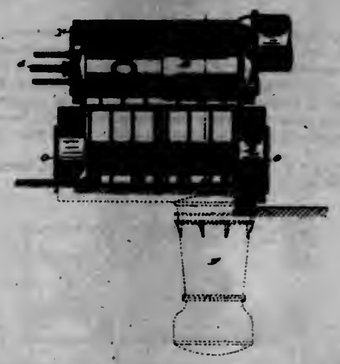
4. A match-block comprising a frame having front and rear check-plates and a bottom plate, the hook-strap having center-pin and slot connection with the rear check-plate, a link, and the link-strap secured to the front check-plate, substantially as described.

5. The combination of the shell or frame having a bracket pulley or sheave having a center-pin, a link, the hook-strap having a slot for the center-pin, and the link-strap, substantially as described.

387,072. FENCE-PANEL. GRAHAM HOOPER, Geneva, Jennings County, Ind. Filed Sept. 9, 1887. Serial No. 248,936. (No model.)



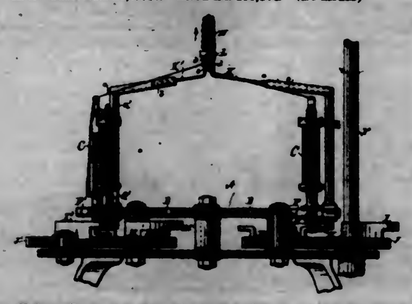
Claim.—The combination, with the posts, of the adjustable collar having the hinged eyes, and means, substantially as described, for securing the collars in their positions, and the fence-panel consisting of the bars having the series of pickets and provided with the hinged eyes, substantially as and for the purpose set forth.



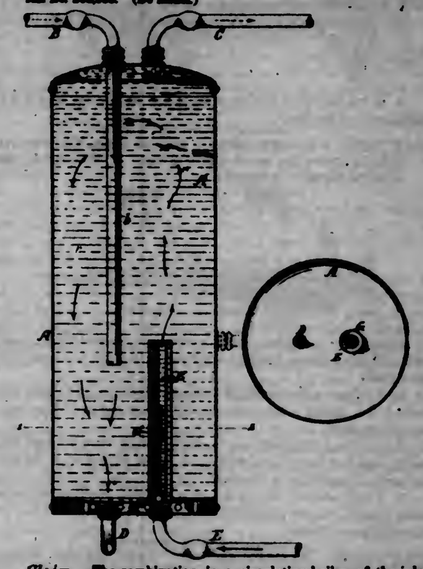
387,073. FISH-BASKET. WILLIAM A. HIRE, Putnam, N. Y. Filed Feb. 2, 1888. Serial No. 262,633. (No model.)

Claim.—The combination, with the basket and the cover therefor, of a handle constructed of strap or band metal secured to the basket and facing outwardly from the upper edge thereof, and having integral bars one and best inward from its center immediately above the edge of the basket to secure the cover, in the manner set forth.

387,073.

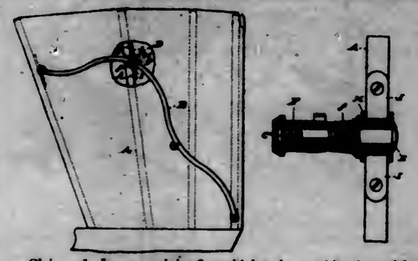


387,074. PUMP. Bowman S. Hixon, Brooklyn, N. Y.; Maria L. Hixon, executrix, and Cyrus G. Hixon, executor, of said Dauphin S. Hixon, deceased, assignors to William A. Perry, Bay Ridge, and Charles C. Worthington, Irvington, N. Y. Filed May 14, 1888. Serial No. 109,415. (No model.)



Claim.—The combination, in a duplex pump, of a horizontally-arranged suction-chamber, a horizontally-arranged force-chamber supported upon the top of the suction-chamber, two horizontal pump-cylinders arranged at the sides of and parallel with suction and force chambers, two vertical or substantially vertical partitions extending the length of each of said chambers and carrying suction and force valves, suction and discharge pipes communicating with said chambers between the partitions, passages H I J K, leading from the outsides of the partitions of the suction-chamber to the opposite ends of each cylinder, and similar passages, Q R S T, leading from the opposite ends of each cylinder to the outsides of the partitions of the force-chamber, substantially as described.

387,075. BRAIDING-MACHINE. Arnold S. Hoxe, Providence, R. I. Filed Dec. 27, 1887. Serial No. 259,174. (No model.)



Claim.—In combination, the upper plate provided with the carrier-tracks and the slot crossing the carrier-track, means for moving the carriers continuously forward along the carrier-tracks, the sliding standard adapted to move within the slot to opposite sides of the carrier-track, the oppositely-acting cams for producing the said movement, and the loop-forming bar, which is loosely held upon the sliding standard, substantially as described.

387,076. BOILER. George B. Herron, Philadelphia, Pa., assignor to the Abram Cox Stove Company, same place. Filed Apr. 7, 1888. Serial No. 269,966. (No model.)

Claim.—The combination, in a circulating-boiler, of the inlet-pipe from the water-back or heating-coil extending into the boiler with an incasing-tube around said inlet-pipe, substantially as and for the purpose described.

387,077. CARRIAGE-TOP PROP. William R. James, Sulphur Springs, Tex. Filed Nov. 12, 1887. Serial No. 255,069. (No model.)

Claim.—1. In a prop-joint for vehicles, the combination, with the bow, of the prop-casting having circumferential flanges secured to the edge of the bow, substantially as specified.

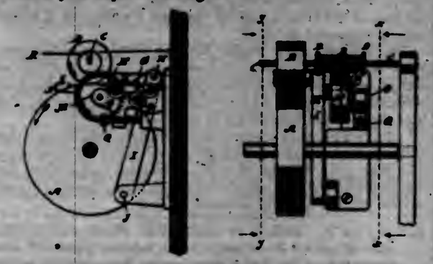
2. In a prop-joint for vehicles, the combination of the bow, the prop-casting having the circumferential flanges lying against the opposite sides of the bow, and the opposite extension-plates lying against and secured by screws to the rear edges of the bow, substantially as specified.

3. In a prop-joint for vehicles, the combination of the bow A, the casting D, provided with the flanges G and extension-plates I, the bolt C, having the head E, the nut F, and the thimble *f*, all constructed and arranged substantially as and for the purpose specified.

387,078. WEATHER-STRIP. James Jamieson, Austin, Ill. Filed Oct. 31, 1887. Serial No. 253,693. (No model.)

Claim.—A weather-strip consisting of a central narrow piece, A, of elastic material, and metal binding-strips B B, firmly secured to and protecting the longitudinal edges of the elastic strip, whereby, by means of nails or screws passed through the metallic strips into a door or door-frame, the portion of the elastic unprotected by the metal strip may be made to bulge outward to a varying degree, substantially as shown and described.

387,079. SELF-OPERATING SIGNALING. Lewis B. Jones, Chicago, Ill., assignor of one-half to William B. Shaw, same place. Filed July 23, 1887. Serial No. 245,009. (No model.)



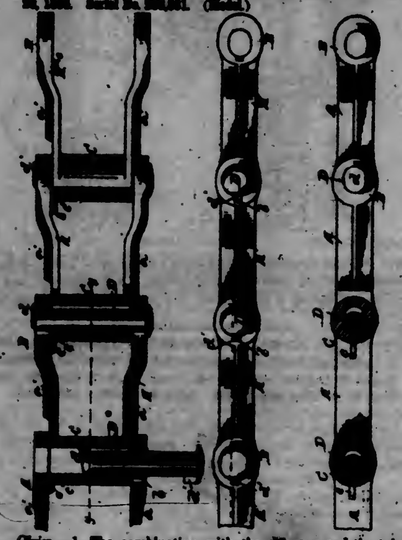
Claim.—1. In an automatic signaling apparatus, the combination, with the shaft carrying the gear-wheel, having the hammer-actuating devices thereon, and pinion, as described, of two gear-wheels engaging said pinion, one connected to the spring or motor, the other carrying a notched disk, a train of gearing for actuating the fly in gear with the wheel carrying the hammer-actuating devices, and two arms, one of which enters the notch in said disk and allows the other to engage the fly and arrest its motion, as set forth.

2. In an automatic signaling apparatus, the combination, with the shaft carrying the gear-wheel, having the hammer-actuating devices thereon, and pinion, as described, of two gear-wheels engaging said pinion, one connected to the spring or motor, the other carrying a notched disk, a train of gearing for actuating the fly in gear with the wheel carrying the hammer-actuating devices, two arms, one of which enters the notch in said disk and allows the other to engage the fly and arrest its motion, and a central pin for moving the same out of engagement with said fly and allowing its further rotation, as set forth.

3. In an automatic signaling device, the combination, with the spring, train of gearing, and fly, as described, of the shaft for said fly, having its ends enlarged to form the bearings and provided with the collars of greater diameter than said enlarged portions for preventing the longitudinal movement of the shaft, substantially as described.

387,080. MACHINE FOR WINDING BOBBINS. James Emerson, New York, N. Y. Filed Feb. 2, 1888. Serial No. 262,714. (No model.)

Brief.—The object of the invention is to produce an improved mechanism for winding bobbins, whereby the accumulation of a certain amount of yarn stops the winding.



Claim.—1. The combination, with the spool-carrying shaft C, having the transmitter B, the actuator A, for revolving the transmitter, and a movable stop, E, of a rotary step-actuator, L, and connections between the latter and the stop, said step-actuator being adapted to be rotated by the material being wound for moving the stop between the actuator and the transmitter, substantially as described.

2. The combination of the spool-carrying shaft C, having the transmitter-disk B, the actuator-disk A, for revolving the latter, the pivoted swinging lever I, the stop E, pivotally connected with the upper portion of the lever, the rotary step-actuator L, adapted to be rotated by the material being wound, and the link K, connecting the step-actuator with the stop-carrying lever for moving the stop between the transmitter and the actuator, substantially as described.

3. The combination of the spool-carrying shaft C, having the transmitter-disk B, the actuator-disk A, the pivoted swinging lever I, carrying the stop E, the pivoted support O, and the weighted rotary step-actuator L, journaled on said support, and the link K, connecting the step-actuator with the stop-carrying lever to move the stop between the transmitter and the actuator disks, substantially as described.

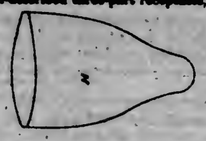
4. The combination of the spool-carrying shaft C, having the transmitter B, the actuator A, the pivoted lever I, the stop E on the lever, the pivoted support O, the set-screw Q, for adjusting the support, the rotary step-actuator L, carried by the support, and the link K, connecting the step-actuator with the pivoted lever to move the stop between the transmitter and the actuator, substantially as described.

387,081. REVERSE. Benjamin A. Lees, Columbus, Ohio, assignor to the Jeffrey Manufacturing Company, same place. Filed Mar. 26, 1888. Serial No. 268,561. (Model.)

Claim.—1. The combination, with the side bar and the tubular end bars having plate-seats which are enlarged laterally and not transversely, of the plates, each having at one end a flange adapted to pass through the plate-seat when the links are in line with each other and to overlap the outer face of the adjacent side bar near one end when the links are in working position, and locking devices, substantially as described, adapted to prevent rotation of the plates relatively to the seats in which their ends are supported, substantially as set forth.

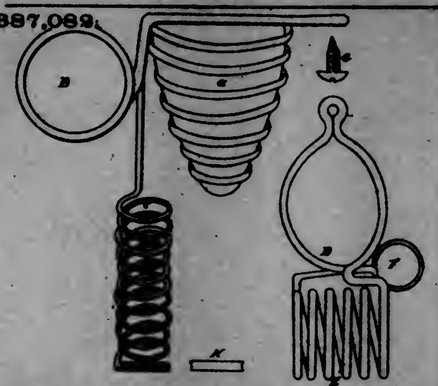
2. The combination, with the side bars and the tubular end bars, both having plate-seats which are laterally elongated in cross-section, of the plates having at their ends lateral projections adapted to pass through the plate-seats when the seats are in line with each other, and to overlap the faces of the adjacent side bars when the links are moved laterally one to the other, the links being provided with stops, substantially as described, projecting from the side bars and engaging with the adjacent links and with the recesses to receive the stops and permit movement of the seats into line with each other, substantially as set forth.

3. The combination, with the side bars and the plates having the laterally-projecting lips, of the spurs upon the inner faces of the side bars and the threads in the tubular end bars, substantially as set forth.



387,082. WRITING-DESK APPENDAGE. Howard Lemmert, Toledo, Ohio. Filed Apr. 20, 1888. Serial No. 272,262. (No model.)

Claim.—1. The herein-described appendage to a desk, consisting of two depending coils and one horizontal coil, in combination with a sponge-receptacle contained within one of the depending coils, as and for the purpose set forth.



2. The herein-described appendage to a desk, comprising a vertical coil and a horizontal coil formed of one portion of a length of wire, with the remaining portion of wire formed into a depending coil having a closed end, as and for the purpose set forth.

3. In an appendage to a desk, a depending coil of wire adapted to be pivotally attached to the same, in combination with a sponge-receptacle fitted within the coil, as and for the purpose set forth.

4. The herein-described three-part receptacle, formed of a single

887,083.

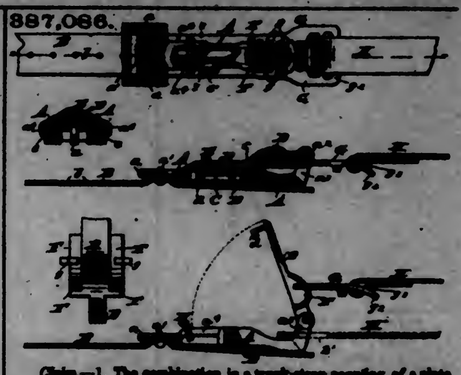
piece of wire and comprising a loop for the reception of a pivot-screw, a depending coil provided with a receptacle, a horizontal coil, and a depending coil having a closed lower end, as and for the purpose set forth.

887,083. FRINGE-POST FOR SEWING-MACHINES. CHARLES F. LEMARDELEY, Bridgeport, Conn., assignor, by mesne assignments, to Charles H. Langdon, Elizabeth, N. J., and George C. Batcheller, New York, N. Y. Filed May 4, 1888. Serial No. 272,734. (No model.)

Claim.—1. A sewing-machine presser-foot having a tape-slot, a flat bottom, convex curves at the sides in front, a separator about midway between the sides extending from the top to the bottom, the lines in the vertical plane from the lower end of the separator to the upper ends of the convex curves and in the horizontal plane from the lower end of the separator to the lower ends of the convex curves being all concave curves.

2. A sewing-machine presser-foot having a tape-slot and a separator in front extending from top to bottom, the lines at the sides being convex curves from points 6 to points 7, the bottom lines being concave curves from points 6 to point 9, and the front lines being concave curves from point 9 to points 7, whereby the short ends of a seam are separated, opened out, and flattened down, and a covering-tape laid in position to be stitched.

887,084. RAIL FOR FENCE-POSTS. CHARLES S. LOSS, Hinsley, Ill. Filed Dec. 4, 1886. Serial No. 254,062. (No model.)



Claim.—A fence-post having a base of asphaltic concrete pressed thereon as a new manufacture.

887,085. FENCE-POST. CHARLES S. LOSS, Auburn, Ill. Filed May 27, 1887. Serial No. 239,288. (No model.)

Claim.—The method herein described of forming a base or support of asphaltic concrete on a metallic bar or rod, which consists in heating one end of said bar or rod and while the same is in a heated condition pressing thereon a body or base of heated asphaltic concrete, as set forth.

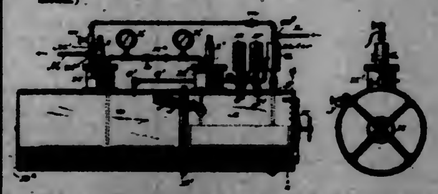
887,086. TRUNK-STRAP COUPLING. HENRY B. LOY, Red Bank, N. J. Filed Mar. 30, 1888. Serial No. 269,728. (No model.)

887,086.

Claim.—1. The combination, in a trunk-strap coupling, of a plate secured at one end to one end of the trunk-strap, a straining-lever pivoted on the said plate to swing against the same, a locking-bolt adapted to engage the free end of the lever when the latter is swung against the plate, and a detachable coupling-piece for establishing temporary connection between the opposite end of the strap and a point on the lever between its free end and pivot, substantially as described.

2. The combination, in a coupling for trunk-straps, of a plate formed with an integral buckle at one end for attachment of the plate to a strap, a straining-lever pivoted to the opposite end of the plate to be swung against the same, and a detachable coupling-piece for establishing connection between the lever and one end of the strap, substantially as described.

3. In a coupling for trunk-straps, the combination, with the plate having a recess in its under side, a slot or aperture in the top extending into the said recess, and a key-hole adjacent to the said recess, of a locking-bolt fitted in the recess, and a straining-lever pivoted to the said plate to be swung against the same to be engaged by the locking-bolt, and means, substantially as described, for attaching the coupling to a trunk-strap, substantially as set forth.



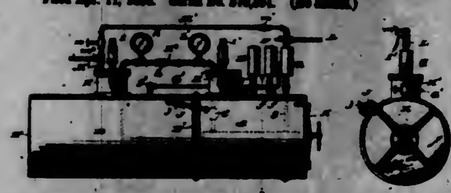
4. In a trunk-strap coupling, the combination, with the plate formed with a buckle, *c*, having a cross-bar provided with stud *c'*, of the straining-lever D, pivoted to be swung against the plate, and the detachable coupling-piece G for establishing connection between the said lever and an end of the trunk-strap, substantially as described.

5. The combination, with the plate A, formed with integral buckle *c*, of a bolt, C, straining-lever D, formed with hook *d* and pivoted on the plate to be swung against the same, and a sliding ring, E, substantially as shown and described.

6. In a trunk-strap coupling, the main plate adapted for connection with one end of a strap and formed with end lugs, a^2 a^2, provided with permanent inwardly-projecting opposing pins a^3 a^3, combined with a straining-lever having a hole, *d'*, into which the pins a^3 of the plate-lugs a^2 are entered, substantially as herein set forth.

7. In a trunk-strap coupling, the combination, with the main plate, of the lever constructed with flanges and pivoted to be swung against said plate, and a toothed adjustable catch-plate buckle whose teeth engage the flanged lever and whose opposite end is adapted to receive one end of the trunk-strap, as herein set forth.

887,087. METHOD OF GENERATING STEAM AND HEATING AIR. WILLIAM G. MACFARLANE, Dunlo, assignor, by direct and mesne assignments, to the MacLaughlin Chemical Motor and Heating Company, Everett, Mass. Filed Dec. 30, 1887. Serial No. 259,411. (No model.)



Claim.—1. The method herein described of generating and propelling steam, which consists in heating water to form steam in a heat-generating chamber by chemical action, conveying the steam thus formed to a regenerating-chamber and contacting it with a chemical, and causing the water of condensation in the said regenerating-chamber to fall on the chemical to form steam, which propels the regenerated steam continuously through the exhaust.

2. The method herein described of generating steam, which consists in expanding an inclosed volume of water in a chamber, placing a quantity of soda under said volume of water, dissolving said soda by water fed thereon, dissolving said soda and water by a charge of sulphuric acid, thereby generating heat which envelops the volume of water and vaporizes the same into steam, and independently exhausting the pressure from said chamber and the steam generated from the volume of water.

3. The herein-described method of generating steam and using the hot air or vapor of the initial generating medium as a regenerative and propulsive medium, which consists in forming steam by a chemical compound, contacting it upon a bed of dry soda in a separate compartment, allowing the heated air from the generating-chamber to flow into the said separate compartment apart from the steam, and causing the water of condensation in the latter compartment to continuously fall upon the bed of soda by vibratory motion, as set forth.

4. The herein-described method of generating and propelling steam, which consists in allowing water to slowly fall upon a bed of dry soda contained in a closed chamber and feeding heated air or vapor generated by a chemical compound in a separate chamber into said chamber containing the dry soda apart from the water, as set forth.

887,088. APPARATUS FOR ECONOMICALLY HEATING WATER TO PRODUCE STEAM. WILLIAM G. MACFARLANE, Dunlo, assignor to the MacLaughlin Chemical Motor and Heating Company, Everett, Mass. Filed Apr. 11, 1888. Serial No. 270,291. (No model.)

Claim.—1. In a steam and heat generating apparatus, the combination, substantially as before set forth, of a boiler divided into generating and regenerating chambers by a partition-head, the said chambers having closed ends, a series of boilers suspended within the generating-chamber, the feed-water tank connected to said boilers, the steam-domes, and the connecting-pipes.

2. In a steam and heat generating apparatus, the combination, substantially as before set forth, of a boiler divided into generating and regenerating chambers by a partitional head, and a series of boilers suspended within the generating-chamber.

3. In a steam and heat generating apparatus, the combination, substantially as before set forth, of the boiler divided into generating and regenerating chambers by a partitional head, a series of boilers suspended in the generating-chamber, and a steam-box in connection with said boilers and also with the generating-chamber.

4. The combination of the generating-chamber A, adapted to receive a chemical compound, the regenerating-chamber B, containing a bed of dry soda, the acid and water feeding tanks in connection with the generating-chamber A, the series of boilers suspended within said generating-chamber, the several receiving and conveying connections, and the inclined pipe J, connecting the chambers A and B, substantially as described.

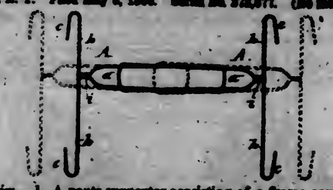
5. The combination of the chambers A and B, the partition F, dividing the same, water-tanks E and G, the acid-tank F, the series of boilers D, D', and D'', suspended in the chamber A and connected to the water-tank G, the steam-box C, attached to the boilers D, D', and D'', the steam-dome H', receiving-dome H, the pipe H'', connecting said dome, exhaust or conveying pipe M, connecting-pipe M', running to the water-tank G from the dome H, and the pipe L, substantially as described.

6. The combination, with the chambers A and B, supplied with boilers and connections, as set forth, and having closed ends, of the divisional partition F and the inclined connecting-pipe J, substantially as described.

7. The combination, with the chambers A and B, having the dividing partition F, the boilers suspended within the chamber A, adapted to be filled with water and connected with a suitable steam-dome, the removable head K for the purpose of giving access to the chamber A, and the water-tank E and acid-tank F, both of which are connected to the chamber A, substantially as described.

8. The combination, with the chambers A and B, having a dividing partition, of the connecting-pipe J, the water-tank G, the feed-pipe G', running from said acid-tank G to the chamber B, and the exhaust-pipe from the latter chamber, substantially as described.

887,089. APPARATUS FOR ECONOMICALLY PRODUCING HEAT. WILLIAM G. MACFARLANE, Dunlo, assignor to the MacLaughlin Chemical Motor and Heating Company, Everett, Mass. Filed Apr. 11, 1888. Serial No. 270,293. (No model.)



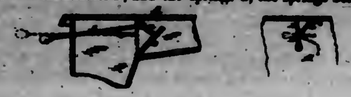
Claim.—1. In the apparatus set forth, the combination, substantially as hereinbefore described, of the cylinder B, the hopper A, having a head, J, mounted on and geared to said cylinder, the removable head D, having an enlarged centrally-situated aperture, and small apertures *d* adjacent thereto, the rod E', the lever F, the apertured valve-plug E on the lower end of the rod E', having apertures *e* therein adapted to register with the apertures *d* in the head D, the tank G, connected to the cylinder B and having a suitable cut-off plug, C', and its connecting-pipe, the exhaust-pipe G, and the drain-pipe H.

2. The combination, with the hopper A, having a closed head, the cylinder B, having a removable head-plate, D, with central apertures, the rod E', lever F, the valve-plug E, carried on the lower end of the rod E', having apertures *e* therein adapted to register with the apertures in the plate D adjacent thereto, a soda and water supply tank, and an exhaust-pipe, substantially as described.

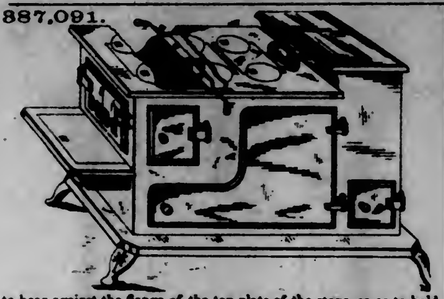
3. The combination, with the hopper A, the cylinder B, head-plate D, having a central aperture with smaller apertures running therefrom at an incline, the lever F, the rod E', and the valve-plug E, carried on the lower end of the rod E', having apertures *e* therein registering with the apertures *d* in the plate D, substantially as described.

4. The combination, with the cylinder B and hopper A, of the apertured plate D between the same, the head J on top of the hopper A, having lugs *j* thereon, the lever F, moving between said lugs *j*, the rod E', and the apertured valve-plug E on the lower end of the rod E', and fitted in the enlarged central aperture in the plate D, having apertures *e* therein adapted to register with the apertures *d* in the said plate D, substantially as described.

887,090. PASTE-SUPPORTER. ANTHONY B. HAGEMAN, Binghamton, N. Y. Filed May 3, 1888. Serial No. 272,877. (No model.)



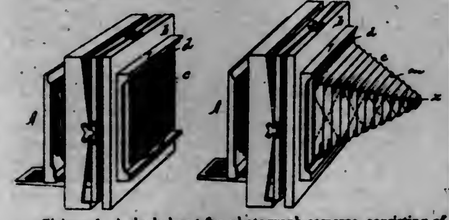
Claim.—1. A paste-supporter consisting of a frame composed of sections adjustably coupled together to permit extension and contraction of said frame, and arms extending in opposite directions from said sections, and terminating with catches adapted to engage the suspender-buttons of the pants, substantially as described and shown.



2. A paste-supporter consisting of a frame composed of two sections, A A, each formed of wire bent into the elongated loop *a*, terminating at one end with arms *b b*, and with hooks *c c* on the free ends of said arms, and the loops *a a* of the said two sections being interlocked with each other and adapted to slide longitudinally on each other, substantially as described and shown.

887,091. REGULATING-DAMPER FOR COOKING-STOVES, &c. JAMES HARROT, Sperry, Iowa. Filed July 23, 1888. Serial No. 280,762. (No model.)

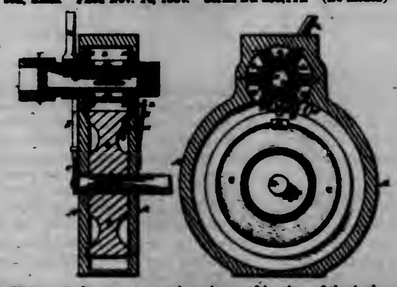
Claim.—The combination, with a stove or range, of the vertical partition E, and the dampers D, placed upon opposite sides thereof and provided with handles F, and the springs G, the springs being made



887,091.

to bear against the flange of the top plate of the stove, so as to hold the dampers in position, substantially as shown and described.

887,092. SHADING-HOOD FOR PHOTOGRAPHIC CAMERAS. THOMAS W. MANN, Holyoke, Mass. Filed Nov. 10, 1886. Serial No. 219,267. (No model.)

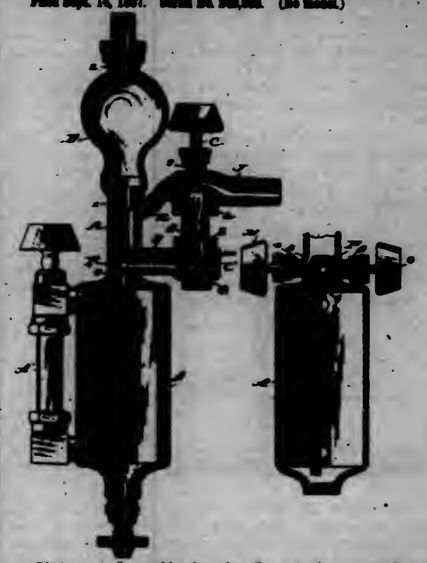


Claim.—1. A shade-hood for photograph-cameras, consisting of the flexible body *m*, attached by one end to the camera and having an opening in its free end, combined with the lazy-tong frame *n*, attached by one end to the camera and to said hood, substantially as set forth.

2. The combination, in a camera, of the frame *d*, having the cross-bar *v*, the collars *c*, and the spring *w* on said bar, the lazy-tongs *n*, having one end pivoted to said collars, and the flexible hood *m*, having its base attached to said frame and inclosing said lazy-tongs, substantially as set forth.

3. A shading-hood for photographic cameras made in pyramidal form of flexible material and having an opening through its apex opposite the ground glass of the camera, and having an internal frame-support which is collapsible together with said hood, whereby the said open end of the latter is permitted to be moved toward and from said glass, and the hood, when distended, is supported in substantially a horizontal position, or one at right angles to the side of said glass, substantially as set forth.

887,093. ROTARY STEAM-ENGINE. WILLIAM B. MAYS, McPherson, Kans. Filed Nov. 14, 1887. Serial No. 255,111. (No model.)



Claim.—1. In a rotary engine, the combination of the inclosing-frame, the driving-shaft, and the rotary piston with a rotating valve which is operated entirely by the piston, and the cylindrical cut-off which extends through the valve, substantially as shown.

2. The combination of the inclosing-frame, the driving-shaft, and the piston with cylindrical cut-off provided with the opening F, the rotating valve provided with spaces for the vane upon the piston to catch in, and the openings H, for the admission of steam, with a spring-catch which locks the valve in position, substantially as described.

3. The combination of the inclosing-frame, the operating-shaft, and piston with the rotating valve which is operated by the piston, the cylindrical cut-off which extends through the valve, the lever, the operating-rod connected thereto, and the cam or crank connected to the piston, substantially as described.

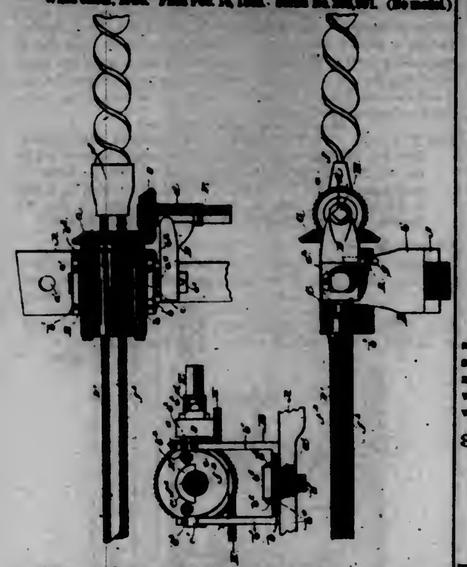
4. The combination of the inclosing-frame, the piston provided with a cam or projection, O, the spring-rod J, provided with studs L N, the valve E, provided with recesses in its end for the stud L to catch in, and the cylindrical cut-off F, which passes through the valve, substantially as specified.

887,094. LUBRICATOR. THOMAS B. HOFFMAN, Mansfield, Ohio. Filed Sept. 14, 1887. Serial No. 249,593. (No model.)

Claim.—1. In combination, the oil-cup A, the center piece, F, having the arms R S, forming a seat for the sight-feed tube, a condenser, B, supported on said center piece, F, a passage through said piece from the condenser to the cup, a passage through the arm S to the sight-feed tube for the oil, and an exit-passage through the nozzle J of the arm R to the steam-space, with suitable regulating-valves for said passages, substantially as described.

2. In combination with an oil-cup, the center piece, F, provided with arms R S and supporting the condenser B, the conduit-pipe *w*, and the sight-feed tube, substantially as described.

3. In combination, the cup A, the center piece, F, the supporting-arms R S for the sight-feed tube, a screw-plug, G, fitting an opening in the arm S and having a passage therethrough for lubricant, a nipple carried by said plug, a screw-collar fitting into the upper part of the opening in the arm S, and a washer between the parts *b* and G, substantially as described.



887,095. DEVICE FOR MOISTENING TOBACCO. JOHN MCPHERSON, Wellsville, N. Y. Filed Feb. 7, 1888. Serial No. 263,552. (No model.)

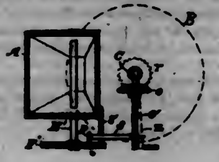
Claim.—The combination of a receptacle for tobacco and other material with a vessel made of suitable material, of such a shape that one of its sides is adapted to impinge against the inner side of the tobacco-receptacle, and having formed in that side apertures, ductile straps having their upper and lower ends bent to form hooks, the lower ones of which engage the apertures in the side of the vessel and the other ones engaging the upper edge of the tobacco-recep-

tacle, and hooks struck up from the body of the straps and extending downward toward the hooks at the lower ends thereof, substantially as set forth.

887,096. ROCK-DRILL. ZACHARIE HELLER and JOHN ROGERS, West Chester, Iowa. Filed Feb. 14, 1888. Serial No. 263,991. (No model.)

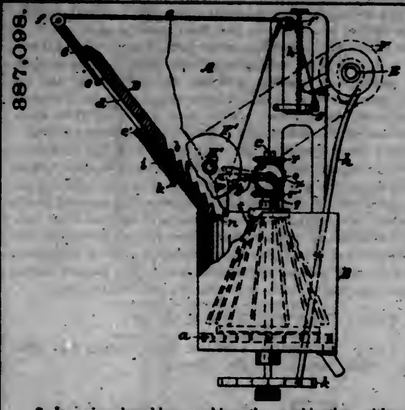
Claim.—1. In a rock-drill, the combination of the bracket having the bearing-notches, the feed-screw sleeve having the trunnions in said notches, and the arm D, detachably secured to the extended squared end of one of the trunnions having the sleeve for the drive-shaft, substantially as specified.

2. In a rock-drill, the combination of the grip-arm, the bracket pivoted thereon, the feed-screw sleeve having the trunnions journaled in the bracket, the arm detachably secured to one of the said trunnions and having the right-angled sleeve, the drive-shaft journaled in said sleeve, and the gear-wheel on said shaft, the feed-screw fastened on opposite sides, and the gear-wheel fitted on said screw and meshing with the gear-wheel on the drive-shaft, substantially as specified.



3. In a rock-drill, the combination of the bracket having a series of openings in the front edge of one side plate and a similar series in the rear edge of the opposite side plate, and the pins H, arranged to pass through corresponding openings in the two series, with the trunnioned feed-screw sleeve and the arm detachably connected to the trunnion, said sleeve and arm being engaged by the pins, substantially as specified.

887,097. DYEING COLORS BY THE SIMULTANEOUS OXIDATION OF MANGANESE AND ANILINE. FRANCOIS HOSSAN, Lyons, France. Filed Dec. 16, 1887. Serial No. 257,927. (No specimens.) Patented in France Dec. 17, 1886, No. 173,686; in Germany Jan. 24, 1886, and in England Apr. 19, 1887, No. 10,132.

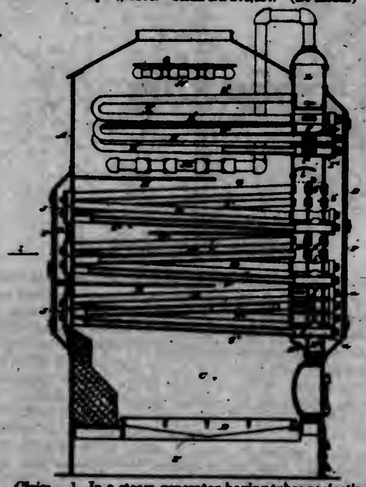


Claim.—The herein-described method of dyeing, which consists in producing colors or tints of the character described directly on the materials by the oxidation of a mixture of a salt of simple diamine and the salt of a simple monamine, substantially as set forth.

887,098. GRAIN-SUPPLYING MACHINE. JAMES H. MONTGOMERY, Kingston, N. Y. Filed June 9, 1888. Serial No. 276,561. (No model.)

Claim.—1. In a cigar-banding machine, the combination, with the hopper having a slot, *d*, and provided with pulleys *f f'*, of a pusher, D, provided with a retracting-spring, *i*, a bar or rod pivoted to the frame of the machine and connected by a cord with the pusher, and a rotary shaft provided with an arm, *m*, substantially as for the purposes described.

887,098.



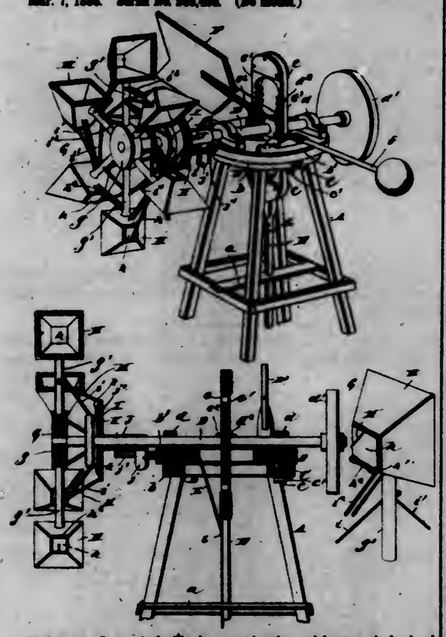
2. In a cigar-banding machine, the combination, with vertical shaft C, provided with beveled wheel *r*, and wheel *r'*, connected with stirring devices, of the shaft *s'*, with beveled wheel *s*, rod *s*, loosely connected with shaft *s'*, a fixed support for said rod, wheel F, provided with a pin, *p*, and a rotary shaft having connection with the shaft of wheel F, substantially as and for the purposes described.

887,099. INCANDESCENT GAS-BURNER. BENJAMIN MARRAS, Philadelphia, Pa. Filed Feb. 20, 1888. Serial No. 264,967. (No model.)

Claim.—An incandescent mantle formed of a single piece of sheet metal, perforated to present a practically uniform web, substantially as described.

887,100. STEAM-GENERATOR. THOMAS F. MORRIS, Jersey City, N. J. Filed Apr. 9, 1888. Serial No. 270,127. (No model.)

Claim.—1. In a steam-generator having tubes projecting into the combustion-chamber from a generator-chamber, the combination, with the said chamber, of a tubular holder, as I, mounted in the walls of said chamber and having apertures in it for the passage of water and steam, and a tube, as G, mounted in said holder and forming a prolongation of same, substantially as set forth.



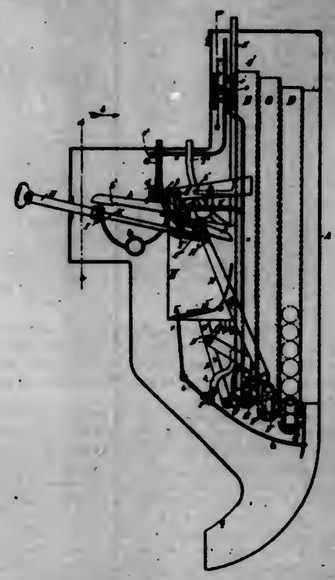
2. In a steam-generator, the combination, with generator-chamber, as B, divided by a partition into the water-chambers, as B' and B'', of a tubular holder, as I, extending across said chamber and secured in the walls of same, and a generator-tube, as G, secured in and forming an extension of said holder, the latter being provided with an aperture where it crosses the chamber B', substantially as and for the purposes set forth.

3. In a steam-generator, the combination, with a generator-chamber, as B, divided by a partition into two chambers, as B' and B², of a tubular holder, as I, extending across said generator-chamber and secured at its ends in the walls of same, said holder having an aperture or apertures in it where it crosses the chamber B', and the branched generator-tube, as G, the lower branch of which is secured in the inner end of said holder and the upper branch of which opens into the chamber B², substantially as and for the purposes set forth.

4. In a steam-generator, the combination, with the generator-chamber forming one wall of same, of the apertured tubular holders extending across the said chamber and mounted in the walls of same, the lower branches of the generator-tubes secured at one end in the inner ends of said holders and in headers, as J, at their other ends, the upper branches of said generating-tubes secured at one end also in said headers and opening into the generator-chamber at their other ends, and the said headers, said tubular holders and headers having removable caps, substantially as and for the purposes set forth.

387,101. WITHDRAWN.

387,102. WINDMILL. ALBERT G. HAHN, Furnas, Dak. Filed Mar. 7, 1888. Serial No. 266,493. (No model.)



Claim.—1. In a windmill, the combination, with the wind-wheel composed of a central hub, the arms standing outward therefrom, and the bottomless pyramidal baskets secured to the ends of the arms, of the doors hinged by their inner edges over the smaller openings of the baskets, and the coiled spring surrounding the pintles of the hinges, and each having one end attached to a door and the other end to the corresponding basket, for the purpose of closing the door against the wind when the latter is not too strong, substantially as specified.

2. In a windmill, the combination, with the bottomless baskets or vanes, doors hinged over the rear openings of said baskets, and springs closing the doors against the wind, of means, substantially as described, whereby the doors can be opened simultaneously from the ground, substantially as specified.

3. In a windmill, the combination, with the bottomless pyramidal baskets, the doors hinged at their inner edges over the smaller rear openings in the baskets, and the coiled springs surrounding the pintles of the hinges and closing the doors against the wind, of the sleeve sliding on the shaft of the wind-wheel and having a disk attached to its outer end, the disk turning on the sleeve, and of larger diameter than the disk secured thereto, the rope or chains connecting the edge of the stationary disk with the doors near their outer edges, and the rope or chain secured to the inner end of the sleeve, passing thence through an opening in the rotating plate of the turn-table of the mill, and thence downward through a staple or sheave secured to the reciprocating drive-rod of said mill, substantially as specified.

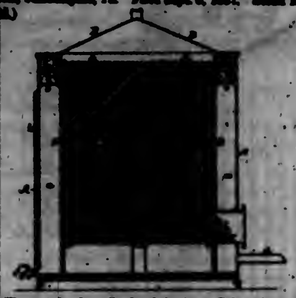
4. In a windmill, the combination, with the wind-wheel composed of the central hub, the radial arms, and the bottomless pyramidal baskets attached to said arms, the doors A, hinged to the rear ends of said baskets, and the coiled springs B', surrounding the pintles B of the hinges, of the sliding sleeve J, having the depending guide-plate j and disk j', the arm j', secured to the ring b', and having a longitudinal guide-slot to receive said depending plate, the disk K, having the lips or joints k, the ropes M, connecting the doors A and disk K and passing through the staples m, secured to the arms of the wind-wheel, and the rope L, passing inward through an opening in the ring b' and downward through a staple or sheave, l, secured to the drive-rod B, substantially as specified.

387,103. GEAR-REPAIRER. PER C. GUSTAFSSON, Gefle, Sweden. Filed Dec. 28, 1886. Serial No. 182,512. (No model.) Patented in Sweden Apr. 30, 1886, No. 30; in Germany Aug. 16, 1886, No. 34,699; in France Aug. 30, 1886, No. 176,894; in England Sept. 1, 1886, No. 10,906; in Norway Dec. 31, 1886, No. 630; in Denmark Dec. 17, 1886, No. 360, and in Austria-Hungary Jan. 17, 1888, No. 34,554 and No. 64,978.

Claim.—1. An apparatus comprising the cigar-receptacle B O D, oscillating bottoms B F G, handle H, cross-bar I, push-bars K L M, levers N N' N², adapted to be moved by the respective push-bars on the intervention of a proper coin between them, and means, as connecting-rods O O' O², for connecting the levers and pivot-shafts of the oscillating bottoms, substantially as herein set forth.

2. The combination of a push-bar, as K, bearing a coin-platform, F, thereon, a coin-tube, as Q, and lever, as N, provided with a transverse grooved shoulder, as N², substantially as and for the purpose herein set forth.

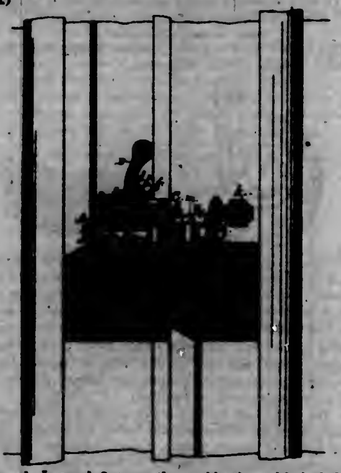
3. The combination of a lever, as N, ratchet-bar *n*, rock-shaft O', having an arm, *l*, connecting-rod *m*, shouldered draw-bar *h*, and trip projection *h'*, handle H, and cross-bar I, substantially as and for the purpose herein set forth.



4. The combination of the handle H, cross-bar I, shouldered cross-bar *h*, rock-shaft O', provided with an arm, *o*, connecting-rod *f*, and cigar-supporting rods *k k*, substantially as herein set forth.

5. The combination of the handle H, push-bar, as L, lever, as N', coin-tube, as R, coin-receptacle S S', double spring A, vibrating lever Z, and means, as the connecting-rod *v'*, for connecting the said coin-discharging device and the said lever, substantially as herein set forth.

6. The combination of the handle H, push-bar, as M, lever, as N², provided with a swiveled bar, *c*², and two coin-tubes, T T, adapted to place coins between the swiveled bar and lever, substantially as herein specified.



7. The combination of a cigar-receptacle bottom, as B, connecting wire or rod *n*, pawl *o*, ratchet-wheel *p*, numbered wheel *q*, coin-receiving tube, as Q, and detent *s*, provided with detent projections *s'* and *s²*, substantially as herein set forth.

387,104. PROCESS OF DRYING OFFAL AND GARBAGE. DAVID B. FAHNESTOCK, Philadelphia, Pa. Filed Sept. 8, 1887. Serial No. 248,894. (No model.)

Claim.—The mode described of drying offal and garbage, said mode consisting in subjecting the same to the action of heated air, and passing the vapors through sulphate of lime before permitting them to escape, all substantially as specified.

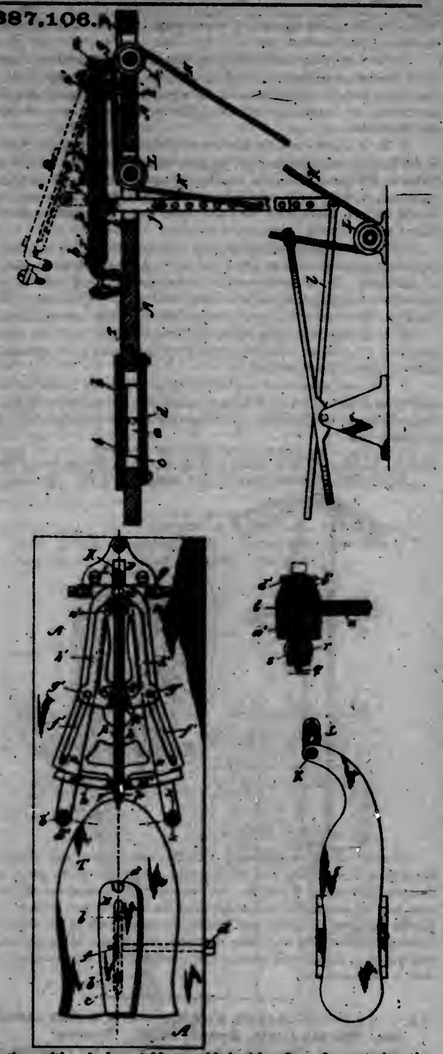
387,105. FASTENING FOR HINGED RAILS OF GATES. JAMES S. FRANCE, Lancaster, Pa. Filed Apr. 2, 1888. Serial No. 269,266. (No model.)

Claim.—1. In a nail-fastener, the combination, with the bolt-case having the slot in the top thereof, of the bolt, the spring bent of the bolt, and the lever inserted in the slot in the case and engaging with the bolt to force it backward, substantially as specified.

2. In a nail-fastener, the combination, with the sliding bolt having the groove P and mechanism for operating the same, of the horizontally-movable keeper provided with the cam-flange K, constructed and operating substantially as specified.

3. In a nail-fastener, the combination, with the sliding bolt having the groove P and mechanism for operating the same, of the recessed keeper-plate provided with the step *i* and the horizontally-movable keeper having the cam-flange K upon its upper surface and stud *p* on the lower, constructed and operating substantially as specified.

4. In a nail-fastener, the combination, with the open-bottomed bolt-case and base-plate and the bolt, of the bottom filling-plate H, substantially as and for the purpose specified.



387,106. MACHINE FOR MARKING THE UPPERS OF BOOTS OR SHOES. JOHN R. FLEMING, Waterville, N. Y. Filed Dec. 16, 1887. Serial No. 258,057. (No model.)

Claim.—1. In a machine for marking uppers, the combination, with a bed or table provided with a form for centering the upper, of a sliding frame, as *b'*, movable toward and from the said form, a marking-tool carried by the said frame, a stationary support, as frame *A*, for the sliding marker-carrying frame, and means for moving the said sliding frame and marking-tool toward and from the said form on the said stationary support, substantially as set forth.

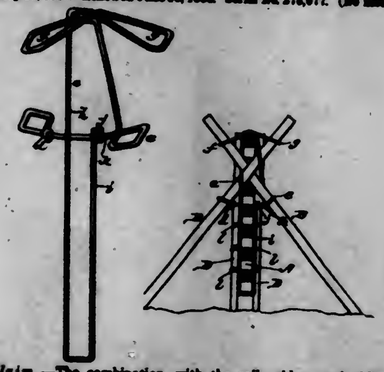
2. In a machine for marking uppers, the herein-described combination, with a bed or table provided with a form for centering the upper, of a sliding frame movable toward and from the form, a marking-tool carried by the said frame and arranged central relative to the said form to produce a central line or mark on the upper, a stationary frame or support for the said sliding frame, and two laterally-swinging side arms pivoted to the said stationary frame and having marking-tools to make transverse or toe-cap marks on the upper, substantially as set forth.

3. In a machine for marking uppers, the herein-described combination, with a bed or table provided with a form for centering the upper, of a sliding marker-carrying frame movable toward and from the said form, a stationary frame or support on which the said sliding frame is adapted to travel, said stationary frame being pivoted at its rear end to the said bed or table or to a device secured thereto, and being provided forward of its pivotal point with means by which it may be raised to lift the marking-tools when desired, substantially as set forth.

4. In a machine for marking uppers having one or more moving arms carrying marking-tools, the combination, with said arms and their actuating mechanism, of the form around which the upper is placed, the block *c*, provided with studs for securing the form in place and received in a slot in the bed, and means, as the set-screw *d*, by

which the block may be secured at any point in the slot, substantially as shown and described.

5. In an upper-marking machine, the combination, with the form B, of the arm *p*, carrying a marking-tool, the frame A, in which said arm slides, and the sliding frame *N*, to which said arm is secured, and mechanism for actuating said sliding frame, substantially as shown and described.



6. In an upper-marking machine provided with means, as block B, for holding the upper in position, the combination therewith of the frame *N*, the movable arm *n*, having divergent slots *f'*, and the sliding frame *N*, having studs *f* to coact with said slots, and means, as bolt K and its treadle, for actuating said frame *N*, substantially as shown and described.

7. In an upper-marking machine having one or more movable arms, the combination, with said arms and their operating mechanism, of the shank *r*, set in the free end of the arm and provided at its lower end with a marking-tool, said tool being held in yielding contact with the upper by means of spring *d*, substantially as shown and described.

8. In an upper-marking machine, the combination, with the movable arm *n*, of shank *r*, marking-roll *g*, spring *d*, and pin *b'*, substantially as shown and described.

9. The combination of the bed A, form B, pivoted frame A, pivoted arms *n*, sliding frame *N*, arm *p*, connecting-rod *j* and its operating-treadle, and bolt K and its operating-treadle, substantially as shown and described.

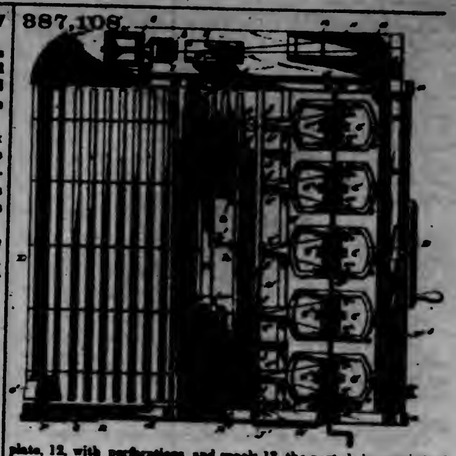
887,107. FENCE. OSCAR B. H. H. REESELEIN, Marion, Ind. Filed July 30, 1887. Renewed June 30, 1888. Serial No. 278,677. (No model.)

Claim.—The combination, with the rails, riders, and oblique brace-bars, of the tying and holding wire connected to the parts, as described, consisting of a single wire, one end tied to one of the oblique bars, carried across the rails and around the opposite bar, thence upwardly and over the riders and around the upper ends of the oblique bars and downwardly and under the lower rail, thence upwardly, and finally tied to the crossed portion and provided with the tie-loops, as shown and described.

887,108. WIRE-FENCE MACHINE. JOHN W. ROSSMAN, Clarinda, Iowa. Filed Mar. 1, 1888. Serial No. 265,895. (No model.)

Claim.—1. In a wire-and-picket-fence machine, the combination, with a rock-shaft, H, provided with projecting arms *h'*, bars *h*, pivoted thereto, spring *i*, and treadle H', of a rock-shaft, J, having horizontally-moving pusher-bars, a spring for holding said pusher-bars normally retracted, and a treadle for moving the rock-shaft, substantially as described.

2. The combination, in a wire-fence machine, of a rock-shaft, J, having horizontally-moving pusher-bars, a spring for holding said pusher-bars normally retracted, and a treadle for operating the same, substantially as shown, and for the purpose set forth.



3. In a wire-fence machine, a roller, L, having a series of recesses, *l*, and slats pivotally secured so as to fold within said recesses, substantially as shown, and for the purpose set forth.

4. In combination with a removable roller, L, slats L', pivotally secured thereto, a cap, *c'*, with a squared recess, a ratchet-wheel mounted on a key-ended shaft, and operating means, substantially as shown, and for the purpose set forth.

5. In a device for untwisting and coiling wires, a shaft provided with gear-wheels connecting the different parts of the same, a spool-carrying frame, a cutting-disk, and spools for winding the wire after being separated, substantially as shown, and for the purpose set forth.

6. The shaft 15, with rotating means and gear-wheels 3, 4, and 5, a spool-carrying frame with a gear-wheel, 6, a disk, 10, transverse plate, 12, with perforations, and spools 13, the parts being organized so as to rotate and operate substantially as described.

887,108.

887,109. HOOK. ALBERT SAWYER, Oshkosh, Wis. Filed June 2, 1887. Serial No. 239,861. (No model.)

Claim.—1. The method of forming hooks herein described, consisting in producing a blank split open at the back of the hook portion proper, and then by pressure closing said split portion at or near the edges thereof to form a hollow hook, substantially as described.

2. The method of forming hooks herein described, consisting in producing a blank split open at the back of the hook portion proper, the edges of said split-open portion being extended in the form of flanges, and then by pressure bringing said flanges together to form a hollow hook, substantially as described.

3. The method of forming hooks herein described, consisting in producing the blank with a partially hollow eye and split open at the back of the hook portion proper, then by pressure closing said split portion at or near the edges thereof to form a hollow hook, substantially as described.

4. The method of forming hooks herein described, consisting in producing a blank with a partially hollow eye and split open at the back of the hook portion proper, the edges of said split-open portion being extended in the form of flanges, then by pressure bringing said flanges together to form a hollow hook, substantially as described.

5. As an improved article of manufacture, a hook formed with its body hollow throughout its entire length, and provided with the strengthening flange or rib at the back, substantially as described.

6. As an improved article of manufacture, a hook having the hollow body portion, and the eye for the attachment of the chain hollow throughout the portion adjacent to the body of the hook, substantially as described.

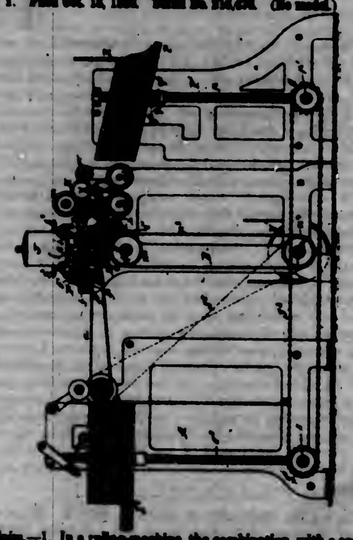
7. As an improved article of manufacture, a blank from which to form hollow hooks, the two sides of which are separated at the back on a line taken longitudinally through the hook, substantially as described.

887,110. COLD SHUT OR OPEN LINK. ALBERT SAWYER, Oshkosh, Wis. Filed Jan. 14, 1888. Serial No. 260,766. (No model.)

Claim.—1. In a link such as described, the combination of a hollow bow, a pin or cross-bar secured to one leg, and an eye formed on the other leg and adapted to receive the end of said pin, substantially as described.

2. In a link such as described, the combination, with the bow provided with an eye on one leg, of a cross-bar or hollow pin rigidly attached to the opposite leg and adapted to enter the eye and be secured therein, substantially as described.

3. The improved link herein described, consisting, essentially, of the bow recessed in the back or outer face with the sides of the recess brought together, one leg of said loop provided with an eye and the other with a pin or cross-bar adapted to enter said eye, substantially as described.



4. The improved link herein described, provided with a hollow bow and strengthening-rib formed by the meeting edges of its recessed back or outer face, and carrying on one leg an eye and on the other leg a hollow cross-bar or pin adapted to enter said eye, substantially as described.

5. In a link such as described, the combination of the hollow bow and its strengthening-rib, the hollow cross-bar or pin united to the solid end of one leg, and the solid eye formed on the opposite leg and in line with the end of said cross-bar or pin, substantially as described.

6. In a link such as described, the combination, with the bow provided with an eye on one leg, of the cross-bar or pin formed integral with the opposite leg and provided with a recess in its back or outer face, terminating at each end in inclined walls or shoulders, the edges of the sides of said recess abutting together to form a strengthening-rib, substantially as described.

7. The improved solid-shut link herein described, consisting, essentially, of a bow recessed on its outer face, the edges of the walls of the said recess abutting together to form a strengthening-rib, an eye formed on one leg of said bow, a cross-bar or pin united to the solid end of the opposite leg, said cross-piece being recessed on its outer face and provided with a strengthening-rib formed by the abutting edges of the recess, while the end of the cross-bar which is adapted to enter the eye is countersunk, as and for the purpose set forth.

887,111. RULING-MACHINE. ADAMS SAWYER, Poughkeepsie, assignor, by mesne assignments, to B. H. Burrell & Co., Little Falls, N. Y. Filed Oct. 12, 1888. Serial No. 287,631. (No model.)

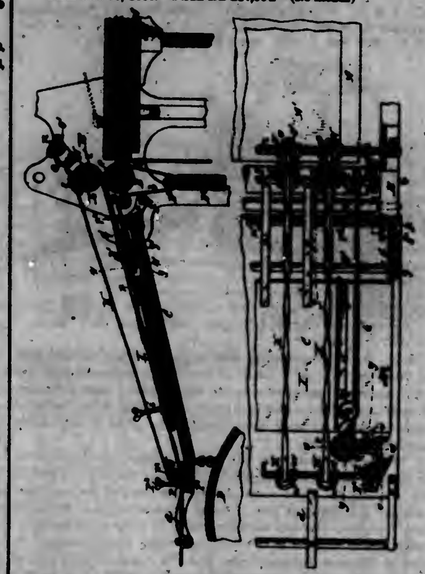
Claim.—1. In a ruling-machine, the combination, with a supporting-shaft, of a hollow ruling-cylinder and supporting-collars adjustably secured to said shaft, substantially as set forth.

2. The combination, with a supporting-shaft, of collars secured to said shaft and provided with tapering ends, and a hollow ruling-cylinder provided with flaring ends which rest against the tapering ends of said collars, substantially as set forth.

3. The combination, with the ruling-cylinder, of an ink-fountain, a shaft journaled in said ink-fountain, and an ink-roller made lengthwise adjustable upon said shaft, substantially as set forth.

4. The combination, with a ruling-cylinder, of an ink-fountain provided with an ink-roller bearing against the ruling-cylinder, an ink-reservoir supplying ink to the fountain, an overflow-pipe attached to the fountain, and a receiver into which the excess of ink is discharged through the overflow-pipe, substantially as set forth.

5. The combination, with the ruling and supporting rollers and the drying-rollers, of combined feed-rollers and cutters arranged between the ruling-rollers and drying-rollers, substantially as set forth.



6. The combination, with the ruling and supporting cylinders and their shafts, of the lower beam, *b'*, in which the lower shafts are journaled, the upper beam, *b''*, in which the upper shafts are journaled, and the slotted vertical adjusting-bolts *b'''*, upon which the upper beam rest loosely, substantially as set forth.

7. The combination, with the delivery mechanism of a ruling-machine, of a receiving-table, feed-screws whereby the table is raised and lowered, a stationary frame in which the feed-screws are supported, screw-nuts in which the feed-screws work, and horizontal pivots on which said table can be tilted, substantially as set forth.

8. The combination, with a ruling-machine, of a feed-table from which the sheets are fed to the ruling-machine, actuating mechanism by which the feed-table is raised as the sheets are fed off, a receiving-table upon which the sheets are delivered from the ruling mechanism, actuating mechanism by which the receiving-table is lowered as the sheets are received, and a positive gear connecting the actuating mechanism of the feed-table with the actuating mechanism of the receiving-table and whereby the receiving-table is lowered as the feed-table is raised, substantially as set forth.

9. The combination, with a ruling-machine, of a vertically-movable feed-table, F', a vertically-movable receiving-table, F, shafts *g'* and *a*, provided, respectively, with sprocket-wheels S and S' and connected with the feed-table and receiving-table by screws, and a drive-chain, S'', running around the sprocket-wheels S S', whereby the feed and receiving tables are moved simultaneously in opposite directions, substantially as set forth.

887,112. PAPER-FEEDER. ADAMS SAWYER, Poughkeepsie, assignor, by mesne assignments, to B. H. Burrell & Co., Little Falls, N. Y. Filed Oct. 22, 1888. Serial No. 287,994. (No model.)

Claim.—1. The combination, with the feed-board and a side guide, of lower tapes, *b*, whereby the sheets are carried to the feed-board, and upper twisted tapes, K, whereby the sheets are moved over the feed-board, substantially as set forth.

2. The combination, with the feed-board I, of the lower tapes, *b*, and a front tape-roller, B', made adjustable toward and from the rear end of said feed-board, substantially as set forth.

3. The combination, with the feed-board I, of the lower feed-tapes, *b*, the lower delivery-roller, B, the front tape-roller, B', made adjustable toward and from the feed-board, the guide-roller B'', and the tightening-rollers B''', substantially as set forth.

4. The combination, with the feed-board, of a grooved revolving guide-wheel, whereby the edge of the sheet is propelled and guided, substantially as set forth.

5. The combination, with the feed-board and the stationary side guide, of a revolving guide-wheel, substantially as set forth.

6. The combination, with the feed-board, of a stationary side

guide, a revolving guide-wheel, and tapes traveling over the feed-board, substantially as set forth.

7. The combination, with the lower delivery-roller, B, and traveling tapes K, of the wheels L, arms N, in which said wheels are journaled, a rod, *n*, upon which the arms N are loosely hung, and springs O, secured to the rod *n* by collars O', substantially as set forth.

8. The combination with the upper feed-tapes, of the wheels L, provided with plain faces, arms N, in which said wheels are journaled, and tape-guides *l*, attached to the arms N, substantially as set forth.

9. The combination, with the lower delivery-roller, B, and the tapes K, of the wheels L, supporting-arms N, flexible shaft *f*, on which the wheels L are mounted, and gear-wheels *P P*, connecting the shaft of the lower roller, B, with the flexible shaft *f*, substantially as set forth.

10. The combination, with the upper feed-tapes, of the main feed-board C and the auxiliary feed-board I, arranged above the main feed-board and below the feed-tapes, and made adjustable at its delivery end toward and from the feed-tapes, substantially as set forth.

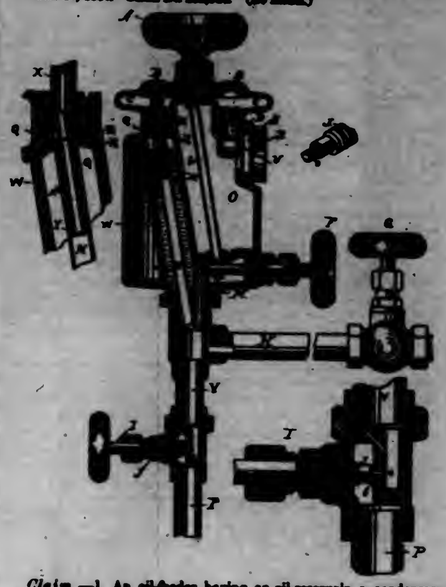
11. The combination, with the feed-board and the upper feed-tapes, K, of the front tape-rollers, M, a shaft, *m*, upon which said rollers are loosely mounted, clamps *m'*, attached to said shaft and embracing the rollers M, and bearings P, in which the shaft is supported substantially as set forth.

12. The combination, with the main feed-board and the adjustable auxiliary feed-board and the feed-tapes K, of the tape-rollers M the supporting-shaft *m*, and the hinged bearings P, provided with adjusting-screws P', substantially as set forth.

13. The combination, with the lower delivery-roller, B, and the feed-board I, of the feed-tapes K *b* and the intermediate guide-bars, *p*, extending from the roller B to the feed-board I, substantially as set forth.

387,113. RULING-MACHINE. ALONZO SHEWEY, Pennsborough, assignor, by mesne assignments, to D. H. Burrell & Co., Little Falls, N. Y. Filed Nov. 3, 1887. Serial No. 254,102. (No model.)

Claim.—1. The combination, with a ruling-cylinder provided with ruling disks or rings, of a series of traveling impression-bands arranged opposite the spaces between the ruling disks or rings and forming straight supporting-surfaces in front and in rear of the point of impression, said bands being unsupported at the point of impression, substantially as set forth.



2. The combination, with two ruling-cylinders provided with ruling disks or rings and arranged one in rear of the other in the direction in which the paper moves through the machine and on opposite sides of the paper, of two series of impression-bands arranged opposite the spaces between the ruling rings or disks and two carrying-rollers which support said bands, one roller being arranged in advance of the front ruling-cylinder and the other roller in rear of the second ruling-cylinder, substantially as set forth.

3. The combination, with a ruling-cylinder provided with ruling disks or rings, of an intermediate roller running in contact with the ruling disks or rings and adjustable toward and from the same, and an ink-fountain provided with an ink-roller running in contact with the intermediate roller, said ink-fountain being adjustable toward and from the intermediate roller, substantially as set forth.

4. The combination, with a ruling-cylinder provided with ruling disks or rings and a roller running in contact with said disks or rings and supplying the same with ink, of friction-wheels mounted upon the shafts of said roller and of the ruling-cylinder and operating as revolving stops, whereby the approach of said roller to the ruling-disks is limited and the pressure between the said roller and the ruling disks or rings is relieved, substantially as set forth.

5. The combination, with a ruling-cylinder provided with ruling disks or rings, of an ink-fountain provided with an ink-roller, an intermediate roller running in contact with the ink-roller and the ruling disks or rings, and gear-wheels mounted upon the ruling-cylinder and the intermediate roller, whereby the latter is driven from the ruling-cylinder, substantially as set forth.

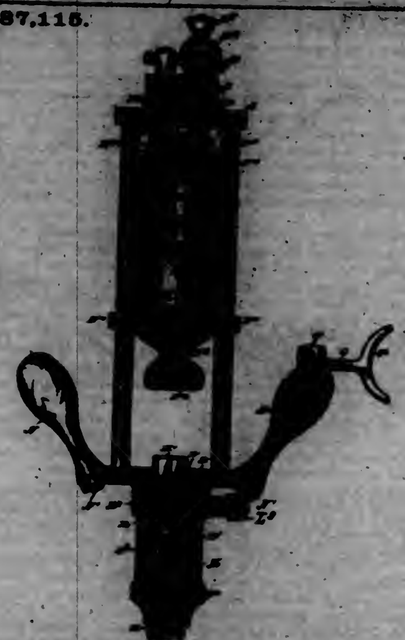
387,114. OIL-FEEDER. ROBERT GRIMSHAW, Holden, Mass. Filed Oct. 17, 1887. Serial No. 252,354. (No model.)

Claim.—1. An oil-feeder having an oil-reservoir, a condenser having a check-valve, and the pipe W, forming an integral part of the reservoir, in combination with a pipe of smaller diameter within the pipe W, thereby forming an annular space between said pipes, said internal pipe having openings near its top whereby it communicates with said space, a steam-pipe leading from the boiler and discharging near the bottom of the internal pipe, and the oil pipe or tube L, said reservoir being provided with the passage M, a valve controlling the communication between said tube and passage, the steam and oil tube V, and a regulating-valve therein contiguous to the oil-reservoir, said valve having its stem cut away on one side, whereby a uniform volume of steam and lubricant is permitted to flow down upon the valves and pistons of the engine, substantially as and for the purpose described.

2. As an improvement in oil-feeders, the combination of an oil-reservoir, a condensing-chamber, a steam-pipe, and an oil-discharge pipe, the combined steam and oil tube V, and the regulating-valve I in the said tube immediately below the steam-pipe and contiguous to the oil-reservoir, said valve having a projection, *c*, below its valve-seat, and having a flattened upper surface, whereby a uniform flow of oil and steam is permitted to the valves and pistons of the locomotive.

3. An oil-feeder having an oil-reservoir, a condenser communicating therewith, and the pipe W, in combination with the steam-pipe H, the pipe N, passing through the pipe W and having openings in its upper end, and a smaller pipe, N', within the pipe N, having openings at its upper end, said pipes W, N, and N' forming between themselves spaces for containing a non-heat-conducting substance, substantially as described.

387,115. RULING OR SHIFTING DEVICE. WILLIS S. SUMMAM, Hinckley, Wis. Filed Sept. 3, 1887. Serial No. 248,712. (No model.)



Claim.—1. In a drill of the class described, a movable cylinder carrying a hammer, in combination with an independent drill-rod, substantially as specified.

2. In a drill of the class described, a movable cylinder carrying a hammer, and having a piston provided with exhaust and supply valves, in combination with an independent drill-rod, substantially as specified.

3. In a drill of the class described, a movable cylinder carrying a hammer and having a piston provided with exhaust and supply valves, in combination with a drill-rod, and a spring to return the hammer, reverse drill, and remove the connection, substantially as specified.

4. In a drill of the class described, the combination, with a frame-

387,115.

work consisting of an upper and lower yoke connected by hollow guides, of a cylinder carrying a hammer mounted for movement in said guides, and of a stationary piston-head mounted in said cylinder, substantially as specified.

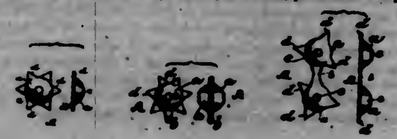
5. In a drill of the class described, the combination, with the frame-work thereof, of a drill-rod mounted therein and provided with a ratchet-wheel near its head, and of a spring-pawl adapted to take into said ratchet and turn the drill-rod, substantially as specified.

6. In a drill of the class described, the combination, with the frame-work thereof, of a supporting-bracket attached thereto and adapted to embrace the arm of the operator, substantially as shown and described.

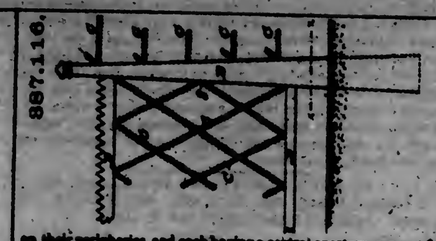
7. The combination, with the yokes A and B, connected by the hollow guides C, of the cylinder F, having the guiding-lugs F', embracing said rods, substantially as specified.

8. The cylinder F, formed with the hammer F², having the reduced neck portion F³, in combination with the removable head F⁴, having the stuffing-boxes F⁵, and the glands F⁶ mounted on said hammer, and adjusting-screws F⁷, substantially as specified.

9. The combination of the lower yoke, B, of the frame-work, provided with the handles H, with the bracket O, secured to said handle, as at O', and bifurcated, as at O², to embrace the body of the operator, substantially as specified.



10. The yoke A, having the stuffing-boxes A' and glands A², in combination with the pipes D and E, flanged, as at D' E', respectively, and the piston-rods G G', entering said yoke, substantially as specified.



11. The cylinder F, constructed as described, in combination with the piston H, having the valve I, formed with the heads I', the ports F², and slot F³, substantially as specified.

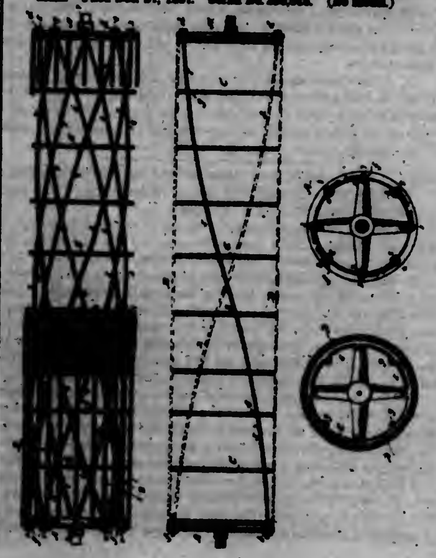
12. The yoke B, having the opening B', flange B², thimble B³, and ferrule B⁴, in combination with the drill-rod K, having the ratchet L, secured thereto by means of the pin or link L', the interposed spring M, and the pawl L², substantially as specified.

387,116. FENCE. FERDINAND EDWARDS, Cobb, Sweden. Filed Apr. 18, 1888. Serial No. 270,622. (No model.)

Claim.—1. A barb for a fence-wire made from sheet metal and comprising two saucer-like parts or halves, *a a*, provided with spurs

on their peripheries, and each having a central aperture, *c*, as set forth, whereby they may be strung on a wire.

2. A barb for a fence-wire made from sheet metal and comprising two integral saucer-like parts or halves, *a a*, provided with spurs on their peripheries and each having a central aperture, *c*, said halves being united by a bent tie, as *b*, and arranged face to face, as set forth.



3. A barbed wire for fencing, consisting of a wire, *c*, and barbs A strung thereon, said barbs being of sheet metal, bulbous and hollow, and provided each with spurs *d d*, as set forth.

387,117. APPARATUS FOR ELECTRICAL CONVERSION AND DISTRIBUTION. WILLIAM STANLEY, Jr., Great Barrington, Mass., assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Feb. 29, 1887. Serial No. 229,117. (No model.) Patented in England July 13, 1887, No. 9,765; in France July 18, 1887, No. 184,726; in Belgium July 13, 1887, No. 78,160; in Italy July 13, 1887, XLIII, 369, and in Canada Nov. 12, 1887, No. 27,551.

Claim.—The hereinbefore described method of equalizing the distribution of potential upon two or more work-circuits, which consists, first, in creating a magnetic field common to all the work-circuits by establishing in the supply-circuit an electro-motive force; second, in inducing a counter electro-motive force in the supply-circuit, and, third, in supplying two or more work-circuits with composite currents formed by the impressed and counter electro-motive forces, whereby the excess of energy in one work-circuit is transferred to another by means of the magnetic field, substantially as described.

387,118. DAIRY-MILL. WILLIAMSON B. SWAYNE, Springfield, Minn. Filed Dec. 27, 1887. Serial No. 258,858. (No model.)
